Unit Features

The HP Series

The HP series raises the bar for Water-Source Heat Pump efficiencies, features and application flexibility. Not only does the HP Series exceed ASHRAE 90.1 efficiencies, but it also uses R-410A, a zero ozone depletion refrigerant, making it an extremely environmentally-friendly option. The HP Series is eligible for additional LEED™ (Leadership in Energy and Environmental Design) points because of the "green" technology design.

Available in sizes from 1½ ton through 5 tons the HP Series offers a wide range of units for most any installation. The HP Series has an extended range refrigerant circuit, capable of geothermal ground loop applications as well as boiler-tower water loop applications. Standard features include: Copeland scroll compressors (rotary for size 018), microprocessor controls, galvanized steel cabinet with powder coat paint, stainless steel drain pan and sound absorbing air handler insulation are just some of the features of the HP Series series.

Heat Controller's exclusive double isolation compressor mounting system makes the HP Series the quietest unit on the market. Compressors are mounted via vibration isolators to a heavy gauge mounting plate, which is further isolated from the cabinet base with rubber grommets for maximized vibration/sound attenuation. The easy access control box and large access panels make installing and maintaining the unit easier than other water-source heat pumps currently in production.

The HP Series Water-Source Heat Pumps are designed to meet the challenges of today's HVAC demands with one of the most innovative products available on the market.

Unit Features

- Sizes 018 (1½ ton) through 060 (5 tons)
- R-410A refrigerant
- Exceeds ASHRAE 90.1 efficiencies
- Galvanized steel construction with powder coat paint
- Stainless steel drain pan
- Sound absorbing glass fiber insulation
- Unique double isolation compressor mounting for quiet operation
- Insulated divider and separate compressor/air handler compartments
- Copeland scroll compressors (rotary for size 018)
- TXV metering device
- Microprocessor controls standard
- PSC three-speed fan motor
- Internally trapped condensate drain line (vertical units only)
- Unit Performance Sentinel performance monitoring system
- Eight Safeties Standard
- Extended range (20 to 120°F, -6.7 to 48.9°C) capable
- Epoxy coated air coil

Available options

- Cupro-Nickel water-coil
- Sound absorbing UltraQuiet package
- Hot water generator
- Field installed electric heater

Selection Procedure

Reference Calculations

Heating	Cooling
$LWT = EWT - \frac{HE}{GPM \times 500}$	$LWT = EWT + \frac{HR}{GPM \times 500}$
$LAT = EAT + \frac{HC}{CFM \times 1.08}$	$LC = TC - SC$ $LAT (DB) = EAT (DB) - \frac{SC}{CFM \times 1.08}$ $S/T = \frac{SC}{TC}$

Legend and Glossary of Abbreviations

BTUH= BTU(British Thermal Unit) per hour	HWC= hot water generator (desuperheater) capacity, Mbtuh
CFM= airflow, cubic feet/minute	IPT= internal pipe thread
COP= coefficient of performance = BTUH output/BTUH input	KW= total power unit input, kilowatts
DB= dry bulb temperature (°F)	LAT= leaving air temperature, °F
EAT= entering air temperature, Fahrenheit (dry bulb/wet bulb)	LC= latent cooling capacity, BTUH
EER= energy efficiency ratio = BTUH output/Watt input	LWT= leaving water temperature, °F
EPT= external pipe thread	MBTUH= 1000 BTU per hour
ESP= external static pressure (inches w.g.)	S/T= sensible to total cooling ratio
EWT= entering water temperature	SC= sensible cooling capacity, BTUH
GPM= water flow in U.S. gallons/minute	TC= total cooling capacity, BTUH
HE= total heat of extraction, BTUH	WB= wet bulb temperature (°F)
HC= air heating capacity, BTUH	WPD= waterside pressure drop (psi & ft. of hd.)
HR= total heat of rejection, BTUH	

Conversion Table - to convert inch-pound (English) to SI (Metric)

Air Flow	Water Flow	Ext Static Pressure	Water Pressure Drop
Airflow (L/s) = CFM x 0.472	Water Flow (L/s) = gpm x 0.0631	ESP (Pa) = ESP (in of wg) x 249	PD (kPa) = PD (ft of hd) x 2.99

