

FRANKE MINERVA 3-IN-1 HOT WATER TAP

HEATING TANK INSTALLATION GUIDE

Introduction

Thank you for purchasing this Franke product, which has been designed and manufactured to the highest quality standards. This product must be installed and commissioned by a qualified professional.

Read this installation guide carefully and plan the layout of the installation carefully before proceeding as failure to install and maintain this unit in strict accordance with these instructions will render your product warranty invalid. The manufacturer will not accept liability for damage or accidents resulting from incorrect installation or operation.

Package Contents

- 1 Franke heating tank unit
- 2 15mm copper pipe (optional)
- 3 T-coupling
- 4 Pressure relief valve and tundish
- 5 Data plate (fixed to heating tank)
- 6 Plastic discharge T piece
- 7 Flexible plastic hose
- 8 Sealing ring
- 9 x2 Compression reducing rings 15-10 mm
- 10 Water Filter Assembly (supplied in separate box)

Application

This product is a boiling water device intended for domestic use only.

Important note: The heating tank is suitable for water at a supply pressure between Minimum 1.5 BAR (23psi) and Maximum 4 BAR (58psi).

A suitable pressure reducing valve can be purchased from any plumbers merchant or online at www.frankefilterflow.co.uk

Safety

This product must be installed by a qualified installer in strict accordance with the instructions and comply with local Water Supply Regulations and safety standards.

Children, or users with a physical or mental disability, should not use this tap unless they have received sufficient instructions about its operation from a person responsible for their safety. Children must never be allowed to play with the appliance.

The Minerva is a built-in domestic electrical appliance. The boiler is fitted with an electrical lead terminating with a 3 pin fused plug for plugging into the 13amp domestic electricity supply. It is important to use a conveniently located socket with a built in switch that can be easily accessed to switch off and isolate the boiler at any time.

The heater must only be connected to the 230V mains electricity supply through either an earthed independent wall socket in the ring main or via a fused spur.

The maximum consumptive power of the unit is 1500 watts.

Always shut off the mains water stopcock before installation.

Never lift the heater tank by the flexible connector hoses.

The power must only be connected POST installation and once the tank has been completely filled with water and vented.

Always disconnect the power to your heater before you close the mains stopcock. Restore power to the heater after the mains stopcock has been opened.

BOILING WATER TANK		
Article number	119.0395.298	
Voltage	230	V
Power	1500	W
Content	4.7	l
Load	7	A
Working pressure [max.]	400	kPa
Working pressure [min.]	150	kPa
Dimensions [L x W x H]	522 x 200 x 145	mm
Heating-up time ($\Delta T=100k$)	23	minutes
Energy consumption when non-operational	25	W
Storage temperature	108°C	°C

Filter maintenance

The water filter supplied with this unit is designed to keep the heater tank free of limescale, to protect the tank from aggressive soft water and to prevent taste problems associated with chlorine.

Important note: The filter cartridge must be changed at least annually to maintain its efficiency. Neglecting to change the cartridge at regular intervals may invalidate your warranty. Please refer to the separate filter maintenance guide for information relating to the filter unit and instructions for replacing the filter cartridge.

Important information relating to the plastic housing

Plastic is susceptible to UV light degradation and may become brittle over time. As a precaution the filter housing should be replaced every 10 years.

Do not under any circumstances: allow the housing to come into contact with solvents, household cleaners and sprays or a naked flame.

Sensible precautions

If you are planning to leave the premises for an extended period (eg. on holiday) it is a sensible precaution to turn off both the electricity supply to the boiler and the water supply to the filter.

Installation sequence

Before you begin installation

Important note: Check the mains water pressure. It must not be below 1.5 bar (measured during a high demand period), or above 4 bar (measured during a low demand period). If the pressure exceeds 4 bar a pressure reducing device must be fitted. A suitable pressure reducing valve can be purchased at www.frankefilterflow.co.uk

Take into account the space required for the Inlet Pressure Relief Valve and Tundish, Waste T-piece and the Filter Set, making sure there is convenient access for routine filter cartridge changes and servicing the tank.

The unit must be installed in a frost free environment.

Ensure there is sufficient ventilation for the tank to avoid overheating. If you feel that the ventilation is inadequate drill some holes in a suitable position at the top and bottom of the cupboard panels. Normally lack of ventilation is less of an issue when the tank is installed behind the plinth (kick-space).

Identify and mark the hot and cold water pipes.

Mark this on the tap inlet and on the water pipe.

Shut off the mains water supply.

