Dedicated Dehumidification for Comfort, Health and Property Protection

According to experts, controlling humidity is essential for comfort, reducing health risks, and protecting the structure and its contents. While the air conditioning will remove moisture from the air, it only does so when it is running for a significant amount of time, and never to a set relative humidity. Newer systems offer dehumidification, but in reality, they are only overcooling to try to remove more moisture, and in most cases are oversized for smaller spaces.

Indoor humidity levels can rise dramatically when outside temperatures are moderate, and the air conditioner is not running. The Santa Fe UltraMD33 In-Wall Dehumidifier is an ideal solution for ensuring a healthy and comfortable living space in basements, apartments, tiny homes, hotel rooms, and homes that are using ductless mini-splits for heating and cooling.

Comfort

Addressing comfort in a living space is very important. High humidity can cause us to feel either hot and sticky or cold and clammy, while it also contributes to musty odors.

Health

According to the *Environmental Protection Agency*, health problems associated with poor indoor air quality include eye irritation, allergies, headaches and respiratory problems such as asthma.

Property Protection

Maintaining proper humidity levels is one of the most important steps in protecting a living space and its contents. Excess moisture can cause musty odors, be detrimental to wood floors, furniture, artwork, electronics, and even the overall structure.

The Solution

The Santa Fe UltraMD33 In-Wall Dehumidifier controls excessive moisture that contributes to poor indoor air quality, property damage, mold, comfort complaints, and reputational risk and liability. Including a dedicated in-wall dehumidifier as an integral part of the mechanical system protects the physical investment and creates a comfortable healthier living environment.
