Disclaimers

Alcatel-Lucent products are intended for commercial uses. Without the appropriate network design engineering, they must not be sold, licensed or otherwise distributed for use in any hazardous environments requiring fail-safe performance, such as in the operation of nuclear facilities, aircraft navigation or communication systems, air traffic control, direct life-support machines, or weapons systems, in which the failure of products could lead directly to death, personal injury, or severe physical or environmental damage. The customer hereby agrees that the use, sale, license or other distribution of the products for any such application without the prior written consent of Alcatel-Lucent, shall be at the customer's sole risk. The customer hereby agrees to defend and hold Alcatel-Lucent harmless from any claims for loss, cost, damage, expense or liability that may arise out of or in connection with the use, sale, license or other distribution of the products in such applications.

This document may contain information regarding the use and installation of non-Alcatel-Lucent products. Please note that this information is provided as a courtesy to assist you. While Alcatel-Lucent tries to ensure that this information accurately reflects information provided by the supplier, please refer to the materials provided with any non-Alcatel-Lucent product and contact the supplier for confirmation. Alcatel-Lucent assumes no responsibility or liability for incorrect or incomplete information provided about non-Alcatel-Lucent products.

However, this does not constitute a representation or warranty. The warranties provided for Alcatel-Lucent products, if any, are set forth in contractual documentation entered into by Alcatel-Lucent and its customers.

This document was originally written in English. If there is any conflict or inconsistency between the English version and any other version of a document, the English version shall prevail.

When printed by Alcatel-Lucent, this document is printed on recycled paper.

Alcatel-Lucent License Agreement

SAMPLE END USER LICENSE AGREEMENT

1. LICENSE

1.1 Subject to the terms and conditions of this Agreement, Alcatel-Lucent grants to Customer and Customer accepts a nonexclusive, nontransferable license to use any software and related documentation provided by Alcatel-Lucent pursuant to this Agreement ("Licensed Program") for Customer's own internal use, solely in conjunction with hardware supplied or approved by Alcatel-Lucent. In case of equipment failure, Customer may use the Licensed Program on a backup system, but only for such limited time as is required to rectify the failure.

1.2 Customer acknowledges that Alcatel-Lucent may have encoded within the Licensed Program optional functionality and capacity (including, but not limited to, the number of equivalent nodes, delegate workstations, paths and partitions), which may be increased upon the purchase of the applicable license extensions.

1.3 Use of the Licensed Program may be subject to the issuance of an application key, which shall be conveyed to the Customer in the form of a Supplement to this End User License Agreement. The purchase of a license extension may require the issuance of a new application key.

2. PROTECTION AND SECURITY OF LICENSED PROGRAMS

2.1 Customer acknowledges and agrees that the Licensed Program contains proprietary and confidential information of Alcatel-Lucent and its third party suppliers, and agrees to keep such information confidential. Customer shall not disclose the Licensed Program except to its employees having a need to know, and only after they have been advised of its confidential and proprietary nature and have agreed to protect same.

2.2 All rights, title and interest in and to the Licensed Program, other than those expressly granted to Customer herein, shall remain vested in Alcatel-Lucent or its third party suppliers. Customer shall not, and shall prevent others from copying, translating, modifying, creating derivative works, reverse engineering, decompiling, encumbering or otherwise using the Licensed Program except as specifically authorized under this Agreement. Notwithstanding the foregoing, Customer is authorized to make one copy for its archival purposes only. All appropriate copyright and other proprietary notices and legends shall be placed on all Licensed Programs supplied by Alcatel-Lucent, and Customer shall maintain and reproduce such notices on any full or partial copies made by it.

3. TERM

3.1 This Agreement shall become effective for each Licensed Program upon delivery of the Licensed Program to Customer.

3.2 Alcatel-Lucent may terminate this Agreement: (a) upon notice to Customer if any amount payable to Alcatel-Lucent is not paid within thirty (30) days of the date on which payment is due; (b) if Customer becomes bankrupt, makes an assignment for the benefit of its creditors, or if its assets vest or become subject to the rights of any trustee, receiver or other administrator; (c) if bankruptcy, reorganization or insolvency proceedings are instituted against Customer and not dismissed within 15 days; or (d) if Customer breaches a material provision of this Agreement and such breach is not rectified within 15 days of receipt of notice of the breach from Alcatel-Lucent.

3.3 Upon termination of this Agreement, Customer shall return or destroy all copies of the Licensed Program. All obligations of Customer arising prior to termination, and those obligations relating to confidentiality and nonuse, shall survive termination.

4. CHARGES

4.1 Upon shipment of the Licensed Program, Alcatel-Lucent will invoice Customer for all fees, and any taxes, duties and other charges. Customer will be invoiced for any license extensions upon delivery of the new software application key or, if a new application key is not required, upon delivery of the extension. All amounts shall be due and payable within thirty (30) days of receipt of invoice, and interest will be charged on any overdue amounts at the rate of 1 1/2% per month (19.6% per annum).

5. SUPPORT AND UPGRADES

5.1 Customer shall receive software support and upgrades for the Licensed Program only to the extent provided for in the applicable Alcatel-Lucent software support policy in effect from time to time, and upon payment of any applicable fees. Unless expressly excluded, this Agreement shall be deemed to apply to all updates, upgrades, revisions, enhancements and other software which may be supplied by Alcatel-Lucent to Customer from time to time.

6. WARRANTIES AND INDEMNIFICATION

6.1 Alcatel-Lucent warrants that the Licensed Program as originally delivered to Customer will function substantially in accordance with the functional description set out in the associated user documentation for a period of 90 days from the date of shipment, when used in accordance with the user documentation. Alcatel-Lucent's sole liability and Customer's sole remedy for a breach of this warranty shall be Alcatel-Lucent's good faith efforts to rectify the nonconformity or, if after repeated efforts Alcatel-Lucent is unable to rectify the nonconformity, Alcatel-Lucent shall accept return of the Licensed Program and shall refund to Customer all amounts paid in respect thereof. This warranty is available only once in respect of each Licensed Program, and is not renewed by the payment of an extension charge or upgrade fee.

6.2 ALCATEL-LUCENT EXPRESSLY DISCLAIMS ALL OTHER WARRANTIES, REPRESENTATIONS, COVENANTS OR CONDITIONS OF ANY KIND, WHETHER EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION, WARRANTIES OR REPRESENTATIONS OF WORKMANSHIP, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, DURABILITY, OR THAT THE OPERATION OF THE LICENSED PROGRAM WILL BE ERROR FREE OR THAT THE LICENSED PROGRAMS WILL NOT INFRINGE UPON ANY THIRD PARTY RIGHTS.

6.3 Alcatel-Lucent shall defend and indemnify Customer in any action to the extent that it is based on a claim that the Licensed Program furnished by Alcatel-Lucent infringes any patent, copyright, trade secret or other intellectual property right, provided that Customer notifies Alcatel-Lucent within ten (10) days of the existence of the claim, gives Alcatel-Lucent sole control of the litigation or settlement of the claim, and provides all such assistance as Alcatel-Lucent may reasonably require. Notwithstanding the foregoing, Alcatel-Lucent shall have no liability if the claim results from any modification or unauthorized use of the Licensed Program by Customer, and Customer shall defend and indemnify Alcatel-Lucent against any such claim.

6.4 Alcatel-Lucent Products are intended for standard commercial uses. Without the appropriate network design engineering, they must not be sold, licensed or otherwise distributed for use in any hazardous environments requiring fail safe performance, such as in the operation of nuclear facilities, aircraft navigation or communication systems, air traffic control, direct life-support machines, or weapons systems, in which the failure of products could lead directly to death, personal injury, or severe physical or environmental damage. The Customer hereby agrees that the use, sale, license or other distribution of the Products for any such application without the prior written consent of Alcatel-Lucent, shall be at the Customer's sole risk. The Customer also agrees to defend and hold Alcatel-Lucent harmless from any claims for loss, cost, damage, expense or liability that may arise out of or in connection with the use, sale, license or other distribution of the Products in such applications.

7. LIMITATION OF LIABILITY

7.1 IN NO EVENT SHALL THE TOTAL COLLECTIVE LIABILITY OF ALCATEL-LUCENT, ITS EMPLOYEES, DIRECTORS, OFFICERS OR AGENTS FOR ANY CLAIM, REGARDLESS OF VALUE OR NATURE, EXCEED THE AMOUNT PAID UNDER THIS AGREEMENT FOR THE LICENSED PROGRAM THAT IS THE SUBJECT MATTER OF THE CLAIM. IN NO EVENT SHALL THE TOTAL COLLECTIVE LIABILITY OF ALCATEL-LUCENT, ITS EMPLOYEES, DIRECTORS, OFFICERS OR AGENTS FOR ALL CLAIMS EXCEED THE TOTAL AMOUNT PAID BY CUSTOMER TO ALCATEL-LUCENT HEREUNDER. NO PARTY SHALL BE LIABLE FOR ANY INDIRECT, SPECIAL OR CONSEQUENTIAL DAMAGES, WHETHER OR NOT SUCH DAMAGES ARE FORESEEABLE, AND/OR THE PARTY HAD BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7.2 The foregoing provision limiting the liability of Alcatel-Lucent's employees, agents, officers and directors shall be deemed to be a trust provision, and shall be enforceable by such employees, agents, officers and directors as trust beneficiaries.

8. GENERAL

8.1 Under no circumstances shall either party be liable to the other for any failure to perform its obligations (other than the payment of any monies owing) where such failure results from causes beyond that party's reasonable control.

8.2 This Agreement constitutes the entire agreement between Alcatel-Lucent and Customer and supersedes all prior oral and written communications. All amendments shall be in writing and signed by authorized representatives of both parties.

8.3 If any provision of this Agreement is held to be invalid, illegal or unenforceable, it shall be severed and the remaining provisions shall continue in full force and effect.

8.4 The Licensed Program may contain freeware or shareware obtained by Alcatel-Lucent from a third party source. No license fee has been paid by Alcatel-Lucent for the inclusion of any such freeware or shareware, and no license fee is charged to Customer for its use. The Customer agrees to be bound by any license agreement for such freeware or shareware. CUSTOMER ACKNOWLEDGES AND AGREES THAT THE THIRD PARTY SOURCE PROVIDES NO WARRANTIES AND SHALL HAVE NO LIABILITY WHATSOEVER IN RESPECT OF CUSTOMER'S POSSESSION AND/OR USE OF THE FREEWARE OR SHAREWARE.

8.5 Alcatel-Lucent shall have the right, at its own expense and upon reasonable written notice to Customer, to periodically inspect Customer's premises and such documents as it may reasonably require, for the exclusive purpose of verifying Customer's compliance with its obligations under this Agreement.

8.6 All notices shall be sent to the parties at the addresses listed above, or to any such address as may be specified from time to time. Notices shall be deemed to have been received five days after deposit with a post office when sent by registered or certified mail, postage prepaid and receipt requested.

8.7 If the Licensed Program is being acquired by or on behalf of any unit or agency of the United States Government, the following provision shall apply: If the Licensed Program is supplied to the Department of Defense, it shall be classified as "Commercial Computer Software" and the United States Government is acquiring only "restricted rights" in the Licensed Program as defined in DFARS 227-7202-1(a) and 227.7202-3(a), or equivalent. If the Licensed Program is supplied to any other unit or agency of the United States Government, rights will be defined in Clause 52.227-19 or 52.227-14 of the FAR, or if acquired by NASA, Clause 18-52.227-86(d) of the NASA Supplement to the FAR, or equivalent. If the software was acquired under a contract subject to the October 1988 Rights in Technical Data and Computer Software regulations, use, duplication and disclosure by the Government is subject to the restrictions set forth in DFARS 252-227.7013(c)(1)(ii) 1988, or equivalent.

8.8 Customer shall comply with all export regulations pertaining to the Licensed Program in effect from time to time. Without limiting the generality of the foregoing, Customer expressly warrants that it will not directly or indirectly export, reexport, or transship the Licensed Program in violation of any export laws, rules or regulations of Canada, the United States or the United Kingdom.

8.9 No term or provision of this Agreement shall be deemed waived and no breach excused unless such waiver or consent is in writing and signed by the party claimed to have waived or consented. The waiver by either party of any right hereunder, or of the failure to perform or of a breach by the other party, shall not be deemed to be a waiver of any other right hereunder or of any other breach or failure by such other party, whether of a similar nature or otherwise.

8.10 This Agreement shall be governed by and construed in accordance with the laws of the Province of Ontario. The application of the United Nations Convention on Contracts for the International Sale of Goods is hereby expressly excluded.

Preface

The Preface provides general information about the 5620 Service Aware Manager documentation suite, including this guide.

Prerequisites

Readers of the 5620 SAM documentation suite are assumed to be familiar with the following:

- 5620 SAM software structure and components
- 5620 SAM GUI operations and tools
- typical 5620 SAM management tasks and procedures
- device and network management concepts

5620 SAM documentation suite

The 5620 SAM documentation suite describes the 5620 SAM and the associated network management of its supported devices. Contact your Alcatel-Lucent support representative for information about specific network or facility considerations.

Table 1 lists the documents in the 5620 SAM customer documentation suite.

Table 1 5620 SAM customer documentation suite

Guide	Description
5620 SAM core documentation	
5620 SAM Release Description	The *5620 SAM Release Description* provides information about the new features associated with a 5620 SAM software release.

(1 of 5)

Guide	Description
5620 SAM Release Notice	The *5620 SAM Release Notice* provides important information about the software release, including outstanding issues and restrictions. This document is not shipped with the on-product customer documentation and must be obtained from OLCS as described in Documentation and resources on the web.
5620 SAM Planning Guide	The *5620 SAM Planning Guide* provides information about 5620 SAM scalability and recommended hardware configurations.
5620 SAM System Architecture Guide	The *5620 SAM System Architecture Guide* is intended for technology officers, network planners, and system administrators to increase their knowledge of the 5620 SAM software structure and components. It describes the system structure, software components, and interfaces of the 5620 SAM. In addition, 5620 SAM fault tolerance, security, and network management capabilities are discussed from an architectural perspective.
5620 SAM | 5650 CPAM Installation and Upgrade Guide	The *5620 SAM | 5650 CPAM Installation and Upgrade Guide* provides OS considerations, configuration information, and procedures for the following: • installing, upgrading, and uninstalling 5620 SAM and 5650 CPAM software in standalone and redundant deployments • 5620 SAM system migration to a different system • conversion from a standalone to a redundant 5620 SAM system
5620 SAM User Guide	The *5620 SAM User Guide* provides information about using the 5620 SAM to manage the service-aware IP/MPLS network, including GUI basics, service configuration, and policy management. The *5620 SAM User Guide* uses a task-based format that employs both high-level workflows and detailed procedures. 5620 SAM management information specific to LTE network elements is covered in the *5620 SAM LTE EPC User Guide* and *5620 SAM LTE RAN User Guide*. 5620 SAM management information specific to 1830 PSS network elements is covered in the *5620 SAM Optical User Guide*.
5620 SAM System Administrator Guide	The *5620 SAM System Administrator Guide* provides information about the tasks performed by a user with a 5620 SAM admin role, including: • 5620 SAM security management tasks such as setting up all required user accounts and user groups • advanced configuration tasks such as configuring, maintaining, and administering the 5620 SAM operational environment • routine maintenance tasks to maintain the 5620 SAM hardware and system integrity and efficiencies
5620 SAM Integration Guide	The *5620 SAM Integration Guide* provides procedures to allow the 5620 SAM to integrate with other Alcatel-Lucent products and third-party products.
5620 SAM Supervision Module User Guide	The *5620 SAM Supervision Module User Guide* provides information about how to configure and use the web-based 5620 SAM Supervision Module for fault management and at-a-glance network element monitoring.
5620 SAM Scripts and Templates Developer Guide	The *5620 SAM Scripts and Templates Developer Guide* provides information that allows users to develop, manage, and run CLI-based or XML-based scripts or templates. The guide is intended for developers, skilled administrators, and operators who are expected to be familiar with the following: • CLI scripting, XML, and the Velocity engine • basic scripting or programming • 5620 SAM functions

(2 of 5)

Guide	Description
5620 SAM Parameter Guide	The *5620 SAM Parameter Guide* provides: • parameter descriptions that include value ranges and default values • parameter options and option descriptions • parameter and option dependencies • parameter mappings to the 5620 SAM-O XML equivalent property names Parameters specific to LTE network elements are covered in the *5620 SAM LTE Parameter Reference*. Parameters specific to 1830 PSS network elements are covered in the *5620 SAM Optical Parameter Reference*. The 5620 SAM online help system includes a Parameter Search Tool that allows you to look up parameters or 5620 SAM and 5650 CPAM forms. See the *5620 SAM User Guide* for more information about using the Parameter Search Tool.
5620 SAM Statistics Management Guide	The *5620 SAM Statistics Management Guide* provides information about how to configure performance and accounting statistics collection and how to view counters using the 5620 SAM. Network examples are included.

5620 SAM Troubleshooting Guide	The *5620 SAM Troubleshooting Guide* provides task-based procedures and user documentation to:
	• help resolve issues in the managed and management networks
	• identify the root cause and plan corrective action for:
	  • alarm conditions on a network object or customer service
	  • problems on customer services with no associated alarms
	• list problem scenarios, possible solutions, and tools to help check:
	  • network management LANs
	  • network management platforms and operating systems
	  • 5620 SAM client GUIs and client OSS applications
	  • 5620 SAM servers
	  • 5620 SAM databases

5620 SAM Alarm Reference	The *5620 SAM Alarm Reference* provides a description of all alarms supported on the 5620 SAM, including LTE and optical alarms, the raising and clearing conditions of each alarm, and the remedial action to fix the problem. The reference is organized by network element type.
5620 SAM Glossary	The *5620 SAM Glossary* defines terms and acronyms used in all of the 5620 SAM documentation, including 5620 SAM LTE documentation.
5620 SAM Network Element Compatibility Guide	The *5620 SAM Network Element Compatibility Guide* provides release-specific information about the compatibility of managed devices in 5620 SAM releases. This document is updated regularly; always consult the latest version on OLCS as described in Documentation and resources on the web.
5620 SAM MPR documentation	
5620 SAM MPR User Guide	The *5620 SAM MPR User Guide* describes how to discover, configure, and manage 9500 MPR and 9500 MPRe devices using the 5620 SAM. The guide is intended for network planners, administrators, and operators and is to be used in conjunction with other guides in the 5620 SAM documentation suite where management of 9500 MPR and 9500 MPRe devices does not differ from other network elements. Alcatel-Lucent recommends that you review the entire *5620 SAM MPR User Guide* before you attempt to use the 5620 SAM in your MPR network.
5620 SAM LTE documentation	
5620 SAM LTE Release Description	The *5620 SAM LTE Release Description* provides information about the LTE features associated with the release.

(3 of 5)

Guide	Description
5620 SAM LTE EPC User Guide	The *5620 SAM LTE EPC User Guide* describes how to discover, configure, and manage LTE ePC devices using the 5620 SAM. The guide is intended for LTE ePC network planners, administrators, and operators and is to be used in conjunction with other guides in the 5620 SAM documentation suite where management of ePC devices does not differ from other network elements. Alcatel-Lucent recommends that you review the entire *5620 SAM LTE EPC User Guide* before you attempt to use the 5620 SAM in your LTE network.
5620 SAM LTE RAN User Guide	The *5620 SAM LTE RAN User Guide* describes how to discover, configure, and manage the Evolved NodeB, or eNodeB, using the 5620 SAM. The guide is intended for LTE RAN network planners, administrators, and operators and is to be used in conjunction with other guides in the 5620 SAM documentation suite where management of RAN devices does not differ from other network elements. Alcatel-Lucent recommends that you review the entire *5620 SAM LTE RAN User Guide* before you attempt to use the 5620 SAM in your LTE network.
5620 SAM LTE Parameter Reference	The *5620 SAM LTE Parameter Reference* provides a list of all LTE ePC and LTE RAN parameters supported in the 5620 SAM.
5620 SAM LTE OSS Interface Developer Guide	The *5620 SAM LTE OSS Interface Developer Guide* provides information about developing LTE OSS applications, including information about the 3GPP OSS interface components and architecture, understanding the 5620 SAM-O schema in the context of LTE, compliance with 3GPP standards, and typical operational scenarios.
5620 SAM optical documentation	
5620 SAM Optical User Guide	The *5620 SAM Optical User Guide* describes how to discover, configure, and manage optical devices using the 5620 SAM. The guide is intended for optical network planners, administrators, and operators and is to be used in conjunction with other guides in the 5620 SAM documentation suite where management of optical devices does not differ from other network elements. Alcatel-Lucent recommends that you review the entire *5620 SAM Optical User Guide* before you attempt to use the 5620 SAM in your optical network.
5620 SAM Optical Parameter Reference	The *5620 SAM Optical Parameter Reference* provides a list of all optical device parameters supported in the 5620 SAM.
5620 SAM-O documentation	
5620 SAM XML OSS Interface Developer Guide	The *5620 SAM XML OSS Interface Developer Guide* provides information that allows you to: • use the 5620 SAM XML OSS interface to access network management information • learn about the information model associated with the managed network • develop OSS applications using the packaged methods, classes, data types, and objects necessary to manage 5620 SAM functions
5650 CPAM documentation	
5650 CPAM Release Description	The *5650 CPAM Release Description* provides information about the new features associated with a 5650 CPAM software release.
5650 CPAM Release Notice	The *5650 CPAM Release Notice* provides important information about the 5650 CPAM software release and corresponding 7701 CPAA software release, including outstanding issues and restrictions. This document is not shipped with the on-product documentation and must be obtained from OLCS as described in Documentation and resources on the web.
5650 CPAM User Guide	The *5650 CPAM User Guide* describes how to capture, inspect, visualize, and troubleshoot IGP and BGP topologies using the 5650 CPAM.
7701 CPAA Hardware Revision 1 Setup and Software Installation Instructions	The *7701 CPAA Hardware Revision 1 Setup and Software Installation Instructions* describes the hardware setup and software installation for the 7701 CPAA Hardware Revision 1, the route analyzer component of the 5650 CPAM.

(4 of 5)

Guide	Description
7701 CPAA Hardware Revision 2 Setup and Software Installation Instructions	The *7701 CPAA Hardware Revision 2 Setup and Software Installation Instructions* describes the hardware setup and software installation for the 7701 CPAA Hardware Revision 2, the route analyzer component of the 5650 CPAM.

(5 of 5)

Obtaining customer documentation

You can obtain 5620 SAM customer documentation:

- from the product
- on the web

On-product documentation

The 5620 SAM on-product customer documentation is delivered in HTML and PDF. Choose Help→User Documentation from the 5620 SAM client GUI to open the help system in a web browser. For best results, use Internet Explorer or Firefox.

The help system opens to the User Documentation Index, which provides a summary of and links to all 5620 SAM customer documents.

Click on the Using the help system tab on the User Documentation Index page to find usage tips for navigating and searching within the on-product customer documentation.

You can return to the User Documentation Index at any time by clicking on the Home icon, shown in Figure 1.

Figure 1 Home icon

Documentation and resources on the web

The 5620 SAM customer documentation is available for download in PDF format from the Alcatel-Lucent Customer Support Center: http://www.alcatel-lucent.com/myaccess. If you are a new user and require access to this service, please contact your Alcatel-Lucent support representative.

Release Notices and any other documents not delivered on-product are posted to this site.

5620 SAM product alerts

Product technical alerts are used to communicate important information to customers about released loads. You can view and subscribe to product alerts for the 5620 SAM from the Alcatel-Lucent Customer Support Center.

Working with PDFs

You can download PDFs of individual guides from the Alcatel-Lucent Customer Support Center, or you can choose to download a zip of all PDFs for a particular release.

You can use the Search function of Acrobat Reader (File→Search) to find a term in a PDF of any 5620 SAM document. To refine your search, use appropriate search options (for example, search for whole words only or enable case-sensitive searching). You can also search for a term in multiple PDFs at once, provided that they are located in the same directory. For more information, see the Help for Acrobat Reader.

Note — Users of Mozilla browsers may receive an error message when opening the PDF files in the 5620 SAM documentation suite. The offline storage and default cache values used by the browsers are the cause of the error message.

Alcatel-Lucent recommends changing the Mozilla Firefox offline storage or Mozilla 1.7 cache value to 100 Mbytes to eliminate the error message.

Documentation conventions

Table 2 lists the conventions that are used throughout the documentation.

Table 2 Documentation conventions

Convention	Description	Example
Key name	Press a keyboard key	Delete
Italics	Identifies a variable	*hostname*
Key+Key	Type the appropriate consecutive keystroke sequence	CTRL+G
Key-Key	Type the appropriate simultaneous keystroke sequence	CTRL-G
*	An asterisk is a wildcard character, which means “any character” in a search argument.	log_file*.txt
↵	Press the Return key	↵
—	An em dash indicates there is no information.	—
→	Indicates that a cascading submenu results from selecting a menu item	Policies→Alarm Policies

Procedures with options or substeps

When there are options in a procedure, they are identified by letters. When there are substeps in a procedure, they are identified by Roman numerals.

Example of options in a procedure

At step 1, you can choose option a or b. At step 2, you must do what the step indicates.

1 This step offers two options. You must choose one of the following.

   a This is one option.

   b This is another option.

2 You must perform this step.

Example of substeps in a procedure

At step 1, you must perform a series of substeps within a step. At step 2, you must do what the step indicates.

1 This step has a series of substeps that you must perform to complete the step. You must perform the following substeps.

   i This is the first substep.

   ii This is the second substep.

   iii This is the third substep.

2 You must perform this step.

Measurement conventions

Measurements in this document are expressed in metric units and follow the Système international d'unités (SI) standard for abbreviation of metric units. If imperial measurements are included, they appear in brackets following the metric unit.

Table 3 lists the measurement symbols used in this document.

Table 3 Bits and bytes conventions

Measurement	Symbol
bit	b
byte	byte
kilobits per second	kb/s

Important information

The following conventions are used to indicate important information:

Warning — Warning indicates that the described activity or situation may, or will, cause equipment damage or serious performance problems.

Caution — Caution indicates that the described activity or situation may, or will, cause service interruption.

Note — Notes provide information that is, or may be, of special interest.

Getting started

1 — What's new? 1-1

1.1 What's new in 5620 SAM Release 11.0 1-2
What's new in 5620 SAM Release 11.0 R8 1-2
What's new in 5620 SAM Release 11.0 R7 1-2
What's new in 5620 SAM Release 11.0 R6 1-5
What's new in 5620 SAM Release 11.0 R5 1-5
What's new in 5620 SAM Release 11.0 R4 1-19
What's new in 5620 SAM Release 11.0 R3 1-19
What's new in 5620 SAM Release 11.0 R2 1-24
What's new in 5620 SAM Release 11.0 R1 1-24

2 — 5620 SAM system overview 2-1

2.1 5620 SAM system overview 2-2
5620 SAM system architecture 2-2
Supported network management modules 2-3
2.2 About this guide 2-3

3 — 5620 SAM GUI overview 3-1

3.1 5620 SAM GUI overview 3-2
Custom workspaces 3-3
Shortcut keys 3-4
Windows and forms 3-4
Multi-edit property forms 3-4
5620 SAM clipboard 3-5
Floating windows 3-5
User preferences 3-6
System preferences 3-6
External windows 3-7
Navigation tree 3-7
Contextual menus 3-7
Indicators and icons 3-7
Task manager 3-8
Text message 3-9
Maps 3-9
Alarm Window 3-9
Forms 3-9
Parameter Search Tool 3-15
Localized language support 3-16
3.2 Using search functions 3-16
Using search filters 3-17
Searches using Boolean operators 3-18
Invalid attributes or values 3-19
Preset filters 3-19
Span of control filters 3-20
Equipment group filters 3-20
Locating attributes on configuration forms 3-20
3.3 Workflow to use the 5620 SAM GUI 3-21
3.4 5620 SAM GUI opening and closing procedures 3-21
Procedure 3-1 To open a single-user GUI client on a Windows station 3-22
Procedure 3-2 To open a single-user GUI client on a RHEL or Solaris station 3-26
Procedure 3-3 To open a client GUI through a client delegate server 3-29
Procedure 3-4 To change to a different 5620 SAM client GUI user 3-30
Procedure 3-5 To close the 5620 SAM GUI 3-30
3.5 Basic 5620 SAM GUI operation procedures 3-31
Procedure 3-6 To open or close a main window 3-31
Procedure 3-7 To close one or all open forms 3-32
Procedure 3-8 To show or hide a window or form 3-32
Procedure 3-9 To arrange windows and forms 3-33
Procedure 3-10 To move a window or form to an external window 3-34
Procedure 3-11 To send a text message to other 5620 SAM users 3-34

Procedure 3-12 To use menus, the toolbar, or shortcuts 3-35
Procedure 3-13 To use menus, windows, and forms to configure or view parameters 3-35
Procedure 3-14 To use the Parameter Search Tool 3-37
Procedure 3-15 To use the 5620 SAM clipboard 3-39
Procedure 3-16 To copy a property form to the clipboard 3-39
Procedure 3-17 To open a property form copied to the clipboard 3-40
Procedure 3-18 To open property forms from the clipboard menu 3-40
3.6 5620 SAM GUI user preferences configuration procedures 3-40
Procedure 3-19 To configure 5620 SAM user preferences 3-40
Procedure 3-20 To customize tabs on configuration forms 3-42
Procedure 3-21 To temporarily display hidden tabs on configuration forms 3-44
Procedure 3-22 To configure the current client time zone 3-44
3.7 5620 SAM GUI search procedures 3-45
Procedure 3-23 To monitor the 5620 SAM Task Manager 3-45
Procedure 3-24 To perform a simple search using column headings 3-46
Procedure 3-25 To perform an advanced search 3-47
Procedure 3-26 To perform a search by specifying endpoints 3-49
Procedure 3-27 To locate an attribute on a configuration form 3-50
Procedure 3-28 To filter object types 3-51
Procedure 3-29 To filter using span of control 3-51
Procedure 3-30 To view and manage listed information 3-52
Procedure 3-31 To save listed information to a file 3-57
Procedure 3-32 To save results list preferences 3-58
Procedure 3-33 To save search filters 3-58
Procedure 3-34 To clear a search filter 3-59
Procedure 3-35 To load a saved search filter 3-60
Procedure 3-36 To delete a saved search filter 3-61
Procedure 3-37 To configure equipment group search filters 3-61
Procedure 3-38 To perform a search using equipment group filters 3-63

4 — 5620 SAM custom workspaces 4-1

4.1 5620 SAM custom workspaces overview 4-2
Workspace customization 4-2
5620 SAM upgrades and custom workspace updates 4-2
Custom tab display 4-3
4.2 Workflow to administer 5620 SAM custom workspaces 4-3
4.3 Workflow to customize 5620 SAM workspaces 4-3
4.4 Workflow to save and update custom workspaces for a 5620 SAM upgrade 4-4
4.5 5620 SAM GUI custom workspace procedures 4-4
Procedure 4-1 To customize menus 4-4
Procedure 4-2 To customize toolbars 4-7
Procedure 4-3 To customize tree labels 4-9
Procedure 4-4 To customize topology map icon labels 4-10
Procedure 4-5 To customize window layouts 4-10
Procedure 4-6 To add or remove a workspace in the workspace selector 4-11
Procedure 4-7 To change to another workspace using the workspace selector 4-12

Procedure 4-8 To delete a workspace from the 5620 SAM 4-12
Procedure 4-9 To export custom workspaces 4-13
Procedure 4-10 To import a workspace 4-13
Procedure 4-11 To add new menu items to a saved custom workspace after a 5620 SAM upgrade 4-14

5 — 5620 SAM navigation tree overview 5-1
5.1 Navigation tree overview 5-2
Using the navigation tree toolbar 5-4
Contextual menus 5-6
5.2 Basic navigation tree procedures 5-11
Procedure 5-1 To search for objects in the navigation tree 5-12
Procedure 5-2 To make a selected object the root of the navigation tree 5-13
Procedure 5-3 To make a selected object the root of another navigation tree 5-13
Procedure 5-4 To restore the default navigation tree root 5-13

6 — 5620 SAM topology map management 6-1
6.1 5620 SAM topology map management overview 6-2
Map window 6-2
Map panel 6-3
Map navigation tree 6-5
Map toolbar 6-6
Zooming in and out 6-11
Bookmarks 6-11
Information tables 6-13
6.2 5620 SAM topology map types 6-14
Physical topology map 6-14
Service tunnel topology map 6-16
EPS path topology maps 6-17
LSP path topology map 6-17
LSP cross-connect topology map 6-18
Flat maps 6-18
Service topology maps 6-19
Composite service topology maps 6-22
6.3 Working with topology maps 6-23
Modifying a service from the topology view 6-24
Managing OAM diagnostics from the topology view 6-24
6.4 Workflow to use 5620 SAM topology maps 6-26
6.5 Basic 5620 SAM topology map procedures 6-27
Procedure 6-1 To open a map from the 5620 SAM main menu 6-27
Procedure 6-2 To open a service topology map 6-27
Procedure 6-3 To open an MPLS provisioned path map from the MPLS Path form 6-27
Procedure 6-4 To open a dynamic LSP path map from the LSP Path form 6-28
Procedure 6-5 To open a flat map 6-29
Procedure 6-6 To open a dynamic LSP cross-connect topology map 6-29
Procedure 6-7 To view and understand map elements 6-30

