Ultra-High Performance MOSFETs

Diodes Incorporated's (Diodes) products are designed for high performance across a wide range of existing and emerging applications

Diodes Incorporated is a leading global designer and manufacturer Analog and Discrete Power Solutions.

We enable innovation by leveraging our broad product portfolio, company-owned operations, and leading-edge packaging technology to meet your needs.

Our broad range of application-specific solutions, coupled with a worldwide network of engineering, testing, manufacturing, and customer service sites, positions us as a premier provider for automotive, industrial, and consumer markets.

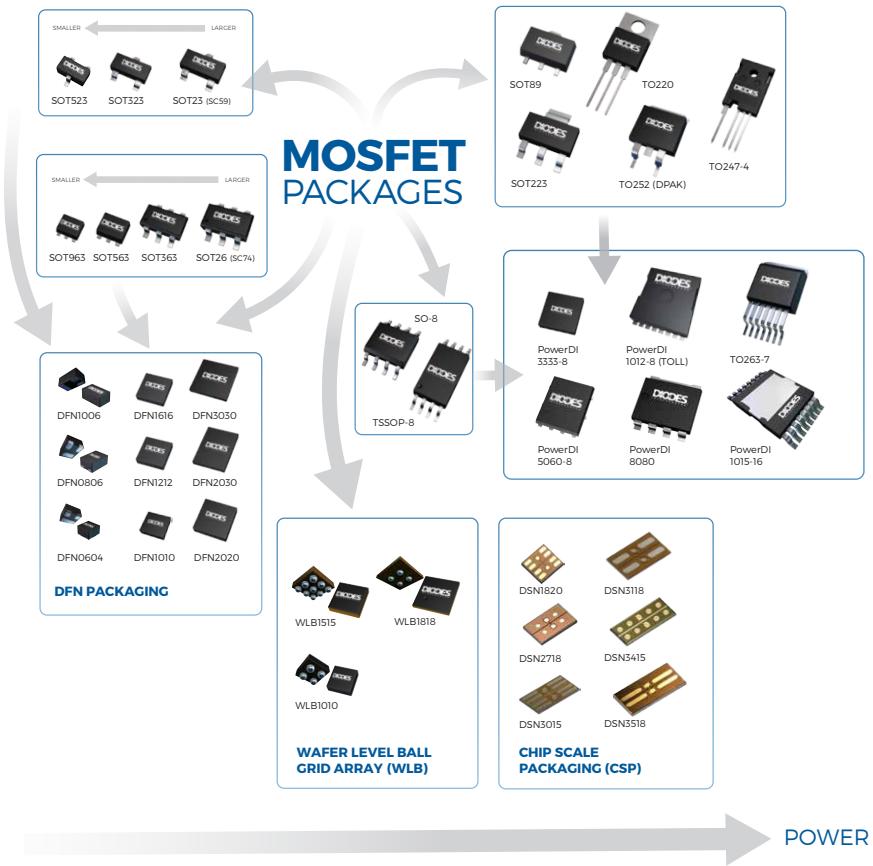

Diodes Incorporated's broad semiconductor portfolio provides our customers with leading-edge solutions for next-generation systems.

Our discrete products portfolio includes silicon carbide MOSFETs, silicon MOSFETs, bipolar transistors, diodes, rectifiers, Super Barrier Rectifiers (SBR[®]), and protection products

Our Analog portfolio comprises power management ICs, LED drivers, standard linear devices and sensors, signal switching, signal integrity, connectivity, and timing products.

Our Logic products include single-gate, dual-gate, and standard logic gates, as well as level translators, analog switches, registers, and multiplexers.