Switch off the mains electrical supply.

- 1 Install the 15mm stop valve included in the Water Filter Assembly (10). Determine the position to fit the 15mm Compression Tee (3) in the mains water pipework. Determine where the waste Tee piece (6) will be connected to the sink plastic waste pipe. **Important note:** There must be a minimum distance of 500mm between the bottom of the tundish and the inlet of the waste connector. If a waste disposal unit is installed, the waste water from the tundish must be piped to discharge directly into the soil stack, rather than the sink waste.

Install the 15mm compression Tee (3) and the waste saddle connection (6).

- 2 Install the Filter Housing (10) to the 15mm compression Tee (3) Connect the Inlet Pressure Relief Valve (4) to the outlet of the filter. (Note there is an arrow in the top of the filter head indicating the direction of flow). Secure the filter unit securely using the bracket and screws provided. **Important note:** If the bracket is not employed the weight of the filter unit when full of water, will put undue strain on the pipework. The distance between the Pressure Relief Valve inlet and the boiling water heater must never exceed 1.5 metres.

- 3 Turn the stop valve (the small knob) on the Inlet Pressure Relief Valve to 'OFF' to turn on the mains water supply and check the assembly for leaks, and rectify as necessary. Once this check has been carried out, turn off the mains water supply again. The expansion discharge of the Inlet Pressure Relief Valve and the tundish must always point downwards and remain unobstructed.

- 4 Connect the waste T-piece (6) to the Inlet Pressure Relief Valve and Tundish (4) using the flexible plastic hose (7). The Tundish has a water trap in order to prevent odours from escaping from the waste pipe.

- 5 The heating tank must be positioned horizontally. Ensure the tank is positioned correctly, following the instructions on the label.

- 6 You can fit the heater (1) behind the plinth, providing the plinth is no less than 150mm (a) or in the kitchen cupboard (b). Both installations need a level and vibration-free surface. Installation option (a) fit the heater behind the plinth. Route the mains lead and connecting hoses upwards behind the floor and backboard of the cabinet. Alternatively drill a 60mm hole in the base of the cabinet and route hoses and mains lead through hole. Installation option (b) Position the heater in the back of the cupboard.

- 7 Connect the cold water hose from the heating tank to the Inlet Pressure Relief Valve (4). The flexible connecting hoses must not be twisted or kinked once connected.
Important note: Do not over-tighten the nut.
- 8 You must now install your Minerva tap following the instructions in the manual supplied. You will need the Sealing ring (8) and the Compression Rings (9) to install the boiling water tap.
- 9 Once the installation is complete, turn on the mains water supply and open the valve on the Inlet Pressure Relief Valve. In order to fill the water heater tank, you first need to fully open the tap. Flush the heater through for 3 minutes until clear water comes out of the tap. After turning the tap off, check all connections for leaks.
Important note: Do not over-tighten the nut.
- 10 Install the filter cartridge in the filter housing. Refer to the separate Cartridge Change Instructions in the filter box.

11 Commissioning the heating tank

Warning!

If there is no running water due to expansion during heating:

Immediately turn the power off and open the boiling water tap in order to take away the water pressure

Attention!

Make sure that the boiler is completely filled with water.

- Plug the heater into a grounded outlet.
- Turn the water heater ON by pressing the ON / OFF button
The water heater is now switched on and heats the water.
- Check the safety valve after about 10 minutes. It should allow expansion water to drain through the drain pipe.
- It takes about 25-30 minutes for the water heater to reach full temperature.

Attention!

The flushing procedure below is only necessary if the boiler is in use for the first time or if it has been out of operation for an extended period.

- Perform the flushing procedure described below:
 - Let the water after filling 1.5 hours standing in the boiler.
 - Open the boiling water tap and wait until cold water flows.
 - Connect the boiling water tap.
 - Follow steps 1 to 3 three times in total.
 - The water heater is now ready for use.
- 12 Affix the supplied data plate close to the unit or on this manual. This will provide easy access to ascertain the model and serial number of the unit even if you decide to place the unit behind the plinth of the cupboard.
- 13 You have successfully completed the installation of your Franke Heating Tank.
- 14 Finally. Please demonstrate to the homeowner the procedure for replacing the water filter cartridge.

Resetting the thermal cut-out

The tank is fitted with a safety device that will shut-off the boiling water if the tank is switched on without water, or there is a power surge. The hot water flow can be restored by operating a reset button on the front of the tank.