Procedure 6-8 To save a map to a file 6-31
Procedure 6-9 To view object information from a map 6-32
Procedure 6-10 To manage the topology map window 6-32
Procedure 6-11 To zoom in and zoom out on a map 6-33
Procedure 6-12 To display only selected map objects 6-33
Procedure 6-13 To display only highlighted map objects 6-34
6.6 5620 SAM topology map configuration procedures 6-34
Procedure 6-14 To create an information table configuration 6-34
Procedure 6-15 To enable or disable a global information table 6-35
Procedure 6-16 To enable or disable a selected information table 6-36
Procedure 6-17 To re-enable or disable map highlights 6-36
Procedure 6-18 To enable or disable a highlight information table 6-37
Procedure 6-19 To delete a map highlight 6-37
Procedure 6-20 To create a map filter 6-38
Procedure 6-21 To load and apply a saved filter to a topology map 6-39
Procedure 6-22 To auto-layout icons on a map 6-40
Procedure 6-23 To search for a specific network object 6-41
Procedure 6-24 To create a bookmark 6-42
Procedure 6-25 To manage bookmarks 6-43
Procedure 6-26 To change the map background image 6-44
6.7 5620 SAM topology map management procedures 6-44
Procedure 6-27 To use OAM diagnostic functions on service topology and composite service flat topology maps 6-45
Procedure 6-28 To create a topology group 6-46
Procedure 6-29 To populate a topology group 6-47
Procedure 6-30 To modify a topology group and create topology groups with the same parameter settings 6-47
Procedure 6-31 To delete a topology group 6-48
Procedure 6-32 To modify a service or composite service using the topology view 6-48
Procedure 6-33 To create a physical link 6-49
Procedure 6-34 To modify a physical link and create physical links with the same parameter settings 6-54
Procedure 6-35 To manage link referencing 6-55
Procedure 6-36 To delete a physical link 6-55
Procedure 6-37 To configure bandwidth availability on physical links 6-56
Procedure 6-38 To view and modify discovered physical link properties 6-57
Procedure 6-39 To switch from a backup/standby protected link to an in-service protected link on a 9500 MPR device 6-58

7 — 5620 SAM scheduling 7-1

7.1 Scheduling overview 7-2
SAM schedules 7-3
7.2 Workflow to manage scheduling 7-4
7.3 Scheduling procedures 7-5
Procedure 7-1 To configure a SAM schedule 7-5
Procedure 7-2 To associate a task with a 5620 SAM schedule 7-7
Procedure 7-3 To modify a scheduled task 7-8

Procedure 7-4 To assign a different user account to a SAM scheduled task 7-9
Procedure 7-5 To turn up or shut down a scheduled task..... 7-9
Procedure 7-6 To view the current status of a SAM scheduled task..... 7-10
Procedure 7-7 To execute a SAM scheduled task..... 7-10
Procedure 7-8 To reset a scheduled task..... 7-11
Procedure 7-9 To delete a scheduled task 7-11
Procedure 7-10 To delete a schedule 7-12

Device management

8 — Device support 8-1

8.1 Device support overview 8-3
Device-specific workflows 8-4
8.2 Workflow to prepare 5620 SAM to manage devices 8-4
8.3 1830 PSS support 8-6
8.4 5780 DSC support 8-6
8.5 7210 SAS support 8-6
7210 SAS-D support 8-7
7210 SAS-E support 8-7
7210 SAS-M and 7210 SAS-X support 8-7
7210 SAS-T support 8-8
System resource profile 8-8
8.6 Workflow to manage 7210 SAS devices 8-10
8.7 7450 ESS support 8-13
8.8 Workflow to manage 7450 ESS devices 8-13
8.9 7705 SAR support 8-16
7705 SAR MWA support 8-16
7705 SAR NEtO support 8-17
7705 SAR auxiliary alarm daughter cards 8-17
7705 SAR 6-port E&M daughter cards 8-17
7705 SAR 12-port SDI card 8-18
7705 SAR Power Injector card 8-18
7705 SAR Optical Add/Drop Mux cards 8-18
7705 SAR CSMv2 card 8-18
7705 SAR 2 × 10-Gig Bridged Ethernet XFP + 1 × 2.5G Virtual Ethernet card 8-18
7705 SAR 6-port FXS Adapter card 8-19
7705 SAR 8-port FXO Adapter card 8-19
7705 SAR 10-port 1GigE/1-port 10GigE X-Adapter card 8-19
7705 SAR 8-port GigE SFP card (-48/+24 VDC) 8-20
7705 SAR Packet Microwave card 8-20
7705 SAR Voice & Tele-Protection MDA 8-20
7705 SAR-A 8-20
7705 SAR-F 8-20
7705 SAR-H 8-21
7705 SAR-M 8-21
7705 SAR-W 8-22

8.10 Workflow to manage 7705 SAR devices 8-22
8.11 7710 SR support 8-25
8.12 Workflow to manage 7710 SR devices 8-25
8.13 7750 MG support 8-28
8.14 7750 SR support 8-28
7750 SR-c4 8-28
7750 SR-c12 8-29
7750 SR-12E 8-29
8.15 Workflow to manage 7750 SR devices 8-29
8.16 7950 XRS support 8-32
Variants 8-32
Shelf components 8-33
8.17 Workflow to manage 7950 XRS devices 8-34
8.18 9471 WMM support 8-37
8.19 9500 MPR and 9500 MPRe support 8-37
8.20 eNodeB support 8-38
8.21 OmniSwitch support 8-38
OmniSwitch LAG objects 8-42
Using WebView to manage an OmniSwitch 8-42
8.22 Workflow to manage OmniSwitch devices 8-43
8.23 GNE support 8-46
Statistics support 8-47
Alarm support 8-48
8.24 Workflow to manage GNEs 8-49

9 — Device commissioning and management 9-1

9.1 Device commissioning overview 9-2
In-band and out-of-band management 9-2
IPv6 device management 9-6
Secure file transfers 9-6
9.2 GNE commissioning overview 9-6
Using alternate element managers 9-7
GNE profiles 9-7
Configuring user-defined alarms for GNEs 9-8
9.3 Workflow to commission Alcatel-Lucent devices 9-9
9.4 Device commissioning procedures 9-10
Procedure 9-1 To commission a device for 5620 SAM management 9-11
Procedure 9-2 To commission an OmniSwitch for 5620 SAM management 9-14
Procedure 9-3 To configure the 5620 SAM SNMP trap sources 9-18
Procedure 9-4 To configure polling for a 7450 ESS, 7705 SAR, 7710 SR, 7750 SR, or 7950 XRS 9-20
Procedure 9-5 To configure polling for a 7210 SAS 9-21
Procedure 9-6 To edit polling settings for multiple devices 9-24
9.5 Workflow to commission GNEs 9-24
9.6 GNE commissioning procedures 9-25
Procedure 9-7 To prepare a GNE for 5620 SAM management 9-25
Procedure 9-8 To configure an alternate EMS for a specific GNE 9-28
Procedure 9-9 To prepare a 9400 AWY or 9500 MSS-1c for 5620 SAM management 9-29
Procedure 9-10 To modify a GNE profile 9-31

Procedure 9-11 To delete a GNE profile 9-32
Procedure 9-12 To create a GNE alarm catalog 9-33
Procedure 9-13 To create a transform function for a GNE alarm catalog 9-37
Procedure 9-14 To add an alarm mapping to a GNE alarm catalog 9-38
Procedure 9-15 To modify or delete a GNE alarm mapping 9-39
Procedure 9-16 To delete a GNE alarm catalog 9-40
Procedure 9-17 To cross launch the 9400 AWY or 9500 MSS-1c J-USM manager 9-42

10 — Device discovery 10-1

10.1 Device discovery overview 10-2
Suspending device management 10-2
Unmanaging and deleting devices 10-4
Post-discovery actions 10-4
SNMP management 10-5
IPv6 discovery 10-6
Discovery and SNMP packet size 10-6
9500 MPR radio link discovery and management 10-7
10.2 Resynchronization of NEs 10-8
10.3 Mediation and SNMP MIBs 10-9
10.4 SSH security 10-9
SSH2 host key management 10-10
SSH2 and device CLI sessions 10-10
SSH2 and script management 10-10
SSH2 and secure file transfers 10-10
10.5 Server resource management 10-11
10.6 SNMP event notification policies 10-11
10.7 Workflow to discover network devices 10-12
10.8 Device discovery procedures 10-14
Procedure 10-1 To configure SNMPv3 on a device 10-14
Procedure 10-2 To verify that SSH2 is enabled on a device 10-18
Procedure 10-3 To enable SSH host key persistence on a device 10-19
Procedure 10-4 To configure NE mediation 10-19
Procedure 10-5 To configure a post-discovery action 10-24
Procedure 10-6 To configure a discovery rule 10-24
Procedure 10-7 To discover devices 10-29
Procedure 10-8 To view the post-discovery action execution status 10-31
Procedure 10-9 To manage a post-discovery action failure on an NE 10-32
Procedure 10-10 To configure an event notification policy 10-33
Procedure 10-11 To assign an event notification policy to an NE 10-35
Procedure 10-12 To edit a discovery rule 10-36
Procedure 10-13 To enable or disable a discovery rule 10-37
Procedure 10-14 To delete a discovery rule 10-37
Procedure 10-15 To rescan the network according to a discovery rule 10-37
Procedure 10-16 To manage, suspend, or unmanage a device 10-38
Procedure 10-17 To specify which management address the 5620 SAM uses to remanage a device 10-39
Procedure 10-18 To delete a device 10-39

Procedure 10-19 To partially or fully resynchronize NEs with the 5620 SAM database 10-40
Procedure 10-20 To list the active and mismatched SSH host keys 10-41
Procedure 10-21 To manually accept a mismatched SSH host key 10-42
Procedure 10-22 To change from SNMPv2c to SNMPv3 management of a device 10-43
Procedure 10-23 To switch from non-secure to secure mediation 10-43
Procedure 10-24 To list and save SNMP MIB information 10-45

11 — Device CLI sessions 11-1

11.1 Device CLI sessions overview 11-2
vi editor support 11-2
11.2 Workflow to use a 5620 SAM CLI 11-3
11.3 CLI procedures 11-3
Procedure 11-1 To configure the 5620 SAM CLI console preferences 11-3
Procedure 11-2 To open and close a 5620 SAM device CLI session 11-4

12 — Working with network objects 12-1

12.1 Working with network objects overview 12-2
Object deployment status 12-3
12.2 Working with topology group objects 12-3
12.3 Working with physical links 12-4
12.4 Workflow to manage network objects 12-5
12.5 Working with network objects procedures 12-5
Procedure 12-1 To monitor the deployment status of a network object 12-5

13 — Device object configuration 13-1

13.1 Device object configuration overview 13-2
13.2 Working with device objects 13-2
13.3 Working with ring group objects 13-2
13.4 Workflow to manage device objects 13-3
13.5 General device configuration procedures 13-5
Procedure 13-1 To create an object 13-5
Procedure 13-2 To modify NE properties 13-5
Procedure 13-3 To configure custom NE property values in the NE form 13-5
Procedure 13-4 To create an operational group 13-6
Procedure 13-5 To enable and configure global cflowd on an NE 13-7
Procedure 13-6 To add a span of control to an NE 13-8
Procedure 13-7 To configure load balancing 13-8
Procedure 13-8 To enable or disable 802.1X 13-9
Procedure 13-9 To configure exclusive policy editing on an NE 13-10
Procedure 13-10 To configure active card alarms on an NE 13-11
Procedure 13-11 To configure a TWAMP server 13-11
Procedure 13-12 To enable LLDP on an NE 13-14
Procedure 13-13 To configure the BFD flap detection interval on an NE 13-15
Procedure 13-14 To configure an IP next hop limit on an NE 13-15

Procedure 13-15 To create a chassis-level PBB configuration 13-15
Procedure 13-16 To configure serving network information on an NE ... 13-16
Procedure 13-17 To configure the RADIUS CoA port on an NE 13-16
Procedure 13-18 To configure two WRED slopes on a 7210 SAS 13-17
Procedure 13-19 To enable frame-based accounting for QoS policies ... 13-18
Procedure 13-20 To configure the system resource profile on a 7210 SAS 13-18
Procedure 13-21 To enable or disable ICMP extensions 13-21
Procedure 13-22 To configure subscriber data persistence 13-21
Procedure 13-23 To configure QoS ingress aggregate rates on the 7705 SAR-M/ME 13-22
Procedure 13-24 To launch an MCT on a 9500 MPRe NE connected to a 7705 SAR 13-22
Procedure 13-25 To start and stop a Webview or Secure Webview session on an OmniSwitch 13-23
Procedure 13-26 To configure the dying gasp alarm on an OS 6250M NE 13-24
13.6 Ring group configuration procedures 13-24
Procedure 13-27 To create a ring group 13-24
Procedure 13-28 To remove a ring group or ring group device 13-26

14 — Logical group object configuration 14-1

14.1 Logical group object configuration overview 14-2
14.2 Working with CCAG objects 14-2
14.3 Working with ISA-AA groups 14-2
14.4 Working with ISA-Tunnel groups 14-3
14.5 Working with ISA-LNS groups 14-4
14.6 Working with ISA-NAT groups 14-4
14.7 Working with ISA-Video groups 14-4
14.8 Working with ISA-WLAN GW groups 14-5
Soft GRE tunnels 14-5
14.9 Working with IGH objects 14-6
14.10 Working with LAG objects 14-6
LAG link mapping profiles 14-7
LAG utilization TCAs 14-7
BFD on Ethernet LAGs 14-8
14.11 Workflow to manage logical group objects 14-8
14.12 Logical group object configuration procedures 14-9
Procedure 14-1 To configure a CCAG 14-9
Procedure 14-2 To configure an ISA-AA group and ISA-AA partitions 14-11
Procedure 14-3 To add an AA subscriber policy override to an ISA-AA group or partition 14-18
Procedure 14-4 To configure cflowd on an ISA-AA group or partition 14-20
Procedure 14-5 To configure an ISA-tunnel group 14-22
Procedure 14-6 To configure an ISA-LNS group 14-23
Procedure 14-7 To configure an ISA-Video group 14-24
Procedure 14-8 To configure an ISA-WLAN GW group 14-25
Procedure 14-9 To create an IGH and add members 14-26
14.13 LAG configuration procedures 14-27
Procedure 14-10 To create a LAG 14-27
Procedure 14-11 To configure a LAG 14-32

Procedure 14-12 To configure an OmniSwitch LAG 14-36
Procedure 14-13 To configure OmniSwitch dynamic LAG members 14-40
Procedure 14-14 To create a LAG link mapping profile 14-42
Procedure 14-15 To configure BFD on a LAG 14-44
Procedure 14-16 To view micro-BFD sessions on a LAG 14-44

15 — Shelf object configuration 15-1

15.1 Shelf object configuration overview 15-2
15.2 Working with shelf objects 15-2
Chassis modes 15-2
Timing synchronization 15-4
Time of Day management on the 7705 SAR-H 15-5
Power management on the 7950 XRS 15-6
15.3 Working with card and card slot objects 15-6
Card provisioning and chassis modes 15-7
15.4 Working with daughter card objects 15-9
IMM daughter cards 15-10
MDA modes for the 7705 SAR 15-10
15.5 Working with bundle objects 15-10
Multilink PPP bundles 15-10
IMA group bundles 15-11
FR group bundles 15-12
15.6 Workflow to manage shelf objects 15-12
15.7 Shelf object configuration procedures 15-14
Procedure 15-1 To configure the device chassis mode 15-14
Procedure 15-2 To configure a VWM shelf for a 7210 SAS 15-15
Procedure 15-3 To configure 7210 SAS dry contact sensors 15-15
Procedure 15-4 To configure switch fabric multicast ingress replication rates 15-16
Procedure 15-5 To configure IMPM overrides 15-17
Procedure 15-6 To enable mixed mode 15-17
Procedure 15-7 To configure timing synchronization 15-18
Procedure 15-8 To configure a 7705 SAR IEEE 1588 PTP clock 15-19
Procedure 15-9 To configure a 7705 SAR IEEE 1588 PTP port 15-20
Procedure 15-10 To configure NTP on supported devices 15-21
Procedure 15-11 To configure a 7705 SAR MW link 15-26
Procedure 15-12 To configure a 7705 SAR MW link member 15-28
Procedure 15-13 To configure 7705 SAR auxiliary alarm definitions 15-30
Procedure 15-14 To configure the IEEE 1588 PTP clock on a 7210 SAS, 7450 ESS, or 7750 SR 15-32
Procedure 15-15 To configure the IEEE 1588 PTP peer of a 7210 SAS, 7450 ESS, or 7750 SR 15-33
Procedure 15-16 To manage an OmniSwitch running configuration 15-34
Procedure 15-17 To configure OmniSwitch health monitoring 15-35
Procedure 15-18 To configure a CCM on a 7950 XRS-20 15-35
Procedure 15-19 To manage the internal fan on a 7210 SAS-D 15-36
Procedure 15-20 To configure a power supply tray 15-37
Procedure 15-21 To configure a power management zone 15-37
Procedure 15-22 To provision a PEQ on a 7950 XRS 15-38

15.8 Card and card slot object configuration procedures 15-38
Procedure 15-23 To assign a card type 15-38
Procedure 15-24 To configure egress WRED queue control on an XCM, IOM 3 or IMM forwarding plane 15-39
Procedure 15-25 To configure IMPM on an XCM, 2 x XP MDA IOM 3, or IMM forwarding plane 15-40
Procedure 15-26 To configure an ingress queue group on a forwarding plane 15-41
Procedure 15-27 To configure NE DDoS protection on a forwarding plane 15-44
Procedure 15-28 To enable named pool mode 15-44
Procedure 15-29 To enable Stable Pool Sizing 15-45
Procedure 15-30 To configure OmniSwitch stacks 15-45
Procedure 15-31 To configure an OmniSwitch CPU temperature threshold 15-46
Procedure 15-32 To configure a CPM on a 7950 XRS 15-46
15.9 Daughter card slot object configuration procedures 15-47
Procedure 15-33 To configure an MDA 15-48
Procedure 15-34 To configure IMPM on an MDA 15-54
Procedure 15-35 To view the operational multicast channel properties of an MDA 15-55
Procedure 15-36 To configure a 7705 SAR module card 15-56
15.10 Bundle configuration procedures 15-59
Procedure 15-37 To create an FR group bundle 15-59
Procedure 15-38 To modify an FR group bundle 15-60
Procedure 15-39 To create an IMA group bundle 15-62
Procedure 15-40 To modify an IMA group bundle 15-64
Procedure 15-41 To create an MLPPP bundle 15-65
Procedure 15-42 To modify an MLPPP bundle 15-67
Procedure 15-43 To configure an MLPPP bundle for multiclass service transmission 15-68
Procedure 15-44 To configure an MLPPP bundle as a network interface on a channelized ASAP MDA 15-70

16 — Port and channel object configuration 16-1

16.1 Port and channel object configuration overview 16-2
16.2 Working with port and channel objects 16-2
Digital diagnostics monitoring 16-5
Tagged and untagged VLAN ports 16-5
Connection termination points for services and interfaces 16-7
STS-3 to STS-192 clear channel 16-7
DS3 clear channel 16-7
DS0 channel groups 16-7
Ethernet ports 16-8
PoE 16-10
PoE on the 7705 SAR-H 16-11
Moving and copying SAPs between ports 16-11
SONET/SDH and TDM port encapsulation 16-13
SONET clear channel applications 16-13
TDM channelization and clear channel applications 16-14
ATM encapsulation 16-16

16.3 SONET and SDH sub-channel applications and structure 16-18
SONET DS3 payload 16-18
SONET VT1.5 and VT2 payloads 16-19
SONET sub-channel syntax 16-20
Comparison of SONET and SDH hierarchies 16-21
SDH AU-4 and AU-3 sub-channel applications 16-22
SDH TU3 payload 16-22
SDH E3 or DS3 payload 16-23
SDH TU11 and TU12 payloads 16-24
16.4 Workflow to manage port objects 16-25
16.5 Workflow to manage channel objects 16-26
16.6 Port configuration procedures 16-27
Procedure 16-1 To configure Ethernet ports 16-27
Procedure 16-2 To change the port mode 16-39
Procedure 16-3 To migrate SAPs from access mode to hybrid mode 16-40
Procedure 16-4 To configure the 5620 SAM to retain non-default port MTU values 16-41
Procedure 16-5 To copy or move L2 SAPs between ports 16-42
Procedure 16-6 To move L3 SAPs within or between ports on the same NE 16-45
Procedure 16-7 To move L3 subscriber interface SAPs between ports on the same NE 16-48
Procedure 16-8 To add a queue group to an Ethernet port 16-51
Procedure 16-9 To configure SONET ports 16-54
Procedure 16-10 To configure an HSMDA override 16-55
Procedure 16-11 To configure TDM DS3 ports 16-56
Procedure 16-12 To configure serial ports 16-57
Procedure 16-13 To configure PW ports 16-57
Procedure 16-14 To configure a 7210 SAS-M channelized TDM DS1 or E1 port 16-58
Procedure 16-15 To assign policies to a 7210 SAS Ethernet port 16-59
Procedure 16-16 To create a 7210 SAS SHG 16-61
Procedure 16-17 To configure a virtual Ethernet port on a 7705 SAR 2-port ring MDA 16-62
Procedure 16-18 To configure PoE ports on a 7210 SAS-T ETR 16-63
Procedure 16-19 To configure PoE ports on a 7705 SAR-H 16-64
Procedure 16-20 To configure PoE ports on a 7705 SAR-W daughter card 16-65
Procedure 16-21 To configure a 7705 SAR ASAP channelized TDM port 16-66
Procedure 16-22 To configure a 7710 SR channelized TDM DS1 or E1 port 16-67
Procedure 16-23 To configure OmniSwitch Ethernet ports 16-68
Procedure 16-24 To configure OmniSwitch PoE Ports 16-72
16.7 Channel and framing link configuration procedures 16-72
Procedure 16-25 To configure SONET clear channels 16-72
Procedure 16-26 To perform a bulk channel creation on ports that support multiple sub-channels 16-74
Procedure 16-27 To configure SONET sub-channels 16-75
Procedure 16-28 To configure SDH sub-channels 16-77
Procedure 16-29 To create VT15 (TU11) or VT2 (TU12) sub-channels 16-79
Procedure 16-30 To create TDM DS1 or E1 channels 16-81

Procedure 16-31 To configure TDM DS1 or E1 channels 16-83
Procedure 16-32 To create serial channels..... 16-85
Procedure 16-33 To create TDM DS3 channels..... 16-87
Procedure 16-34 To configure TDM DS3 channels 16-89
Procedure 16-35 To configure a DS3/E3 channel as a network interface on a channelized ASAP MDA 16-94
Procedure 16-36 To configure an L3 interface on a DS3/E3 channel on a channelized ASAP MDA 16-96
Procedure 16-37 To configure a PVC 16-97
Procedure 16-38 To create an ILMI link..... 16-98
Procedure 16-39 To configure an ILMI link 16-100

17 — Inventory management 17-1

17.1 Inventory management overview..... 17-2
17.2 Sample inventory management workflow 17-5
17.3 Workflow to manage inventory 17-6
17.4 Inventory management procedures 17-7
Procedure 17-1 To list and sort inventory data..... 17-7
Procedure 17-2 To save inventory output in HTML format 17-8
Procedure 17-3 To save inventory output in CSV format..... 17-9
Procedure 17-4 To save a filter 17-9
Procedure 17-5 To inventory CLEI codes for managed device objects..... 17-9
Procedure 17-6 To inventory card software versions for a managed device 17-10
Procedure 17-7 To inventory port types for a managed device..... 17-11
Procedure 17-8 To inventory shelf data for a managed device 17-12
Procedure 17-9 To inventory all managed CCMs..... 17-13
Procedure 17-10 To inventory all managed cards..... 17-13
Procedure 17-11 To inventory all managed fan trays..... 17-14
Procedure 17-12 To inventory all managed flash memory..... 17-14
Procedure 17-13 To inventory all managed physical links 17-15
Procedure 17-14 To inventory all managed ports 17-16
Procedure 17-15 To inventory all managed power supply trays 17-16
Procedure 17-16 To inventory all managed processors..... 17-17
Procedure 17-17 To inventory all managed shelves..... 17-18
Procedure 17-18 To inventory all management ports 17-18
Procedure 17-19 To collect inventory data for network device SLA audits 17-19

18 — Card migration 18-1

18.1 Card migration management overview 18-2
Restrictions 18-2
18.2 Workflow to manage card migration 18-3
18.3 Card migration management procedures..... 18-4
Procedure 18-1 To create a card migration event 18-4
Procedure 18-2 To execute a saved card migration event..... 18-6
Procedure 18-3 To delete a card migration event 18-6

19 — TCA 19-1

19.1 TCA overview 19-2
Statistics counters 19-2
TCA configuration example 19-3
19.2 Workflow to configure TCA 19-4
19.3 TCA management procedures 19-4
Procedure 19-1 To configure a custom TCA profile 19-5
Procedure 19-2 To configure a TCA policy 19-6
Procedure 19-3 To apply a TCA policy to objects using the object properties forms 19-9
Procedure 19-4 To delete a TCA policy 19-10

20 — Bulk operations 20-1

20.1 Bulk operations overview 20-2
20.2 Workflow to manage bulk operations 20-2
20.3 Bulk operations procedures 20-2
Procedure 20-1 To create a bulk change 20-3
Procedure 20-2 To modify a bulk change 20-5
Procedure 20-3 To execute a bulk change 20-5
Procedure 20-4 To view executed batch information 20-6
Procedure 20-5 To stop one or more bulk changes 20-7
Procedure 20-6 To delete a bulk change 20-7

21 — Auto-provision 21-1

21.1 Auto-provision overview 21-2
21.2 Workflow to configure network devices using auto-provision 21-4
21.3 Auto-provision procedures 21-4
Procedure 21-1 To configure a source template 21-4
Procedure 21-2 To configure a target template 21-7
Procedure 21-3 To apply a target template to an unprovisioned NE 21-8

Network management

22 — NE routing and forwarding 22-1

22.1 NE routing and forwarding overview 22-2
L3 network interfaces 22-2
Routing protocols 22-4
LLDP 22-5
Routing policies 22-7
Cflowd 22-11
Shared Risk Link Group policies 22-11
22.2 Network domain overview 22-12
22.3 Workflow to configure NE routing and forwarding 22-12
22.4 Workflow to configure network domains 22-14

22.5 NE routing and forwarding configuration procedures 22-15
Procedure 22-1 To configure a routing instance or a VRF instance 22-15
Procedure 22-2 To configure local DHCPv4 server on a routing instance 22-23
Procedure 22-3 To configure local DHCPv6 server on a routing instance 22-28
Procedure 22-4 To perform a Force Partner Down action on a local DHCP server failover 22-31
Procedure 22-5 To configure a routing instance on an OmniSwitch 22-32
OmniSwitch DHCP relay and snooping 22-33
Procedure 22-6 To configure a UDP relay service, DHCP snooping, and DHCP Option 82 on OmniSwitch routing instances 22-34
Procedure 22-7 To configure a RADIUS server on a routing instance 22-36
Procedure 22-8 To configure a RADIUS proxy server on a routing instance 22-36
Procedure 22-9 To create an L3 interface 22-38
Procedure 22-10 To configure an L3 interface 22-47
Procedure 22-11 To create a L3 interface on an OmniSwitch 22-50
Procedure 22-12 To configure L3 interfaces on an OmniSwitch 22-51
Procedure 22-13 To create a static route 22-51
Procedure 22-14 To configure a static route on an OmniSwitch 22-52
Procedure 22-15 To configure a routing policy statement 22-53
Procedure 22-16 To configure a prefix list policy 22-59
Procedure 22-17 To configure a community policy 22-60
Procedure 22-18 To configure a damping policy 22-62
Procedure 22-19 To configure an AS Path policy 22-63
Procedure 22-20 To configure an AS Path Group policy 22-64
Procedure 22-21 To configure an MPLS administrative group policy 22-65
Procedure 22-22 To configure a Shared Risk Link Group policy 22-67
Procedure 22-23 To create a static configuration for a SRLG Policy 22-68
Procedure 22-24 To view network resources 22-70
Procedure 22-25 To view a routing instance or related object 22-71
Procedure 22-26 To view routing policy usage 22-71
Procedure 22-27 To view DHCPv6 leases 22-72
Procedure 22-28 To view DHCPv6 log events 22-73
Procedure 22-29 To view a routing policy from a CLI session 22-74
Procedure 22-30 To list MVPN Extranet objects for a NE 22-75
Procedure 22-31 To display IOM/IMM Label FIB information 22-76
Procedure 22-32 To display ECMP/LAG hashing of Epipe services 22-76
22.6 Network domain configuration procedures 22-78
Procedure 22-33 To create a network domain 22-78
Procedure 22-34 To associate a network interface with a network domain 22-78
Procedure 22-35 To remove a network interface from a network domain 22-79
Procedure 22-36 To associate a service tunnel with a network domain 22-79
Procedure 22-37 To remove a service tunnel from a network domain 22-79
Procedure 22-38 To delete a network domain 22-80

23 — Protocol configuration 23-1

23.1 Protocol configuration overview 23-3
IPv6 support 23-3
BGP 23-6
MP-BGP 23-8
RIP 23-8
LDP 23-9
IS-IS 23-11
OSPF 23-13
RSVP 23-14
L2TP 23-16
PIM 23-19
IGMP 23-22
MSDP 23-22
MLD 23-23
Bridging 23-23
WPP 23-24
23.2 Workflow to configure protocols 23-24
23.3 Workflow to configure BGP 23-25
23.4 Workflow to configure RIP 23-26
23.5 Workflow to configure LDP 23-26
23.6 Workflow to configure IS-IS 23-26
23.7 Workflow to configure OSPFv2 and OSPFv3 23-27
23.8 Workflow to configure RSVP 23-27
23.9 Workflow to configure L2TP 23-27
23.10 Workflow to configure PIM 23-28
23.11 Workflow to configure IGMP 23-28
23.12 Workflow to configure MSDP 23-29
23.13 Workflow to configure MLD 23-29
23.14 Workflow to configure bridging on an OmniSwitch device 23-29
23.15 Workflow to configure WPP 23-29
23.16 BGP configuration procedures 23-30
Procedure 23-1 To enable BGP on a routing instance 23-31
Procedure 23-2 To configure global-level BGP 23-31
Procedure 23-3 To configure a BGP confederation 23-37
Procedure 23-4 To configure peer-group-level BGP 23-38
Procedure 23-5 To configure peer-level BGP 23-43
Procedure 23-6 To enable or disable BGP peering 23-47
Procedure 23-7 To perform a routing policy test 23-48
23.17 RIP configuration procedures 23-49
Procedure 23-8 To enable RIP on a routing instance 23-49
Procedure 23-9 To configure global-level RIP 23-49
Procedure 23-10 To configure group-level RIP 23-51
Procedure 23-11 To configure interface-level RIP 23-52
23.18 LDP configuration procedures 23-52
Procedure 23-12 To enable LDP on a routing instance 23-53
Procedure 23-13 To configure global-level LDP 23-53
Procedure 23-14 To configure an LDP interface 23-57
Procedure 23-15 To configure an LDP peer 23-58
Procedure 23-16 To configure an LDP targeted peer 23-60
Procedure 23-17 To configure ECMP for LDP routing 23-62
Procedure 23-18 To view the LDP session information 23-63

23.19 IS-IS configuration procedures 23-64
Procedure 23-19 To enable IS-IS on a routing instance..... 23-65
Procedure 23-20 To configure IS-IS on a routing instance 23-66
Procedure 23-21 To configure an IS-IS link group on a routing instance..... 23-70
Procedure 23-22 To configure an IS-IS NET address..... 23-71
Procedure 23-23 To configure an IS-IS interface 23-72
23.20 OSPF configuration procedures 23-75
Procedure 23-24 To enable OSPF on a routing instance..... 23-76
Procedure 23-25 To create an OSPF area..... 23-77
Procedure 23-26 To create an OSPF neighbor on an OmniSwitch..... 23-78
Procedure 23-27 To add a Layer 3 interface to an OSPF router 23-79
Procedure 23-28 To create an OSPF area range 23-81
Procedure 23-29 To create a virtual link 23-81
Procedure 23-30 To configure OSPF on a default routing instance or a VRF routing instance 23-83
Procedure 23-31 To add a router to an OSPF area 23-86
23.21 RSVP configuration procedures 23-87
Procedure 23-32 To configure RSVP on a routing instance 23-87
Procedure 23-33 To configure an RSVP interface 23-89
23.22 L2TP configuration procedures 23-90
Procedure 23-34 To configure L2TP on a routing instance..... 23-91
Procedure 23-35 To view L2TP tunnels and tunnel endpoints..... 23-95
Procedure 23-36 To view L2TP tunnel instance endpoints on a subscriber instance 23-96
Procedure 23-37 To view L2TP sessions..... 23-97
Procedure 23-38 To view PPP sessions 23-97
23.23 PIM configuration procedures 23-98
Procedure 23-39 To enable PIM on a routing instance..... 23-98
Procedure 23-40 To configure PIM on a routing instance 23-99
Procedure 23-41 To create a PIM site on a VPRN routing instance 23-104
Procedure 23-42 To configure Anycast PIM on a router 23-113
Procedure 23-43 To create a PIM interface on a base routing instance or VPRN routing instance..... 23-116
Procedure 23-44 To view an mVPN P2MP LSP object 23-118
23.24 IGMP configuration procedures 23-119
Procedure 23-45 To enable IGMP on a router..... 23-119
Procedure 23-46 To configure an IGMP site on a router..... 23-119
Procedure 23-47 To configure IGMP on an OmniSwitch 23-122
Procedure 23-48 To create an IGMP interface..... 23-122
Procedure 23-49 To turn up or shut down an IGMP interface 23-124
Procedure 23-50 To view IGMP multicast reporting statistics for an IGMP site..... 23-125
Procedure 23-51 To view IGMP source statistics 23-125
23.25 MSDP configuration procedures..... 23-126
Procedure 23-52 To enable MSDP on a router 23-127
Procedure 23-53 To configure global-level MSDP..... 23-127
Procedure 23-54 To configure group-level MSDP 23-128
Procedure 23-55 To configure an MSDP source 23-131
Procedure 23-56 To configure peer-level MSDP 23-131
Procedure 23-57 To configure group-peer-level MSDP 23-133
Procedure 23-58 To enable or disable MSDP peering 23-134