MOSFET Package Evolution

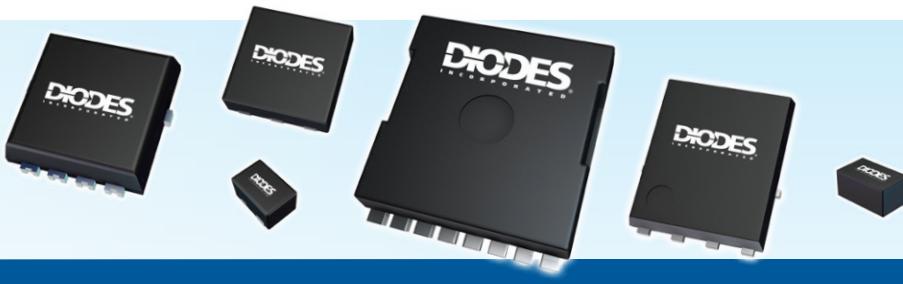

As advances in semiconductor technology processes lead to improved device performance and efficiencies, it is essential that packaging technologies keep pace with these developments.

On the one hand, increased loads—such as in automotive motors and pumps and industrial drives—demand larger die for higher current handling and the thermal management challenges that creates.

On the other hand, reduced silicon geometries lead to smaller and smaller devices to meet the demands of wearables and other highly integrated systems.

Diodes' PowerDI1012-8 (TOLL) package can handle very high currents. Top-side cooled packages such as PowerDI1015 provide an improved thermal pathway to ambient via appropriate heatsinking. High-temperature (175°C) automotive SiC devices meet the demands of rapidly-evolving EV systems.

Diodes' DFN2020 (2mm x 2mm PCB footprint) delivers the same current-handling capabilities as the popular SOT223 package for 9% of the PCB real estate. Chip Scale Packages (CSP) allow designers integration of protection MOSFETs for battery charge and discharge control.

Encompassing N- and P-channels, the portfolio ranges from -600V to +1700V in single, dual, complementary, and H-Bridge (Quad) configurations. These are offered in a wide range of package options, from the tiny DFN0604 (0.6mm by 0.4mm) to the thermally-efficient PowerDI1012-8 (TOLL) and PowerDI1015 (top-side cooled) packages. Innovations in chip-scale packaging enable the lowest $R_{DS(ON)}$ for a given footprint.

Embracing both industry-standard and differentiated products, the broad portfolio has expanded to over 2,200 products, from small-signal to power MOSFETs. Diodes Incorporated utilizes technologies that are uniquely suited for specific applications, such as using shield-gate technology to reduce conduction and switching losses, which is ideal for BLDC motor driving.

Diodes' lateral MOSFETs (LD-MOS) feature industry-leading Figure of Merit (FOM), which enables greater efficiency in DC-DC buck converters.

The breadth of the Diodes' MOSFET portfolio enables designers to select a device that is optimized for their application, ranging from consumer to industrial to automotive segments.

The portfolio is suited to requirements in:

- | | |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none">■ DC-DC conversion■ LED lighting■ Load switching■ Battery chargers■ Power-over-ethernet | <ul style="list-style-type: none">■ Motor control■ Battery protection■ Power supplies■ Audio circuits |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|

The majority of products in the Diodes MOSFET product portfolio are designed to meet the stringent requirements of the AEC-Q101 reliability standard of the Automotive Electronic Council.

A key part of our capability is automotive compliance. Such parts are qualified to AECQ101, manufactured in facilities certified to the rigorous IATF 16949 standard, and capable of customer audit to VDA6.3. Furthermore, all in-house packaging utilizes an environmentally 'green' mold compound.

Diodes Incorporated's MOSFET product development strategy is focused on high-growth market segments such as Automotive, LED lighting, smartphones, and the Internet of Things.

MOSFETs

Silicon Carbide (SiC) MOSFETs

Silicon carbide offers designers unique properties essential in tomorrow's power electronic systems such as in green energy, energy storage systems, and electric vehicles.