Disconnect the tank's electrical power supply. Operate the boiling water handle on the tap to check that the tank is full of water. Switch on the power supply and allow 25 minutes for the tank to reheat before use.

Shutting down

If you plan a long time not to make use of the boiler, for example, due to holidays, you can disable it temporarily.

- a) Turn the water heater off using the ON / OFF button.
- b) Remove the plug from the socket to avoid accidental activation.

Drain

Disconnect the electricity supply to the tank. Operate the boiling water function until only cold water flows from the spout. Shut off the water supply to the tank at the main stopcock or use the stop valve on the pressure relief valve. Operate the boiling water function again to release the pressure in the heating tank. Turn it off once the water stops flowing. Disconnect the pipes from the heating tank. Remove the tank carefully and pour out the water it contains.

Attention!

Do not lift the water heater to the flexible hose or power cord.

Tip

Catch and clean leak water from the installation when detaching the heating tank.

- a) Turn the boiler off.
- b) Remove the plug from the socket.
- c) Open the boiling water tap and wait until cold water flows.
- d) Close the boiling water tap.
- e) Close the stop valve on the inlet combination.
- f) Open the boiling water tap to the system pressure fetch.
- g) Turn the tap to closed when no water flows.
- h) Disconnect the pipes from the boiler.
- i) Keep the heater hose ends up to prevent the boiler draining.
- j) Place the heater on the sink.
- k) You can remove the water from the tank through the water hoses in to the sink. Empty the boiler.

Warning!

Boiling water causes tension in a cold sink, which can crack the sink.

It is therefore imperative that you turn on the cold tap when draining heated water. Preferably empty the heated water into the drain rather than the sink.

Warning!

Make sure the water heater is completely rinsed with cold water!

Order of installation

Install in order from 1 to 5.

- A** Cold water supply
- B** Warm water supply
- C** Drain pipe
- D** Socket
- E** Plumbing kit

- 1** Boiling water tap
- 2** Inlet combination
- 3** Drain connection
- 4** Water filler
- 5** Heating tank

Troubleshooting

Q Water is constantly running or dripping in the tundish and water is overflowing

- 1 This indicates that the water pressure is too high; above the 4 bar (58psi) stipulated maximum. In normal operation the pressure relief valve will allow water to drip in the tundish for approximately 20 minutes after the tank is switched on. Thereafter it will drip periodically, after water is drawn off and as the tank comes back up to temperature. Check the water pressure at a low demand period (mid morning or mid afternoon). If it exceeds 4 bar (58psi) it will be necessary to install a 3-4 bar pressure limiting valve. A suitable pressure reducing valve can be purchased at www.frankefilterflow.co.uk or from a plumber's merchant. If you want to stop the flow of water in the meantime, first switch off the electrical to the tank then turn off the water supply to the tank at the green handled stop valve underneath your sink.
- 2 The distance between the bottom of the tundish and the waste inlet connection is less than the stipulated 500mm minimum.

Q The cold water flow from the tap is slow

Check that the filter is installed correctly. It should be filtering the cold water to the boiler only, not both the cold water supply to the tap and to the boiler.

If the filter unit is correctly installed it may be that the filter cartridge is clogged & blocking the cold water feed and needs replacing.

Q The tap is spluttering and spitting

The tap dispenses boiling water at the outlet of the spout and, as a consequence, there will be some splutter, steam and noise. This can be quite off-putting at first, but any concerns are quickly dispensed with once the simple technique for operating the boiling water is understood.

Please visit the link below www.franke.co.uk/minerva then click 'How it works' to see how the tap should dispense boiling water.

You will see the operator rotate the tap handle carefully to run off the lag of non-boiling water until the water starts to steam; they then stop, put the receptacle completely over the end of the taps spout and continues to dispense the boiling water, at the same time gradually lowering the receptacle. Adopting this method ensures all of the boiling water is contained and prevents any splashing your hands.

Q The flow of boiling water splutters more than shown in the video

- 1 Check for kinks in the flexible hoses supplying water to the system.
- 2 Check that the stop valve in the pressure relief valve is fully open – the smaller of the two knobs positioned on the left side of the valve – by rotating it clockwise.
- 3 Check the water pressure. As previously stated, it must be no lower than 1.5 bar or higher than 4 bar. Check the pressure with a proper gauge; a visual estimate looking at the flow from the outlet is not a reliable measure. The flow through your hot water tap may be less than you are used to due to the complex nature of the internal waterways. Water pressure between 3 and 4 bar is recommended for optimum performance.
- 4 Remove the filter cartridge and try running the system without the cartridge installed to determine whether the cartridge is blocked and restricting the flow.