23.26 MLD configuration procedures 23-134
Procedure 23-59 To enable MLD on a routing instance 23-135
Procedure 23-60 To configure MLD on a routing instance or VPRN routing instance 23-135
Procedure 23-61 To create an MLD interface on a base routing instance or VPRN routing instance 23-137
Procedure 23-62 To configure an MLD interface on an IES L3 access interface 23-138
23.27 Bridging configuration procedures 23-140
Procedure 23-63 To configure bridging on an OmniSwitch 23-140
Procedure 23-64 To release a violated OmniSwitch LPS port 23-147
23.28 WPP configuration procedure 23-148
Procedure 23-65 To create a web portal 23-148

24 — NAT 24-1

24.1 NAT overview 24-2
L2-aware NAT 24-3
Large-scale NAT 24-3
Static port forwarding 24-4
NAT pools 24-4
NAT policies 24-5
ISA-NAT groups 24-5
NAT Destinations 24-5
NAT 64 24-5
DS Lite 24-5
Deterministic NAT 24-6
24.2 Workflow to configure NAT 24-6
24.3 NAT configuration procedures 24-6
Procedure 24-1 To configure an ISA-NAT group 24-7
Procedure 24-2 To configure a NAT policy 24-8
Procedure 24-3 To configure NAT on a routing instance 24-9
Procedure 24-4 To configure a NAT deterministic script on a remote server 24-15
Procedure 24-5 To create an IPFIX export policy 24-16
Procedure 24-6 To view reserved IP address and reserved block information on an ISA-NAT group 24-17
Procedure 24-7 To view ISA-NAT object information 24-18
Procedure 24-8 To configure statistics on an ISA-NAT group 24-18
Procedure 24-9 To plot LSN subscriber host statistics 24-20
Procedure 24-10 To start or stop a NAT address-pool drain operation 24-21

25 — MPLS 25-1

25.1 MPLS overview 25-2
LSPs 25-2
25.2 Sample MPLS configuration 25-11
25.3 Workflow to configure MPLS 25-12
25.4 MPLS procedures 25-13
Procedure 25-1 To enable MPLS on a routing instance 25-13
Procedure 25-2 To configure an MPLS instance 25-14

Procedure 25-3 To create an MPLS interface 25-16
Procedure 25-4 To create an MPLS path 25-18
Procedure 25-5 To view an MPLS path 25-20
Procedure 25-6 To create a static LSP 25-21
Procedure 25-7 To view and configure a static LSP 25-22
Procedure 25-8 To create a dynamic LSP 25-23
Procedure 25-9 To configure a dynamic LSP 25-28
Procedure 25-10 To create a dynamic LSP from a tunnel template 25-30
Procedure 25-11 To list dynamic LSPs 25-32
Procedure 25-12 To run an OAM validation test for a dynamic LSP 25-32
Procedure 25-13 To create a Point-to-Multipoint LSP 25-32
Procedure 25-14 To create a Manual Bypass LSP 25-36
Procedure 25-15 To configure a Manual Bypass LSP 25-39
Procedure 25-16 To configure an LSP path 25-40
Procedure 25-17 To create an LSP path using a tunnel template 25-43
Procedure 25-18 To configure an LSP Path optimization policy 25-44
Procedure 25-19 To terminate an LSP Path optimization policy that is in progress 25-46
Procedure 25-20 To view LSP Path optimization policy results 25-47
Procedure 25-21 To view detour and bypass path information 25-48
Procedure 25-22 To view exclude route object information 25-49
Procedure 25-23 To create an LSP template for MVPN 25-50
Procedure 25-24 To view LSP templates for MVPN created using CLI 25-52
Procedure 25-25 To view LSPs created by one-hop P2P and mesh P2P templates 25-53
Procedure 25-26 To list and view MPLS objects 25-53

26 — MPLS-TP 26-1

26.1 MPLS-TP overview 26-2
Proactive OAM 26-2
26.2 Simplified provisioning 26-3
26.3 Workflow to configure MPLS-TP 26-3
26.4 MPLS-TP procedures 26-4
Procedure 26-1 To enable MPLS-TP on a routing instance 26-4
Procedure 26-2 To configure an MPLS-TP instance 26-5
Procedure 26-3 To create an MPLS-TP BFD template policy 26-5
Procedure 26-4 To configure a proactive OAM template on an MPLS-TP instance 26-6
Procedure 26-5 To configure a protection template on an MPLS-TP instance 26-7
Procedure 26-6 To create an MPLS-TP LSP 26-7
Procedure 26-7 To create an MPLS-TP LSR cross-connect path 26-10
Procedure 26-8 To create a bidirectional MPLS-TP LSP 26-12

27 — Service tunnels 27-1

27.1 Service tunnel overview 27-2
Tunnel selection profiles 27-3
27.2 IP/MPLS service tunnels 27-3
IP/MPLS service tunnels design considerations 27-4
Class-based forwarding 27-5

27.3 Ethernet (G.8031) tunnels 27-5
Transit services 27-6
27.4 Ethernet (G.8032) rings 27-7
ERP topology 27-7
Supported ERP service types 27-8
Automatic Ethernet ring creation 27-8
Auditing Ethernet rings 27-9
Service provisioning on Ethernet (G.8032) rings 27-9
27.5 Workflow to configure service tunnels 27-10
27.6 Workflow to configure Ethernet (G.8032) rings 27-11
27.7 Configuring service tunnel procedures 27-11
Procedure 27-1 To create an IP/MPLS service tunnel 27-11
Procedure 27-2 To create an SDP using a tunnel template 27-18
Procedure 27-3 To create a tunnel selection profile 27-19
Procedure 27-4 To create or configure an Ethernet tunnel endpoint 27-21
Procedure 27-5 To create an Ethernet tunnel 27-24
Procedure 27-6 To create or configure an Ethernet Ring Element 27-27
Procedure 27-7 To create or configure an Ethernet Ring Element on an OmniSwitch NE 27-30
Procedure 27-8 To create an Ethernet (G.8032) ring 27-34
Procedure 27-9 To create an Ethernet (G.8032v2) ring on OmniSwitch NEs 27-42
Procedure 27-10 To configure a transit service on an Ethernet ring 27-44
Procedure 27-11 To discover service tunnels 27-46
Procedure 27-12 To discover flow-through services 27-47
Procedure 27-13 To view and manage service tunnels and tunnel elements 27-48
Procedure 27-14 To view the service tunnel topology 27-49
Procedure 27-15 To run an OAM validation test on a service tunnel 27-50
Procedure 27-16 To perform an Ethernet (G.8032) ring audit 27-51

28 — Lawful Intercept 28-1

28.1 Lawful Intercept overview 28-2
Security 28-3
28.2 Workflow to configure LI 28-4
28.3 5620 SAM LI configuration procedures 28-5
Procedure 28-1 To create an LI user account on the 5620 SAM 28-6
Procedure 28-2 To create an additional NE LI user account using the 5620 SAM GUI 28-8
Procedure 28-3 To create an NE LI user profile using CLI 28-10
Procedure 28-4 To create an LI user account on an NE using a CLI 28-11
Procedure 28-5 To configure NE LI user security 28-13
Procedure 28-6 To synchronize the global 5620 SAM NE user configuration profile with the local NE user configuration profile 28-15
Procedure 28-7 To configure an LI mediation policy 28-15
Procedure 28-8 To enable NE discovery for LI 28-16
Procedure 28-9 To configure the LI Filter Lock 28-18
Procedure 28-10 To configure LI on a specific NAT subscriber 28-18
Procedure 28-11 To enable or disable the use of a secure channel for LI users 28-20

29 — IPsec 29-1

29.1 IPsec overview 29-2
IPv6 IPsec 29-3
BFD 29-3
29.2 IPsec VPN 29-4
Tunnel types 29-4
Typical applications for IPsec corporate services 29-4
29.3 Multi-chassis IPsec 29-7
29.4 Sample video wholesale IPsec configuration 29-7
29.5 Workflow to configure and manage an IPsec configuration 29-8
29.6 Workflow to configure and manage an IPsec configuration using the IPsec VPN 29-9
29.7 Workflow to enable BFD over a static LAN-to-LAN IPsec tunnel 29-9
29.8 General IPsec procedures 29-10
Procedure 29-1 To configure an IKE policy 29-10
Procedure 29-2 To configure an IPsec transform 29-11
Procedure 29-3 To create an IPsec static security association 29-12
Procedure 29-4 To create an IPsec tunnel template 29-13
Procedure 29-5 To create an IPsec security policy 29-13
Procedure 29-6 To create a tunnel interface on an IES or VPRN 29-15
Procedure 29-7 To create an IPsec tunnel on a VPRN tunnel interface 29-20
Procedure 29-8 To create an IPsec gateway on an IES or VPRN 29-24
Procedure 29-9 To enable BFD for a static LAN-to-LAN IPsec tunnel 29-26
29.9 IPsec VPN procedures 29-27
Procedure 29-10 To create an IPsec VPN 29-27
Procedure 29-11 To select a service NE site for an IPsec VPN 29-28
Procedure 29-12 To create or select a secure VPRN service for an IPsec VPN 29-29
Procedure 29-13 To create or select a delivery service for an IPsec VPN 29-30
Procedure 29-14 To select a tunnel group for an IPsec VPN 29-32
Procedure 29-15 To assign policies and configurations for a dynamic site-to-site IPsec VPN 29-33
Procedure 29-16 To assign policies and configurations for a dynamic soft client IPsec VPN 29-35
Procedure 29-17 To assign policies and configurations for a static IPsec VPN 29-37

30 — ISA-Video 30-1

30.1 ISA-Video overview 30-2
30.2 Workflow to configure and manage an ISA-Video configuration 30-3
30.3 ISA-Video procedures 30-4
Procedure 30-1 To add a Video interface to a VPRN site 30-4
Procedure 30-2 To add a Video interface to an IES site 30-6
Procedure 30-3 To add a Video interface to a VPLS site 30-8

31 — Alarm management 31-1

31.1 Alarm management overview 31-2
Alarm status, severity, and aggregation 31-6
Alarm thresholds 31-10
Alarm suppression 31-12
Alarm filters 31-13
Filtering alarms for OSS clients using the 5620 SAM GUI 31-13
Correlated alarms 31-13
Automatic purging of alarms 31-15
31.2 Workflow to manage alarms 31-15
31.3 Alarm management procedures 31-17
Procedure 31-1 To configure alarm severity and deletion behavior 31-17
Procedure 31-2 To configure alarm history database management behavior 31-20
Procedure 31-3 To customize the default behavior of specific alarm policies 31-20
Procedure 31-4 To display the Additional Text Find button on object properties forms 31-21
Procedure 31-5 To configure additional text policies 31-22
Procedure 31-6 To set a policy to clear an alarm that is not implicitly cleared 31-25
Procedure 31-7 To configure alarm filters for OSS clients using the 5620 SAM GUI 31-25
Procedure 31-8 To reload all alarms from the historical alarm database 31-27
Procedure 31-9 To enable or disable audible alarms 31-28
Procedure 31-10 To enable or disable the display of alarm flags in the alarm window 31-28
Procedure 31-11 To enable or disable the display of correlated alarms in the alarm window 31-29
Procedure 31-12 To enable or disable the display of alarmed equipment in navigation trees for the View Alarmed Object function 31-30
Procedure 31-13 To view and manage network alarms in the Alarm window 31-30
Procedure 31-14 To view and manage object alarms on object properties forms 31-33
Procedure 31-15 To view and manage alarms using the Alarm Info form 31-36
Procedure 31-16 To create search filters to view specific network alarms 31-38
Procedure 31-17 To acknowledge alarms using the contextual menu on alarm lists 31-39
Procedure 31-18 To acknowledge alarms using the Alarm Info form 31-40
Procedure 31-19 To manually promote or demote the severity of an alarm 31-42
Procedure 31-20 To list alarms received during a specified time period 31-43
Procedure 31-21 To search for alarms received during a specified time period 31-44
Procedure 31-22 To pause the dynamic alarm list from scrolling when viewing alarms 31-44

Procedure 31-23 To copy alarm information to the clipboard 31-45
Procedure 31-24 To view network alarm statistics 31-46
Procedure 31-25 To review historical alarm records 31-46
Procedure 31-26 To view the source object of an historical alarm 31-47
Procedure 31-27 To save lists of logged historical alarm records 31-48

32 — OAM diagnostic tests 32-1

32.1 OAM diagnostic tests overview 32-2
Ethernet CFM 32-4
MTU ping OAM 32-6
Tunnel ping OAM 32-7
Service site ping OAM 32-8
VCCV Ping OAM 32-8
VCCV trace OAM 32-10
LSP Ping OAM 32-10
LSP Trace OAM 32-11
P2MP LSP Ping OAM 32-11
P2MP LSP Trace OAM 32-12
LDP Tree Trace OAM 32-12
MAC ping OAM 32-13
MAC trace OAM 32-14
MAC populate OAM 32-15
MAC purge OAM 32-15
CPE ping 32-16
ANCP loopback 32-16
F5 OAM loopback 32-16
VPRN ping and VPRN trace 32-16
ATM OAM ping 32-16
Multicast FIB ping 32-16
Multicast router information 32-17
Multicast trace 32-17
ICMP ping 32-17
ICMP trace 32-17
OmniSwitch ping and traceroute 32-17
DNS ping 32-18
Service assurance test management and configuration 32-18
32.2 Sample OAM diagnostic test configuration 32-22
32.3 Workflow to use OAM diagnostic tests 32-24
32.4 OSS OAM Test Results file retrieval 32-26
32.5 OAM diagnostic tests procedures 32-26
Procedure 32-1 To create and run an MTU ping OAM diagnostic from a service tunnel 32-27
Procedure 32-2 To create an MTU ping OAM diagnostic from the test manager 32-28
Procedure 32-3 To create and run a tunnel ping OAM diagnostic from a service tunnel 32-29
Procedure 32-4 To create a tunnel ping OAM diagnostic from the test manager 32-31
Procedure 32-5 To create and execute a CFM Global MEG OAM diagnostic 32-31

Procedure 32-6 To create and execute a CFM Continuity Check OAM diagnostic 32-32
Procedure 32-7 To create and execute a CFM loopback diagnostic 32-33
Procedure 32-8 To create and execute a CFM link trace diagnostic 32-37
Procedure 32-9 To create and execute a CFM Eth test diagnostic 32-39
Procedure 32-10 To create and execute a CFM one-way delay diagnostic..... 32-40
Procedure 32-11 To create and execute a CFM two-way delay diagnostic..... 32-42
Procedure 32-12 To create and execute a CFM single-ended loss diagnostic..... 32-45
Procedure 32-13 To create and execute a CFM two-way SLM (Synthetic Loss Measurement) diagnostic 32-47
Procedure 32-14 To configure and run VPRN OAM diagnostics from a service 32-49
Procedure 32-15 To configure and run MAC populate OAM diagnostics 32-54
Procedure 32-16 To configure and run MAC purge OAM diagnostics..... 32-55
Procedure 32-17 To configure and run MAC ping OAM diagnostics 32-56
Procedure 32-18 To configure and run MAC trace OAM diagnostics 32-57
Procedure 32-19 To configure and run CPE ping OAM diagnostics..... 32-59
Procedure 32-20 To configure and run ANCP loopback diagnostics 32-60
Procedure 32-21 To configure and run service site ping OAM diagnostics 32-62
Procedure 32-22 To run the F5 OAM loopback diagnostic..... 32-63
Procedure 32-23 To configure and run VCCV Ping OAM diagnostics 32-63
Procedure 32-24 To configure and run VCCV Trace OAM diagnostics 32-65
Procedure 32-25 To configure and run LSP or MPLS-TP LSP Ping OAM diagnostics 32-66
Procedure 32-26 To configure and run LSP or MPLS-TP LSP Trace OAM diagnostics 32-68
Procedure 32-27 To configure and run P2MP LSP Ping OAM diagnostics 32-70
Procedure 32-28 To configure and run P2MP LSP Trace OAM diagnostics 32-74
Procedure 32-29 To configure and run LDP Tree Trace OAM diagnostics 32-75
Procedure 32-30 To configure and run multicast router information OAM diagnostics 32-76
Procedure 32-31 To configure and run multicast trace OAM diagnostics 32-77
Procedure 32-32 To configure and run multicast FIB ping OAM diagnostics 32-78
Procedure 32-33 To configure and run an ATM OAM ping..... 32-79
Procedure 32-34 To configure an ATM OAM loopback 32-80
Procedure 32-35 To configure and run an ICMP ping 32-81
Procedure 32-36 To configure and run an ICMP trace 32-82
Procedure 32-37 To configure and run a DNS ping..... 32-83
Procedure 32-38 To create an OmniSwitch OAM CLI script 32-85
Procedure 32-39 To configure an advanced loopback test on an OmniSwitch port..... 32-89
Procedure 32-40 To configure and run an OmniSwitch OAM ping..... 32-90

Procedure 32-41 To configure and run an OmniSwitch OAM traceroute 32-92
Procedure 32-42 To configure an 802.3ah EFM OAM diagnostic 32-93
Procedure 32-43 To configure an 802.3ah EFM OAM diagnostic on an OmniSwitch at the NE or port level 32-98
Procedure 32-44 To view OAM diagnostic test results 32-103
Procedure 32-45 To interpret OAM diagnostic results 32-112
Procedure 32-46 To configure threshold-crossing alarms on NE-schedulable OAM tests 32-120
Procedure 32-47 To configure NM threshold-crossing alarms on non-NE-schedulable OAM tests 32-121
Procedure 32-48 To edit an OAM diagnostic test 32-122
Procedure 32-49 To delete an OAM diagnostic test 32-123
Procedure 32-50 To set STM managed device test limits 32-123

33 — VRRP 33-1

33.1 VRRP overview 33-2
VR 33-3
Master router 33-4
Owner and non-owner VRRP instances 33-4
VRRP types 33-5
Primary addresses 33-5
Backup addresses 33-5
VRRP message authentication 33-5
33.2 Workflow to configure VRRP 33-5
33.3 VRRP management procedures 33-6
Procedure 33-1 To create a VR 33-6
Procedure 33-2 To create and configure a VRRP instance 33-6
Procedure 33-3 To add a VRRP instance 33-9
Procedure 33-4 To modify a VR or VRRP instance 33-9
Procedure 33-5 To view the status of a VR 33-10
Procedure 33-6 To delete a VRRP instance 33-11
Procedure 33-7 To delete a VR 33-11

34 — APS 34-1

34.1 APS overview 34-2
Bidirectional mode 34-3
Unidirectional mode 34-3
Switching modes 34-4
MLPPP 34-4
APS port configurations 34-5
SC APS 34-6
MC APS 34-6
APS on channelized ASAP MDAs 34-7
APS on channelized CES MDAs 34-7
APS on multilink bundles 34-7
1+1 APS configuration example 34-8
Configuring SAPs on APS-protected ports 34-9
34.2 Workflow to manage APS 34-9

34.3 APS management procedures 34-10
Procedure 34-1 To create an SC APS group 34-10
Procedure 34-2 To create an MC APS group 34-12
Procedure 34-3 To create an SC APS IMA or MLPPP bundle 34-15
Procedure 34-4 To create an MC APS MLPPP bundle 34-20
Procedure 34-5 To change the operational state of an SC APS channel 34-24
Procedure 34-6 To delete an SC APS group 34-24
Procedure 34-7 To delete an SC APS bundle 34-25
Procedure 34-8 To delete an MC APS group or bundle 34-25

35 — lightRadio Wi-Fi 35-1

35.1 lightRadio Wi-Fi 35-2
Migrant user handling 35-3
35.2 Workflow to configure lightRadio Wi-Fi 35-4

36 — MC peer groups 36-1

36.1 MC peer groups overview 36-2
36.2 Workflow to manage MC peer groups 36-3
36.3 MC peer groups management procedures 36-3
Procedure 36-1 To configure an MC peer group 36-3
Procedure 36-2 To configure an MC peer 36-6
Procedure 36-3 To perform an on-demand protocol synchronization between MC peer group members 36-7
Procedure 36-4 To view an MC peer on one NE 36-8
Procedure 36-5 To delete an MC peer group 36-9

37 — MC IPsec 37-1

37.1 MC IPsec overview 37-2
37.2 Workflow to configure and manage MC IPsec 37-2
37.3 MC IPsec management procedures 37-3
Procedure 37-1 To configure MC IPsec on an MC peer group 37-4
Procedure 37-2 To create an MC IPsec group 37-6
Procedure 37-3 To configure MC IPsec on a VPRN tunnel interface 37-8
Procedure 37-4 To configure MC IPsec on an IES or VPRN L3 access interface 37-9
Procedure 37-5 To perform an MC IPsec switchover 37-10
Procedure 37-6 To view an MC IPsec peer on an NE 37-11
Procedure 37-7 To configure an MC IPsec peer site 37-11

38 — MC endpoint groups 38-1

38.1 MC endpoint groups overview 38-2
BFD 38-2
38.2 Workflow to manage MC endpoint groups 38-2
38.3 MC endpoint groups management procedures 38-3
Procedure 38-1 To configure an MC endpoint group 38-3
Procedure 38-2 To modify an MC endpoint group 38-4
Procedure 38-3 To view an MC endpoint peer on one NE 38-5

Procedure 38-4 To delete an MC endpoint group 38-6

39 — MC LAG groups 39-1

39.1 MC LAG groups overview 39-2
MC synchronization 39-2
39.2 Workflow to manage MC LAG groups 39-2
39.3 MC LAG groups management procedures 39-3
Procedure 39-1 To create an MC LAG group 39-3
Procedure 39-2 To configure an MC LAG group member 39-5
Procedure 39-3 To configure an MC LAG peer on one NE 39-6
Procedure 39-4 To delete an MC LAG group 39-7
39.4 MC AOS groups overview 39-7
39.5 Workflow to manage MC AOS groups 39-8
39.6 MC AOS groups management procedures 39-8
Procedure 39-5 To create an MC AOS group 39-8
Procedure 39-6 To create an MC AOS VFLink Group 39-10
Procedure 39-7 To create an MC AOS LAG Group 39-11
Procedure 39-8 To configure an MC AOS group member 39-12

40 — MC synchronization groups 40-1

40.1 MC synchronization groups overview 40-2
MC synchronization and dual-homed L2/L3 CO 40-2
40.2 Workflow to manage MC synchronization groups 40-3
40.3 MC synchronization groups management procedures 40-3
Procedure 40-1 To create an MC synchronization group 40-3
Procedure 40-2 To configure protocol synchronization between MC peer group members 40-5
Procedure 40-3 To view an MC synchronization peer on one NE 40-5
Procedure 40-4 To delete an MC synchronization group 40-6

41 — MC ring groups 41-1

41.1 MC ring groups overview 41-2
Steady-state condition 41-3
Broken ring condition 41-4
Object relationships 41-5
MC ring group and redundant VLL Epipe access operation 41-6
MC ring groups and subscriber hosts 41-7
41.2 Workflow to manage MC ring groups 41-7
41.3 MC ring groups management procedures 41-10
Procedure 41-1 To create an MC ring group 41-10
Procedure 41-2 To configure L3 forwarding from a VPLS or MVPLS to an IES or VPRN service 41-12
Procedure 41-3 To configure an MC ring group for redundant VLL Epipe access 41-13
Procedure 41-4 To turn up the MC rings in an MC ring group 41-14
Procedure 41-5 To view the operational status of MC ring group components 41-15
Procedure 41-6 To configure an MC ring peer on one NE 41-17
Procedure 41-7 To delete an MC ring group 41-19

Policy management

42 — Policies overview 42-1

42.1 Policies overview 42-2
Policy types 42-2
Global policies 42-12
Policy distribution 42-13
Policy audits 42-14
Policy overrides 42-15
42.2 Workflow to create and assign policies 42-16
42.3 Policies procedures 42-17
Procedure 42-1 To distribute a policy 42-17
Procedure 42-2 To distribute multiple policies 42-21
Procedure 42-3 To create a policy distribution group 42-23
Procedure 42-4 To modify a policy 42-24
Procedure 42-5 To delete a policy 42-25
Procedure 42-6 To copy or overwrite a policy 42-26
Procedure 42-7 To synchronize a policy 42-27
Procedure 42-8 To perform a policy audit for policy groups and types 42-28
Procedure 42-9 To perform a policy audit for multiple global policies with same type 42-30
Procedure 42-10 To perform a policy audit for global policy 42-31
Procedure 42-11 To configure a policy audit schedule 42-33
Procedure 42-12 To identify differences between a global and local policy or two local policies 42-35
Procedure 42-13 To configure the maximum policy objects per deployer 42-37
Procedure 42-14 To configure the maximum number of tasks for distribution 42-38

43 — QoS policies 43-1

43.1 QoS policies overview 43-2
Access ingress policies 43-2
Access egress policies 43-5
Network policies 43-6
Network queue policies 43-7
Slope policies 43-7
HSMDA slope policies 43-8
Shared-queue policies 43-8
Scheduler policies 43-10
HSMDA scheduler policies 43-12
Port scheduler policies 43-12
Policer control policies 43-13
Named buffer pool policies 43-14
Queue Group Template policies 43-14
7705 SAR fabric profiles 43-15
HSMDA pool policies 43-16
ATM QoS policies 43-16

MC MLPPP ingress and egress QoS profiles 43-16
MCFR ingress and egress QoS profiles 43-16
OmniSwitch QoS policies 43-16
7210 SAS QoS policies 43-17
43.2 Workflow to configure policer control hierarchy 43-18
43.3 Workflow to configure 5620 SAM named buffer pools 43-19
43.4 QoS policies procedures 43-20
Procedure 43-1 To configure an access ingress policy 43-20
Procedure 43-2 To configure a 7210 SAS or 1830 PSS access ingress policy 43-28
Procedure 43-3 To configure a SAP access egress policy 43-33
Procedure 43-4 To configure a 7210 SAS or 1830 PSS port access egress policy 43-41
Procedure 43-5 To configure a 7210 SAS SAP access egress policy 43-43
Procedure 43-6 To configure a network policy 43-45
Procedure 43-7 To configure a 7210 SAS or 1830 PSS network policy 43-47
Procedure 43-8 To configure a WRED slope policy 43-50
Procedure 43-9 To configure a 7210 SAS slope policy 43-52
Procedure 43-10 To configure an HSMDA WRED slope policy 43-54
Procedure 43-11 To configure a 7210 SAS queue management policy 43-56
Procedure 43-12 To configure a network queue policy 43-58
Procedure 43-13 To configure a 7210 SAS or 1830 PSS network queue policy 43-62
Procedure 43-14 To modify a shared-queue policy 43-63
Procedure 43-15 To configure a scheduler policy 43-65
Procedure 43-16 To configure an HSMDA scheduler policy 43-68
Procedure 43-17 To configure an HSMDA WRR policy 43-69
Procedure 43-18 To configure a port scheduler policy 43-71
Procedure 43-19 To configure a 7210 SAS or 1830 PSS port scheduler policy 43-73
Procedure 43-20 To configure a policer control policy 43-74
Procedure 43-21 To configure a port policy 43-75
Procedure 43-22 To configure a named buffer pool policy 43-76
Procedure 43-23 To configure an ingress queue group template policy 43-77
Procedure 43-24 To configure an egress queue group template policy 43-81
Procedure 43-25 To configure an Advanced Configuration policy 43-86
Procedure 43-26 To configure a 7705 SAR fabric profile 43-88
Procedure 43-27 To configure a 7210 SAS remarking policy 43-90
Procedure 43-28 To configure a 7210 MPLS LSP-Exp Map policy 43-91
Procedure 43-29 To configure an HSMDA pool policy 43-92
Procedure 43-30 To configure Q1 pools 43-93
Procedure 43-31 To create an Aggregation Scheduler 43-94
Procedure 43-32 To configure an ANCP MSS static map 43-96
Procedure 43-33 To configure an ATM QoS policy 43-97
Procedure 43-34 To configure an OmniSwitch QoS policy condition 43-98
Procedure 43-35 To configure an OmniSwitch QoS policy action 43-100
Procedure 43-36 To create an OmniSwitch QoS policy 43-101
Procedure 43-37 To create an OmniSwitch QoS list 43-102
Procedure 43-38 To create or configure a MC MLPPP ingress QoS profile 43-104

Procedure 43-39 To create or configure a MC MLPPP egress QoS profile 43-105
Procedure 43-40 To create or configure an MCFR ingress QoS profile .. 43-106
Procedure 43-41 To create or configure an MCFR egress QoS profile ... 43-107
Procedure 43-42 To configure QoS policy overrides on an L2 or L3 access interface 43-108
Procedure 43-43 To configure QoS policy overrides on access ingress policy meters for the 7210 SAS 43-113
Procedure 43-44 To configure QoS policy overrides on access ingress queues for a 7210 SAS-X 43-114

44 — Filter policies 44-1

44.1 Filter policies overview 44-2
Shared filter entries 44-2
SAP and service tunnel forwarding 44-3
Embedded filter policies 44-3
Web portal redirect 44-4
44.2 Filter policies procedures 44-4
Procedure 44-1 To configure an ACL MAC filter policy 44-4
Procedure 44-2 To configure an ACL IP filter policy 44-8
Procedure 44-3 To configure an ACL IPv6 filter policy 44-13
Procedure 44-4 To configure an ACL VLAN filter policy 44-18
Procedure 44-5 To configure an IP Prefix List 44-19
Procedure 44-6 To configure a filter Port List 44-20
Procedure 44-7 To configure a DHCP filter policy 44-21
Procedure 44-8 To configure an LI MAC filter policy 44-24
Procedure 44-9 To configure a Block Reservation policy 44-25
Procedure 44-10 To configure a Filter Log 44-26
Procedure 44-11 To configure a Sys Log 44-28
Procedure 44-12 To copy filter policy filter entries 44-29
Procedure 44-13 To configure embedded and embedding filter policies 44-30

45 — Multicast policies 45-1

45.1 Multicast policies overview 45-2
Egress multicast groups 45-2
Multicast package policies 45-2
Ingress Multicast Bandwidth policy 45-4
Ingress Multicast Info policy 45-4
Ingress Multicast Reporting Destination policy 45-6
7210 Multipoint Bandwidth Management policy 45-6
SSM Translate policy 45-6
45.2 Multicast policies procedures 45-6
Procedure 45-1 To create an egress multicast group policy 45-6
Procedure 45-2 To configure a multicast CAC policy 45-8
Procedure 45-3 To configure an Ingress Multicast Bandwidth policy 45-9
Procedure 45-4 To configure an Ingress Multicast Information policy ... 45-11
Procedure 45-5 To create or edit an ingress multicast reporting destination policy 45-21
Procedure 45-6 To configure a Multicast SSM Translate policy 45-22

Procedure 45-7 To view NE multicast reporting destination statistics 45-23
Procedure 45-8 To view multicast CAC channel statistics 45-24
Procedure 45-9 To configure a multicast package policy 45-25
Procedure 45-10 To configure a 7210 SAS multipoint bandwidth management policy 45-27

46 — Time of day policies 46-1
46.1 Time of day policies overview 46-2
Time range assignment analysis tool 46-2
46.2 Time of day policies procedures 46-2
Procedure 46-1 To configure a time range policy 46-3
Procedure 46-2 To configure a time of day suite 46-4
Procedure 46-3 To perform a time range entry assignment analysis 46-7

47 — VRRP policies 47-1
47.1 VRRP policies overview 47-2
47.2 VRRP policies procedures 47-3
Procedure 47-1 To configure a VRRP priority-control policy 47-3

48 — Auto tunnels policies 48-1
48.1 Auto tunnels policies overview 48-2
Tunnel templates 48-2
Class of Service 48-3
Tunnel groups 48-3
Tunnel policy rules 48-4
48.2 Workflow to configure auto tunnel creation 48-5
48.3 Auto tunnels policies procedures 48-6
Procedure 48-1 To create a rule-based group 48-6
Procedure 48-2 To convert old auto tunnel rules to template-based auto tunnel rules 48-7
Procedure 48-3 To create a mesh or ring topology rule 48-9
Procedure 48-4 To create a hub-and-spoke topology rule 48-11
Procedure 48-5 To import tunnels not managed by topology rules 48-13
Procedure 48-6 To display and delete tunnel elements 48-14
Procedure 48-7 To execute or reapply a topology rule 48-15
Procedure 48-8 To display missing tunnel elements 48-16

49 — AAA policies 49-1
49.1 AAA policies overview 49-2
RADIUS-based accounting policies 49-2
NAT RADIUS accounting policies 49-2
RADIUS server policies 49-2
Accounting on/off groups 49-3
Route download policies 49-3
Subscriber authentication policies 49-3
49.2 Workflow to configure AAA policies 49-3