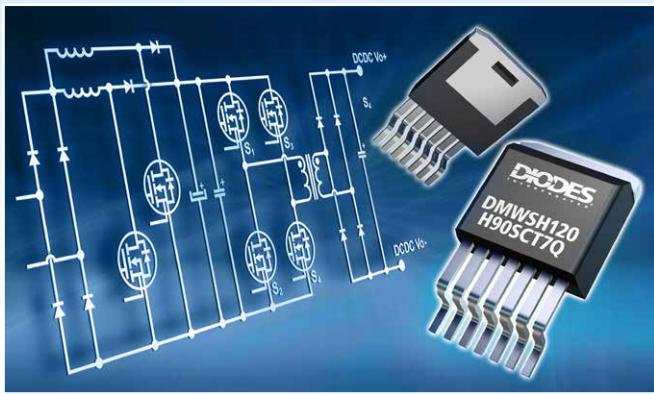

Wide band gap materials such as SiC offer fast switching and low on-resistance at higher temperatures and voltages than silicon can offer.

Future electronic systems such as electric vehicles and renewable energy demand ever higher efficiencies at higher power densities. Diodes' SiC MOSFETs feature robust body diodes that deliver fast switching and low reverse recovery charge, minimizing switching losses at high frequencies. By using the planar manufacturing process, Diodes has created new MOSFETs that offer more robust and reliable performance in automotive applications—and with increased drain current, junction temperature, and power rating.

Diodes' innovative packaging solutions include the TO247-4 (Type WH) package, which offers an additional Kelvin sense pin. This can be connected to the source to optimize switching performance, enabling even higher power densities.

Diodes' SiC portfolio includes Schottky Barrier Diodes (SBD) as well as power MOSFETs. SiC's unique properties make it ideal in such applications as:

- EV high-power DC-DC converters
- EV charging systems
- Automotive motor drivers
- On-board chargers
- Industrial motor drives
- Solar inverters
- Data center and telecom power supplies
- DC-DC converters
- Next-generation applications in green energy, energy storage systems, and electric vehicles

The DIODES Advantage

- **Low $R_{DS(ON)}$ and Low Q_G**
Enables system designers to maximize efficiency while ensuring power dissipation is kept to a minimum
- **Low Thermal Resistance Packaging**
Enables higher switching currents
- **Kelvin Sense Pin**
Optimizes switching performance, enabling higher power densities
- **Robust Body Diode**
Fast t_{RR} and Low Q_{RR} minimizes switching losses
- **Qualified to 175°C**
Suitable for use in high-ambient environments

Diodes at the Forefront of Miniaturization

Diodes has been at the forefront of small package development and manufacturing for many years and offers an industry-leading portfolio of devices with the smallest of footprints.

Improvements in both lead design and underside thermal pads mean that devices that were once available in SOT (small-outline transistor) packages now have smaller equivalents. For example, the internal dissipation losses are reduced in the much smaller DFN (dual flat no lead) packages compared to similar devices, improving design flexibility and boosting efficiency.

The trend for smaller packages continues apace. Of course, the journey towards miniaturization has been driven over the decades by the need to pack more functionality and capability into less space, which is especially important with the increasing numbers of "wearable" and mobile devices. More recently, the emergence of ubiquitous interconnectivity, such as the Internet of Things (IoT) and adoption of Artificial Intelligence (AI) in more everyday devices further fuels the insatiable demand for high-performance devices with tiny footprints.

Supplying semiconductor components in packaged form not only protects the die inside but also provides a more convenient way of handling the components and using them in automated manufacturing processes. Diodes offers a vast range of small outline packages (SOPs), including the very small outline package (VSOP) and chipscale packages (CSPs) meeting this constant demand. One of the most in-demand discrete packages from Diodes Incorporated that feeds this developing market is the high current density PowerDI series.

Improvements in packaging technology mean that devices that were once available in a 6.5mm x 7mm SOT223 (small-outline transistor)

can now fit in the tiny DFN2020 (dual flat no lead) occupying just 2mm x 2mm of PCB area. One popular such device is the 40V DMTH4008LFDFW, an automotive-compliant MOSFET in DFN2020.