Q The boiling water function is dispensing cold water instead of boiling water

Check that the electrical supply is correctly connected and there is power to the tank.

Check if the thermal cut-off has tripped out. Refer to Resetting the thermal cut-out in the installation guide and follow the procedure to reset the tank. If this doesn't work, or if the same thing happens repeatedly, contact our service provider.

Q Poor hot water flow (not the boiling water)

Check the hot water pressure. Please be aware that most Gravity fed hot water systems will not provide sufficient pressure to the hot side without a suitable pump installed.

Q Despite having a filter installed, froth (and/or) scum is forming

The function of the filter is to protect the boiling water tank and remove chlorine to improve taste. It will not remove the calcium and magnesium in hard water areas that causes the frothy appearance. Calcium and magnesium are harmless and are considered beneficial minerals.

Q The heating element causes a short circuit

Refer the matter to your service provider.

Troubleshooting

If you are unable to remedy a failure or malfunction, **please contact your installer or Franke FilterFlow (0808 165 0008)**. Switch the boiling water unit by unplugging it from the wall socket.

If a fault occurs in the system, give the LED lighting this to the ON / OFF button. In the table below you will find the meaning of these LED indications.

LED indication failures boiler		
LED color	LED Description Action	Action
Red	1 second on / 1 second off	Hardware error
Red / White	1 second red / 1 second white	Hardware failure - sensor is defective
Red / Yellow	1 second red / 1 second yellow	Dry Operation - There is no water in boiler
Red / Orange	1 second red / 1 second orange	Circuit breaker tripped - Boiler is hot (*)

* Set the boiler out of operation and contact **your installer or Franke FilterFlow (0808 165 0008)**

Reset message boiler

If the heater shows a fault, you can reset.

a) During the fault message hold the on/off switch for 5 seconds.
The message is reset and switches the boiler OFF.

b) Now switch ON the boiler again.

If the boiler gives the same error message again after a reset, turn it off and **contact your installer or Franke FilterFlow (0808 165 0008)**

Water leakage	
Cause	Solution
a) Leaking connection	• Check the link(s) and tighten if necessary. • If necessary, replace the link(s).
b) Hose(s) leak	• Check and replace the leaking hose(s).
c) Boiler leak	• Remove the plug from the socket. Shut off the water supply. Please contact your installer or Franke FilterFlow (0808 165 0008)
d) Leaking tap	• Turn off the water supply. Please contact your installer or Franke FilterFlow (0808 165 0008)

Mixer does not water	
Cause	Solution
a) Hose(s) bent	• Check the hose(s) and remove the kink out of the hose(s).
b) The main tap is closed	• Turn on the main water tap.
c) The combination of the inlet valve is close	• Turn the tap of the inlet combination open.

Troubleshooting

Mixer provides only cold water	
Cause	Solution
a) Hose(s) bent	• Check the hose(s) and remove the kink out of the hose(s).
b) Water heater is not working	• Consult the manual of your water heater.
c) Boiling Water Appliance does not work	• Consult the manual of your boiling water unit.
Only with combined installation (*)	
* Combi-plant boiler, the boiling water is also used for mixed (hot) water with the aid of a mixing valve.	

Reduced water spray or excessive splashing	
Cause	Solution
a) Calcification and / or pollution aerator	• Descaling and / or cleaning the aerator.
b) Pollution or calcification lime filter in the boiling water valve.	• Descaling and / or rinsing of the lime filter.
c) Insufficient water pressure (<150 kPa)	• Contact your water supplier.
d) The hose(s) bent	• Check the hose(s) and remove the kink out of the hose(s).
e) The combination of the inlet valve is not fully open.	• Turn the tap of the inlet combination open.

Tap does not dispense boiling water	
Cause	Solution
a) Hose(s) bent	• Check the hose (s) and remove the kink out of the hose(s).
b) The main tap is closed	• Turn on the main water tap.
c) The combination of the inlet valve is close	• Turn the tap of the inlet combination open.

The water from the boiling water tap does not boil	
Cause	Solution
a) The plug is not in wall socket	• Insert the plug into a grounded outlet.
a) The plug is not in wall socket	• Check the power supply and repair the break.
c) The boiler is OFF (standby) [type-dependent]	• Turn the boiler ON.
d) The water heater is not fully warmed up	• Wait until the boiler is heated.
e) The boiler is in failure	• Reset the boiler.