49.3 AAA policies procedures 49-3
Procedure 49-1 To configure a RADIUS-based accounting policy 49-4
Procedure 49-2 To configure a NAT RADIUS accounting policy 49-7
Procedure 49-3 To configure an L2TP RADIUS accounting policy 49-9
Procedure 49-4 To configure a RADIUS server policy 49-11
Procedure 49-5 To initiate an accounting on/off message from a RADIUS server policy 49-14
Procedure 49-6 To configure an accounting on/off group 49-15
Procedure 49-7 To configure a route download policy 49-16
Procedure 49-8 To configure an ISA RADIUS policy 49-17
Procedure 49-9 To force a route download on an NE 49-17

50 — 802.1x policies 50-1

50.1 802.1x policies overview 50-2
50.2 802.1x policies procedures 50-2
Procedure 50-1 To configure an 802.1X policy 50-2

51 — PBB MRP policies 51-1

51.1 PBB MRP policies overview 51-2
51.2 Workflow to manage PBB MRP policies 51-2
51.3 PBB MRP policies procedures 51-2
Procedure 51-1 To configure a PBB MRP policy 51-2

52 — AOS Ethernet Service policies 52-1

52.1 AOS Ethernet Service policies overview 52-2
52.2 AOS Ethernet Service policies procedures 52-2
Procedure 52-1 To configure an OmniSwitch Ethernet service UNI profile 52-2
Procedure 52-2 To configure an OmniSwitch Ethernet SAP profile 52-3
Procedure 52-3 To configure an OmniSwitch Ethernet service custom L2 profile 52-4
Procedure 52-4 To clear custom L2 profile stats 52-5

53 — Connection profile policies 53-1

53.1 Connection profile policies overview 53-2
7210 SAS VLAN ranges on Epipe SAPs 53-2
53.2 Workflow to manage connection profiles 53-3
53.3 Connection profile policies procedures 53-3
Procedure 53-1 To configure a connection profile policy 53-3
Procedure 53-2 To configure a VLAN range for 7210 SAS Epipe VLL service 53-4

54 — Residential subscriber policies 54-1

54.1 Residential subscriber policies overview 54-2
Subscriber identification policies 54-2
Subscriber profiles 54-3
SLA profiles 54-4

Subscriber explicit maps 54-4
ANCP policies 54-5
Host lockout policies 54-5
Host tracking policies 54-6
Operational states of primary and secondary RADIUS scripts 54-6
Diameter policies 54-6
PPPoE policies 54-7
54.2 Residential subscriber policy management procedures 54-8
Procedure 54-1 To configure a subscriber identification policy 54-9
Procedure 54-2 To configure an ANCP policy 54-12
Procedure 54-3 To configure a PPPoE policy 54-13
Procedure 54-4 To configure a PPP policy 54-15
Procedure 54-5 To configure an MSAP policy 54-17
Procedure 54-6 To configure a host tracking policy 54-20
Procedure 54-7 To configure a category map policy 54-21
Procedure 54-8 To configure a credit control policy 54-24
Procedure 54-9 To configure an IGMP policy 54-25
Procedure 54-10 To configure a BGP Peering policy 54-26
Procedure 54-11 To configure a diameter policy 54-29
Procedure 54-12 To configure a subscriber multicast CAC policy 54-31
Procedure 54-13 To configure a mobile gateway profile 54-32
Procedure 54-14 To configure a host lockout policy 54-33
Procedure 54-15 To clear host lockouts 54-34
Procedure 54-16 To configure a RADIUS script policy 54-36
Procedure 54-17 To configure an SLA profile 54-37
Procedure 54-18 To configure a subscriber profile 54-42
Procedure 54-19 To configure a subscriber explicit map 54-48

55 — Remote network monitoring policies 55-1
55.1 Remote network monitoring policies overview 55-2
55.2 Remote network monitoring policies procedures 55-2
Procedure 55-1 To configure a remote network monitoring policy 55-2

56 — Constraint policies 56-1
56.1 Constraint policies overview 56-2
Size constraint policies 56-2
Ageout constraint policies 56-2
56.2 Constraint policies procedures 56-2
Procedure 56-1 To configure a size constraint policy 56-2
Procedure 56-2 To configure an ageout constraint policy 56-3

57 — NAT policies 57-1
57.1 NAT policies overview 57-2

58 — Format and range policies 58-1

58.1 Format and range policies overview 58-2
58.2 Format and range policies procedures 58-5
Procedure 58-1 To create or configure a format policy 58-6
Procedure 58-2 To create or configure a range policy 58-8

59 — PCP policies 59-1

59.1 PCP policies overview 59-2
59.2 Workflow to configure and apply PCP policies 59-2
59.3 PCP policies procedures 59-2
Procedure 59-1 To create a PCP policy 59-2
Procedure 59-2 To view a PCP policy 59-3
Procedure 59-3 To create a NAT PCP server on the base routing instance 59-4
Procedure 59-4 To create a NAT PCP server on a VPRN routing instance 59-4
Procedure 59-5 To associate an interface with a NAT PCP server 59-5
Procedure 59-6 To modify the interface associated with a NAT PCP server 59-6
Procedure 59-7 To modify the routing instance associated with the NAT PCP server 59-7

60 — Firewall policies 60-1

60.1 Overview of firewall policies on the 7705 SAR-H 60-2
Firewall zone management 60-2
60.2 Workflow to configure and manage firewall policies on the 7705 SAR-H 60-4
60.3 Configuring firewall policies for the 7705 SAR-H 60-4
Procedure 60-1 To configure a host group firewall policy 60-4
Procedure 60-2 To configure a service group firewall policy 60-6
Procedure 60-3 To configure a rule set firewall policy 60-9
Procedure 60-4 To configure a zone firewall policy 60-13
Procedure 60-5 To configure a firewall log policy 60-15

Service management

61 — Service management and QoS 61-1

61.1 Service management and QoS overview 61-2
Access interfaces 61-6
Automatic SDP (service tunnel) binding for services 61-7
Multi-segment tunnel selection 61-7
Automatic PBB tunnel binding 61-11
Lightweight SAPs 61-11

61.2 5620 SAM and the triple play service delivery architecture 61-12
Service differentiation and QoS 61-14
BTV multicast 61-19
61.3 BTV multicast configuration examples 61-22
Device preconfiguration 61-22
Network preconfiguration 61-24
Multicast configuration common to all examples 61-25
Example A configuration 61-25
Example B configuration 61-26
Example C configuration 61-26
Example D configuration 61-27
61.4 Sample network configuration using QoS 61-29
61.5 Sample SAP QoS configuration 61-31
61.6 Workflow to implement QoS on an OmniSwitch 61-39
61.7 Workflow to implement QoS on the 7750 SR, 7450 ESS, 7710 SR, 7705 SAR, and 7950 XRS 61-40
61.8 5620 SAM QoS policies 61-41
Access ingress policies 61-44
Access egress policies 61-44
Network policies 61-45
Network queue policies 61-46
Scheduling 61-47
Port scheduler policies 61-47
HSMDA scheduler policies 61-48
Slope policies 61-48
HSMDA slope policies 61-49

62 — Queue groups 62-1

62.1 Queue group overview 62-2
Queue Group Template policies 62-2
Port queue groups 62-2
Port queue group LAGs 62-2
Access SAP forwarding class-based redirection 62-3
Network IP interface forwarding class-based redirection 62-4
Queue group statistics 62-4
Queue group configuration validation rules 62-4
62.2 Workflow to configure access SAP forwarding class-based redirection 62-6
62.3 Workflow to configure network IP interface forwarding class-based redirection 62-7
62.4 Workflow to configure statistics collection for queue groups 62-8

63 — Virtual ports 63-1

63.1 Virtual port overview 63-2
SLA Profiles 63-2
Subscriber Profiles 63-2
63.2 Workflow to configure and manage virtual ports 63-3
63.3 Virtual ports procedures 63-3
Procedure 63-1 To configure a virtual port using the navigation tree 63-3
Procedure 63-2 To configure a virtual port using the Port QoS form 63-4
Procedure 63-3 To copy a virtual port 63-5

64 — Customer configuration and service management 64-1

64.1 Customer configuration and service management overview 64-2
Managing the size of a service associated with a customer 64-2
64.2 Workflow to create a customer profile and manage customer services..... 64-3
64.3 Customer configuration and service management procedures..... 64-3
Procedure 64-1 To create a customer profile..... 64-3
Procedure 64-2 To list the services associated with a customer..... 64-4
Procedure 64-3 To view a service map for a customer..... 64-4
Procedure 64-4 To modify and manage customer information..... 64-5
Procedure 64-5 To move sites from one service to another 64-6
Procedure 64-6 To delete customers..... 64-7

65 — Residential subscriber management 65-1

65.1 Residential subscriber overview 65-2
Residential subscriber components..... 65-2
Subscriber identification strings 65-5
Migrating to the TPSDA model 65-6
65.2 Sample configuration 65-6
65.3 Workflow to manage residential subscribers 65-9
65.4 Residential subscriber management 65-12
Configuration requirements 65-13
Local DHCP server..... 65-13
Local user database..... 65-14
ARP host 65-14
Static hosts and residential subscriber management..... 65-15
Subscriber host connectivity verification..... 65-15
Routed CO 65-17
Subscriber host polling and monitoring 65-19
Subscriber services..... 65-20
Managed routes..... 65-21
65.5 Residential subscriber management procedures 65-22
Procedure 65-1 To enable automatic generation of subscriber IDs..... 65-22
Procedure 65-2 To configure DHCP lease management for a subscriber host..... 65-22
Procedure 65-3 To configure DHCP event monitoring for a subscriber host..... 65-23
Procedure 65-4 To monitor DHCP events for a subscriber host 65-24
Procedure 65-5 To configure a local user database for subscriber host authentication 65-25
Procedure 65-6 To enable or disable subnet draining on a local DHCPv4 server 65-37
Procedure 65-7 To configure NE SHCV event handling 65-38
Procedure 65-8 To retrieve PPPoA sessions 65-39
Procedure 65-9 To configure a MEP on an SDP Binding..... 65-39
Procedure 65-10 To configure L2Aware static port forwarding on a residential subscriber instance..... 65-41
Procedure 65-11 To resynchronize static port forwarding entries..... 65-42
Procedure 65-12 To collect, view, and clear host tracking statistics and information..... 65-43
Procedure 65-13 To view subscriber host information 65-50

Procedure 65-14 To view a subscriber and the associated subscriber hosts 65-51
Procedure 65-15 To view a subscriber instance and its related information 65-52
Procedure 65-16 To view DHCP lease information 65-54
Procedure 65-17 To view SLA policy instances on a subscriber instance 65-55
Procedure 65-18 To view SHCV log events 65-56
Procedure 65-19 To change the identification of a subscriber 65-56
Procedure 65-20 To reset a subscriber's subscription credit limit 65-57
Procedure 65-21 To modify the primary subscriber identification script or URL 65-58
Procedure 65-22 To delete an inactive residential subscriber instance 65-59
65.6 SAP and MSAP management 65-60
SAP DHCP monitoring 65-60
Managed SAP (MSAP) 65-61
65.7 Workflow to manage MSAPs 65-64
65.8 SAP managment procedures 65-65
Procedure 65-23 To manage residential subscriber management components on a SAP 65-65
Procedure 65-24 To enable or disable residential subscriber management on a SAP 65-67
Procedure 65-25 To create a static host for residential subscriber management on a SAP 65-67
Procedure 65-26 To configure a MEP on a SAP 65-70
Procedure 65-27 To list and manage subscriber management SAPs 65-72
Procedure 65-28 To create a capture SAP 65-72
Procedure 65-29 To list MSAPs and view MSAP properties 65-76
Procedure 65-30 To view an MSAP event log, modify the global MSAP log policy, and purge MSAP log records 65-77
Procedure 65-31 To modify and re-evaluate an MSAP policy on an MSAP 65-77
Procedure 65-32 To modify an MSAP policy and re-evaluate the MSAPs 65-78
Procedure 65-33 To re-evaluate lease states for an MSAP 65-79
Procedure 65-34 To delete an MSAP 65-80
Procedure 65-35 To delete an MSAP policy 65-80
Procedure 65-36 To configure DHCP event monitoring for a SAP 65-80
Procedure 65-37 To monitor DHCP events for a SAP 65-81
Procedure 65-38 To view or configure active residential subscriber hosts on a SAP 65-82

66 — VLAN service management 66-1

66.1 VLAN service management overview 66-2
VLAN ring groups 66-2
VLAN groups 66-4
OmniSwitch VLAN service policies 66-4
OmniSwitch network management 66-5
Spanning tree protocols 66-5
66.2 Sample L2 VPN VLAN configuration 66-6

66.3 Sample BTV VLAN configuration 66-8
66.4 Sample interconnection VLAN configuration 66-10
66.5 Workflow to create VLAN services (OmniSwitch) 66-12
66.6 VLAN service management procedures 66-14
Procedure 66-1 To create a standard VLAN service 66-14
Procedure 66-2 To create an OmniSwitch L2 VPN TLS VLAN service 66-17
Procedure 66-3 To create an OmniSwitch BTV VLAN service 66-21
Procedure 66-4 To create an OmniSwitch VIP VLAN service 66-26
Procedure 66-5 To associate an access interface with a VLAN service 66-28
Procedure 66-6 To create a VLAN group 66-29
Procedure 66-7 To delete a VLAN group or group member 66-31
Procedure 66-8 To add a MEP to an OmniSwitch VLAN service access interface 66-31
Procedure 66-9 To configure IGMP on an OmniSwitch VLAN site 66-32
Procedure 66-10 To run an OAM validation test on a VLAN service 66-34
Procedure 66-11 To view the VLAN service operational status 66-35
Procedure 66-12 To view the service topology associated with a VLAN 66-36
Procedure 66-13 To modify a VLAN service 66-36
Procedure 66-14 To delete a VLAN service 66-37

67 — VLL service management 67-1

67.1 VLL service management overview 67-2
VLL types 67-4
VLL spoke switching 67-9
VLL redundancy 67-10
HSDPA Offload Resiliency 67-15
SDP bindings bandwidth allocation 67-17
Port redundancy 67-18
Copying and moving SAPs between ports 67-19
DoS protection 67-19
DDoS protection 67-19
BGP VPWS 67-19
67.2 Sample VLL service 67-19
67.3 Workflow to create a VLL service 67-21
67.4 VLL service management procedures 67-23
Procedure 67-1 To create a VLL Epipe service 67-23
Procedure 67-2 To create a VLL Epipe site 67-25
Procedure 67-3 To link the Epipe service to a backbone VPLS site 67-28
Procedure 67-4 To create a spoke SDP binding on a VLL Epipe site 67-30
Procedure 67-5 To configure an MPLS-TP static pseudowire on an Epipe spoke SDP binding 67-39
Procedure 67-6 To create a spoke SDP FEC binding on a VLL Epipe site 67-40
Procedure 67-7 To configure an Epipe site for BGP multi-homing 67-41
Procedure 67-8 To create a VLL Apipe service 67-44
Procedure 67-9 To create a VLL Apipe site 67-46
Procedure 67-10 To create a spoke SDP binding on a VLL Apipe site 67-47
Procedure 67-11 To configure an MPLS-TP static pseudowire on an Apipe spoke SDP binding 67-51

Procedure 67-12 To create a VLL Fpipe service 67-52
Procedure 67-13 To create a VLL Fpipe site 67-54
Procedure 67-14 To create a spoke SDP binding on a VLL Fpipe site 67-55
Procedure 67-15 To create a VLL Hpipe service 67-59
Procedure 67-16 To create a VLL Hpipe site 67-61
Procedure 67-17 To create a spoke SDP binding on a VLL Hpipe site 67-62
Procedure 67-18 To create a VLL Ipipe service 67-66
Procedure 67-19 To create a VLL Ipipe site 67-68
Procedure 67-20 To create a spoke SDP binding on a VLL Ipipe site 67-70
Procedure 67-21 To create a VLL Cpipe service 67-76
Procedure 67-22 To create a VLL Cpipe site 67-78
Procedure 67-23 To create a spoke SDP binding on a VLL Cpipe site 67-79
Procedure 67-24 To configure an MPLS-TP static pseudowire on an Cpipe spoke SDP binding 67-83
Procedure 67-25 To configure a GNE site on a VLL service 67-84
Procedure 67-26 To create an endpoint for a redundant VLL service.... 67-85
Procedure 67-27 To create a VLL L2 access interface on a terminating site 67-86
Procedure 67-28 To assign ingress and egress QoS policies to a VLL L2 access interface 67-94
Procedure 67-29 To configure scheduling on a VLL L2 access interface 67-97
Procedure 67-30 To assign ingress and egress ACL filters to the VLL L2 access interface 67-100
Procedure 67-31 To assign an accounting policy to a VLL L2 access interface 67-102
Procedure 67-32 To assign a time of day suite to the VLL L2 access interface 67-103
Procedure 67-33 To assign a DoS protection policy or DDoS protection policy to an Epipe or Ipipe L2 access interface 67-104
Procedure 67-34 To associate a MEP with an Epipe or Apipe L2 access interface 67-104
Procedure 67-35 To configure microwave compression on an MW link SAP associated with a 7705 SAR on the VLL L2 access interface 67-108
Procedure 67-36 To configure an Ethernet tunnel on a VLL L2 access interface 67-109
Procedure 67-37 To assign an ANCP policy to a VLL L2 access interface 67-110
Procedure 67-38 To specify OAM functionality and assign ingress and egress ATM policies an Epipe, Apipe, or Ipipe L2 access interface 67-110
Procedure 67-39 To specify the CEM functionality for an Epipe L2 access interface with CEM encapsulation 67-112
Procedure 67-40 To specify the CEM functionality for the Cpipe L2 access interface..... 67-113
Procedure 67-41 To switch to the redundant port for a VLL SAP from an L2 access interface properties form 67-114
Procedure 67-42 To switch to the redundant port for one or more VLL SAPs from a service, site, or port properties form 67-115
Procedure 67-43 To create a SAP aggregation group 67-118
Procedure 67-44 To create an HSDPA resiliency configuration 67-120

Procedure 67-45 To activate and manually operate an HSDPA resiliency configuration 67-121
Procedure 67-46 To run an OAM validation test for a VLL service 67-122
Procedure 67-47 To view the service topology associated with a VLL service 67-123
Procedure 67-48 To view the VLL service operational status 67-124
Procedure 67-49 To view the local PW status information for a VLL service 67-124
Procedure 67-50 To view the peer PW status information for a VLL service 67-125
Procedure 67-51 To modify a VLL service 67-125
Procedure 67-52 To modify a VLL service using the topology view 67-126
Procedure 67-53 To delete a VLL service 67-129
Procedure 67-54 To create a BGP VPWS 67-130

68 — VPLS management 68-1

68.1 VPLS management overview 68-2
HVPLS 68-4
MVPLS 68-5
Dual homing for VPLS 68-7
Provider Backbone Bridging in VPLS 68-9
SPB in VPLS 68-14
BGP Auto Discovery 68-16
BGP VPLS 68-17
BGP VPLS Multi-homing 68-18
MVR on VPLS 68-19
GSMP group on VPLS 68-21
L2 management interfaces on VPLS 68-22
Routed VPLS 68-22
FIBs 68-22
MAC learning 68-23
MAC move 68-24
Flooding 68-24
Spanning tree protocols 68-25
IGMP snooping 68-25
MLD snooping 68-26
PIM snooping 68-26
Split horizon groups 68-27
Residential split horizon groups 68-27
Default SAPs 68-28
Layer 2 protocol tunneling termination 68-29
BPDU translation 68-30
DoS protection 68-30
DDoS protection 68-30
Copying and moving SAPs between ports 68-30
68.2 Sample VPLS configuration 68-30
68.3 Workflow to create a VPLS 68-37
68.4 VPLS management procedures 68-41
Procedure 68-1 To create a VPLS 68-41
Procedure 68-2 To configure a VPLS for AA reporting to the 5670 RAM 68-42

Procedure 68-3 To assign a multicast package policy to a VPLS 68-43
Procedure 68-4 To configure bandwidth management for a VPLS..... 68-44
Procedure 68-5 To configure the VPLS for BGP auto-discovery 68-45
Procedure 68-6 To add protected MAC addresses to a VPLS..... 68-46
Procedure 68-7 To configure a VPLS site 68-46
Procedure 68-8 To configure MFIB, STP, FIB, and MAC learning protection for a VPLS site..... 68-50
Procedure 68-9 To configure SHCV for a VPLS site..... 68-53
Procedure 68-10 To configure a default gateway for a VPLS site..... 68-53
Procedure 68-11 To configure ingress multicast forwarding on a VPLS site 68-54
Procedure 68-12 To configure a provider tunnel for a VPLS site 68-55
Procedure 68-13 To configure service tunnel required bandwidth for a VPLS site 68-56
Procedure 68-14 To configure IGMP snooping on a VPLS site..... 68-57
Procedure 68-15 To create an endpoint for redundancy (dual homing) on a VPLS site 68-58
Procedure 68-16 To configure an SHG on a VPLS site 68-59
Procedure 68-17 To configure MVR for a VPLS site 68-60
Procedure 68-18 To configure a GSMP group on a VPLS site..... 68-61
Procedure 68-19 To configure L2 management interfaces on a VPLS site 68-62
Procedure 68-20 To configure MLD snooping for a VPLS site 68-63
Procedure 68-21 To create a virtual MEP on a VPLS site..... 68-64
Procedure 68-22 To configure MVR for MLD on a VPLS site 68-65
Procedure 68-23 To configure IGMP host tracking on a VPLS site 68-66
Procedure 68-24 To create a VPLS or MVPLS L2 access interface 68-67
Procedure 68-25 To assign ingress and egress QoS policies to an L2 access interface..... 68-76
Procedure 68-26 To configure scheduling on an L2 access interface 68-79
Procedure 68-27 To configure BPDU Termination, STP, and FIB parameters for the VPLS L2 access interface 68-83
Procedure 68-28 To assign a DoS protection policy or DDoS protection policy to the VPLS L2 access interface 68-85
Procedure 68-29 To configure residential subscriber management for the VPLS L2 access interface..... 68-86
Procedure 68-30 To configure an Ethernet tunnel on a VPLS L2 access interface 68-88
Procedure 68-31 To configure a redundant VLAN range on a VPLS L2 access interface..... 68-89
Procedure 68-32 To configure IGMP snooping for the VPLS L2 access interface 68-90
Procedure 68-33 To configure the ARP host for the VPLS L2 access interface 68-92
Procedure 68-34 To configure DHCP for the VPLS L2 access interface..... 68-93
Procedure 68-35 To configure MVR for a VPLS L2 access interface 68-95
Procedure 68-36 To configure anti-spoofing filters for a VPLS L2 access interface 68-96
Procedure 68-37 To associate a MEP with a VPLS L2 access interface... 68-98
Procedure 68-38 To assign an ANCP policy to a VPLS L2 access interface..... 68-102

Procedure 68-39 To configure PIM snooping on a VPLS L2 access interface 68-103
Procedure 68-40 To configure MLD snooping for a VPLS L2 access interface 68-103
Procedure 68-41 To configure MVR (MLD) for a VPLS L2 access interface 68-105
Procedure 68-42 To configure custom object attributes for AA reporting to the 5670 RAM 68-106
Procedure 68-43 To create a VPLS mesh SDP binding 68-107
Procedure 68-44 To create a VPLS spoke SDP binding 68-113
Procedure 68-45 To configure an MPLS-TP static pseudowire on a VPLS spoke SDP binding 68-121
Procedure 68-46 To assign a DoS protection policy to a VPLS SDP binding 68-122
Procedure 68-47 To configure MFIB, STP, FIB, MRP, and MAC learning protection parameters on a VPLS SDP binding 68-123
Procedure 68-48 To configure DHCP for the VPLS SDP binding 68-125
Procedure 68-49 To configure IGMP snooping for the VPLS SDP binding 68-126
Procedure 68-50 To associate a MEP with the VPLS SDP binding 68-128
Procedure 68-51 To configure MLD Snooping for the VPLS SDP binding 68-130
Procedure 68-52 To configure PIM snooping for the VPLS SDP binding 68-131
Procedure 68-53 To configure custom object attributes for AA reporting to the 5670 RAM for a spoke SDP binding 68-132
Procedure 68-54 To configure a site for BGP AD or BGP VPLS 68-133
Procedure 68-55 To configure a site for BGP VPLS Multi-homing 68-138
Procedure 68-56 To re-evaluate the PW Templates associated with a BGP AD or BGP VPLS 68-142
Procedure 68-57 To assign tunnel administrative groups to a BGP or BGP AD VPLS 68-143
Procedure 68-58 To create an HVPLS 68-144
Procedure 68-59 To create an MVPLS 68-145
Procedure 68-60 To create a B-site for VPLS or MVPLS 68-148
Procedure 68-61 To enable SPB on a control B-VPLS site 68-155
Procedure 68-62 To enable SPB on a user B-VPLS site 68-158
Procedure 68-63 To view SPB fate-shared objects 68-159
Procedure 68-64 To view SPB instances on an NE 68-160
Procedure 68-65 To create an I-VPLS 68-160
Procedure 68-66 To create a VPLS or MVPLS B-L2 access interface 68-168
Procedure 68-67 To create a static ISID range on a VPLS B-L2 access interface or spoke SDP binding 68-178
Procedure 68-68 To create a static B-MAC on a B-VPLS site 68-179
Procedure 68-69 To create an ISID policy on a control or user B-VPLS site 68-180
Procedure 68-70 To create a VPLS I-L2 access interface 68-181
Procedure 68-71 To configure a GNE site on a VPLS service 68-194
Procedure 68-72 To force a switchover to a redundant spoke SDP binding 68-196
Procedure 68-73 To run a VPLS service OAM validation test 68-196

Procedure 68-74 To add or modify FIB entries associated with a VPLS 68-197
Procedure 68-75 To list FIB entries associated with a VPLS 68-198
Procedure 68-76 To view the service topology associated with a VPLS service 68-199
Procedure 68-77 To view the VPLS service operational status 68-199
Procedure 68-78 To view IGMP snooping queriers 68-200
Procedure 68-79 To view MLD snooping queriers 68-201
Procedure 68-80 To modify a VPLS 68-201
Procedure 68-81 To modify a VLPS using the topology view 68-203
Procedure 68-82 To delete a VPLS 68-209

69 — Mirror service management 69-1

69.1 Mirror service overview 69-2
69.2 Sample mirror service configuration 69-4
69.3 Workflow to create a mirror service 69-5
69.4 Mirror service procedures 69-7
Procedure 69-1 To create a mirror service 69-7
Procedure 69-2 To create a destination site on a mirror service 69-9
Procedure 69-3 To create a source site on a mirror service 69-11
Procedure 69-4 To configure an MPLS-TP static pseudowire on a mirror SDP binding 69-15
Procedure 69-5 To create an endpoint for redundancy support on the site 69-16
Procedure 69-6 To create an L2 access interface on a destination site 69-18
Procedure 69-7 To specify a SAP on the site as a mirror source 69-21
Procedure 69-8 To specify a port on the site as a mirror source 69-22
Procedure 69-9 To specify a source IP or LI source IP filter entry for the mirror source 69-23
Procedure 69-10 To specify a source IPv6 or LI source IPv6 filter entry for the mirror source 69-24
Procedure 69-11 To specify a source MAC or LI source MAC filter entry for the mirror site 69-26
Procedure 69-12 To specify an LI source LI MAC filter for the mirror site 69-27
Procedure 69-13 To specify an MPLS ingress label for the mirror 69-28
Procedure 69-14 To specify a source subscriber or LI source subscriber as a mirror source 69-28
Procedure 69-15 To view the service topology associated with a mirror service 69-30
Procedure 69-16 To view the mirror service operational status 69-31
Procedure 69-17 To view LI mirrored subscriber hosts configured with a RADIUS server 69-31
Procedure 69-18 To create a mirror port on a 7210 SAS 69-32
Procedure 69-19 To run an OAM validation test for a mirror service 69-33
Procedure 69-20 To modify a mirror service 69-34
Procedure 69-21 To delete a mirror service 69-34

70 — IES management 70-1

70.1 IES management overview 70-2
IES configuration 70-2
ATM SAP terminations for IES 70-4
Routed CO dual homing using SRRP 70-5
DoS protection 70-7
DDoS protection 70-7
Local DHCP servers 70-7
Local user database 70-8
PPPoE protocol on IES 70-8
L2TP configuration for IES 70-8
70.2 Sample IES configuration 70-8
70.3 Workflow to create an IES 70-10
70.4 IES management procedures 70-13
Procedure 70-1 To create an IES 70-13
Procedure 70-2 To configure an IES for AA reporting to the 5670 RAM 70-14
Procedure 70-3 To configure an IES site 70-15
Procedure 70-4 To configure a GNE site on an IES service 70-16
Procedure 70-5 To apply OSPF, RIP, or IS-IS to an IES site 70-17
Procedure 70-6 To add an IGMP interface to an IES 70-18
Procedure 70-7 To add a PIM interface to an IES 70-21
Procedure 70-8 To create an L2 SDP spoke termination on an IES service 70-23
Procedure 70-9 To configure an MPLS-TP static pseudowire on an IES spoke SDP binding 70-28
Procedure 70-10 To configure a subscriber interface on an IES 70-29
Procedure 70-11 To add an AARP interface to an IES 70-33
Procedure 70-12 To configure a group interface on an IES 70-34
Procedure 70-13 To configure a WLAN GW for an IES group interface 70-53
Procedure 70-14 To add a TMS interface to an IES 70-56
Procedure 70-15 To implement dual homing using SRRP 70-59
Procedure 70-16 To configure IGMP host tracking on an IES site 70-62
Procedure 70-17 To configure an L3 access interface on an IES site 70-63
Procedure 70-18 To configure custom object attributes for AA reporting to the 5670 RAM on an IES L3 access interface 70-66
Procedure 70-19 To bind an IES L3 access interface to a VPLS site or VPLS I-site 70-67
Procedure 70-20 To apply OSPF, RIP, or IS-IS to an IES L3 interface 70-68
Procedure 70-21 To assign ingress and egress QoS policies to an IES L3 access interface 70-69
Procedure 70-22 To assign ingress and egress QoS policies to an IES L3 access interface on the 7210 SAS 70-72
Procedure 70-23 To configure scheduling on an IES L3 access interface 70-73
Procedure 70-24 To assign ingress and egress ACL filters to an IES L3 access interface 70-75
Procedure 70-25 To associate a local DHCPv4 or DHCPv6 server to an IES L3 access interface 70-76
Procedure 70-26 To assign an accounting policy to an IES L3 access interface 70-77

Procedure 70-27 To assign an ANCP policy to an IES L3 access interface 70-78
Procedure 70-28 To assign a time of day suite to an IES L3 access interface 70-79
Procedure 70-29 To configure residential subscriber management for an IES L3 access interface 70-80
Procedure 70-30 To assign a DoS protection policy or DDoS protection policy to an IES L3 access interface 70-81
Procedure 70-31 To assign an IP address to an IES L3 access interface 70-81
Procedure 70-32 To configure bi-directional forwarding detection for an IES L3 access interface 70-82
Procedure 70-33 To configure IPv4 ICMP for an IES L3 access interface 70-83
Procedure 70-34 To configure IPv6 ICMP on an IES L3 access interface 70-84
Procedure 70-35 To configure IPCP for an IES L3 access interface 70-85
Procedure 70-36 To configure ARP for an IES L3 access interface 70-86
Procedure 70-37 To configure neighbor discovery on an IES L3 access interface 70-87
Procedure 70-38 To configure IPv4 DHCP for an IES L3 access interface 70-88
Procedure 70-39 To configure ATM on an IES L3 access interface 70-90
Procedure 70-40 To create a VRRP instance on an IES L3 access interface for a virtual router 70-91
Procedure 70-41 To configure anti-spoofing filters for an IES L3 access interface 70-92
Procedure 70-42 To configure router advertisement on an IES L3 access interface 70-93
Procedure 70-43 To specify queue overrides on an IES L3 access interface 70-95
Procedure 70-44 To configure IPv6 DHCP on an IES L3 access interface 70-95
Procedure 70-45 To view the service operational status 70-97
Procedure 70-46 To view the service topology 70-97
Procedure 70-47 To modify an IES 70-98
Procedure 70-48 To modify an IES using the topology view 70-99
Procedure 70-49 To delete an IES 70-101

71 — VPRN service management 71-1

71.1 VPRN service management overview 71-2
VPRN service routers 71-4
Inter-AS connections 71-5
MP-BGP Multicast IPv4 71-6
IPv6 support 71-6
PIM for VPRN 71-6
OSPF sham link support 71-7
ATM SAP terminations for VPRN 71-8
Epipe SDP spoke termination on VPRN services 71-9
Routed CO dual homing using SRRP 71-10
DoS protection 71-11