Taking up less than 10% of the area on a PCB that a traditional SOT223 package requires, this kind of miniature MOSFET brings greater power density to many automotive applications, including DC-DC converters, LED backlighting, and advanced driver assistant systems (ADAS).

Diodes' expertise in packaging ensures that the smallest of devices can withstand the harshest of environments, with many devices qualified to the stringent automotive standard AEC-Q101.

Discover Diodes - More than Discretes

Diodes delivers analog and discrete power solutions through its high-quality semiconductor products to the world's leading companies.

We have a diverse product portfolio covering diodes, rectifiers, transistors, MOSFETs, SiC diodes and MOSFETs, protection devices, logic, voltage translators, amplifiers and comparators, sensors, and power management devices such as AC-DC converters, DC-DC switching, linear voltage regulators, voltage references, LED drivers, power switches, photocouplers, and voltage supervisors.

We also have timing and connectivity solutions including clock ICs, crystal oscillators, PCIe packet switches, multi-protocol switches, interface products, and signal integrity solutions for high-speed signals.

Our market focus is on high-growth, end-user applications in the following segments:

Automotive: connected driving, comfort/style/safety, and electrification/powertrain;

Industrial: embedded systems, precision controls, medical, clean energy, machine to machine, motor control, and IoT;

Computing: cloud computing, server, AI server, storage, data centers, and edge AI;

Consumer Electronics: IoT: wearables, home automation, home appliances, smart infrastructure, and charging solutions;

Communications: smart phones, 5G networks, and enterprise networking.

Highest Efficiency from LDMOS 30V Half-Bridge Power

The DMN3012LEG, DMN3013LDC, and DMN3022LDC are the first in a new generation of discrete MOSFETs, offering industry-leading efficiency in a package measuring just 3.3mm x 3.3mm, providing significant cost, power and space savings in a range of power conversion and control applications.

Integrating dual MOSFETs in a single package reduces the board space, which typically requires two separate devices, by up to 50%, and when used in DC/DC synchronous buck converters and half-bridge power topologies, reduces the size of many power converter solutions.

Industry-lowest power losses are realized through the Lateral Diffused MOS (LDMOS) design optimizing high power density, high-efficiency, and high-frequency capabilities along with ultra-low internal inductance, low on-resistance, and low capacitance.

The low-profile package (1.2mm typ.) meets all designs in computing / tablet PC products.

The DIODES Advantage

Improves System Efficiency

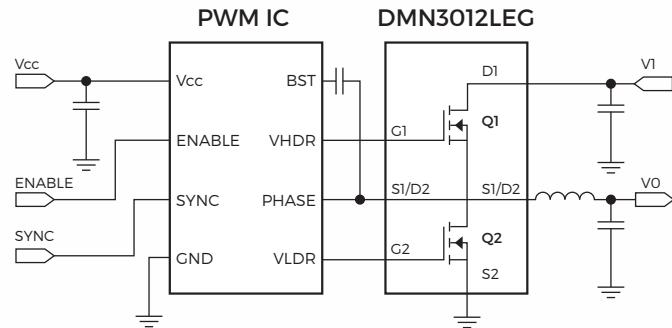

- Superior peak power efficiency of 95%
- Low input capacitances provide fast switching speeds
- Improved performance at light load
- Optimized for 5V gate drive applications

Reduced System Temperature

- Low on-resistance provides low conduction loss
- Ultra-low package inductance reduces switching loss
- Underside pad improves thermal resistance and power handling

Improved Reliability

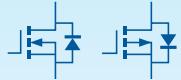

- Unclamped inductive switch (UIS) ruggedness tested at production

Innovative Side Wall Feature Enhances AOI Efficiency

Automated Optical Inspection (AOI) technology is widely used across the electronics manufacturing industry.

Diodes Incorporated's side wall plateable (SWP) feature ensures AOI compatibility for its PowerDI and DFN packages. As device and PCB footprints shrink, inspecting solder joint quality becomes challenging.