Selection Procedure

- Step 1 Determine the actual heating and cooling loads at the desired dry bulb and wet bulb conditions.
- Step 2 Obtain the following design parameters: Entering water temperature, water flow rate in GPM, air flow in CFM, water flow pressure drop and design wet and dry bulb temperatures. Air flow CFM should be between 300 and 450 CFM per ton. Unit water pressure drop should be kept as close as possible to each other to make water balancing easier. Go to the appropriate tables and find the proper indicated water flow and water temperature.
- Step 3 Select a unit based on total and sensible cooling conditions. Select a unit which is closest to, but no larger than, the actual cooling load.
- Step 4 Enter tables at the design water flow and water temperature. Read the total and sensible cooling capacities (Note: interpolation is permissible, extrapolation is not).
- Step 5 Read the heating capacity. If it exceeds the design criteria it is acceptable. It is quite normal for Water-Source Heat Pumps to be selected on cooling capacity only since the heating output is usually greater than the cooling capacity.
- Step 6 Determine the correction factors associated with the variable factors of dry bulb and wet bulb.

Corrected Total Cooling =
tabulated total cooling x wet bulb correction.
Corrected Sensible Cooling =
tabulated sensible cooling x wet/dry bulb correction.
- Step 7 Compare the corrected capacities to the load requirements. Normally if the capacities are within 10% of the loads, the equipment is acceptable. It is better to undersize than oversize, as undersizing improves humidity control, reduces sound levels and extends the life of the equipment.
- Step 8 When completed, calculate water temperature rise and assess the selection. If the units selected are not within 10% of the load calculations, then review what effect changing the GPM, water temperature and/or air flow and air temperature would have on the corrected capacities. If the desired capacity cannot be achieved, select the next larger or smaller unit and repeat the procedure. Remember, when in doubt, undersize slightly for best performance.

Example Equipment Selection For Cooling

Step 1 Load Determination:

Assume we have determined that the appropriate cooling load at the desired dry bulb 80°F and wet bulb 65°F conditions is as follows:

Total Cooling	22,100 BTUH
Sensible Cooling.....	16,500 BTUH
Entering Air Temp	80°F Dry Bulb / 65°F Wet Bulb

Step 2 Design Conditions:

Similarly, we have also obtained the following design parameters:

Entering Water Temp.....	90°F
Water Flow (Based upon 10°F rise in temp.)	6.0 GPM
Air Flow	730 CFM

Step 3, 4 & 5 HP Selection:

After making our preliminary selection (TTH026 - Full Load), we enter the tables at design water flow and water temperature and read Total Cooling, Sens. Cooling and Heat of Rej. capacities:

Total Cooling.....	24,200 BTUH
Sensible Cooling.....	16,300 BTUH
Heat of Rejection.....	29,900 BTUH

Step 6 & 7 Entering Air and Airflow Corrections:

Next, we determine our correction factors.