DDoS protection 71-11
Local DHCP servers..... 71-12
Local user database..... 71-12
PPPoE protocol on VPRN services..... 71-12
L2TP on VPRN services 71-13
IPsec..... 71-13
71.2 Sample VPRN service configuration 71-13
71.3 Sample hub-and-spoke VPRN configuration 71-16
71.4 Workflow to create a VPRN service 71-20
71.5 VPRN service management procedures 71-22
Procedure 71-1 To create a VPRN service 71-22
Procedure 71-2 To configure AA reporting to the 5670 RAM 71-23
Procedure 71-3 To configure a VPRN site..... 71-23
Procedure 71-4 To configure an SNMP community for mediating the IPv6 objects on a VPRN site..... 71-25
Procedure 71-5 To configure an MVPN VRF instance on a VPRN site 71-26
Procedure 71-6 To enable routing protocols on a VPRN site 71-30
Procedure 71-7 To resync soft GRE tunnels on a VPRN site 71-31
Procedure 71-8 To configure a BGP confederation on a VPRN site 71-32
Procedure 71-9 To configure a routing instance on a VPRN site 71-33
Procedure 71-10 To bind a VPRN site to service tunnels..... 71-39
Procedure 71-11 To configure VRF import and export policies on a VPRN site 71-41
Procedure 71-12 To configure static routes on a VPRN site 71-42
Procedure 71-13 To configure a GSMP group on a VPRN site 71-43
Procedure 71-14 To configure a local DHCPv4 server on a VPRN site 71-45
Procedure 71-15 To configure a local DHCPv6 server on a VPRN site 71-45
Procedure 71-16 To configure DSCP on a VPRN site 71-46
Procedure 71-17 To configure an override source IP address or L3 interface on a VPRN site 71-47
Procedure 71-18 To configure IGMP host tracking on a VPRN site..... 71-48
Procedure 71-19 To configure WLAN gateway functionality on a VPRN site 71-49
Procedure 71-20 To configure DNS for a VPRN site 71-50
Procedure 71-21 To configure route aggregates on a VPRN site 71-50
Procedure 71-22 To configure an L3 access interface on a VPRN site ... 71-51
Procedure 71-23 To configure NTP on a VPRN site..... 71-56
Procedure 71-24 To configure custom object attributes for AA reporting to the 5670 RAM on a VPRN L3 access interface 71-57
Procedure 71-25 To assign ingress and egress QoS policies to a VPRN L3 access interface 71-58
Procedure 71-26 To configure scheduling on a VPRN L3 access interface..... 71-61
Procedure 71-27 To assign ingress and egress ACL filters to a VPRN L3 access interface 71-64
Procedure 71-28 To assign an accounting policy to a VPRN L3 access interface 71-65
Procedure 71-29 To assign a time of day suite to a VPRN L3 access interface 71-66
Procedure 71-30 To bind a VPRN L3 access interface to a VPLS site or VPLS I-site..... 71-67

Procedure 71-31 To associate a local DHCPv4 or DHCPv6 server with a VPRN L3 access interface 71-68
Procedure 71-32 To assign an NE DoS protection policy or NE DDoS protection policy to a VPRN L3 access interface 71-70
Procedure 71-33 To configure residential subscriber management for a VPRN L3 access interface 71-70
Procedure 71-34 To assign an IP address to a VPRN L3 access interface 71-71
Procedure 71-35 To configure IPv4 ICMP for a VPRN L3 access interface 71-72
Procedure 71-36 To configure IPv6 ICMP on a VPRN L3 access interface 71-73
Procedure 71-37 To configure IPCP for a VPRN L3 access interface 71-74
Procedure 71-38 To configure Bi-directional Forwarding Detection for a VPRN L3 access interface 71-75
Procedure 71-39 To configure ARP for a VPRN L3 access interface 71-76
Procedure 71-40 To configure neighbor discovery on a VPRN L3 access interface 71-77
Procedure 71-41 To configure IPv4 DHCP for a VPRN L3 access interface 71-78
Procedure 71-42 To create a VRRP instance on a VPRN L3 access interface for a virtual router 71-80
Procedure 71-43 To configure anti-spoofing filters for a VPRN L3 access interface 71-81
Procedure 71-44 To configure router advertisement on a VPRN L3 access interface 71-83
Procedure 71-45 To assign an ANCP policy to a VPRN L3 access interface 71-84
Procedure 71-46 To specify queue overrides on a VPRN L3 access interface 71-85
Procedure 71-47 To configure IPv6 DHCP on a VPRN L3 access interface 71-86
Procedure 71-48 To configure a VPRN network interface 71-87
Procedure 71-49 To configure a GNE site on a VPRN service 71-93
Procedure 71-50 To configure OSPFv2, OSPFv3, PIM, RIP, L2TP, or MLD on a VPRN routing instance 71-95
Procedure 71-51 To configure BGP on a VPRN routing instance 71-96
Procedure 71-52 To configure IGMP on a VPRN routing instance 71-101
Procedure 71-53 To add a Global Route Table to a VPRN site 71-103
Procedure 71-54 To add a PIM interface to a VPRN 71-104
Procedure 71-55 To add an IGMP interface to a VPRN 71-105
Procedure 71-56 To create a VPRN spoke SDP binding 71-107
Procedure 71-57 To create an L2 SDP spoke termination on a VPRN service 71-113
Procedure 71-58 To configure an MPLS-TP static pseudowire on a VPRN spoke SDP binding 71-117
Procedure 71-59 To configure a subscriber interface on a VPRN 71-118
Procedure 71-60 To configure a group interface on a VPRN 71-123
Procedure 71-61 To collect and view PPP ATM SAP statistics and information for a VPRN group interface 71-140
Procedure 71-62 To configure a WLAN GW for a VPRN group interface 71-141

Procedure 71-63 To add an IP mirror interface to a VPRN 71-144
Procedure 71-64 To add a TMS interface to a VPRN 71-145
Procedure 71-65 To implement dual homing using SRRP 71-147
Procedure 71-66 To create an OSPF sham link 71-151
Procedure 71-67 To run an OAM validation test for a VPRN service 71-153
Procedure 71-68 To view the service topology map associated with a VPRN service 71-154
Procedure 71-69 To view the VPRN service operational status 71-154
Procedure 71-70 To view DHCPv6 leases 71-155
Procedure 71-71 To view DHCPv6 log events 71-156
Procedure 71-72 To modify a VPRN service 71-157
Procedure 71-73 To modify a VPRN service using the topology view ... 71-158
Procedure 71-74 To delete a VPRN service 71-162

72 — PW routing and dynamic MS-PW service management 72-1

72.1 PW routing and dynamic MS-PW service management overview 72-2
PW routing 72-2
MS-PW routing 72-2
Dynamic MP-PW services 72-3
72.2 Workflow to configure PW routing and dynamic MS-PW services 72-3
72.3 PW routing and dynamic MS-PW service management procedures 72-5
Procedure 72-1 To configure PW routing using the navigation tree 72-5
Procedure 72-2 To create, modify, or view a PW routing NE configuration using the Manage Services form 72-7
Procedure 72-3 To configure a dynamic MS-PW service using PW routing 72-9
Procedure 72-4 To display MS-PW routing tables 72-11
Procedure 72-5 To perform spoke SDP FEC operations from an endpoint 72-12
Procedure 72-6 To discover and manage MS-PW switching sites 72-12
Procedure 72-7 To conduct MS-PW routing OAM tests 72-13

73 — Service PW template policy management 73-1

73.1 Service PW template policies overview 73-2
73.2 Workflow to configure PW template policies 73-2
73.3 Service PW template policies procedures 73-2
Procedure 73-1 To create a PW template policy 73-2
Procedure 73-2 To distribute a PW template policy 73-5
Procedure 73-3 To reevaluate a PW template policy on a local definition after a configuration change 73-6

74 — Composite service management 74-1

74.1 Composite service management overview 74-2
Hierarchical organization of composite services 74-3
Network discovery of composite services 74-4
Connector types 74-5
74.2 Sample composite service configuration 74-7
74.3 Workflow to create a composite service 74-8

74.4 Composite service management procedures 74-9
Procedure 74-1 To create a composite service 74-10
Procedure 74-2 To add services to a composite service 74-10
Procedure 74-3 To create a cross connect connector 74-11
Procedure 74-4 To create an SCP connector 74-13
Procedure 74-5 To create a spoke connector 74-14
Procedure 74-6 To create a routed VPLS connector 74-16
Procedure 74-7 To run an OAM validation test for a composite service 74-18
Procedure 74-8 To rediscover composite services 74-19
Procedure 74-9 To view the service topology map associated with a composite service 74-19
Procedure 74-10 To modify a composite service using the navigation tree 74-20
Procedure 74-11 To modify a composite service using the flat topology view 74-21
Procedure 74-12 To delete a composite service 74-25

75 — Dynamic service management 75-1

75.1 Dynamic service management overview 75-2
Dynamic service structure 75-2
75.2 Dynamically-created objects 75-3
Unsupported operations 75-3
ID range behavior 75-3
75.3 Workflow to create dynamic services 75-4
75.4 Dynamic service management procedures 75-4
Procedure 75-1 To configure a dynamic service policy 75-5
Procedure 75-2 To configure an NE for dynamic service 75-6
Procedure 75-3 To list dynamically created objects on an NE 75-6

76 — Application assurance 76-1

76.1 Application assurance overview 76-2
AA protocol signatures 76-3
AA policers 76-3
AA flow watermark policies 76-4
AA transit IP and transit prefix policies 76-4
Application performance reporting 76-4
AA HTTP error redirect policies 76-4
76.2 ISA-AA groups and partitions 76-4
Multiple ISA-AA groups 76-5
ISA-AA partitions 76-5
76.3 AA components 76-6
AA group policies 76-7
Applications 76-8
Application groups 76-8
Application profiles 76-8
Application filters 76-10
AQPs 76-10
Custom protocols 76-11

76.4 5670 RAM reporting attributes 76-11
Usage-based billing 76-12
Residential DCP groups 76-12
76.5 AA accounting policies 76-13
76.6 Workflow to configure AA 76-14
76.7 Application assurance procedures 76-15
Procedure 76-1 To configure an AA group policy 76-16
Procedure 76-2 To configure AARP 76-23
Procedure 76-3 To configure an AA policer 76-25
Procedure 76-4 To renumber application filter entries 76-27
Procedure 76-5 To configure an AQP 76-28
Procedure 76-6 To configure a policy sync group 76-32
Procedure 76-7 To configure an AA accounting policy 76-35
Procedure 76-8 To configure an AA flow watermark 76-36
Procedure 76-9 To configure an AA transit IP policy 76-37
Procedure 76-10 To configure an AA transit prefix policy 76-39
Procedure 76-11 To configure a database persisted transit subscriber aggregator 76-41
Procedure 76-12 To associate a database persisted transit subscriber with an aggregator 76-42
Procedure 76-13 To configure 5670 RAM AA reporting attributes for a database persisted transit subscriber 76-42
Procedure 76-14 To view database persisted transit subscriber information 76-43
Procedure 76-15 To configure usage-based billing for an application profile 76-44
Procedure 76-16 To associate an application with a charging group 76-45
Procedure 76-17 To enable application performance reporting on a service using default DCP subnet groups 76-46
Procedure 76-18 To disable application performance reporting on a service 76-47
Procedure 76-19 To configure a custom DCP subnet group 76-48
Procedure 76-20 To configure an AA HTTP error redirect policy 76-50
Procedure 76-21 To configure an AA HTTP redirect policy 76-51
Procedure 76-22 To configure an AA HTTP enrichment policy 76-52
Procedure 76-23 To configure an HTTP notification policy 76-54
Procedure 76-24 To configure an AA session filter 76-55
Procedure 76-25 To configure a URL filter 76-57
Procedure 76-26 To enable an AA protocol signature 76-58
Procedure 76-27 To view AA summary information for an ISA-AA group or partition 76-58
Procedure 76-28 To view AA statistics data for an ISA-AA group or partition 76-60
Procedure 76-29 To view the AA special study statistics data 76-61
Procedure 76-30 To view AA statistics data for application filters 76-62
Procedure 76-31 To delete an AA application, application group, or custom protocol 76-63
Procedure 76-32 To delete an inactive AA transit subscriber instance 76-64

77 — Service Test Manager 77-1

77.1 Service Test Manager overview 77-2
Test policies 77-2
Test suites 77-2
77.2 Sample Service Test Manager implementation 77-4
77.3 Sample network monitoring configuration 77-7
77.4 Sample network monitoring configuration steps 77-8
77.5 Sample SAA accounting files configuration 77-14
77.6 Sample SAA accounting files configuration steps 77-14
77.7 Sample threshold-crossing alarm configuration 77-16
77.8 Sample threshold-crossing alarm configuration steps 77-17
77.9 7210 SAS Y.1564 service test 77-19
Workflow to configure and execute Y.1564 bidirectional tests 77-20
77.10 Sample 7210 SAS Y.1564 service test configuration steps 77-20
77.11 Sample OmniSwitch device SLA testing 77-26
77.12 Workflow to use the Service Test Manager 77-31
77.13 Service Test Manager procedures 77-33
Procedure 77-1 To configure a STM test policy 77-33
Procedure 77-2 To configure threshold-crossing alarms on NE-schedulable OAM tests within a test policy 77-43
Procedure 77-3 To configure threshold-crossing alarms on non-NE-schedulable OAM tests within a test policy 77-45
Procedure 77-4 To create a test suite 77-46
Procedure 77-5 To modify a test suite 77-50
Procedure 77-6 To schedule the execution of a test suite 77-52
Procedure 77-7 To schedule the execution of a test suite using an existing NE schedule 77-53
Procedure 77-8 To execute a STM test suite 77-53
Procedure 77-9 To run a One Time Validation 77-54
Procedure 77-10 To execute one or more individual tests from the STM 77-56
Procedure 77-11 To view Test Suite results 77-57
Procedure 77-12 To view and compare Test Suite results for a tested entity 77-58
Procedure 77-13 To view and compare test results 77-58
Procedure 77-14 To delete a test suite 77-59

78 — Ethernet CFM 78-1

78.1 Ethernet CFM overview 78-2
MEGs 78-2
MEPs 78-2
MIPs 78-5
Ethernet-CFM redundancy 78-5
Sample Ethernet CFM implementation 78-5
Ethernet CFM implementation for composite services 78-6
Primary VLAN support for Ethernet CFM 78-9
78.2 Workflow to configure Ethernet CFM 78-11
78.3 Ethernet CFM procedures 78-12
Procedure 78-1 To configure an Ethernet CFM MD and subordinate objects associated with the MD 78-12
Procedure 78-2 To configure automatic MEP ID assignment on an NE ... 78-27

Procedure 78-3 To automatically create identical MEPs on a redundant pair of service SAPs 78-27
Procedure 78-4 To change the MEG sub-group association for managed MEPs or unmanaged remote MEPs 78-29
Procedure 78-5 To configure a default MD on an OmniSwitch 78-30

79 — Tunnel administrative groups 79-1

79.1 Tunnel administrative groups overview 79-2
79.2 Workflow to configure tunnel administrative groups 79-3
79.3 Tunnel administrative group procedures 79-3
Procedure 79-1 To create a tunnel administrative group 79-3
Procedure 79-2 To list and view tunnel administrative groups 79-4

80 — RCA audit 80-1

80.1 RCA audit overview 80-2
5620 SAM service audit 80-2
Physical link audits 80-4
Viewing and analyzing RCA audit results 80-5
80.2 Workflow to configure RCA audit 80-8
80.3 RCA audit procedures 80-9
Procedure 80-1 To configure an RCA audit policy 80-9
Procedure 80-2 To perform an RCA audit of a VLL service 80-11
Procedure 80-3 To perform an RCA audit of a VPLS 80-13
Procedure 80-4 To perform an RCA audit of a VPRN service 80-15
Procedure 80-5 To perform an RCA audit of multiple services 80-17
Procedure 80-6 To perform an RCA audit of a physical link 80-19
Procedure 80-7 To create a service audit scheduled task 80-20

81 — Service throughput configuration 81-1

81.1 Service throughput configuration overview 81-2
81.2 Workflow to prepare for and restore from a service throughput configuration 81-2
81.3 Service throughput configuration procedures 81-3
Procedure 81-1 To prepare a service throughput configuration 81-3
Procedure 81-2 To restore a service after a throughput configuration 81-7

Getting started

1 — What's new?

2 — 5620 SAM system overview

3 — 5620 SAM GUI overview

4 — 5620 SAM custom workspaces

5 — 5620 SAM navigation tree overview

6 — 5620 SAM topology map management

7 — 5620 SAM scheduling

1 — What's new?

1.1 What's new in 5620 SAM Release 11.0 *1-2*

1.1 What's new in 5620 SAM Release 11.0

This section highlights new features for 5620 SAM Release 11.0 and provides pointers into the documentation for more information.

New features and enhancements for this release are also described in the following guides:

- *5620 SAM XML OSS Interface Developer Guide*
- *5620 SAM LTE OSS Interface Developer Guide*
- *5620 SAM LTE EPC User Guide*
- *5620 SAM LTE RAN User Guide*
- *5620 SAM Optical User Guide*
- *5620 SAM MPR User Guide*
- *5650 CPAM User Guide*

The *5620 SAM Release Description* and *5620 SAM LTE Release Description* provide Committed and Candidate feature lists for the entire 11.0 Release. The release description documents not only include the NMS features and nodal features that are documented in 5620 SAM customer documentation, they also identify the nodal features supported by the 5620 SAM but documented in the NE customer documentation.

What's new in 5620 SAM Release 11.0 R8

Table 1-1 lists the features added in 5620 SAM Release 11.0 R8 and described in 5620 SAM core customer documentation.

Table 1-1 5620 SAM Release 11.0 R8 features

Feature ID	Feature or function	Description	See
7450 ESS and 7750 SR enhancements			
SAM-33075 SAM-33077 SAM-33079	New card support	The 5620 SAM supports provisioning the following cards on the 7750 SR-12E: • 2Tb CPM / Switch Fabric 5 E • M-SFM5-12E	Chapter 15
SAM-40903 SAM-40905	CPM5 and SFM5 support	The 5620 SAM supports the discovery of CPM5 and SFM5 modules in 7450 ESS and 7750 SR nodes. CPM5 modules are removable and are displayed as a separate node in the Equipment tree.	—

What's new in 5620 SAM Release 11.0 R7

Table 1-2 lists the features added in 5620 SAM Release 11.0 R7 and described in 5620 SAM core customer documentation.

Table 1-2 5620 SAM Release 11.0 R7 features

Feature ID	Feature or function	Description	See
Device management enhancements			
SAM-26607	Stable pool sizing	The 5620 SAM now supports the configuring of stable pool sizing on FP2 MDAs to enable an even split of buffering.	Procedure 15-29
7210 SAS-T enhancements			
SAM-31356	SyncE support	The 5620 SAM supports Synchronous Ethernet timing synchronization for the 7210 SAS-T and 7210 SAS-T ETR, Release 6.0 R3.	Procedure 15-7
SAM-31356	PoE support on the 7210 SAS-T ETR	The 5620 SAM supports Power over Ethernet on the 7210 SAS-T ETR, Release 6.0 R3.	Procedure 16-18
7705 SAR enhancements			
SAM-20723	10-port 1GigE/1-port 10GigE X-Adapter card with encryption	The 5620 SAM supports the 10-port 1GigE/1-port 10GigE X-Adapter card with encryption, on the 7705 SAR-18, Release 6.0 R5 or later.	Section 8.9
SAM-20725	8-port GigE SFP card with encryption	The 5620 SAM supports the 8-port GigE SFP card with encryption, on the 7705 SAR-8 and the 7705 SAR-18, Release 6.0 R5 or later.	Section 8.9
SAM-20729	6-port FXS Adapter card	The 5620 SAM supports the 6-port FXS Adapter card, on the 7705 SAR-8 and 7705 SAR-18, Release 6.0 R5 or later.	Section 8.9
SAM-30549	Peer discovery	The 5620 SAM supports the option to disable peer discovery on a microwave link on the 7705 SAR-8 and 7705 SAR-18, Release 6.0 R5 or later.	Procedure 15-11
7950 XRS enhancements			
SAM-30098	Power management	The 5620 SAM supports configuring power management zones on 7950 XRS nodes, and power priority values on MDAs installed in 7950 XRS nodes. Detailed information about power usage is available on the power management zone, shelf, card slot, and daughter card slot configuration forms for 7950 XRS nodes.	Section 15.2 Procedure 15-21 Procedure 15-22 Procedure 15-33
Network management enhancements			
SAM-27518	RFE 147695: certificate authentication fails between SR and eNodeB (SHA-2 support for certificate signature)	The 5620 SAM supports the following signature algorithms for local certificate generation requests: • SHA-1 • SHA-256 • SHA-224 • SHA-384 • SHA-512	*5620 SAM System Administrator Guide*
SAM-30604	GNE management client cross-launch from navigation tree	You can enable a network navigation tree contextual menu option that opens an alternate EMS client application for a GNE.	Section 9.2 Procedures 9-7 and 9-8
SAM-31119	High limit for IP next hops	Configurable IP next hop entry limit for hosts' managed routes. Configuration at NE (global) level.	Procedure 13-14

(1 of 3)

Feature ID	Feature or function	Description	See
Protocol enhancements			
SAM-13541	Template auto-creation of LDP targeted peers	The 5620 SAM supports the display of CLI template auto-created LDP targeted peers in the routing navigation tree. You can view properties but you cannot modify, shut down, or delete an auto-created LDP targeted peer that was created on an NE using a CLI template.	Procedure 23-16
SAM-22452	IS-IS—metric offsets for link group and link quality thresholds	You can create an IS-IS link group to bundle multiple member interfaces that are treated as a single virtual link for ECMP. You can create up to 8 bundles of IS-IS member interfaces. Each group behaves as single virtual link for ECMP purposes.	Procedures 23-21 and 23-23, 49-8
SAM-22625	RFE 150880—IS-IS instance level router ID configuration	You can configure the ISIS router ID value in each IS-IS instance, including the default instance. By default, the global value of router ID is used when an IS-IS instance is created. The IS-IS system ID for the instance continues to be derived from the router ID.	Section 23.1 Procedure 23-20
SAM-27516	RFE 150674—MVPN does not switch from *G to SG group with protocol protection enabled	You can enable the extraction and processing of PIM packets arriving at an NE inside a tunnel on a network interface in a protocol protection configuration.	*5620 SAM System Administrator Guide*
SAM-27520	RFE 155291	Configurable group interface source address for IGMP queries on base routing instance and VPRN site routing instance. Configurable query source IP address on IES site routing instance and VPRN group interface.	Procedures 23-46, 71-52, 70-6
Policy enhancements			
SAM-26072	PPTP ALG protocol option	The ALG Protocols parameter on a NAT policy supports the PPTP option.	Procedure 24-2
SAM-28843	RFE 160029	A WLAN-GW can insert the ISA RADIUS client IP address in NAS IP address attribute in authentication requests generated from ISA. Configurable NAS IP Address Origin in ISA RADIUS policy.	Procedure 49-8
SAM-30134	RFE 161438: SYSLOG: Support "-" as part of log-prefix	The 5620 SAM now supports including the "-" character in the body of the Message parameter string, provided that the character is not the first or last in the string.	Procedure 44-11
SAM-30529	RFE 160938: Match on AH/ESP NextHeader existence in IPv6 ACL line card filters	The 5620 SAM now supports matching on the presence or absence of IPv6 Authentication Headers and Encapsulating Security Payload Headers in ACL IPv6 filters.	Procedure 44-3
Service management enhancements			
SAM-22454	MPLS-TP Services—PW status signaling with status request support	A static PW status request message allows a peer that has a stale PW status for the far-end of a PW to request that the peer PE send a static PW status update. The 5620 SAM supports static PW status signaling with status request on: • Epipe VLL spoke SDP bindings • Cpipe VLL spoke SDP bindings • Apipe VLL spoke SDP bindings • VPLS spoke SDP bindings • IES spoke SDP bindings • VPRN spoke SDP bindings • mirror service spoke SDP bindings	Procedures 67-24, 68-45, 69-3, 69-4, 70-9, and 71-58

(2 of 3)

Feature ID	Feature or function	Description	See
SAM-22623	Show IOM/IMM label FIB information	You can use the Show FP Tunnel Table command on a routing instance to display the IOM/IMM label, next-hop, and outgoing interface information for BGP, LDP, and RSVP tunnels on the interface.	Procedure 22-31
SAM-27508	R-VPLS in BGP AD VPLS	You can configure BGP AD on routed VPLS, including routed I-VPLS and B-VPLS.	Chapter 68
SAM-27512	IANA VRF route type encoding compliance	You can configure a BGP site to change the type encoding of the VRF route import extended community used by NG-MPVN services to the IANA-compliant value using the IANA MVPN VRF Import Subtype parameter.	Procedure 23-2
SAM-27651	BGP Next Hop Unchanged	You can configure a BGP peer group to leave the BGP next hop unchanged when sending label-IPv4 routes to BGP peers using the Next Hop Unchanged parameter.	Procedure 23-4
SAM-28001	BGP IPv6 Multicast	The Family parameter on the VPN tab of BGP sites, groups, and peers supports the Multicast IPv6 option.	Chapter 23
SAM-28010	RFE 105360	You can configure IP MTU on IES and VPRN group interfaces.	Procedures 70-12 and 71-60
SAM-28845	RFE 159489—Improve service ID-based double hashing with ECMP and LAG	The hashing algorithm is improved on the ingress IOM when both ECMP and LAG are performed by the same NE. You can use the 5620 SAM to configure service ID LAG hashing to improve the LAG spraying of VLL service packets when both ECMP and LAG hashing are performed by the same NE.	Procedure 13-7
OAM and service testing enhancements			
SAM-12860	Improved timing accuracy for OAM delay measurements	Supported devices can now be configured to use the time recovered by PTP as the source of system time. This allows for improved accuracy in OAM delay measurements.	Procedure 15-10
SAM-22630	RFE 152308: ETH-CSF Reception Triggering Fault Propagation	Ethernet CSF frames are can now be processed by a MEG as an additional trigger for fault propagation on a receiving MEP.	Procedure 78-1
SAM-25105	Scale - Implement a mechanism of protection for retention setup	The DB test result retention time has been increased to a maximum of 720 hours. The 5620 SAM will automatically reduce the configured retention time based on the number of results and their incoming rate.	Refer to the *5620 SAM Parameter Guide*.
SAM-27658	RFE 155490: Support path-destination option with LDP-over-RSVP and LDP-BGP stitching	BGP label routes can now be specified for LSP or MPLS-TP LSP Ping and Trace OAM diagnostics.	Procedures 32-25 and 32-26
SAM-28019	RFE 151034: Implement hop-by-hop search for mtrace	The multicast trace test has been enhanced to ping neighboring NEs in a multicast group chain to determine which NE fails to respond.	Chapter 32

(3 of 3)

What's new in 5620 SAM Release 11.0 R6

5620 SAM Release 11.0 R6 is a maintenance release. No features have been added.

What's new in 5620 SAM Release 11.0 R5

Table 1-3 lists the features added in 5620 SAM Release 11.0 R5 and described in 5620 SAM core customer documentation.

Table 1-3 5620 SAM Release 11.0 R5 features

Feature ID	Feature or function	Description	See
GUI enhancements			
—	New filter type 'IS BLANK'	The 5620 SAM supports a new filter type, IS BLANK, for list window quick filters and advanced filtering.	Table 3-1
—	Export CSV files using UTF-8 with BOM encoding	The 5620 SAM supports exporting CSV files using UTF-8 with BOM encoding.	*5620 SAM System Administrator Guide*
SAM-336	Enhanced statistics plotting categorization	Each statistics class in the following drop-down lists has an icon that indicates the supported plot types: • Statistics Manager • Statistics tab of object properties form	"Graphing statistics overview" in the *5620 SAM Statistics Management Guide*
SAM-16574	Browse Examples of Scripts display enhancement	The Browse Examples of Scripts tree is optimized to present bundled scripts in bundles only.	"To browse and create from sample scripts, templates, and script bundles" in the *5620 SAM Scripts and Templates Developer Guide*
SAM-20246	Retain collapsible panels	The 5620 SAM supports saving the open or closed state of collapsible panels when a configuration form closes.	Section 3.1
SAM-21434	Enhanced selection of child objects in statistics plotter	When a Monitored Object in the Statistics Plotter window has one or more plottable child objects, the Monitored Object field is a drop-down selector for the child objects.	Procedure "To create a statistics graph" in the *5620 SAM Statistics Management Guide*
SAM-20315	Hide tabs on configuration forms	The 5620 SAM supports customization of tabs on a configuration form based on the user ID and object type. You can display, hide, or reorder tabs.	Procedure 3-20 Procedure 3-21
SAM-21571	Add workspaces to a user group	The 5620 SAM supports mandatory workspaces added to user groups.	*5620 SAM System Administrator Guide*
SAM-21545	Upgrades for saved workspaces from a previous release	The 5620 SAM supports adding new menu items to a saved workspace from a previous release.	Procedure 4-1
SAM-21995	Enhancements for Statistics UI Form	The Statistics tab of the properties form for some objects has separate child tabs for different groups of statistics counters.	"Tabular statistics view" in the *5620 SAM Statistics Management Guide*
SAM-22637	Regrouped tabs on service configuration forms	The tabs on service and site configuration forms have been regrouped to simplify navigation. The changes affect the following services and related sites: • VLL • VPLS • VPRN	Chapter 67 Chapter 68 Chapter 71
SAM-23981	Multi edit property forms	The 5620 SAM supports an enhanced multi-edit functionality on devices and property forms.	Chapter 3
Map enhancements			
SAM-788	Ethernet CFM on Composite Service Flat Map	This feature allows you to view and create CFM MEGs and tests from the Composite Service flat topology map.	Section 6.2 and 6.3 Procedures 6-27 and 6-32

(1 of 14)

Feature ID	Feature or function	Description	See
5620 SAM system management enhancements			
SAM-15196	KVM virtualization support	The 5620 SAM supports system deployment in a KVM virtual environment.	*5620 SAM Planning Guide*
SAM-15403	SSL certificate expiry management	When SSL is enabled in a 5620 SAM deployment, the 5620 SAM monitors the SSL certificate expiry and raises alarms when the expiry date is nearing and when the certificate is expired.	"Configuring SSL security" in the *5620 SAM | 5650 CPAM Installation and Upgrade Guide*
SAM-19983	Database tablespace consumption alarms	The 5620 SAM monitors the database tablespace capacity and raises alarms when the capacity is low.	—
SAM-22337	XML schema change summary table	The XML Schema Changes page includes a summary table with links to the change content.	*5620 SAM-O XML Reference*
Device management enhancements			
SAM-224	Subscriber data persistence	The 5620 SAM supports the configuration of NE file persistence for certain dynamic objects.	Procedure 13-22
SAM-15333	DCR 584557 - Remove GNE trap gap resynchronization	The 5620 SAM no longer supports trap resynchronization after the detection of a trap gap on a GNE.	—
SAM-19254	Management Suspended state for NEs	You can place a managed NE in a state of suspended management, which means that the 5620 SAM stops managing the NE, but retains the NE information.	Chapter 10
SAM-23815	OLC state for power supply trays	The 5620 SAM supports the configuration of the OLC state for power supply trays.	Procedure 15-20 *5620 SAM System Administrator Guide*
7210 SAS-D enhancements			
SAM-30648	Y.1564 test support on 7210 SAS-D and 7210 SAS-M (network)	5620 SAM support for Y.1564 bidirectional tests is extended to the 7210 SAS-D, Release 6.0 R2 or later.	Sections 77.9 and 77.10
7210 SAS-E enhancements			
7210 SAS-M enhancements			
SAM-22495	Support for bidirectional MIPs in Epipe services	The 5620 SAM Ethernet CFM function supports the creation of bidirectional MIPs for Epipe SAPs and SDPs configured on the 7210 SAS-M (in network mode), Release 6.0 R1 or later.	Procedure 78-1
SAM-30648	Y.1564 test support on 7210 SAS-D and 7210 SAS-M (network)	5620 SAM support for Y.1564 bidirectional tests is extended to the 7210 SAS-M (in network mode), Release 6.0 R2 or later.	Sections 77.9 and 77.10
7210 SAS-T enhancements			
SAM-20760	Support for the 7210 SAS-T device	The 5620 SAM supports management of the 7210 SAS-T and 7210 SAS-T ETR. Equipment and service support is similar to the 7210 SAS-M (in access-uplink mode), Release 6.0 R2. QoS support is similar to the 7210 SAS-D, Release 6.0 R2.	Section 8.5
7210 SAS-X enhancements			
SAM-31055	QoS override for access ingress queues	The 5620 SAM supports the configuration of policy overrides for access ingress policy queues applied to L2 access interfaces on the 7210 SAS-X, Release 6.0 R1 or later. Some restrictions apply.	Procedure 43-44

(2 of 14)

Feature ID	Feature or function	Description	See
SAM-22495	Support for bidirectional MIPs in Epipe services	The 5620 SAM Ethernet CFM function supports the creation of bidirectional MIPs for Epipe SAPs and SDPs configured on the 7210 SAS-X, Release 6.0 R1 or later.	Procedure 78-1
7450 ESS and 7750 SR enhancements			
SAM-12829	1588-2008 PTP support for 7750 SR-c12	The 5620 SAM supports the configuration of a 1588-2008 PTP clock on a 7750 SR-c12 equipped with a CFM XP B card.	Procedure 15-14 Procedure 15-15
SAM-13562	PTP time information	The 5620 SAM displays information about PTP time in the General tab of the PTP clock properties form. The following read-only parameters appear in the Time Properties Attributes panel: • Time Traceable • Frequency Traceable • PTP Timescale • PTP Time Source	—
SAM-19990	Automatic PAC FP3 IMM provisioning	When a supported PAC FP3 IMM is equipped in a card slot and provisioned, the daughter cards are automatically discovered and appear in the navigation tree.	Section 15.3
SAM-20251	NTP using IPv6	The 5620 SAM supports configuring IPv6 addresses for NTP associations, clients, peers or servers on the 7750 SR.	Procedure 15-10
SAM-23735	1588 ToD with hardware assistance	The 5620 SAM supports enabling 1588 PTP ToD hardware assistance on network interfaces and IES interfaces on the following MDAs: • 10-Port 1Gb XP SFP • 20-Port 1Gb XP SFPI • 1-Port 10Gb XP XFP • 2-Port 10Gb XP XFP • 4-Port 10Gb XP XFP • 4-Port 10Gb XP XFP IMM • 8-Port 10Gb XP XFP IMM The PTP HW Assist parameter can only be configured if the MDA has Sync-E enabled and the interface has a valid IPv4 address.	Procedure 22-10 Procedure 70-17
SAM-24165	LACP remote port information	The 5620 SAM displays information about the LACP partner of a LAG in the LACP tab of the LAG configuration form.	Section 14.10
SAM-25469	Configurable throttle rate for log events	The 5620 SAM supports throttle rate configuration for create and delete event traps on the 7750 SR, Release 11.0 R4 or later.	*5620 SAM System Administrator Guide*
SAM-25517	LLDP tunneling	The 5620 SAM supports enabling Dot1x tunneling on ports on the following nodes: • 7450 ESS • 7710 SR • 7750 SR • 7950 XRS The Tunneling parameter is located on the LLDP tab of the Port configuration form.	Procedure 16-1