The SWP feature includes a dimple in the lead-frame solder connection, making solder joints visible to AOI systems during assembly.

This feature not only improves solder joint visibility but also enhances joint strength, thereby improving product reliability within electronics manufacturing.

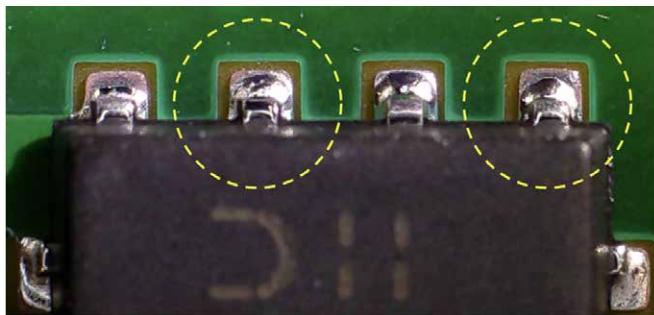

The DIODES Advantage

Enhanced Solder Joint Visibility for AOI

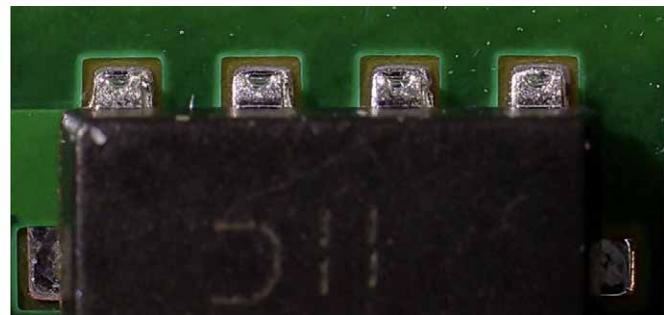

- Improved quality assurance
- Reduces manual inspection time

Stronger Solder Joints

- Improves product robustness and reliability

Uncertainty when determining solder joint quality leads to unnecessary manual inspection time.

Dimples fill with solder

Lead sidewall dimple feature on the PowerDI5060-8 package

Application Focus

MOSFETs for DC to DC Conversion

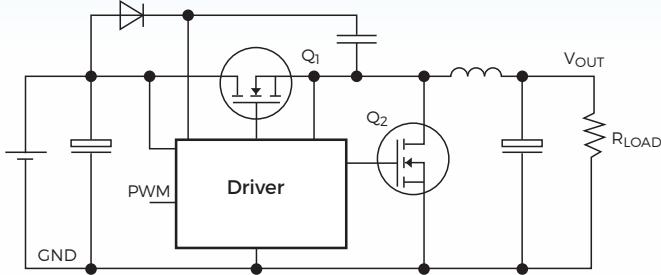

MOSFET REQUIREMENTS FOR DC to DC CONVERSION

High-Side MOSFET (Q1)

- Low gate charge (Q_{GD})
- Low gate resistance (R_g)
- Low input capacitance (C_{iss})

Low-Side MOSFET (Q2)

- Low $R_{DS(ON)}$ - minimize conduction losses

As well as the nominal maximum power that the DC/DC converter can deliver, the two MOSFETs must handle voltage spikes caused by parasitic inductances and a current level equal to the maximum output current, plus 50 percent of the ripple current. The losses from the high side (Q1) and low side (Q2) are important. Not only will static losses from the on-resistance through the transistor cause lower efficiency, but so will losses incurred during switching.

Q1 – High-Side MOSFET

In high-frequency synchronous conversion topologies, the high-side MOSFET can often be switched at frequencies twice that of the low-side MOSFET. Therefore, the gate charge, gate resistance, and input capacitance are key parameters.

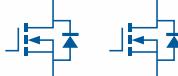

Q2 – Low-Side MOSFET

The low-side MOSFET is usually dominated by conduction losses ($R_{DS(ON)}$) with additional conduction losses for dead time.

