For safe operation, we recommend not to reconnect the PowerCube.

5. Troubleshooting common problems

1. Some outlets do not work

- **Possible cause:** the socket is not properly connected to the mains or is internally damaged.
- **Solution:**
 - Check that the PowerCube is properly plugged into a working outlet.
 - Try another appliance to verify the outlet is functional.

2. PowerCube is heating up

- **Possible cause:** prolonged loading with high power devices (e.g. kettle, heater).
- **Solution:**
 - Check that the total power does not exceed 3680 W.
 - Avoid connecting multiple powerful appliances at the same time.
 - If the heating recurs even at low load, do not use the product.

3. The sockets are tight - it is difficult to insert the plug into them

- **Possible cause:** the new product has a tighter protection mechanism due to the child lock.
- **Solution:**
 - When using for the first time, the fork should be inserted straight and more firmly.
 - After a few uses, the mechanism will loosen slightly and handling will be easier.

4. Incompatible with sockets without earthing (e.g. older wiring)

- **Possible cause:** the PowerCube requires a **grounded socket** (type E).
- **Solution:**
 - Use only in standard outlets with protective pin or side contacts.
 - Do not use with reducers that bypass grounding.