(3 of 14)

Feature ID	Feature or function	Description	See
SAM-27490	Fine granularity BER thresholds	The 5620 SAM supports configuring fine granularity BER threshold parameters on 100G DWDM IMMs. The parameters appear in the Fine Granularity BER Thresholds panel of the Optical Transport Channel Unit tab on the port configuration form.	Procedure 16-1
SAM-27492	Rx-LOS threshold behavior for 100G DWDM interfaces	The 5620 SAM supports specifying the behavior of a 100G DWDM interface when the Rx-LOS threshold is reached, using the Rx LOS Reaction parameter on the Coherent Optics tab of the Port configuration form.	Procedure 16-1
SAM-28727	New IMM combination support	The 5620 SAM supports the configuration of a 2-PAC FP3 IMM card with the following combinations of daughter cards: • 1-port 100GE CFP and 10-port 10GE SFP	—
7705 SAR enhancements			
SAM-19794	OSPF on VPRN	The 5620 SAM supports the configuration of OSPF on a VPRN routing instance on the 7705 SAR, Release 6.0 R4 or later.	Procedure 71-50
SAM-19796	BGP Next-Hop-Self on route reflector	The 5620 SAM supports the configuration of a base router BGP instance to allow a route reflector of IP-VPN routes using its IP address as the next hop rather than BGP choosing the next hop, on Release 6.0 R4 or later.	Procedure 23-2
SAM-19813	Policy-based routing	The 5620 SAM supports the configuration of next hop routing on an ACL IP filter policy on the 7705 SAR, Release 6.0 R4 or later.	Procedure 44-2
SAM-19969	eBGP on base router	The 5620 SAM supports the configuration of eBGP on a base router on the 7705 SAR, Release 6.0 R4 or later.	Section 23.16
SAM-22012	T-LDP local LSR ID	The 5620 SAM supports the configuration of the local LSR ID on an LDP routing instance on the 7705 SAR, Release 6.0 R4 or later.	Procedure 23-16
SAM-22685	Adaptive clock recovery on MEF 8	The 5620 SAM supports the configuration of adaptive clock recovery on a 16/32 port DS1/E1 ASAP MDA and a i8/i16 port DS1/E1 ASAP MDA, Release 6.0 R4 or later.	Procedure 16-31
SAM-22689	Adaptive clock recovery on 7705 SAR-A	The 5620 SAM supports the configuration of adaptive clock recovery on a DS1/E1 ASAP MDA on the 7705 SAR-A, Release 6.0 R4 or later.	Procedure 16-31
SAM-28732	MWA backup and restore	The 5620 SAM supports the backup and restore of the radio database tar file for 7705 SAR NEs that have radios configured.	*5620 SAM System Administrator Guide*
7705 SAR-H enhancements			
SAM-22653	Firewall log policy	The 5620 SAM supports configuration of a firewall log policy on the 7705 SAR-H.	Procedure 60-5
SAM-24018	NTP support	The 5620 SAM supports configuring NTP on the 7705 SAR-H.	Procedure 15-10
SAM-28633	PoE Plus	The 5620 SAM supports PoE Plus with internal power supply on the 7705 SAR-H.	Procedure 16-19
7950 XRS enhancements			
SAM-12815	Support for soft reset on FP3-based line cards	The 5620 SAM supports performing a soft reset on XCM cards installed in a 7950 XRS, Release 11.0 R6 or later.	*5620 SAM System Administrator Guide*
SAM-14421	Routed VPLS support for 7950 XRS	The 5620 SAM supports the creation of Routed VPLS connectors for VPLS and I-VPLS sites on the 7950 XRS.	Procedure 68-7

(4 of 14)

Feature ID	Feature or function	Description	See
SAM-14437	Support for minor ISSUs	The 5620 SAM supports minor ISSUs for the 7950 XRS, Release 11.0 R6 and later.	*5620 SAM System Administrator Guide*
SAM-21238	Support of 6x40GE QSFP C-XMA	The 5620 SAM supports the 6x40GE QSFP C-XMA card for the 7950 XRS-20 and 7950 XRS-16c.	Section 8.16
SAM-21240	Support of 7950 XRS-16c	The 5620 SAM supports the discovery and management of the 7950 XRS-16c.	Section 8.16
SAM-23064	Apipe support for 7950 XRS	The 5620 SAM supports the creation of VLL Apipe services with sites on the 7950 XRS. The Apipe site must be a switching site, as Apipe SAPs are not supported on the 7950 XRS.	Procedure 67-8
OmniSwitch enhancements			
SAM-8852 SAM-15561	G.0832v2 support for AOS 6.4.5 R02 and AOS 7.3.1 NEs	The 5620 SAM supports the configuration of Ethernet Ring Elements using G.8032v2 on 6.4.5 R02 and 7.3.1 OmniSwitch NEs.	Procedure 27-7
SAM-14695	MC LAG support for AOS 6.4.5 NEs	The 5620 SAM supports the configuration of MC AOS groups on OS 6850E, OS 9700E, and OS 9800E, Release 6.4.5 or later.	Section 39.4
SAM-14697	ISSU support for stackable NEs	The 5620 SAM supports ISSU for OS 6400, OS 6850E, OS 6855, Release 6.4.5 R02 or later, in stacked configuration.	*5620 SAM System Administrator Guide*
SAM-22777	OS 6250 and OS 6450 AOS 6.6.4 support	The 5620 SAM supports the AOS Release 6.6.4 or later on the OS 6250 and OS 6450 switches.	Section 8.21
SAM-23456	Additional OS 6450 variations supported	The 5620 SAM supports new light models of the OS 6450.	Section 8.21
SAM-23458	Custom L2 profiles support	The 5620 SAM supports the creation of custom L2 profiles on the OS 6250M, Release 6.6.4 or later, and the OS 6450, Release 6.6.4 or later.	Procedure 52-3
SAM-25963	OS 6450-10 stacking support	The 5620 SAM supports stacking on the OS 6450-10, OS 6450-10L, OS 6450-P10, and OS 6450-P10L, Release 6.6.4 or later.	Procedure 15-30
SAM-25972	MEP ID used to target SAA test destination	The 5620 SAM supports use of the target's MEP ID in determining SAA test destination for CFM Loopback and CFM Two Way Delay tests. Applicable only to OmniSwitch NEs.	Procedure 32-7 Procedure 32-11
SAM-28988	Additional OS 10K card variation supported	The 5620 SAM supports the new OS10K-XNI-U32E card.	Section 8.21
Network management enhancements			
—	List ISA-WLAN GW groups and Soft GRE tunnels	The 5620 SAM lets you globally list ISA-WLAN GW groups and Soft GRE tunnels from the Manage→ ISA Functions→ ISA-WLAN main menu. ISA-WLAN GW groups can also be listed from Manage→ Equipment.	Section 14.8
SAM-742	DHCP failover support	Failover support on local DHCPv4 and DHCPv6 servers. Configurable on base routing instance and VPRN routing instance.	Section 65.4 Procedures 22-2, 22-3, and 22-4
SAM-13022	NAT and LNS reassembly	ISA-BB group reassembly configuration on base routing instance and VPRN site.	Procedures 22-1 and 71-3

(5 of 14)

Feature ID	Feature or function	Description	See
SAM-13028	Trap drop handling improvements	A windowing trap delayer option provides an enhanced method to resync the subscriber table in the event of a trap drop from an NE.	"To configure the windowing trap delayer option for subscriber table resyncs" in the *5620 SAM System Administrator Guide*
SAM-13062	RADIUS enhancements	• Session Timeout configuration on the PPP policy. • On the SLA profile, expanded range for the Category Timeout parameter. • On the RADIUS based accounting policy, expanded range for the Update Interval, Server Retry Attempts, and Server Timeout parameters. Support for three new RADIUS include attributes (Framed Route, Framed Ipv6 Route, and All Authorized Session Addresses). RADIUS server policy and Update Interval Jitter configuration. • On the Subscriber Authentication Policy, expanded range for the Retry Attempts and Timeout parameters. RADIUS server policy and Accounting Stop Message configuration. • On the local user database, PPP host, expanded range for the Password and Username parameters. RADIUS based accounting policy and duplicate RADIUS based accounting policy configuration. • On the local user database, DHCP host, RADIUS based accounting policy and duplicate RADIUS based accounting policy configuration. • On the RADIUS server policy, expanded range for the Timeout Seconds and Retry Attempts parameters. Support for Blocked State, Accounting Interim Minimum Interval, Accounting Interim Maximum Interval, Accounting Interim Lifetime, Accounting Stop Minimum Interval, Accounting Stop Maximum Interval, and Accounting Stop Lifetime configuration. • Accounting on/off configuration on the RADIUS server policy. • New accounting on/off group policy object. • On the RADIUS server policy, new Tools command to initiate Accounting On or Accounting Off messages from the NE.	Section 49.1 Procedures 54-4, 49-1, 49-4, 49-5, 49-6, and 65-5
SAM-13092	Dynamic block reservation	On a NAT pool configuration, dynamic port blocks can be reserved for the lifetime of a static port forward.	Section 24.1 and Procedure 24-3
SAM-13094	DS Lite/NAT64 fragmentation	IPv6 packet fragmentation support on DS Lite addresses and NAT64.	Section 24.1 and Procedure 24-3
SAM-13156	NAT traversal for IKEv2 remote access tunnel	You can enable NAT traversal support for IKEv2.	Procedure 29-1
SAM-15529	Minimum, maximum, and average value calculations in statistics plotter	The 5620 SAM Statistics Plotter legend now displays the minimum, maximum, and average values of the plot area defined by the slider position.	Procedure "To create a statistics graph" in the *5620 SAM Statistics Management Guide*
SAM-16581	Script methods to return object counts	Two Velocity script methods are available for counting network objects.	"Callouts" in the *5620 SAM Scripts and Templates Developer Guide*

(6 of 14)

Feature ID	Feature or function	Description	See
SAM-13543 SAM-9818	IP-IP tunneling support on the MS-ISA for the 7750 SR-7, 7750 SR-12, and 7750 SR-c12	An IP tunnel is a numbered IP interface of a private service, such as a VPRN or IES, that is associated with a private SAP to a tunnel group. You can configure IP tunnels, as well as GRE tunnels, on the tunnel interface under VPRN and IES services using the 5620 SAM.	Procedure 29-6
SAM-16886	Duplicate IP address alarms and search	The 5620 SAM raises an alarm if an IP address is used by more than one base router network interface or IES L3 interface in the network. You can search for duplicate IP addresses using the Network Resources tool.	Procedure 22-24
SAM-17958	Alarm history	The 5620 SAM allows you to search for historical alarms based on a specified time period.	Procedure 31-21
SAM-19232	DHCPv6 server attributes	Ignore Rapid Commit and Interface ID Mapping configuration on local DHCPv6 server. Prefix Type configuration on IPv6 address pool prefix.	Procedure 22-3
SAM-20241	Template execution using different scope of command profile	To ensure consistent service creation by multiple operators, you can specify a scope of command profile for service template execution that supersedes the operator scope of command profile.	"XML API template overview" in the *5620 SAM Scripts and Templates Developer Guide*
SAM-20798	RFE 123469 - MCS over hybrid ports	Enhancement to allow SRRP on hybrid ports, including hybrid ports in MCS with full ESM (including multicast). Supported on the 7750 SR Release 10.0 R10.	Procedure 40-1
SAM-21398	Script-based alarm generation	You can use a Velocity script method to generate a 5620 SAM alarm.	"Callouts" in the *5620 SAM Scripts and Templates Developer Guide*
SAM-21425	Plotting of normalized statistics for non-traffic statistics counters	You can plot rate-based statistics for non-traffic statistics counters, such as active subscriber hosts.	"Graphical statistics view" in the *5620 SAM Statistics Management Guide*
SAM-21429	Opening link endpoint plots from topology maps using plotter profiles	After you configure a plotter profile to include the other endpoint of a port-based link, you can use a right-click menu option on the link in a topology map to automatically begin plotting the endpoint data.	"Graphical statistics view" in the *5620 SAM Statistics Management Guide*
SAM-21495	Various scripting enhancements	The 5620 SAM supports the following script functions: • streaming XML File input • output to a file • script association with a specific object to enable right-click menu access to the script from the object	"Callouts" and "Script execution" in the *5620 SAM Scripts and Templates Developer Guide*
SAM-21517	NAT deterministic script	On NE properties, you can specify the URL of a remote server on which NAT deterministic script results are stored.	Section 24.1 and Procedure 24-4
SAM-21589	RFE 138556	In a NAT configuration, you can specify a standby routing instance in a redundant pool configuration for static port forward requests.	Section 24.1 and Procedure 24-3
SAM-21593	Enhanced multicast LAG hashing to enable per (S,G) hash over a LAG	You can configure an NE to send multicast traffic over a LAG.	Procedure 13-7
SAM-21715	Deterministic DS Lite	Configurable DS Lite maximum subscriber limit on deterministic NAT configuration.	Procedure 24-3

(7 of 14)

Feature ID	Feature or function	Description	See
SAM-21967	RFE 126552 - Subnet allocation based on system ID	Vendor specific option string configuration on IES and VPRN group interface, and subnet binding key configuration on local DHCPv4 server address pool. Allows local DHCP server to provide more subnets as the subscriber base grows, and remove them as the subscriber base shrinks.	Procedures 22-2, 70-12 and 71-60
SAM-22459	Additional Text Find icon	The 5620 SAM supports the Additional Text Find icon on the object property forms by enabling or disabling the Show Additional Text Button Properties Forms parameter on the Alarm Settings form.	Procedure 31-4
SAM-22749	Residential subscriber host mid-session change	You can configure the ANCP string and intermediate destination ID on a dynamic residential subscriber host. The Subscriber profile string, SLA profile string, and application profile string can be specified using a Select button, or typed as free text. All of the above parameters can be changed without re-instantiating the host.	Procedure 65-38
SAM-26040	Alarm Settings window	The 5620 SAM supports an enhanced form on the Alarm Settings window.	Chapter 31
SAM-26202	Residential subscriber instance information retrieved from network	The following read-only information on the Residential Subscriber Instance GUI form is read directly from the network (as opposed to being stored in the 5620 SAM database): • General tab - ANCP String, Intermediate Destination ID, Subscriber Profile, NAT Policy, Application Profile, Subscribed Application Profile, ISA-AA Group ID, Egress Secondary Shaper, RADIUS Egress Aggregate Rate Limit, Operational Egress Aggregate Rate Limit • ANCP Subscriber Line Rates tab - all information • Subscriber QoS Overrides tab - all information • Multicast CAC Status - all information	—
SAM-30508	RFE 161635	Maximum limit of active WLAN GW IOMs per WLAN GW group increased from four to five.	Section 14.8
—	Purging historical alarms	The 5620 SAM does not support manual purging of historical alarms from the Historical alarms form and the Alarm Settings form.	Chapter 31 *5620 SAM System Administrator Guide*
Protocol enhancements			
SAM-12960	MPLS-TP—OAM	Ping and trace tests are enhanced to support MPLS-TP LSPs.	Procedures 32-25 and 32-26
SAM-12962 SAM-19106 SAM-21305	MPLS-TP Services—PW status signalling without status request support	The 5620 SAM supports static PW status signaling on: • Epipe VLL spoke SDP bindings • Cpipe VLL spoke SDP bindings • Apipe VLL spoke SDP bindings • VPLS spoke SDP bindings • IES spoke SDP bindings • VPRN spoke SDP bindings • mirror service spoke SDP bindings Only static PW-to-static PW switching is supported.	Procedures 67-4, 67-5, 67-10, 67-11, 67-23, 67-24, 68-44, 68-45, 69-3, 69-4, 70-8, 70-9, 71-57, and 71-58

(8 of 14)

Feature ID	Feature or function	Description	See
SAM-12964 SAM-23494	MPLS-TP—LSR	MPLS-TP is a set of MPLS protocol functions that enables the use of MPLS in transport networks and applications. MPLS-TP provides in-band proactive OAM and protection mechanisms that do not rely on a control plane, such as RSVP-TE, to operate. MPLS-TP enables MPLS to be deployed in a statically configured transport network without the need for a dynamic control plane. The 5620 SAM provides simple provisioning for the network management support of MPLS-TP.	Chapter 26 Procedures 25-2 and 27-1
SAM-12968	Unnumbered interfaces on LDP	The 5620 SAM supports configuring an unnumbered interface as an LDP interface.	Procedure 23-14
SAM-12978	Automatic creation of RSVP-TE LSP mesh	The 5620 SAM supports two new LSP template types in addition to the existing P2MP LSP template for VPRN MVPN: • one-hop P2P • mesh P2P You cannot configure these template types using the 5620 SAM. When the templates are created using CLI, the 5620 SAM displays the templates as read-only. You cannot modify, distribute, or remove these template types using the 5620 SAM. When the templates are configured and associated with an auto-LSP using CLI, they automatically create dynamic LSPs. The 5620 SAM displays the dynamic LSPs. The dynamically created LSPs cannot be associated with SDPs. When you create VPRN MVPNs, the one-hop and mesh P2P template types are not listed when you select the MVPN Include Tunnel Template and the MVPN Selective Tunnel Template.	Procedure 25-24 Procedure 25-25
SAM-13014	IPv6 MVPN	The 5620 SAM supports all IPv6 multicast protocols in an MVPN instance. The IPv4 mLDP or RSVP-TE core carries IPv6 multicast traffic within IPv4 mLDP or RSVP-TE provider tunnels. The following is supported: • MLD on IES and VPRN routing instances • IPv6 PIM on VPRN routing instances and routing interfaces • IPv6 BFD for VPRN • BGP Family support for IPv6 MVPN	Procedures 23-2, 23-43, 23-59, 23-60, 23-61, 23-62, 71-38, 71-50
SAM-14196	MPLS auto-bandwidth based on forwarding class subset	The 5620 SAM supports sampling weight parameters for auto bandwidth forwarding classes on dynamic LSPs. These parameters allow you to change how the bandwidth rate is calculated by assigning different weight percentages to each forwarding class.	Section 25.1 Procedure 25-9
SAM-19104	BGP Deterministic MED	You can configure the BGP best path selection algorithm to group and compare all of the paths that belong to the same AS, when some of the paths originate from neighboring ASes or do not have a MED attribute.	Procedures 23-2 and 71-51
SAM-21764	IS-IS/OSPF LFA with multicast fast failover	An NE can select the active or standby paths using IS-IS and OSPF LFAs.	Procedure 23-40
SAM-23098	mVPN P2MP LSP navigation	You can navigate to a P2MP LSP from an mVPN inclusive tunnel.	Procedure 23-44

(9 of 14)

Feature ID	Feature or function	Description	See
SAM-24172	PE ID based MAC flush for interoperation with Cisco/Juniper	The 5620 SAM supports the configuration of an LDP peer to control the processing of the LDP PE-ID Tlv to handle the MAC flush for interoperation with Cisco and Juniper.	Procedure 23-15
Policy enhancements			
SAM-613	DCR 598650: Scheduling of policy audits	The 5620 SAM now allows policy audits to be added to the Scheduler functions.	Procedures 42-11, 7-1, and the *5620 SAM System Administrator Guide*.
SAM-667	Multiple distributions in one click	The 5620 SAM now allows multi-selection of most global policy types for distribution. The selected policies must all be of the same type.	Procedures 42-2 and 42-14
SAM-683	DCR 581270 - Audit mismatches with non-existent entry	This feature identifies differences between a policy entry that exists in both the global and a local versions of a policy. Conducting a policy audit indicates exactly which fields are different. This also includes missing entries.	Section 42.1 and Procedure 42-12
SAM-705	Distribution progress (OSSI part)	For OSS access, the 5620 SAM now sends a JMS message with the results of a policy distribution event. A task monitor is added to the distribution task.	The *5620 SAM XML OSS Interface Developer Guide*
SAM-706	DCR 509367 - Distribution supports NE groups	The 5620 SAM now supports policy distribution to groups of NEs. This is handled by creating a policy distribution group.	Section 42.1 and Procedures 42-1 and 42-3
SAM-11507	Queue Group Override at FP and Port levels for Access/Network Egress/Ingress	Support for queue group policer control overrides at the forwarding plane and port levels is added.	Procedure 15-26
SAM-12426	Improve creation of ACL filter entries	The 5620 SAM now supports copying ACL filter policy filter entries between policies.	Procedure 44-12
SAM-12802	Embedded ACL filters	The 5620 SAM introduces a new type of ACL filter policy. An embedded filter policy allows operators to define a common set of filter policy rules that can then be embedded in one or more ACL filter policies.	Section 44.1 and Procedure 44-13
SAM-12864	IPv4/IPv6 CPM filter port match enhancements (port range, port-list, port command)	The 5620 SAM now supports creating and specifying a Port List to use when matching source and destination TCP/UDP ports in CPM filter policies.	Procedure 44-6 and the *5620 SAM System Administrator Guide*
SAM-13749	DCR 627591: Switch distribution mode on CLI change	The 5620 SAM now enables a policy change made using CLI to switch the distribution mode for certain types of local policies to Local Edit Only.	Procedure 42-1, and the *5620 SAM System Administrator Guide*. Also refer to the "Switch Distribution Mode to Local Edit Only on CLI Change" parameter in the *5620 SAM Parameter Guide*.
SAM-15081	Auto-generation of filter prefix lists (IOM filter support)	The 5620 SAM now supports the auto-generation of IP Prefix Lists for both IPv4 and IPv6 ACL IP filter policies.	Procedures 44-5, 44-2, and 44-3
SAM-20430	Policy exclusive edit command	The 5620 SAM now supports setting a "Use Exclusive Edit" parameter for an NE to prevent its local policy definitions from being changed by global updates.	Procedure 13-9

(10 of 14)

Feature ID	Feature or function	Description	See
SAM-21735	Shared filter terms from RADIUS	High watermark and low watermark alarm threshold configuration for dynamically-inserted filter count on ACL IP filter policy and ACL IPv6 filter policy.	Section 44.1 Procedures 44-2 and 44-3
SAM-21971	RFE 141452 - QoS on mobile gateway profile	Support for PGW and GGSN QoS configuration on mobile gateway profile.	Procedure 54-13
SAM-21973	RFE 141457 - charging characteristics on mobile gateway profile	Support for charging characteristic configuration on mobile gateway profile.	Procedure 54-13
SAM-23177	DCR 658552: Add description to prefix list member	A Description field was added to the prefix list policy to allow entering descriptive text.	Procedure 22-16
SAM-23199	DCR 658548: New tabs needed for Routing Policy, Prefix list and Community	The 5620 SAM now allows you to display a list of NEs currently using global or local versions of certain routing policy types.	Procedure 22-26
SAM-24945	Add Filter Log and SysLog Policy	The 5620 SAM now allows you to configure a Filter Log and Sys Log for use with IP, IPv6, and MAC filter entries.	Procedures 44-10 and 44-11
SAM-25600	Ageout constraint policy	The ageout constraint policy defines a configurable ageout interval for a specified object type, after which objects are deleted from the 5620 SAM database.	Chapter 56 Procedure 56-2
SAM-27553	Aggregation Scheduler visibility at Port and Card levels	The 5620 SAM now lists associated aggregation schedulers in the Aggregation tab of the properties form of an assigned card or port (including LAGs).	Procedure 43-31
SAM-30695	Policy Synchronization Improvement	Changes were made to the policy synchronization GUI: • Distribution Mode button was renamed to Switch Distribution Mode • Available and destination instances panels were renamed	Procedures 42-1 and 42-7, and the *5620 SAM System Administrator Guide*.
Service management enhancements			
SAM-736	Managed routes	The 5620 SAM can retrieve managed route information from the NE for hosts instantiated on IES and VPRN services.	Section 65.4
SAM-12877	SAP and SDP binding loopback with MAC swap	The 5620 SAM supports the creation of a service throughput configuration that uses a SAP or MPLS SDP binding with loopback enabled as the traffic test destination. SAP and SDP binding loopbacks are supported for sites in Epipe and VPLS services on the 7450 ESS, 7750 SR, and 7950 XRS Release 11.0R4.	Procedure 81-1
	Service throughput configuration enhancements	The following enhancements have been made to service throughput configurations: • You can configure multiple service throughput tests on a service. • Existing service throughput configurations are listed on the Throughput Configuration tab of a service or composite service.	Chapter 81
SAM-12915	Configurable OSPF redistribution timers	You can configure the redistribution timers on an OSPF site to adjust the delay before a different external route is sent using OSPF.	Procedure 23-30

(11 of 14)

Feature ID	Feature or function	Description	See
SAM-12992	BGP VPWS support	The 5620 SAM supports the configuration of a BGP VPWS. A BGP VPWS is an L2 VPN that uses BGP signaling to establish pseudowires. BGP VPWS is supported on the 7450 ESS, 7710 SR, 7750 SR, and 7950 XRS, Release 11.0R1.	Section 67.1 Procedure 67-54
SAM-13006	PW SAP for IES and VPRN services	You can choose a PW port as the terminating port for an L3 access interface on an IES or VPRN service. The PW port must be bound to a service tunnel.	Procedure 70-17 Procedure 71-22
	Secondary shaper support for PW port binding	You can specify an HSMDA egress secondary shaper for a PW port binding using the PW SAP Secondary Shaper parameter. The parameter only appears when you configure a PW port binding for an HSMDA port.	Procedure 27-1
SAM-13012	PIM, OSPF, IGMP, MVPN support on carrier carrier VPN VPRNs	You can configure PIM, OSPF, IGMP, and MVPN on a VPRN service that has the Carrier Carrier VPN parameter enabled.	Chapter 71
SAM-13024	Vport-aware H-QoS adjustment for multicast	Egress Rate Modify status configuration on virtual ports for ATM or Ethernet ports.	Procedures 63-1 and 63-2
SAM-13046	DHCP server multihoming enhancements	Address assignment configuration on IES and VPRN group interfaces. DHCP server synchronization configuration on IES and VPRN subscriber interfaces.	Procedures 70-10, 70-12, 71-59, and 71-60
SAM-13122	AA ICAP URL filtering	You can apply parental-control filtering to AA traffic.	Chapter 76
SAM-16140	RPF Vector support	The 5620 SAM supports configuring RPF vector processing on a PIM site for use with an option-C or option-B draft-Rosen Inter-AS MVPN. The RPF Vector parameter must be configured on each site in the MVPN.	Procedure 23-40
SAM-17706	Service Type field in Service Manager	The Service Type column is added to the Manage Services form for all 5620 SAM services.	—
SAM-19662	Support for application filter protected ranges	When you renumber a range of AA application filters, you can specify an end value to exercise greater control over the allocation of filter IDs.	Chapter 76
SAM-19889	Static B-MACs and ISIDs for connection to non-SPB-managed networks	You can configure static B-MACs and static ISIDs to allow an SPB interface to be configured on a SAP or spoke SDP binding that is not part of the SPB network or region. This allows SPB networks to interface to other PBB networks that use other control planes. Static B-MACs allow remote PBB Epipes to connect to SPB managed networks. Static ISIDs allow I-VPLS services to connect to non-SPB I-VPLS services. You can create an ISID policy to specify the use of the default multicast tree and suppression of the advertisement of ISIDs in SPB when I-VPLS or static ISIDs are used for unicast services. Static B-MACs and static ISIDs are supported on SAPs and spoke SDP bindings, and SAPs on MC-LAGs.	"SPB in VPLS" in section 68.1 Procedures 68-67, 68-68, and 68-69
SAM-19895	PPPoE remote ID and circuit ID on LUDB	Remote ID and circuit ID configuration on PPP hosts on local user database.	Procedure 65-5
SAM-20846	DHCPv6 Route Populate on VPRN and IES	The 5620 SAM supports configuring route populate parameters on L3 access interfaces in VPRN and IES services, and specifying DHCPv6 protocols as part of the From Criteria in a policy statement entry.	Procedure 70-44 Procedure 71-47 Procedure 22-15

(12 of 14)

Feature ID	Feature or function	Description	See

SAM-21870	Service and composite service states	The overall service and composite service states are simplified to include only the following operational flags to determine the Aggregated Operational Status of a service or composite service:
		• Services
		  • Site(s) Down
		  • SDP Binding(s) Down
		  • Monitored Access(es) Down
		• Service sites
		  • SDP Binding(s) Down
		  • Monitored Access(es) Down
		• Composite services
		  • Service Component Degraded
		The Composite Service Aggregated Operational State depends on the aggregated operational state or states of the services that are associated with it.
			—

SAM-21951	BFD on LAG support	The 5620 SAM supports the configuration of BFD on an ethernet LAG. When you enable BFD on a LAG, the 5620 SAM creates micro-BFD sessions for each link in the LAG.	Section 14.10 Procedure 14-15 Procedure 14-16
SAM-21963	BGP split horizon support	The 5620 SAM supports the configuration of Split Horizon parameter on BGP sites and peer groups on base routers and in VPRN services.	Procedure 23-2 Procedure 23-4 Procedure 71-51
SAM-22137	OSPFv3 as PE-CE protocol in VPRNs	You can create multiple OSPFv3 instances on a VPRN, and add L3 access to those instances.	Section 71.1 Procedure 71-6
SAM-22160	AA application import script	When a new set of AA applications is available from Alcatel-Lucent, you can import the application set using the 5620 SAM script management function.	Chapter 76
SAM-22232	Re-evaluate lease states	The 5620 SAM Re-evaluate Lease States function allows SLA profile or subscriber profile changes on residential subscribers without re-instantiating the hosts.	See chapter 65 and Procedure 65-33.
SAM-22613	Cflowd for L2 interfaces on VPLS and EPipe services	The 5620 SAM supports enabling ingress Cflowd for L2 access interfaces on sites and i-sites in VPLS, MVPLS, and Epipe services.	Procedure 67-27 Procedure 68-24
SAM-22747	AA HTTP enrichment	You can configure an AA HTTP enrichment policy for a 7750 SR and use it as the action criterion in an application QoS entry.	Chapter 76
SAM-24151	List dynamically created objects on an NE	The 5620 SAM supports displaying lists of dynamically created objects on an NE, including sites and SAPs. The list of dynamic SAPs is automatically updated; lists of other objects must be retrieved from the NE.	Procedure 75-3
SAM-24159	HTTP content insertion for in-browser notification	You can configure an HTTP notification policy and associate it with an AQP on an AA group or partition.	Chapter 76
SAM-24163	Upstream Multicast Hop to mVPN	You can configure the Unicast Route Preference option for the US Multicast Hop Selection under mVPN for VPRN PIM sites.	Procedure 23-41
SAM-24177	RFE 147085	Support for RADIUS-communicated pools for SLAAC IP address assignment. IPv6 address assignment configuration on IES and VPRN group interfaces.	Procedures 70-12 and 71-60
SAM-24179	RFE 147082	WLAN Gateway IPv6 Address configuration on IES soft GRE group interface.	Procedure 70-13

(13 of 14)

Feature ID	Feature or function	Description	See
SAM-24478	G8032 Ethernet ring discovery	The 5620 SAM automatically discovers G8032 Ethernet rings and creates the related paths and interconnects. You can also perform an Ethernet ring audit to discover new rings, or troubleshoot problems with existing rings.	Chapter 27 Procedure 27-16
SAM-24558	DTS 104244 - DHCP unique identifier	Server ID configuration for local DHCPv6 server on routing instance, VPRN routing instance, VPRN group interface, and IES group interface.	Procedures 22-3, 70-12, and 71-60
OAM and service testing enhancements			
SAM-777	Re-generation of MEG/MEP/Tests upon service topology change	This feature allows objects (SDP bindings, SAPs, and applicable CFM tests) in the MEG and MEG sub-groups to automatically change in response to topology changes in a service or composite service.	Procedure 78-1
SAM-788	Ethernet CFM on Composite Service Flat Map	This feature allows you to view and create CFM MEGs and tests from the Composite Service flat topology map.	Section 6.2 and 6.3 Procedures 6-27 and 6-32
SAM-792	One-time Service/Composite Service test validation	The 5620 SAM supports running a one-time test validation. This permits quickly testing a service or composite service, either during provisioning or after activation. A variety of services and transport components can be tested.	Procedures 77-9, 25-12, 27-15, 66-10, 67-46, 68-73, 71-67, and 74-7
SAM-933	Auto creation of MEG, MEPs (and MIPs) for G8032 ring segs	The 5620 SAM provides a mechanism to automatically generate OAM objects for ethernet rings. Global MEGS, MEPs, and MIPs are included.	Procedure 27-8
SAM-12882	802.3ah enhancements - ISSU operation	The 5620 SAM now supports a "Grace Tx State Enable" parameter which allows an NE to locally execute a grace period. When the grace period is enabled, all peer timeouts are extended locally and an eligible EFM-OAM entity transmits grace period information.	Procedure 32-42
SAM-15436	DCR 594961: Display Service Test Status on managed services	The 5620 SAM now displays a Test Suite Count indicator to show the number of configured test suites that a specific test entity is currently associated with.	Procedures 77-4
Additional features			
5620 SAM documentation enhancements			
—	Creation of a new *5620 SAM MPR User Guide*	Consolidates the tasks performed by a user to discover, configure, and manage 9500 MPR and 9500 MPRe devices using the 5620 SAM. This guide is intended to be used in conjunction with the *5620 SAM User Guide*.	*5620 SAM MPR User Guide*

(14 of 14)

What's new in 5620 SAM Release 11.0 R4

5620 SAM Release 11.0 R4 is a maintenance release. No features have been added.

What's new in 5620 SAM Release 11.0 R3

Table 1-4 lists the features added in 5620 SAM Release 11.0 R3 and described in 5620 SAM core customer documentation.