Troubleshooting

The tank is shorting

Cause	Solution
a) There is a short circuit in the wiring or the element of the boiler.	Remove the plug from the socket. Please contact your installer or Franke FilterFlow (0808 165 0008)

No expansion water from the inlet combination

Cause	Solution
a) Inlet combination defective.	Remove the plug from the socket. Replace the inlet combination.
b) No water in the boiler.	Turn the boiler ON.
c) The boiler is OFF (standby) [type-dependent].	Wait until the boiler is heated.
d) The boiler is in failure.	Reset the boiler.
e) Heater broken.	The device is irreparably damaged. Please contact your installer or Franke FilterFlow (0808 165 0008)

Heating Tank Operation

Pressing the ON / OFF button turns the heating tank on to heat the water.

Press the ON / OFF button to turn off the heating tank off.

The LED light provides the status of the heating tank according to the table below:

LED indicator			
Heating Tank Status	Description	LED Colour (Normal)	LED Colour (Eco-mode)
Boiler OFF	Hold	White	White
Boiler ON	The boiler is turned ON	See below	See below
Cold water	Water temperature < 45°C	Blue	Light Blue
Warm Water	45°C < Water temperature < 103°C	Orange	Purple
Boiling Water	Water temperature > 103°C	Red	Pink
Eco	Water is not heated unless < water temperature 50°C	Green	Green

Eco-Mode

When the heater is turned on, the water is automatically maintained at the temperature, so that at any time of the day boiling water is available.

However, there will also be times when you are not use boiling water, such as when you are sleeping.

In order to prevent the water heating unnecessarily at certain times you can use the energy-saving ECO mode.

ECO mode occurs after every day at the same time in when in operation. The duration of the ECO mode is 6 hours and the LED indicator during this time is indicated by being highlighted green.

When using a Combi Switch, when the boiling water boiler off, disappearing the establishment of the ECO mode. ECO mode must then be reset.

Enabling ECO mode

You can only turn the ECO mode when the device is ON. The ECO mode is enabled by the depressing the ON / OFF button for 4 seconds. Once the LED is green, you have a period 6 hours, and the start time (*) then applies for each day as long as ECO mode is enabled.

*The starting time shifts to the between summer and winter time by one hour. You will need to reset the correct time at that moment.

ECO mode off

You can turn off the ECO mode by depressing the ON / OFF button for 4 seconds until the LED lights up blue, orange or red.

This operation deletes the specified time. Then you can enable ECO mode at any time.

If the voltage drops, ECO mode will be turned off and must be reset.

Guarantee

This Franke product carries a 2 year warranty against material and manufacturing defects. The warranty will be valid from the date of purchase as shown on the sales invoice. Please keep the invoice for your records. This is a domestic appliance only. The warranty will only be validated when it is used in a domestic environment.

Warranty

What is covered by the Franke guarantee?

- The repair or replacement of your system if your system is found to be defective due to faulty materials or within 2 years of purchase at Franke's discretion.
- If any part is no longer available or out of manufacture, Franke will replace it with a functional alternative.

Terms and conditions of the Franke 2 year guarantee

- The guarantee is valid for the UK and Republic of Ireland.
- The guarantee becomes effective at the date of purchase (or the date of delivery if this is later).
- Proof of purchase is required under the terms of the guarantee.
- The guarantee provides benefits which are additional to, and do not affect your statutory rights as a consumer.

What is not covered by the guarantee?

- What is not covered by the guarantee? The Franke Minerva Heating Tap. See separate installation guide for the tap warranty details.

www.franke.co.uk

Franke does not guarantee the repair or replacement of a product as a result of:

- Normal wear and tear.
- Accidental damage, faults caused by negligent use or care, misuse, neglect, careless operation or handling of the system which is not in accordance with the Minerva operating guidelines.
- Use of the filter system for anything other than normal domestic household purposes.
- Use of parts not assembled or installed in accordance with the instructions of your Minerva.
- Faulty Installation, repairs or alterations (not in accordance with the installation guide).

How do I make a claim under my Franke 2 year guarantee?

- If you are in any doubt as to what is covered by your guarantee or wish to discuss a claim please call Franke FilterFlow on 0808 165 0008 between the hours of 9.00am and 5.00pm, Monday to Friday. If you are calling for the first time please have your receipt to hand so we can record your date of purchase.
- Franke FilterFlow is the exclusively appointed after sales service agent and water filter supplier for the Franke Minerva 3-in-1 Boiling Water Tap.
- The company reserves the right to alter, change or modify product specifications without prior notice.