Highlighted Products

Application Focus

Automotive Brushless DC Motor Control

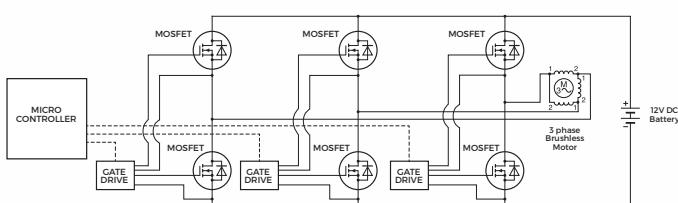

Brushless DC (BLDC) motor control provides improved performance, longer life, reduced noise, and greater ease of use compared to equivalent mechanical solutions.

The DIODES Advantage

- Low R_{DS(ON)}
Reduced conduction losses
- Low Q_{GD}
Reduced switching losses
- 100% Avalanche Rated
Ensures robust design able to withstand the reverse avalanche energy generated by the BLDC
- Rated to +175°C For use in high-ambient temperature environments
- Low Thermal Resistance Package
Maintains low operating temperature

3-phase BLDC systems are widely used in automotive applications such as fuel pumps, water pumps, anti-lock braking systems (ABS), and power steering systems. The motor power depends on the vehicle application and performance. In BLDC motor systems, MOSFETs are typically configured in a 3-phase bridge arrangement to drive the DC motor and must be capable of handling start-up and stalled motor currents of up to six times the continuous current rating of the motor.

MOSFETs Driving 3-Phase BLDC Motor

Application Focus

Automotive MOSFETs for reverse battery protection

Application Requirements

Protect against reverse polarity connection of the battery during vehicle maintenance. During the reconnection of a vehicle's battery, it is possible to reverse the battery polarities, thus causing damage to the vehicle's electronics.

- Simple, Low-Cost, and Minimal Component Count
 - Minimal Power Losses
 - Pulse Ruggedness to ISO7637
 - AEC-Q101 and PPAP Supported
- Example Product: 60V P-Channel MOSFET
- DMPH6050SPDWQ

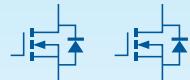

51V - 99V P-Channel

MOSFET H-Bridges Reduce Footprint by 50%

Packaging dual N-channel and dual P-channel MOSFETs in DFN5045 and SO-8 packages, Diodes Incorporated has provided a unique solution that enables designers to reduce the PCB space and component count required by low-power, full H-bridge applications.

In just a single footprint, these H-bridges can replace the equivalent of four single or two dual parts in space-limited single-phase brushed and brushless motor driving, inductive wireless charging circuits, and DC-DC converters.

30V - 100V H-Bridge

The DIODES Advantage

■ Reduce footprint

In DFN5045 (5mm x 4.5mm) and SO-8 (5mm x 6mm) packages, these H-bridges can save PCB space and reduce component count and assembly costs

■ Low $R_{DS(ON)}$

Minimized conduction losses enables these H-bridges to tolerate high continuous current under motor stall conditions.

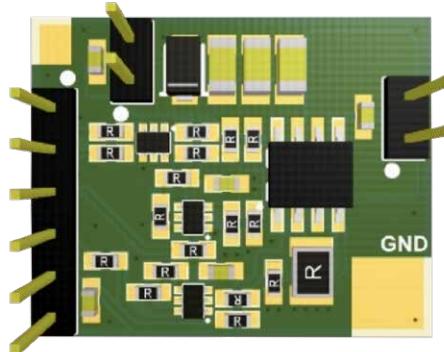

■ High pulsed current capability

Allows for a high in-rush current to be drawn safely during the start-up of inductive loads

H-Bridge Evaluation Board

This board includes driver transistors to allow the H-Bridge (DMHC4035LSD) to be driven from 3.3V Micro.

For more details and quotations, please contact your nearest Diodes sales office or representative.

IntelliFET® Self-protected MOSFETs

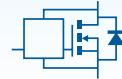

Diodes incorporated designs, develops, and manufactures a range of self-protected MOSFETs that provide general-purpose switching.