Table 1-4 5620 SAM Release 11.0 R3 features

Feature ID	Feature or function	Description	See
7210 SAS-D enhancements			
SAM-14715	Transit service enhancements	The 5620 SAM extends support for transit services for the 7210 SAS-D, Release 4.0 R7 or later, to include: • alarm association • listing of transit services • listing of transported services	Section 27.3
SAM-22480	Support of 7210 SAS Release 6.0 R1 in SAM 11.0R3	The 5620 SAM supports Release 6.0 R1 for the 7210 SAS-D.	—
SAM-22482	QoS override	The 5620 SAM supports policy overrides for access ingress policy meters applied to L2 access interfaces on the 7210 SAS-D, Release 6.0 R1 or later. Some restrictions apply.	Procedure 43-43
SAM-22487	DHCP relay support for 7210 SAS	The 5620 SAM supports configuring DHCP relay on the 7210 SAS, Release 6.0 R1 or later.	Procedure 68-34
SAM-22491	IPv6 SSH	The 5620 SAM supports SSH access for CLI sessions on 7210 SAS NEs with IPv6 management addresses. This feature is supported on the 7210 SAS-D, Release 6.0 R1 or later.	Sections 9.2, 10.1, and 10.4 Procedures 10-2, 10-6, and 11-2
SAM-22493	Support for two WRED slopes	The 7210 SAS supports three WRED slopes per queue: • high priority TCP • low priority TCP • non-TCP With this feature, you can specify that only the high and low priority TCP slopes are used, and non-TCP slopes are ignored. The 5620 SAM supports two WRED slopes for the 7210 SAS-D, Release 6.0 R1 or later.	Procedure 13-18
SAM-27638	Dot1x tunneling on uplink	The 5620 SAM supports 802.1x authentication tunneling for the 7210 SAS-D, Release 6.0 R1 or later.	Procedure 16-1
SAM-27817	Reboot Upgrade support for 7210 SAS	The 5620 SAM supports performing the Reboot Upgrade action on 7210 SAS nodes. However, you cannot use an upgrade policy to trigger a Reboot Upgrade on a 7210 SAS node.	*5620 SAM System Administrator Guide*
7210 SAS-E enhancements			
SAM-21561	1830 VWM flexible CWDM clip-on module support	The 1830 VWM is an add-on optical module that attaches to the USB port of a 7210 SAS device. The 5620 SAM supports the configuration of an equipment shelf for the 1830 VWM on the 7210 SAS-E, Release 5.0 R4 or later.	Procedure 15-2
SAM-22480	Support of 7210 SAS Release 6.0 R1 in SAM 11.0R3	The 5620 SAM supports Release 6.0 R1 for the 7210 SAS-E.	—
SAM-22482	QoS override	The 5620 SAM supports policy overrides for access ingress policy meters applied to L2 access interfaces on the 7210 SAS-E, Release 6.0 R1 or later. Some restrictions apply.	Procedure 43-43
SAM-22487	DHCP relay support for 7210 SAS	The 5620 SAM supports configuring DHCP relay on the 7210 SAS, Release 6.0 R1 or later.	Procedure 68-34

(1 of 5)

Feature ID	Feature or function	Description	See
SAM-22491	IPv6 SSH	The 5620 SAM supports SSH access for CLI sessions on 7210 SAS NEs with IPv6 management addresses. This feature is supported on the 7210 SAS-E, Release 6.0 R1 or later.	Sections 9.2, 10.1, and 10.4 Procedures 10-2, 10-6, and 11-2
SAM-27817	Reboot Upgrade support for 7210 SAS	The 5620 SAM supports performing the Reboot Upgrade action on 7210 SAS nodes. However, you cannot use an upgrade policy to trigger a Reboot Upgrade on a 7210 SAS node.	*5620 SAM System Administrator Guide*
7210 SAS-M enhancements			
SAM-14705	ITU-T Y.1564 test-head support for 7210 SAS-M Nodes	The 5620 SAM supports test-head functionality and Y.1564 bidirectional tests for service configuration and throughput on the 7210 SAS-M, Release 5.0 R4 or later.	Sections 77.9 and 77.10
SAM-14715	Transit service enhancements	The 5620 SAM extends support for transit services for the 7210 SAS-M (in access-uplink mode), Release 4.0 R7 or later, to include: • alarm association • listing of transit services • listing of transported services	Section 27.3
SAM-21561	1830 VWM flexible CWDM clip-on module support	The 1830 VWM is an add-on optical module that attaches to the USB port of a 7210 SAS device. The 5620 SAM supports the configuration of an equipment shelf for the 1830 VWM on the 7210 SAS-M, Release 5.0 R4 or later.	Procedure 15-2
SAM-22436	Hybrid ports support	The 5620 SAM supports hybrid mode when you configure Ethernet ports on the 7210 SAS-M (Network mode), Release 6.0 R1 or later.	Procedures 16-1, 16-15
SAM-22480	Support of 7210 SAS Release 6.0 R1 in SAM 11.0R3	The 5620 SAM supports Release 6.0 R1 for the 7210 SAS-M.	—
SAM-22482	QoS override	The 5620 SAM supports policy overrides for access ingress policy meters applied to L2 access interfaces on the 7210 SAS-M, Release 6.0 R1 or later. Some restrictions apply.	Procedure 43-43
SAM-22487	DHCP relay support for 7210 SAS	The 5620 SAM supports configuring DHCP relay on the 7210 SAS, Release 6.0 R1 or later.	Procedure 68-34
SAM-22489	SRLG policy support for 7210 SAS	The 5620 SAM supports distributing SRLG policies to the 7210 SAS-M and 7210 SAS-X, Release 6.0 R1 or later.	Procedures 22-22 and 22-23
SAM-22491	IPv6 SSH	The 5620 SAM supports SSH access for CLI sessions on 7210 SAS NEs with IPv6 management addresses. This feature is supported on the 7210 SAS-M, Release 6.0 R1 or later.	Sections 9.2, 10.1, and 10.4 Procedures 10-2, 10-6, and 11-2
SAM-22493	Support for two WRED slopes	The 7210 SAS supports three WRED slopes per queue: • high priority TCP • low priority TCP • non-TCP With this feature, you can specify that only the high and low priority TCP slopes are used, and non-TCP slopes are ignored. The 5620 SAM supports two WRED slopes for the 7210 SAS-M, Release 6.0 R1 or later.	Procedure 13-18

(2 of 5)

Feature ID	Feature or function	Description	See
SAM-22497	OSPF IP ECMP	The 5620 SAM supports ECMP routing for the 7210 SAS-M (in network mode), Release 6.0 R1. The device system resource profile must be appropriately configured.	Procedures 13-20 and 22-1
SAM-27638	Dot1x tunneling on uplink	The 5620 SAM supports 802.1x authentication tunneling for the 7210 SAS-M (in access-uplink mode), Release 6.0 R1 or later.	Procedure 16-1
SAM-27817	Reboot Upgrade support for 7210 SAS	The 5620 SAM supports performing the Reboot Upgrade action on 7210 SAS nodes. However, you cannot use an upgrade policy to trigger a Reboot Upgrade on a 7210 SAS node.	*5620 SAM System Administrator Guide*
7210 SAS-X enhancements			
SAM-1245	Hierarchical ingress QoS (ingress queuing)	The 5620 SAM supports the configuration of HQoS queues for 7210 SAS access ingress policies. When deployed, the HQoS policies can be attached to L2 access interfaces on the 7210 SAS-X, Release 5.0 R4 or later. You can allocate resources for this function in the system resource profile. Aggregate rate shaping is also supported when you attach the policy to a SAP.	Sections 8.5 and 43.1 Procedures 13-20, 43-2, 67-28, 68-25, and 70-22
SAM-21561	1830 VWM flexible CWDM clip-on module support	The 1830 VWM is an add-on optical module that attaches to the USB port of a 7210 SAS device.The 5620 SAM supports the configuration of an equipment shelf for the 1830 VWM on the 7210 SAS-X, Release 5.0 R4 or later.	Procedure 15-2
SAM-22436	Hybrid ports support	The 5620 SAM supports hybrid mode when you configure Ethernet ports on the 7210 SAS-X, Release 6.0 R1 or later.	Procedures 16-1, 16-15
SAM-22480	Support of 7210 SAS Release 6.0 R1 in SAM 11.0R3	The 5620 SAM supports Release 6.0 R1 for the 7210 SAS-X.	—
SAM-22482	QoS override	The 5620 SAM supports policy overrides for access ingress policy meters applied to L2 access interfaces on the 7210 SAS-X, Release 6.0 R1 or later. Some restrictions apply.	Procedure 43-43
SAM-22487	DHCP relay support for 7210 SAS	The 5620 SAM supports configuring DHCP relay on the 7210 SAS, Release 6.0 R1 or later.	Procedure 68-34
SAM-22489	SRLG policy support for 7210 SAS	The 5620 SAM supports distributing SRLG policies to the 7210 SAS-M and 7210 SAS-X, Release 6.0 R1 or later.	Procedures 22-22 and 22-23
SAM-22491	IPv6 SSH	The 5620 SAM supports SSH access for CLI sessions on 7210 SAS NEs with IPv6 management addresses. This feature is supported on the 7210 SAS-X, Release 6.0 R1 or later.	Sections 9.2, 10.1, and 10.4 Procedures 10-2, 10-6, and 11-2
SAM-22497	OSPF IP ECMP	The 5620 SAM supports ECMP routing for the 7210 SAS-X, Release 6.0 R1. The device system resource profile must be appropriately configured.	Procedures 13-20 and 22-1
SAM-27817	Reboot Upgrade support for 7210 SAS	The 5620 SAM supports performing the Reboot Upgrade action on 7210 SAS nodes. However, you cannot use an upgrade policy to trigger a Reboot Upgrade on a 7210 SAS node.	*5620 SAM System Administrator Guide*
7705 SAR enhancements			

(3 of 5)

Feature ID	Feature or function	Description	See
SAM-11313	1+1 HSB protection support	The 5620 SAM supports the configuration, discovery, and operational state of an integrated MPT radio on the 7705 SAR-8 and 7705 SAR-18. The protection state is displayed on the links and 1+1 links are grouped in a common link group.	Sections 6.2 and 8.9 Procedures 15-11 and 15-12
SAM-16226	MEF 8 support on 2p channelized OC3 and 4p DS3	The 5620 SAM supports MEF 8 on the 2-port channelized OC3 and 4-port DS3 cards on the 7705 SAR-8 and 7705 SAR-18, Release 6.0 R2 or later. MEF 8 allows TDM services to be emulated across Epipe services using circuit emulation.	Section 67.1 Procedure 67-27
SAM-19798	SDI port Hold Time Up and Hold Time Down	The 5620 SAM supports Hold Time Up (milliseconds) and Hold Time Down (milliseconds) on RS-232 ports on SDI cards.	Procedure 16-32
SAM-20711	TWAMP server support	The 5620 SAM supports the configuration of a TWAMP server on the 7705 SAR, Release 5.0 R1 or later.	Section 8.9 Procedure 13-11
SAM-21180	Scheduled statistics support for SNMP based counters	The 5620 SAM supports scheduling of performance statistics for the 7705 SAR MIBs.	*5620 SAM Statistics Management Guide*
SAM-22010	ACL VLAN filter policy support on 2 port ring MDA	The 5620 SAM supports the configuration of an ACL VLAN filter policy on a 2-port ring MDA on the 7705 SAR, Release 6.0 R1 or later.	Procedures 16-1 and 44-4
SAM-22014	SSM on 2p 10G ring MDA	The 5620 SAM supports SSM on a 7705 SAR 2-port 10 Gig ring MDA.	Section 8.9
SAM-22659	MAC pinning on 2p 10G ring MDA	The 5620 SAM supports MAC pinning on a 7705 SAR 2-port 10 Gig ring MDA.	Procedure 15-33
SAM-22660	CFM Loopback on ring ports on 2P 10Gig Ring card	The 5620 SAM supports the configuration of CFM loopback on the ring port of a 2-port 10 Gig ring card on the 7705 SAR, Release 6.0 R3 or later.	Procedure 16-1
SAM-22662	Differential clock on 7705 SAR-A MDA	The 5620 SAM supports differential clock recovery on a 7705 SAR-A MDA, Release 6.0 R2 or later.	Procedures 15-33, 16-31, and 16-34
SAM-22664	IEEE 1588 edge time stamps on 7705 SAR-A and 7705 SAR-W	The 5620 SAM supports the collection of statistics for IEEE 1588 PTP timestamps on the 7705 SAR-A and 7705 SAR-W. The 5620 SAM supports the configuration of the Time of Day message type and output on the 7705 SAR-A.	Chapter 15, Procedure 16-1 *5620 SAM Statistics Management Guide* Procedure 13-2
SAM-22668	Pseudo-wire status signaling on the VPLS service	The 5620 SAM supports pseudo-wire status signaling on the VPLS service.	Procedure 68-44
SAM-22670	Pseudo-wire status signaling on the VLL Epipe service	The 5620 SAM supports pseudo-wire status signaling on the VLL Epipe service.	Procedure 67-4
SAM-22672	Differential clock recovery on 4p channelized DS3 cards and ports	The 5620 SAM supports differential clock recovery on a 4-port channelized DS3 card and DS3 port with CEM encapsulation on the 7705 SAR, Release 6.0 R3 or later.	Procedures 15-33, 16-31, and 16-34
SAM-22678	2 port ring MDA WAN support	The 5620 SAM supports WAN mode on a 2-port 10 Gig ring MDA Ethernet port on the 7705 SAR, Release 6.0 R2 or later.	Section 8.9 Procedure 16-1
SAM-23055	Auxiliary alarm definition on an Ethernet port	The 5620 SAM supports the configuration of an auxiliary alarm definition with trigger input on an Ethernet port on the 7705 SAR, Release 6.0 R1 or later.	Procedure 15-13

(4 of 5)

Feature ID	Feature or function	Description	See
SAM-24661	DHCP loopback	The 5620 SAM supports the configuration of DHCP loopback on a VPRN service L3 access interface on the 7705 SAR, Release 5.0 R1 or later.	Procedure 71-22
SAM-25483	Multicast address support for MEF 8 remote mac	The 5620 SAM supports multicast address for MEF 8 remote MAC on the 7705 SAR.	Section 67.1 Procedure 67-39
SAM-27930	Scheduler mode on SAP ingress and egress	The 5620 SAM supports the configuration of 4-Priority or 16-Priority scheduler modes for egress and ingress Ethernet interface aggregation schedulers on the 7705 SAR, Release 6.0 R1 or later.	Procedures 16-1, 67-29, 68-26, 70-23, and 71-26
9500 MPR/9500 MPRe enhancements			
SAM-5982	NTP configuration for date and time	The 5620 SAM supports the configuration of NTP for date and time on the 9500 MPR.	Procedure 15-10
SAM-12666	NEtO distribution - 4.2 Multi-version	The 5620 SAM supports NEtO distribution of the 4.2 Multi-version on the 9500 MPR and 9500 MPRe, in addition to 4.1, 4.0, and 3.4 releases.	–
SAM-21786 SAM-21788	1+1 MPT -xC over core card support	The 5620 SAM supports MPT-HC/MC pair protection configuration on the 9500 MPR core-enhanced card.	Chapter 8
SAM-21790	MPT-HL connected to Core-E/MSS-1 SFP port	The 5620 SAM supports an MPT-HL connection to the Core-E/MSS-1 SFP port in a 1+0 radio configuration.	Chapter 8
SAM-21792	SNMP support of PPP table for adjacent node auto discovery over radio port (9500 MPRe)	The 5620 SAM supports SNMP for adjacent node auto discovery over a 9500 MPRe radio port.	–
SAM-21798	Enhanced fan tray	The 5620 SAM supports the configuration of an enhanced fan tray with relay alarm points on the 9500 MPR, Release 4.2 or later.	–
SAM-21800	SNMP for G.826 radio PM	The 5620 SAM supports SNMP for G.826 radio PM (current and historical data) on the 9500 MPRe.	–
SAM-21861	VLAN topology view observation with P2MP extension	During the creation of VLAN services, intermediate sites are automatically added to the service topology view.	Procedure 66-1
SAM-21862	VLAN service with radio port as endpoint	The 5620 SAM supports a radio port as an access interface on a hop-based VLAN service on the 9500 MPR.	–
SAM-21903	ERPS ring services discovery button	The 5620 SAM supports a button for discovery of ERPS ring services on the 9500 MPR.	–

(5 of 5)

What's new in 5620 SAM Release 11.0 R2

5620 SAM Release 11.0 R2 is a maintenance release. No features have been added.

What's new in 5620 SAM Release 11.0 R1

Table 1-5 lists the features added in 5620 SAM Release 11.0 R1 and described in 5620 SAM core customer documentation.

Table 1-5 5620 SAM Release 11.0 R1 features

Feature ID	Feature or function	Description	See
GUI enhancements			
—	Copy Property Form Identifier	The 5620 SAM supports the Copy Property Form Identifier function. This is applicable to property, alarms and statistic forms.	Procedure 3-16
SAM-340	Workspace customization	The 5620 SAM supports the customization of menus, toolbars, tree labels, topology icon labels and window layout selections on the 5620 SAM GUI.	Procedures 4-1, 4-2, 4-3, 4-4, and 4-5
		You can export and import workspaces using the 5620 SAM GUI.	Procedures 4-9 and 4-10
		You can add or delete workspaces in the Workspaces tab of the User Preferences form. You can select workspaces from the workspace selector combo box on the 5620 SAM GUI.	Procedure 4-8
		The 5620 SAM supports the following scope of command roles for workspace management, import and export and public control: • administrator • user management • SAM management and operations	*5620 SAM System Administrator Guide*
SAM-12825	LAG egress QoS optimization	You can reduce the number of egress resources consumed by each SAP on a LAG by enabling the Per Forwarding Path Egress Queue parameter.	Procedures 14-10 and 14-11
SAM-13652	Go To Property Form	The 5620 SAM supports the enhancement of the Go To Property form function. A user can copy window identifiers and paste the information into trouble tickets or send them to peers.	Procedure 3-17
SAM-13431	Custom properties on NE configuration forms	The 5620 SAM supports custom properties that are configured using the System Preferences form; for example, location and site name. The custom properties can also be configured using the 5620 SAM-O.	*5620 SAM System Administrator Guide* *5620 SAM-O XML Reference*
SAM-15405	Indication of secure client communication with main server	A 5620 SAM GUI client that communicates with a main server over a secure channel displays a padlock icon in the login form, GUI status bar, and information form.	*5620 SAM User Guide* *5620 SAM | 5650 CPAM Installation and Upgrade Guide*
SAM-16722	Support for IPv6 UDPTCP entries on CPM filters	The 5620 SAM supports configuring a IPv6 CPM filter entry that filters on UDPTCP headers.	*5620 SAM System Administrator Guide*
Map enhancements			
SAM-362	Create from Template option in service map	The right-click contextual menu in a service map allows template-based service object creation, depending on the templates that are bound to the service.	Chapter 6
5620 SAM system management enhancements			
SAM-1848	SNMP monitoring	The 5620 SAM supports the monitoring of a 5620 SAM station using native RHEL or Solaris SNMP functions.	*5620 SAM | 5650 CPAM Installation and Upgrade Guide*, for optional OS packages related to SNMP

(1 of 21)

Feature ID	Feature or function	Description	See
SAM-19187	Windows support for client delegate server deployment	5620 SAM client delegate server deployment is supported on a Microsoft Windows platform for remote GUI client access.	*5620 SAM Planning Guide*, for platform and remote access requirements *5620 SAM | 5650 CPAM Installation and Upgrade Guide*, for configuration information
SAM-17345	Export of multiple script test results	The 5620 SAM supports the export of multiple script test results.	*5620 SAM Scripts and Templates Developer Guide*
SAM-19171	Database error monitoring	You can configure the 5620 SAM to raise an alarm when the Oracle database software detects an error. This function enhances troubleshooting and security by providing early notification of potential problems such as SQL injection attacks.	*5620 SAM System Administrator Guide*
SAM-19174	Configurable database login security	To increase database security, you can configure the 5620 SAM to limit the number of Oracle database login failures. When the specified limit is reached, the 5620 SAM prevents further database login attempts until the user account is unlocked.	*5620 SAM System Administrator Guide*
SAM-19361	One-time password use for remote users	You can enable one-time password use for RADIUS and TACACS+ during 5620 SAM remote authentication policy configuration.	*5620 SAM System Administrator Guide*
SAM-14940	NE resync audit	You can perform NE resync audits and identify configuration differences between managed NEs and the 5620 SAM database.	*5620 SAM Troubleshooting Guide*
Device management enhancements			
SAM-15929	Reserved blocks/IP addresses per ISA-NAT MDA	You can display the number of reserved port blocks and reserved IP addresses on an ISA-NAT MDA.	Procedure 24-6
SAM-17483	EMS definition in equipment tree	The 5620 SAM supports the categorization of an EMS within a created topology group.	Procedure 10-6
7210 SAS-D enhancements			
SAM-1249	Fault propagation for Epipe services	The 5620 SAM supports fault propagation for MEPs in VLL Epipe services for the 7210 SAS-D, Release 5.0 R2 or later.	Procedure 78-1
SAM-8345	IEEE 1588-2008 PTP timing synchronization	The 5620 SAM supports the configuration of an IEEE 1588-2008 PTP clock as the timing synchronization reference for the 7210 SAS-D 6F 4T ETR, Release 5.0 R2 or later.	Procedures 15-7, 15-14, and 15-15
SAM-14715	Transit service	The 5620 SAM supports transit services on VPLS and VLL services. For VPLS on G.8032 Ethernet rings you can use the Create Transit Service function. For VPLS and VLL services on non-G.8032 ring topologies, the 5620 SAM uses a manually-configured transit service. The 5620 SAM supports this feature for the 7210 SAS-D, Release 4.0 R7 or later.	Section 27.3 Procedure 27-10
SAM-15416	Up MEPs for VPLS	The 5620 SAM supports up MEPs for VPLS on the 7210 SAS-D, Release 5.0 R1 or later.	Procedures 68-21, 68-37, and 78-1

(2 of 21)

Feature ID	Feature or function	Description	See
SAM-15424	Fan support	The 5620 SAM supports the configuration of the fan administration mode for the 7210 SAS-D 128 Mbyte variant, Release 5.0 R2 or later.	Procedure 15-19
SAM-15835	EFM timing enhancements	When you configure ports for EFM OAM the 5620 SAM supports a minimum transmit interval of 100 ms (formerly 500 ms) for the 7210 SAS-D, Release 5.0 R2 or later.	Procedure 32-42
SAM-19336	IPv6 MAF support	The 5620 SAM extends support for IPv6 match criteria for management access filters to the 7210 SAS-D, Release 5.0 R1 or later. This feature is now supported on all 7210 SAS chassis types, Release 5.0 R1 or later.	*5620 SAM System Administrator Guide*
SAM-21667	Forwarding class and profile for mirror services	The 5620 SAM supports the configuration of forwarding classes and profiles for mirror services on the 7210 SAS-D, Release 5.0 R1 or later.	Procedure 69-2
7210 SAS-E enhancements			
SAM-15420	USB support (Sandisk 4Gb and 8Gb only)	The 5620 SAM supports USB devices as flash memory for storing accounting statistics for the 7210 SAS-E, Release 5.0 R2 or later.	*5620 SAM Statistics Management Guide*
SAM-15833	IPv6 ingress ACLs for VPLS and VLL services	The 5620 SAM supports IPv6 ingress ACL filter policies for the 7210 SAS-E Release 5.0 R3 or later, in VPLS and VLL services. Policies are supported on the 7210 SAS-E when the system resource profile is appropriately configured.	Procedures 13-20, 67-27, and 68-24 Chapter 8
SAM-19334	MVR support in VPLS	The 5620 SAM extends support for MVR configuration in VPLS services to the 7210 SAS-E, Release 5.0 R1 or later.	Procedures 68-17 and 68-35
SAM-19336	IPv6 MAF support	The 5620 SAM extends support for IPv6 match criteria for management access filters to the 7210 SAS-E, Release 5.0 R1 or later. This feature is now supported on all 7210 SAS chassis types, Release 5.0 R1 or later.	*5620 SAM System Administrator Guide*
SAM-21667	Forwarding class and profile for mirror services	The 5620 SAM supports the configuration of forwarding classes and profiles for mirror services on the 7210 SAS-E, Release 5.0 R1 or later.	Procedure 69-2
7210 SAS-M enhancements			
SAM-1249	Fault propagation for Epipe services	The 5620 SAM supports fault propagation for MEPs in VLL Epipe services for the 7210 SAS-M, Release 5.0 R2 or later.	Procedure 78-1
SAM-8339	Up MEPs for Epipe and VPLS	The 5620 SAM supports up MEPs for Epipe and VPLS services on the 7210 SAS-M (in access uplink mode), Release 5.0 R2 or later.	Procedures 68-21, 68-37, and 78-1
SAM-10062	IPv6 support for IS-IS	The 5620 SAM supports IPv6 addressing during IS-IS configuration for the 7210 SAS-M, Release 5.0 R2 or later.	Procedure 23-20
SAM-14715	Transit service	The 5620 SAM supports transit services on VPLS and VLL services. For VPLS on G.8032 Ethernet rings you can use the Create Transit Service function. For VPLS and VLL services on non-G.8032 ring topologies, the 5620 SAM uses a manually-configured transit service. The 5620 SAM supports this feature for the 7210 SAS-M (in access-uplink mode), Release 4.0 R7 or later.	Section 27.3 Procedure 27-10

(3 of 21)

Feature ID	Feature or function	Description	See
SAM-15418	Processing of 3-plus-tag packets received on a QinQ SAP in an Epipe service	The 5620 SAM supports the configuration of a dot1q or QinQ L2 access interface on 3-plus-tag Epipe services for the 7210 SAS-M, Release 5.0 R2 or later. A 3-plus-tag Epipe service preserves customer tags when packets received on a QinQ SAP are forwarded to a spoke SDP binding or a dot1q or QinQ L2 access interface.	Section 67.1 Procedures 67-2, 67-4, and 67-27
SAM-15420	USB support (Sandisk 4Gb and 8Gb only)	The 5620 SAM supports USB devices as flash memory for storing accounting statistics for the 7210 SAS-M, Release 5.0 R2 or later.	*5620 SAM Statistics Management Guide*
SAM-15835	EFM timing enhancements	When you configure ports for EFM OAM the 5620 SAM supports a minimum transmit interval of 100 ms (formerly 500 ms) for the 7210 SAS-M, Release 5.0 R2 or later.	Procedure 32-42
SAM-21626	Processing of 3-plus-tag packets in QinQ to QinQ traffic	The 5620 SAM supports the configuration of two QinQ L2 access interfaces on 3-plus-tag Epipe services for the 7210 SAS-M, Release 5.0 R3 or later. A 3-plus-tag Epipe service preserves customer tags when packets received on a QinQ SAP are forwarded to a spoke SDP binding or a dot1q or QinQ L2 access interface.	Section 67.1 Procedures 67-2, 67-4, and 67-27
SAM-21628	Ethernet CFM support in 3-plus-tag Epipe services	The 5620 SAM supports Ethernet CFM on 3-plus-tag Epipe services for the 7210 SAS-M, Release 5.0 R3 or later.	Section 67.1
SAM-21667	Forwarding class and profile for mirror services	The 5620 SAM supports the configuration of forwarding classes and profiles for mirror services on the 7210 SAS-M, Release 5.0 R1 or later.	Procedure 69-2
7210 SAS-X enhancements			
SAM-1249	Fault propagation for Epipe services	The 5620 SAM supports fault propagation for MEPs in VLL Epipe services for the 7210 SAS-X, Release 5.0 R2 or later.	Procedure 78-1
SAM-15422	IEEE 1588-2008 PTP timing synchronization	The 5620 SAM supports the configuration of an IEEE 1588-2008 PTP clock as the timing synchronization reference for the 7210 SAS-X, Release 5.0 R3 or later.	Procedures 15-7, 15-14, and 15-15
SAM-10062	IPv6 support for IS-IS	The 5620 SAM supports IPv6 addressing during IS-IS configuration for the 7210 SAS-X, Release 5.0 R2 or later.	Procedure 23-20
SAM-15418	Processing of 3-plus-tag packets received on a QinQ SAP in an Epipe service	The 5620 SAM supports 3-plus-tag Epipe services on the 7210 SAS-X, Release 5.0 R2 or later. A 3-plus-tag Epipe service preserves customer tags when packets received on a QinQ SAP are forwarded to a spoke SDP binding or a dot1q or QinQ L2 access interface.	Section 67.1 Procedures 67-2, 67-4, and 67-27
SAM-15835	EFM timing enhancements	When you configure ports for EFM OAM the 5620 SAM supports a minimum transmit interval of 100 ms (formerly 500 ms) for the 7210 SAS-X, Release 5.0 R2 or later.	Procedure 32-42
SAM-21626	Processing of 3-plus-tag packets in QinQ to QinQ traffic	The 5620 SAM supports the configuration of two QinQ L2 access interfaces on 3-plus-tag Epipe services for the 7210 SAS-X, Release 5.0 R3 or later. A 3-plus-tag Epipe service preserves customer tags when packets received on a QinQ SAP are forwarded to a spoke SDP binding or a dot1q or QinQ L2 access interface.	Section 67.1 Procedures 67-2, 67-4, and 67-27
SAM-21628	Ethernet CFM support in 3-plus-tag Epipe services	The 5620 SAM supports Ethernet CFM on 3-plus-tag Epipe services for the 7210 SAS-X, Release 5.0 R3 or later.	Section 67.1

(4 of 21)

Feature ID	Feature or function	Description	See
SAM-21667	Forwarding class for mirror services	The 5620 SAM supports the configuration of forwarding classes for mirror services on the 7210 SAS-X, Release 5.0 R1 or later.	Procedure 69-2
7450 ESS and 7750 SR enhancements			
	New daughter card support	The 5620 SAM supports the following new daughter cards: • 2-Port 10GE MDA with WaveTracker • 1-port 100GE, 10-port GE Combo Plasma IMM on the 7750 SR-7, 7750 SR-12, and 7750 SR-12E • FP3 1-Port 100GE DWDM IMM on the 7750 SR-12 and 7750 SR-12E	Chapter 15
SAM-12813	Soft reset support for FP3-based line cards	The 5620 SAM supports performing a soft reset on FP3-based line cards installed in a Release 11.0 R1 or later 7450 ESS or 7750 SR.	*5620 SAM System Administrator Guide*
SAM-12819	Mixed-mode ISA support	The 5620 SAM supports configuring the following objects on a mixed-mode 7450 ESS or 7750 SR, Release 11.0 or later: • ISA broadband applications, ISA video, and ISA tunnel daughter cards • VSM-CCA cards • ISA LNS groups • ISA NAT groups • ISA Tunnel groups • ISA Video groups • ISA WLAN GW groups (7750 SR only)	Chapter 14
SAM-13142	Synchronous ethernet with SSM support for 48-port 1GB Ethernet EPTX MDA.	The 5620 SAM supports configuring synchronous Ethernet with SSM on 48-port 1GB Ethernet Extended Performance TX MDAs on the 7750 SR.	Procedure 15-33
SAM-14509	TCA support for LAGs on 7450 ESS, 7710 SR, 7750 SR, and 7950 XRS	The 5620 SAM supports enabling TCA on LAG objects configured on 7450 ESS, 7710 SR, 7750 SR, and 7950 XRS nodes.	Section 14.10
SAM-15693	Support for IPv6 Cflowd collectors	The 5620 SAM supports configuring Cflowd collectors that use IPv6 addresses.	Procedure 13-5
SAM-18598	ISA-IPsec support on 7450 ESS in mixed mode	The 7450 ESS in mixed mode provides the same IPsec support as the 7750 SR.	—
SAM-18661	Support for coherent optical configuration	The 5620 SAM supports configuring coherent optical parameters on the Ethernet port of a 1-Port 100GE OTU4 DWDM tunable optic IMM.	Procedure 16-1
SAM-21031	NTP support on 7750 SR	The 5620 SAM supports configuring NTP on the 7750 SR, and on VPRN sites located on the 7750 SR.	Procedures 15-10 and 71-23
7705 SAR enhancements			
SAM-5834	APS on 2P OC3 access side	The 5620 SAM supports the configuration of SC APS on a 2-port OC3 MDA on the 7705 SAR-8 and 7705 SAR-18, Release 6.0 R1 or later.	Chapters 16 and 34
SAM-5836	CSMv2 card support	The 5620 SAM supports the configuration of a CSMv2 card on the 7705 SAR-8.	Section 8.9
SAM-5838	2 port ring MDA support	The 5620 SAM supports the configuration of a 2 × 10-Gig Bridged Ethernet XFP + 1 × 2.5G Virtual Ethernet card on the 7705 SAR-8 and 7705 SAR-18, Release 6.0 R1 or later.	Section 8.9 Procedures 15-33, 16-1, 16-17, and 43-6