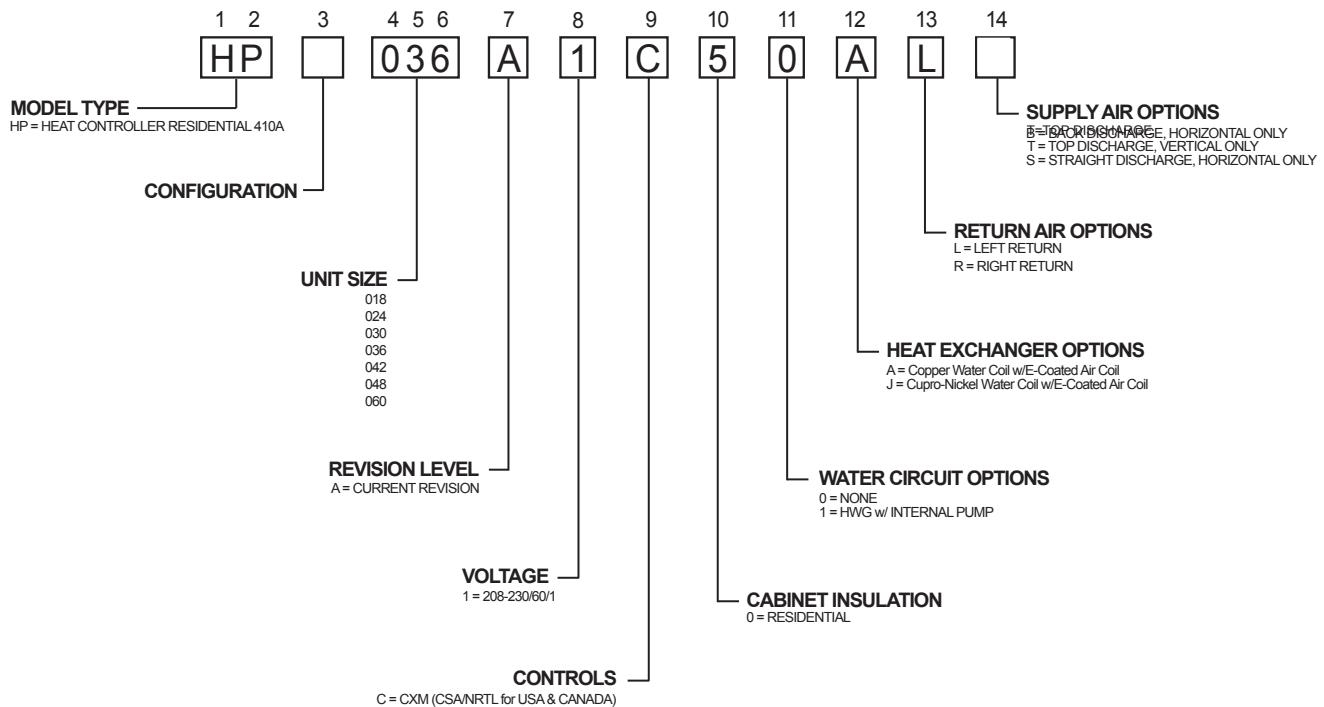

Table	Ent Air	Air Flow	Corrected
Corrected Total Cooling =	24,200	x 0.975	x 0.978 = 23,076
Corrected Sens Cooling =	16,300	x 1.096	x 0.926 = 16,543
Corrected Heat of Reject =	29,900	x 0.979	x 0.978 = 28,628

Step 8 Water Temperature Rise Calculation & Assessment:

Actual Temperature Rise	9.5°F
-------------------------------	-------

When we compare the Corrected Total Cooling and Corrected Sensible Cooling figures with our load requirements stated in Step 1, we discover that our selection is within +/- 10% of our sensible load requirement. Furthermore, we see that our Corrected Total Cooling figure is within 1,000 Btuh the actual indicated load.

Performance Data Selection Notes

For operation in the shaded area when water is used in lieu of an anti-freeze solution, the LWT (Leaving Water Temperature) must be calculated. Flow must be maintained to a level such that the LWT is maintained above 40°F [4.4°C] when the JW3 jumper is not clipped (see example below). This is due to the potential of the refrigerant temperature being as low as 32°F [0°C] with 40°F [4.4°C] LWT, which may lead to a nuisance cutout due to the activation of the Low Temperature Protection. JW3 should never be clipped for standard range equipment or systems without antifreeze.

Example:

At 50°F EWT (Entering Water Temperature) and 1.5 gpm/ton, a 3 ton unit has a HE of 22,500 Btuh. To calculate LWT, rearrange the formula for HE as follows:

$HE = TD \times GPM \times 500$, where HE = Heat of Extraction (Btuh);
 TD = temperature difference (EWT - LWT) and GPM = U.S. Gallons per Minute.