These are especially suited for loads with high in-rush current such as found in inductive circuits.

Switching all types of resistive, inductive, and capacitive loads, these devices feature overtemperature, overvoltage, and overcurrent protection, enabling circuit designers to dramatically increase reliability.

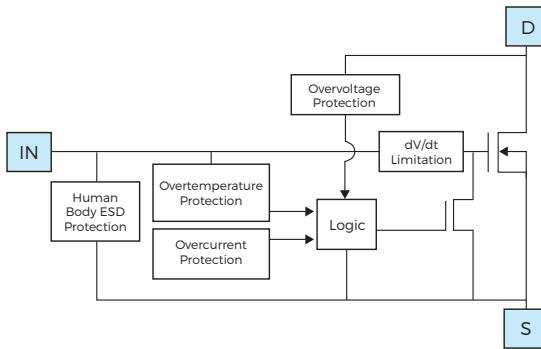

The Diodes IntelliFET portfolio is packaged in SOT23F, SOT223, SM8, and SO-8.

Single-channel

Dual-channel

The DIODES Advantage

- Overvoltage, Over-Temperature and Overcurrent Protection

Improved robustness and reliability for harsh environment.

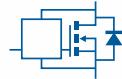

- Low $R_{DS(ON)}$

$R_{DS(ON)}$ minimizes the conduction losses through the device.

- 3V and 5.5V Inputs

IntelliFET portfolio can be driven directly from a microcontroller.

Smart Load Switches

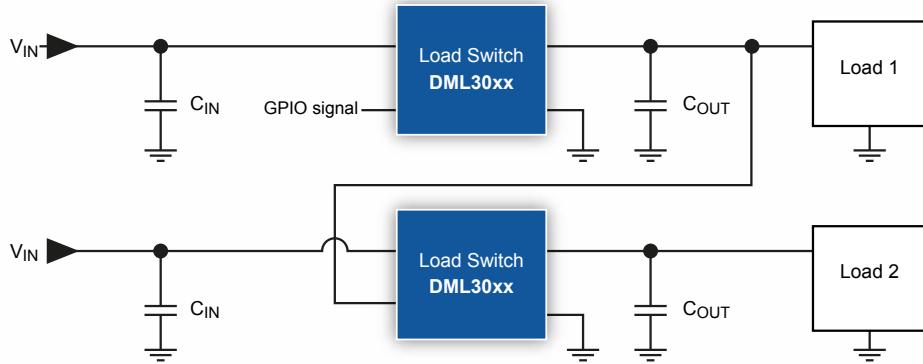

The DIODES Advantage

Features DML10xx Family

- Integrated N-MOSFET with Ultra-Low-Resistance
- Input Voltage Range 0.8 V to 4 V
- Under Voltage Lockout
- Low Quiescent Current

DML30xx Family has additional features

- Advanced Controller with Charge Pump
- Wide Input Voltage Range 0.5 V to 22V
- Soft-Start via Adjustable Slew Rate Control (SR)
- Power Good Signal (PG)
- Thermal Shutdown
- Short-Circuit Protection (SC)
- Extremely Low Standby Current
- Load Bleed (Quick Discharge)

Diodes Automotive

Semiconductors form an integral part of modern automobiles.

A typical vehicle may have up to 100 Electronic Control Units (ECUs) embedded in systems including those governing engine, transmission, active safety, passenger comfort, and infotainment systems.

Diodes has a wide portfolio of automotive-compliant analog, discrete, and timing products.

These automotive parts are clearly identified by a 'Q' at the end of the part number.

Diodes' fully automotive-compliant 'Q' MOSFETs are all:

- Qualified to AEC-Q101
- Manufactured in facilities certified to the rigorous IATF 16949 standard,
- Manufactured in facilities capable of customer audit to VDA6.3
- Supported by Production Part Approval Process (PPAP) documentation

Thus meeting all the requirements of the automotive electronics industry.