$$TD = HE / (GPM \times 500)$$

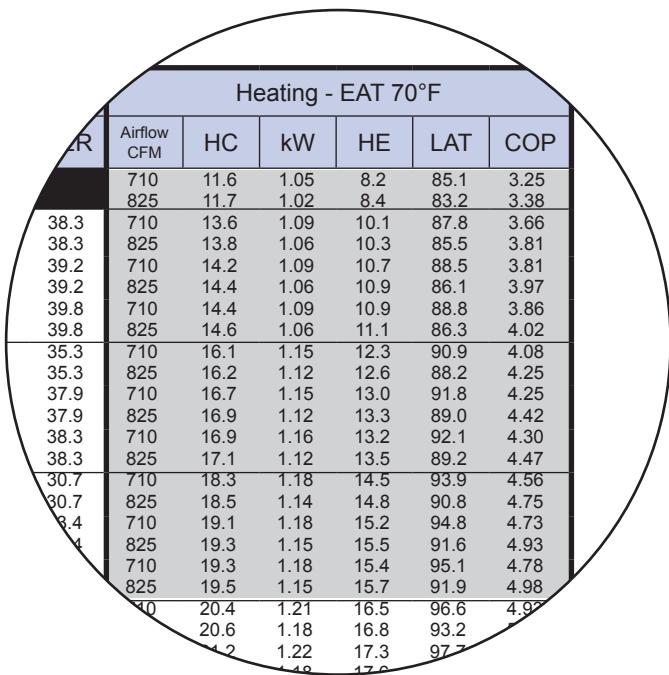

$$TD = 22,500 / (4.5 \times 500)$$

$$TD = 10^{\circ}\text{F}$$

$$LWT = EWT - TD$$

$$LWT = 50 - 10 = 40^{\circ}\text{F}$$

In this example, as long as the EWT does not fall below 50°F, the system will operate as designed. For EWTs below 50°F, higher flow rates will be required (open loop systems, for example, require at least 2 gpm/ton when EWT is below 50°F).

Interpolation is permissible; extrapolation is not.

All entering air conditions are 80°F DB and 67°F WB in cooling, and 70°F DB in heating.

AHR/ISO certified conditions are 80.6°F DB and 66.2°F WB in cooling and 68.6°F DB in heating.

Table does not reflect fan or pump power corrections for AHR/ISO conditions.

All performance is based upon the lower voltage of dual voltage rated units.

Performance stated is at the rated power supply; performance may vary as the power supply varies from the rated.

Operation below 40°F EWT is based upon a 15% methanol antifreeze solution.

See performance correction tables for operating conditions other than those listed above.

See Performance Data Selection Notes for operation in the shaded areas.

Operation not recommended

Interpolation is permissible; extrapolation is not.

All entering air conditions are 80°F DB and 67°F WB in cooling, and 70°F DB in heating.

AHR/ISO certified conditions are 80.6°F DB and 66.2°F WB in cooling and 68.6°F DB in heating.

Table does not reflect fan or pump power corrections for AHR/ISO conditions.

All performance is based upon the lower voltage of dual voltage rated units.

Performance stated is at the rated power supply; performance may vary as the power supply varies from the rated.

Performance Data

HPV036

1,200 CFM Nominal (Rated) Airflow

Performance capacities shown in thousands of Btuh

Interpolation is permissible; extrapolation is not.

All entering air conditions are 80°F DB and 67°F WB in cooling, and 70°F DB in heating.

AHR/ISO certified conditions are 80.6°F DB and 66.2°F WB in cooling and 68°F DB in heating.

Table does not reflect fan or pump power corrections for AHR/ISO conditions.

All performance is based upon the lower voltage of dual voltage rated units.

Performance stated is at the rated power supply; performance may vary as the power supply varies from the rated.

Operation below 40°F EWT is based upon a 15% methanol antifreeze solution.

See performance correction tables for operating conditions other than those listed above.

See Performance Data Selection Notes for operation in the shaded areas.

Operation not recommended

Interpolation is permissible; extrapolation is not.

All entering air conditions are 80°F DB and 67°F WB in cooling, and 70°F DB in heating.

AHRI/ISO certified conditions are 80.6°F DB and 66.2°F WB in cooling and 68°F DB in heating.

Table does not reflect fan or pump power corrections for AHRI/ISO conditions.

All performance is based upon the lower voltage of dual voltage rated units.

Performance stated is at the rated power supply; performance may vary as the power supply voltage varies.

Operation below 40°F EWT is based upon a 15% methanol antifreeze solution.

See performance correction tables for operating conditions other than those listed above.
See Performance Data Selection Notes for operation in the shaded areas.

See Performance Data Selection Notes for operation in the shaded areas.

Operation not recommended

Black areas denote ESP where operation is not recommended.

Units factory shipped on medium speed. Other speeds require field selection.

All airflow is rated and shown above at the lower voltage if unit is dual voltage rated, e.g. 208V for 208-230V units.

Performance stated is at the rated power supply, performance may vary as the power supply varies from the rated.

Notes:

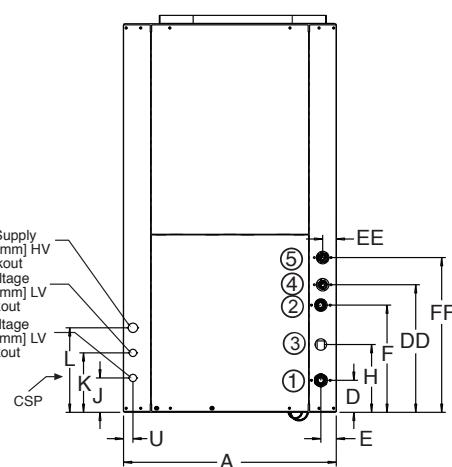

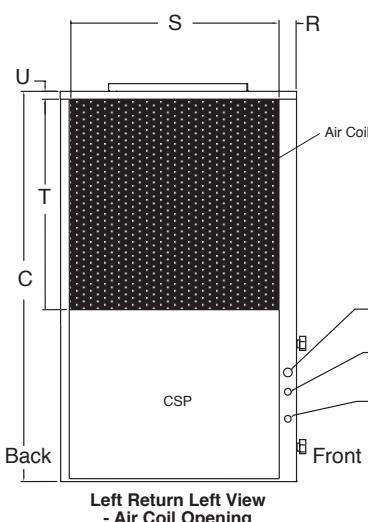

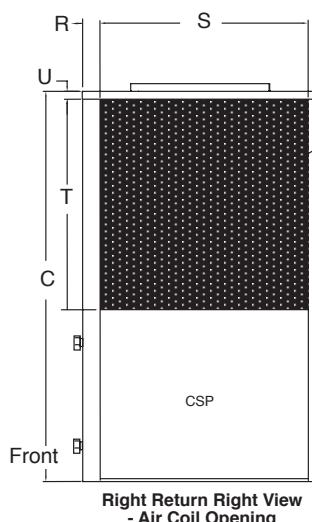

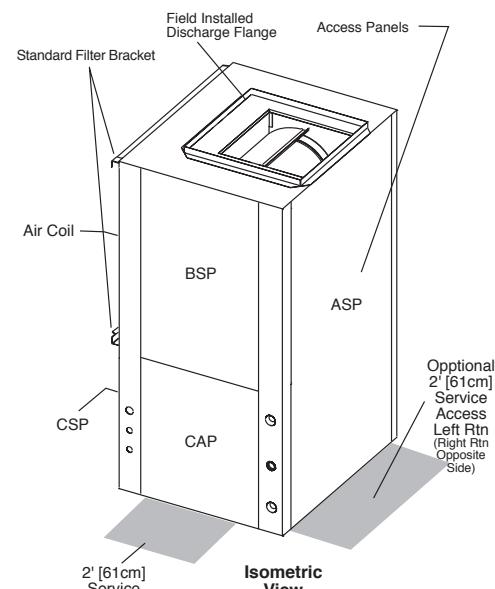

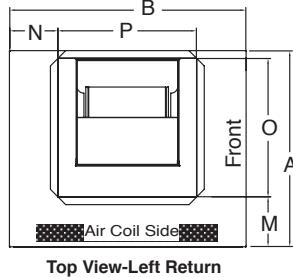

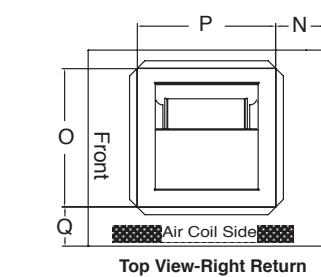

1. While clear access to all removable panels is not required, installer should take care to comply with all building codes and allow adequate clearance for future field service.
2. Front & Side access is preferred for service access. However, all components may be serviced from the front access panel if side access is not available.
3. Discharge flange is field installed.
4. Condensate is 3/4" socket.
5. Source water and optional HWG connections are 1" swivel.