(5 of 21)

Feature ID	Feature or function	Description	See
SAM-5840	Multi-chassis LAG support	The 5620 SAM supports MC LAG groups on the 7705 SAR-8, 7705 SAR-18, 7705 SAR-A, 7705 SAR-M and 7705 SAR-W, Release 6.0 R1 or later.	Sections 8.9, 36.1, and 39.1
SAM-5843	Multi-chassis APS support	The 5620 SAM supports multi-chassis APS on the 7705 SAR, Release 6.0 R1 or later.	Section 34.1
SAM-5845	PIM support	The 5620 SAM supports the enabling and configuration of PIM on a routing instance on the 7705 SAR, Release 6.0 R1 or later.	Procedures 23-39, 23-40 and 23-43
SAM-5847	Multicast protocol support	The 5620 SAM supports multicast protocols on the 7705 SAR, Release 6.0 R1 or later.	Chapter 23
SAM-5849	MLD support	The 5620 SAM supports configuration of MLD in a multicast domain on the 7705 SAR, Release 6.0 R1 or later.	Sections 23.1 and 61.2
SAM-5857	8-port FXO Adapter card support	The 5620 SAM supports the configuration of an 8-port FXO Adapter card on the 7705 SAR-8 and the 7705 SAR-18, Release 6.0 R1 or later.	Section 8.9
SAM-10069	Remove a PPP link from an MLPPP bundle	The 5620 SAM supports the automatic removal of a PPP link from an MLPPP bundle if the DS1 BER exceeds a threshold on the 7705 SAR, Release 5.0 R5 or later.	Procedures 15-41 and 16-33
SAM-11303	LDP prefix-aggregation	The 5620 SAM supports the introduction of LDP prefix-aggregation on the 7705 SAR, Release 6.0 R1 or later.	Section 23.18 Procedure 23-17
SAM-11307	VRRP support	The 5620 SAM supports VRRP on IES and VPRN services with policies and router interfaces on the 7705 SAR, Release 6.0 R1 or later.	Procedures 70-40 and 71-42
SAM-11309	BFD 10-ms timer	The 5620 SAM supports BFD transmitter and receiver values from 10 milliseconds to 100 000 milliseconds on the 7705 SAR, Release 6.0 R1 or later.	Procedure 22-10
SAM-11311	Routed VPLS to IES/VPRN	The 5620 SAM supports the routed VPLS connector function on the 7705 SAR, Release 6.0 R1 or later.	Section 74.1 Procedures 70-19 and 71-30
SAM-11315	Port-level hard policing at SAP ingress	The 5620 SAM supports port-level hard policing at the SAP ingress for the 7705 SAR, Release 6.0 R1 or later.	Procedure 16-1
SAM-11317	MEF 8 support on Epipe services	The 5620 SAM supports MEF 8 on Epipe services for the 7705 SAR, Release 6.0 R1 or later. MEF 8 allows TDM services to be emulated across Epipe services using circuit emulation.	Section 67.1 Procedure 67-27
SAM-11325	2-port ring MDA SFP support	The 5620 SAM supports SFP on the 2-port ring MDA, enabling the Media Adapter and DDM tabs at the port level on the 7705 SAR-8 and the 7705 SAR-18, Release 6.0 R1 or later.	Section 8.9 Procedure 16-1
SAM-11327	LDP LSR ECMP support	The 5620 SAM supports the configuration of ECMP on an LDP routing interface, on the 7705 SAR, Release 6.0 R2 or later.	Procedures 23-17 and 32-29
SAM-11329	RIP routing site support	The 5620 SAM supports a RIP routing site in the routing navigation tree on the 7705 SAR, Release 6.0 R1 or later.	Section 23.17 Procedures 23-9, 23-10, and 23-11
SAM-11333	7705 SAR-W support	The 5620 SAM supports the introduction of the 7705 SAR-W.	Section 8.9 Procedure 15-36

(6 of 21)

Feature ID	Feature or function	Description	See
SAM-12363	NTP support	The 5620 SAM supports NTP on the 7705 SAR, Release 5.0 R5 and 6.0 R1 or later. The 7705 SAR acts only as an NTP client.	Procedure 15-10
SAM-13172	Differential clock on ASAP v2	The 5620 SAM supports the configuration of a differential clock on 16/32x channelized ASAP v2 cards on the 7705 SAR-8 and 7705 SAR-18, Release 6.0 R1 or later.	Procedure 15-33
SAM-13174	SSM for E1 channels	The 5620 SAM supports the configuration of synchronous status messages on E1 channels on the 7705 SAR, Release 6.0 R1 or later. HSMs are used by synchronous Ethernet peers to ensure the quality of the timing synchronization source.	Procedure 16-31
SAM-13176	SAP down, MEP up	When you associate a MEP with an Epipe L2 access interface, you can configure the parameter Hold MEPs Up When SAP is Down so that if the SAP is down, the MEP remains operationally up, on the 7705 SAR, Release 6.0 R1 or later.	Procedure 67-34
SAM-13791	9500 MPRe integration	The 5620 SAM supports the integration of the 9500 MPRe on the 7705 SAR-8 and 7705 SAR-18 as a single NE, Release 6.0 R1 or later. The configuration of radio parameters is via the MCT tool. Management capabilities provide radio discovery, configuration status and state, alarm integration and management, and statistics management. MPT software packages are bundled with the 7705 SAR image and the files are pushed to the 7705 SAR during a 5620 SAM upgrade.	Procedures 15-12 and 67-27 *5620 SAM System Administrator Guide*
SAM-13793	9500 MPRe integration	The 5620 SAM supports the integration of the 9500 MPRe on the 7705 SAR-8 and 7705 SAR-18 as a single NE, Release 6.0 R1 or later. Radio links between an integrated single NE are discovered and displayed on the 5620 SAM physical map. All link-related faults are correlated to ports and to upper layer objects like LSPs or services.	Procedure 15-12
SAM-13857	9500 MPRe integration	The 5620 SAM supports an integrated MCT cross-launch from the NE or port level on the 7705 SAR-8 and 7705 SAR-18 as a single NE, Release 6.0 R1 or later.	–
SAM-13874	7705 SAR-A support	The 5620 SAM supports the introduction of the 7705 SAR-A.	Section 8.9
SAM-13986	SAP aggregation group topology map enhancements	SAP aggregation groups are displayed in the topology map view and navigation tree for VLL Apipe services.	Procedure 67-52 Section 6.2
SAM-15409	SAP egress support	The 5620 SAM supports SAP egress support on the 7705 SAR, Release 6.0 R1 or later.	Section 43.1 Procedure 43-26
SAM-15447	Scheduled statistics support for SNMP-based counters	The 5620 SAM supports the enabling of SNMP-based scheduled statistics for Port Net Egress accounting statistics on the 7705 SAR.	*5620 SAM Statistics Management Guide*
SAM-15708	CFM synthetic loss measurement test support	The 5620 SAM supports CFM two-way SLM tests for Epipe services on the 7705 SAR, Release 6.0 R1 or later.	Section 32.1
SAM-15710	7705 SAR DHCP client on the network interface	The 5620 SAM supports the DHCP client on the network interface on the 7705 SAR.	Procedure 22-10

(7 of 21)

Feature ID	Feature or function	Description	See
SAM-15714	GPON module SFP support	The GPON module card supports SFP on the 7705 SAR-M Release 6.0 R1 or later, enabling the Media Adapter and DDM tabs at the port level.	Section 8.9 Procedure 16-1
SAM-15722	IPv6 support for 4-port OC3	The 5620 SAM supports the configuration of IPv6 interfaces on ports on the 4-port OC3/STM1 ASAP SFP card.	Procedure 16-1
SAM-15848	STM1 Electrical 0/70C SFP support	The 2-port OC3/STM1 ASAP SFP card supports the STM1 Electrical 0/70C SFP on the 7705 SAR-8 and the 7705 SAR-18, Release 5.0 R6 or later.	Section 16.2
SAM-15903	OAM test enhancement for DSL modules	F5 OAM loopback test added to the ATM services. This test can also be executed from a test suite.	Section 32.1 Procedure 32-22
SAM-16224	Differential clock on 4p DS3/E3	The 5620 SAM supports the configuration of a differential clock on a 4 × channelized DS3/E3 ASAP on the 7705 SAR-8, 7705 SAR-18, 7705 SAR-A and 7705 SAR-W.	Procedures 15-33, 16-31, and 16-34
SAM-16314	ICB on MC LAG support	The 5620 SAM supports the configuration of ICB on MC LAG for Epipe services on the 7705 SAR, Release 6.0 R1 or later.	Section 39.1 Procedure 67-4
SAM-17875	OAM tests for multicast protocols	The 5620 SAM supports multicast router information, OAM diagnostics and multicast trace OAM diagnostics on the 7705 SAR, Release 6.0 R1 or later.	Procedures 32-30 and 32-31
7705 SAR-H enhancements			
SAM-11045	7705 SAR-H License	The 5620 SAM supports licenses for 7705 SAR-H firewall features. It provides a count of software licenses for firewall on the 7705 SAR platform. It also provides standard 5620 SAM provisioning and assurance features.	*5620 SAM System Administrator Guide*
SAM-11057	7705 SAR-H Firewall—Host Group policy	The 5620 SAM supports the configuration of a Host Group firewall policy on the 7705 SAR-H.	Procedure 60-1
SAM-11061	7705 SAR-H Firewall manager	The 5620 SAM supports the 7705 SAR-H firewall features through a centralized firewall manager. You can allow zone definition entries to be applied to the firewall by using the management access interface and the CPM interface.	*5620 SAM System Administrator Guide*
SAM-11063	7705 SAR-H Firewall—Service Group policy	The 5620 SAM supports the configuration of a Service Group firewall policy on the 7705 SAR-H.	Procedure 60-2
SAM-11065	7705 SAR-H Firewall—Rule Set policy	The 5620 SAM supports the configuration of a Rule Set firewall policy on the 7705 SAR-H.	Procedure 60-3
SAM-11068	7705 SAR-H Firewall—Zone policy	The 5620 SAM supports the configuration of a Zone firewall policy on the 7705 SAR-H.	Procedure 60-4
SAM-11093	7705 SAR-H Firewall—Zone management	The 5620 SAM supports firewalls in zones to set a level of trust and access rights to a set of related objects like interfaces, host addresses, and users on the 7705 SAR-H.	Section 60.1
SAM-11760	7705 SAR-H firewall statistics	The 5620 SAM supports firewall statistics provided by the firewall at the firewall site, zone, SAP, Spoke-SDP, management access firewall and CPM firewall.	*5620 SAM Statistics Management Guide*
SAM-11762	7705 SAR-H firewall alarms	The 5620 SAM supports firewall alarms on the 7705 SAR-H.	*5620 SAM Alarm Reference*

(8 of 21)

Feature ID	Feature or function	Description	See
SAM-11783	7705 SAR-H combo MDA	The 5620 SAM supports combo MDAs on the 7705 SAR-H.	Section 8.9
SAM-11769	7705 SAR-H system and services	The 5620 SAM supports the following services/pseudowires on the 7705 SAR-H: • VLL (Cpipe, Epipe, Ipipe) • VPRN • IES • VPLS The 5620 SAM does not support the following VLL services in Release 11.0R1: • Apipe • Fpipe • Hpipe The 5620 SAM supports the following network management functions on the 7705 SAR-H: • Backup and Restore • Software Upgrade • IPv6 • SNMPv3 • Routing	Chapters 67, 68, 70, 71, 9, 10, 22, 23, 71
SAM-11771	7705 SAR-H QoS policy	The 5620 SAM supports QoS policies on the 7705 SAR-H: • Access ingress policy • Access egress policy • MC MLPPP egress QoS profiles • Network policy • Network queue policies • Slope policies	Table 42-1 Chapter 43
SAM-11773	7705 SAR-H network synchronization	The 5620 SAM supports the configuration of an IEEE 1588-2008 PTP clock as the timing synchronization reference for the 7705 SAR-H. The 5620 SAM supports the following features on network synchronization. • IEEE 1588-2008 PTP timing synchronization • Time of Day	Chapters 15 and 46 Procedures 15-7, 15-8, and 15-9
SAM-11775	7705 SAR-H PoE	The 5620 SAM supports internal and external PoE on the 7705 SAR-H.	Section 15.4 Procedure 16-19

SAM-11777	7705 SAR-H OAM	The 5620 SAM supports the following OAM functionality on the 7705 SAR-H:
		• ICMP ping
		• MAC trace OAM
		• MAC ping OAM
		• LSP ping OAM
		• LSP trace OAM
		• MAC purge OAM
		• MAC populate OAM
		• CFM Eth test diagnostic
		• CFM one-way delay
		• CFM two-way delay
		• NE schedulable OAM tests
		• Non-NE schedulable OAM tests
		• Service Test Manager
		  • Test policies
		  • Test suites
			Sections 32.1 and 77.1
			Procedures 32-9, 32-10, 32-11, 32-46, and 32-47

(9 of 21)

Feature ID	Feature or function	Description	See
SAM-11767	7705 SAR-H compact MDA	The 5620 SAM supports compact MDAs on the 7705 SAR-H. Power supply source is supported on the 7705 SAR-H.	Sections 8.9 Chapter 16 Procedures 15-33, 16-1, 16-11, 16-12, 16-27, 16-32, and 16-33
SAM-20826	7705 SAR-H DHCP server support	The 5620 SAM supports configuring local DHCP servers on the 7705 SAR-H on VPRN and Routing Interfaces. The local DHCP server leases IP addresses to clients in the network.	Chapters 22, 65, and 71 Procedures 22-2 and 22-10
7950 XRS enhancements			
SAM-14417	Support for static pseudowire routing	The 5620 SAM supports static pseudowire routing on the 7950 XRS, Release 11.0 R1 or later.	Section 72.1
SAM-14426	Support for VLL Ipipe services	The 5620 SAM supports the creation of VLL Ipipe services on the 7950 XRS-20.	Procedure 67-18
SAM-18375 SAM-18373	400 GE XMA cards	The 5620 SAM supports the configuration of the following 400 GE XMA cards for the 7950 XRS-20: • 40-port 10 GE SFP+ XMA • 4-port 100 GE CXP XMA	Procedure 15-23 Section 8.16
SAM-19081	SFM X20 B cards	The 5620 SAM supports the configuration of SFM X20 B cards in SFM card slots on the 7950 XRS-20.	Procedure 15-23 Section 8.16
9500 MPR/9500 MPRe enhancements			
—	9500 MPRe integration with 7705 SAR	See SAM-13791, SAM-13793, and SAM-13857 for feature details.	—
OmniSwitch enhancements			
SAM-5565	OS 6900 and OS 10K AOS 7.3.1 support	The 5620 SAM supports the AOS Release 7.3.1 or later on the OS 6900 and OS 10K switches.	Section 8.21
SAM-8475	OS 6900 and OS 10K MC AOS group support	The 5620 SAM supports the configuration of MC AOS groups on the OS 6900 and OS 10K NEs, Release 7.3.1 or later. This includes the creation of MC AOS LAG groups, MC AOS VFLink groups, IPC VLANs, and VIP VLANs.	Procedure 39-5, 39-6, 39-7, 39-8, and 66-4
SAM-8850 SAM-10678	Additional cards supported on OS 10K	The 5620 SAM supports OS10K-QNI-U4, OS10K-QNI-U8, and OS10K-XNI-U16E cards on OS 10K switches.	Section 8.21
SAM-8854 SAM-8857 SAM-8995	OS 6900 and OS 10K Ethernet OAM and SAA support	The 5620 SAM supports the use of the Service Test Manager for Ethernet OAM and SAA activities on the OS 6900 and OS 10K NEs, Release 7.3.1 or later.	Chapter 32, 77 and 78
SAM-14691	OS 6400, OS 6850E, OS 6855, OS 9700E, and OS 9800E AOS 6.4.5 support	The 5620 SAM supports the AOS Release 6.4.5 or later on the OS 6400, OS 6850E, OS 6855, OS 9700E, and OS 9800E switches.	Section 8.21
SAM-14693	Extended CPE test-head support	The 5620 SAM supports the configuration of CPE SLA test-head OAM tests on the OS 6850, OS 6855 U24X, and OS 9000E NEs.	Section 77.11
SAM-15526	OS 6850E and OS 6855 Dying Gasp support	The 5620 SAM supports Dying Gasp - Power Loss on the OS 6850E and OS 6855 NEs, Release 6.4.5 or later.	Procedure 13-26
SAM-15550 SAM-15564	Custom L2 profiles	The 5620 SAM supports the creation of custom L2 profiles on the OS 6250M, OS 6450, and OS 6850E NEs.	Procedure 52-3

(10 of 21)

Feature ID	Feature or function	Description	See
Network management enhancements			
SAM-335	Normalized Statistics Plotter graphs	You can use the 5620 SAM Statistics Plotter to plot octet throughput as a calculated bit rate using a specified scale, such as Gb/s.	*5620 SAM Statistics Management Guide*
SAM-844	Incongruent routing topology for VPRN	The 5620 SAM supports configuring static routes and BGP, OSPF and PIM sites on a VPRN to use separate routing tables for unicast and multicast traffic.	Procedure 71-12 Procedure 71-50
SAM-8211	Additional text policies	The 5620 SAM supports additional text policies to display specific information about an alarmed object in the additional text column of the dynamic alarm list and on the Alarm Info form.	Procedure 31-5
SAM-8571	NAT configuration usability	Reorganization of NAT configuration GUI with usability enhancements.	Chapter 24
SAM-9614	RHEL support for 3GPP OSS interface	The 3GPP OSS interface is supported for 5620 SAM systems on RHEL.	*5620 SAM | 5650 CPAM Installation and Upgrade Guide*
SAM-12038 SAM-2752	IPsec multi-chassis redundancy	5620 SAM MC IPsec redundancy provides a one-to-one inter-NE stateful failover mechanism for IPsec tunnels. MC IPsec provides protection for NE failure or MS-ISA failure. This feature supports only IKEv2 static LAN-to-LAN tunnels on multi-active tunnel groups.	Section 29.3
SAM-12889	MAC accounting	The 5620 SAM supports the collection of statistics for MAC address traffic on the following L3 interfaces: • Network interface • IES SAP • VPRN SAP	Procedures 22-9, 70-17, and 71-22
SAM-12894	Indirect next-hop for route aggregation	The 5620 SAM supports creating a route aggregation with an indirect IP address as the next-hop.	Procedure 71-21
SAM-12966	Unnumbered L3 network interfaces for MPLS	The 5620 SAM supports the selection of an unnumbered L3 network interface on MPLS interfaces. Unnumbered L3 network interfaces do not have an IP address configured.	Procedure 25-3
SAM-12982	One-second CCM interval	The 5620 SAM supports setting the CCM interval for ethernet rings to 1s.	Procedures 27-6 and 78-1
	G.8032 support for 7450 ESS-6, 7750 SR-c4, and 7750 SR-c12	The 5620 SAM supports configuring G.8032 ethernet ring elements and global MEGs on the 7450 ESS-6, 7750 SR-c4, and 7750 SR-c12. For these platforms, the CCM interval must be set to 1s.	
SAM-13034	Distributed CPU protection	An NE DDoS protection policy extends DoS protection functionality by controlling traffic destined to IOM or CPM CPUs on a per SAP, per protocol basis. A DDoS protection policy can be configured on a base router network interface, as well as on a variety of VPRN, IES, VPLS, and VLL SAPs.	*5620 SAM System Administrator Guide* Chapters 22, 67, 68, 70, and 71
SAM-13088	Deterministic NAT	Support for deterministic NAT configuration on a base routing instance, and on a VPRN routing instance.	Chapter 24 Procedure 24-3
SAM-13102	Migrant user handling	Support for migrant user handling in a Wi-Fi offload application through IES and VPRN soft GRE group interfaces.	Chapter 35 Procedures 71-62 and 70-13

(11 of 21)

Feature ID	Feature or function	Description	See
SAM-14176	RADIUS CoA port	The 5620 SAM supports the system-wide configuration of the RADIUS CoA port on an NE.	Procedure 13-17
SAM-14278	Custom text for alarm policies	The 5620 SAM supports up to 256 characters of custom text that can be added to an alarm policy.	Procedure 31-2
SAM-14679	Dual sided plotter infrastructure	By clicking on a button, you can plot statistics for the other endpoint of an object such as a physical or an optical link that terminates on a physical port.	*5620 SAM Statistics Management Guide*
SAM-15306	Set OLC state when shutting down or turning up an object	The 5620 SAM supports setting the OLC state of an object to Maintenance when an object is shut down or In Service when an object is turned up using the System Preferences form.	*5620 SAM System Administrator Guide*
SAM-15355	Statistics Plotter Improvements: save option	The monitored object name is displayed in the legend of the 5620 SAM Statistics Plotter when the Legend option is selected. The object name is also shown in a saved view of a graph when the option is selected.	*5620 SAM Statistics Management Guide*
SAM-15645	Post-discovery auto-configuration	In a 5620 SAM discovery rule, you can specify a post-discovery action to perform on successfully discovered NEs after rule execution. A post-discovery action is a 5620 SAM control script that invokes other control or XML API scripts to send configuration information to the discovered NEs.	Chapter 10 *5620 SAM Scripts and Templates Developer Guide*
SAM-15708	Egress hash configuration support for LAG access	Support for configuring a LAG group to use per-link egress hashes for LAG access eligibility.	Procedure 14-10
SAM-15827	NAT44 efficiency improvements	Support for on-demand retrieval of large-scale NAT entries, based on a routing instance ID.	Procedure 24-7
SAM-16007	Extended hardware virtualization support	Live network deployment of a 5620 SAM main server, database, or auxiliary server in a VM is supported.	*5620 SAM Planning Guide* *5620 SAM | 5650 CPAM Installation and Upgrade Guide*
SAM-16572	Control script input from file	A 5620 SAM control script can import information from a local or remote text or XML file.	*5620 SAM Scripts and Templates Developer Guide*
SAM-17978	Additional columns in the Historical Alarms list	The 5620 SAM supports the following additional columns in the Historical Alarms form: • Previous Severity • Original Severity • Highest Severity • Last Time Severity Changed • Last Time Cleared	Procedure 3-30
SAM-18618	WebDAV configuration during 5620 SAM installation or upgrade	You can enable or disable WebDAV access to activation data during a 5620 SAM main server installation or upgrade. The WebDAV access setting persists through subsequent upgrades.	*5620 SAM | 5650 CPAM Installation and Upgrade Guide*
SAM-18828	Real-time plotting for dynamic objects	You can plot LSN subscriber host statistics data using the 5620 SAM Statistics Plotter.	Procedure 24-9
SAM-19019	Node redundancy on PW ports	Support for MC sync group configuration on PW ports for ESM over MPLS Pseudowire redundant configurations.	Procedure 16-13
SAM-19369	UDP authentication and accounting ports	Support for UDP authentication port and UDP accounting port configuration on a RADIUS server site on a routing instance.	Procedure 22-7

(12 of 21)

Feature ID	Feature or function	Description	See
SAM-19406	Multiple control-script instances	The 5620 SAM Script Manager supports the creation of multiple control-script instances, as is done for XML API scripts. The script instances and results are stored in the 5620 SAM database.	*5620 SAM Scripts and Templates Developer Guide*
Protocol enhancements			
SAM-12891	BGP flowspec support	The 5620 SAM supports the following BGP flowspec enhancements: • IPv6 • VPRN BGP for the flowspec IPv4 and IPv6 address families on PE-CE eBGP and PE-PE iBGP sessions • flowspec filtering on VPRN IP interfaces • flowspec filtering on IES IP interfaces	Procedures 22-10, 23-2, 23-4, 23-5, 70-8, 70-17, 71-22, and 71-56
SAM-12895	BGP Routing Policy Support	The 5620 SAM supports using routing policies for BGP next hop resolution and peer tracking. Applying a routing policy to a BGP restricts which routes are considered valid when determining a path to a peer or next hop.	Procedure 23-2
SAM-12913	Filter out LSA on OSPF instances	The 5620 SAM supports filtering out flooded LSAs on an OSPF interface. The filter can be configured to block all flooded LSAs, or to allow LSAs from the router or type 3, 5, or 7 default LSAs.	Procedure 23-27
SAM-12900 SAM-12901	Multiple OSPFv3 instance support	The 5620 SAM supports configuring multiple OSPFv3 instances on router instances and routing interfaces.	Section 23.20
SAM-12903	IPv4 address family support on OSPFv3	The 5620 SAM supports configuring OSPFv3 instances that support IPv4 addresses. OSPFv3 instances configured with an Instance ID of 0 to 31 support IPv6, and 64 to 95 support IPv4.	Section 23.20
SAM-12927	Accumulated IGP support	The 5620 SAM supports using accumulated IGP metrics with BGP peer groups, peers, and routing policy statements.	Procedure 23-4, 23-5, and 22-15
SAM-12933	Multicast fast-failover	You can enable fast failover on multicast IP streams on PIM interfaces.	Procedure 23-40
SAM-12950	Automatic ABR selection for inter-area RSVP P2P LSP	The 5620 SAM extends the existing behavior by making the ABR selection automatic at the ingress LER. You do not need to include the ABR as a loose hop in the LSP path definition.	Automatic ABR selection and dynamic ABR bypass protection Procedure 25-22
	Dynamic Bypass LSP for ABR NE protection	The 5620 SAM supports dynamic bypass computation, signaling, and association with the primary path of an inter-area P2P LSP to provide ABR NE protection.	Dynamic bypass LSP for ABR NE protection
SAM-12958	T-LDP hello reduction	The 5620 SAM supports hello reduction for target peers in an LDP session.	Procedures 23-13 and 23-16
SAM-12972	Administrative group support on FRR backup LSP	The administrative group constraints configured on an LSP primary path are used for the signalling of bypass LSPs. Both the P2P LSP and the P2MP S2L path bypass LSPs are supported.	Procedures 25-2, 25-8, 25-9, 25-13, and 25-23
SAM-12976	LDP support loopback interface as LSR-ID	The 5620 SAM supports the selection of any local loopback interface as the local LSR-ID during LDP interface creation.	Procedure 23-14
SAM-13016	Sender-only and receiver-only MVPN	The 5620 SAM supports the configuration of sender-only, receiver-only, and sender-and-receiver MVPN for PIM.	Procedure 23-40

(13 of 21)

Feature ID	Feature or function	Description	See
SAM-13076	LAC parameter configuration at site level	You can configure LAC parameters at the L2TP site level. The parameters can be inherited by child L2TP tunnel group profiles and L2TP tunnel profiles.	Chapter 23 Procedure 23-34.
SAM-13547	LAC tunnel selection enhancements	A Tunnel Selection Blacklist function is configurable on L2TP sites. The function suspends tunnels that return predetermined result codes, indicating that they are inoperative.	Section 23.1 Procedure 23-34
	Cisco NAS-Port	Support for Cisco NAS-Port Ethernet and Cisco NAS-Port ATM configuration on an L2TP site. The parameters specify Cisco NAS-Port information to include in the Cisco NAS-Port AVP for L2TP control messages related to a session in an L2TP protocol instance.	Procedure 23-34
SAM-14218	IGP shortcut relative metric support	The 5620 SAM supports LFA rule definitions and relative metric values for SPF calculation for IGP shortcuts.	Procedures 25-8 and 25-10
SAM-14224	Community for aggregate routes	The 5620 SAM supports assigning a community to an aggregate route on a base or VPRN routing instance.	Procedures 22-1 and 71-21
SAM-15690	Static route for BGP flap suppression	The 5620 SAM supports dynamic next-hop BGP route selection for black hole static routes on a base routing instance.	Procedure 22-13
SAM-15696	OSPF option to relax the condition that an ABR must have an adjacency in area 0 to advertise default into NSSA	A base router OSPF instance that is an ABR to an NSSA no longer must have a full adjacency in area 0 in order to advertise a default route into the NSSA. You can enable the Adjacency Check parameter to enforce an ABR to have an adjacency in area 0 before the default route or routes can be advertised into the NSSA.	Procedures 23-25 and 23-31
SAM-15917	Community for static routes	The 5620 SAM supports assigning a community to a static route on a base or VPRN routing instance.	Procedures 22-13 and 71-12
SAM-16739	Timer-based restart of BGP session when prefix limit reached	You can specify the maximum idle time during which BGP peering is disabled before there is an attempt to re-establish the connection with the BGP peer when the prefix limit is reached.	Procedures 23-4 and 23-5
	next-hop-self for VPN routes on a route reflector	You can configure the base router BGP instance to allow a route reflector of IP-VPN routes to use its IP address as the next hop rather than BGP choosing the next hop.	Procedure 23-2
	BGP local AS prepended to AS path	The 5620 SAM supports the option of prepending only the local AS to the AS path and not the global AS when routes are advertised to an eBGP peer that is configured for local AS.	Procedure 23-2, 23-4 and 23-5
SAM-16929	RFE 145092	Enhancement to weighted session assignment method. Next Attempt configuration on L2TP sites (base and VPRN routing instance) specifies how backup tunnels are chosen in the event of session failure.	Procedure 23-34
SAM-20304	Removal of LAG limitations for high-speed interfaces	The 5620 SAM supports a maximum reference bandwidth of up to 4 Tb/s on the following interfaces: • IS-IS instance • OSPF instance • OSPF3 instance • VPRN OSPF instance	Chapter 23
SAM-21151	RFE 141713	Configurable CHAP Challenge length on L2TP tunnel group profile and L2TP tunnel profile.	Procedure 23-34

(14 of 21)

Feature ID	Feature or function	Description	See
Policy enhancements			
SAM-10395	Increasing the bandwidth limit for multicast channels in MCACs	The multicast channel bandwidth in MCAC has been increased to 10 Gbps.	*5620 SAM Parameter Guide*
SAM-11646	Route download policy	The route download policy provides a mechanism to download customer-assigned subnets from a RADIUS server to an NE.	Chapter 49 Procedures 49-7 and 49-9
SAM-12832	Override egress FC for ingress QoS policies	The 5620 SAM now supports explicitly configuring the egress FC in a SAP ingress QoS policy.	Procedure 43-1 *5620 SAM Parameter Guide*
SAM-12866	Auto-generation of filter prefix lists (CPM IPv4/IPv6 apply-path BGP base routing instance, wildcard-only	The 5620 SAM now supports the auto-generation of IP prefix lists for both IPv4 and IPv6. The auto-generated prefix list can be used in CPM filters.	Procedure 44-5
SAM-12887	BGP policy framework: sub-policies	In routing policy statements, you can include sub-policy calls to enable the grouping of match criteria over multiple policy entries for more complex match conditions.	Procedure 22-15
SAM-12936	RFE 135082: M-CAC for (S, G) in VRF; i.e. CAC on # replications per SAP	The Maximum Number of Group Sources Per Group parameter has been added to specify how many SAP group source addresses are allowed per group address.	Procedures 70-12, 68-29, 68-32, 68-49, 68-70, 71-52, 71-55, and 23-48
SAM-13044	Shared RADIUS filter terms	Shared filter entries from RADIUS allow the use of RADIUS parameters to enhance a local IP or IPv6 filter list with dynamic entries which are shared between multiple subscriber hosts. Support for Host Shared Start Entry and Host Shared Count configuration on ACL IPv6 filter policy and ACL IPv6 filter policy.	Procedures 44-2 and 44-3
SAM-13064	HTTP redirection for IPv6 filter policies	The 5620 SAM supports creating IPv6 filter entries that use an HTTP redirect action.	Procedure 44-3
SAM-13067	Flexible IPv6 PD Prefix length	A delegated IPv6 prefix length option has been added to the address pools for local DHCP servers in base routing and VPRN routing instances, as well as to PPP and DHCP hosts for subscriber management. A variable-length option (0) has also been added to the delegated IPv6 prefix length option under subscriber interfaces.	Procedure 71-59 Procedure 22-3 Procedure 65-5
SAM-13076	LAC parameter configuration at site level	You can configure LAC parameters at the L2TP site level, and the parameters can be inherited by child L2TP tunnel group profiles and L2TP tunnel profiles.	Chapter 23 Procedure 23-34
SAM-13745	Policy enhancement: Progress on release	The global policy release and distribution mechanism has been modified. When a global policy is altered and the configuration mode changes from Draft to Released, the change will no longer be automatically released to all local definitions. A release window now opens instead and allows the operator to modify the distribution list. The existence of a previous local definition on any particular NE is also indicated in this window.	Procedure 42-1 Procedure 42-4
SAM-14171	VRRP host unreachable event ICMP packet size	The 5620 SAM supports using the Padding Size parameter to adjust the size of ICMP packets sent due to a VRRP host unreachable event.	Procedure 47-1

(15 of 21)

Feature ID	Feature or function	Description	See
SAM-14180	Port fragmentation support for IPv6 packets in ACL policies	Fragmentation support has been added for IPv6 ACL filter policies for FP2- and FP3-based IOMs/IMMs/X-MASs and C-XMAs on 7750 SR and 7750c12 platforms.	Procedure 44-3 *5620 SAM System Administrator Guide* *5620 SAM Parameter Guide*
SAM-14199	Support for multiple community names in policy statement entries	Two enhancements were made to policy entry usage related to "community". 1:Adding a community list expression to the "From community". 2. The ability to specify multiple community-list names in the action part of a policy entry.	Procedure 22-15
SAM-15087 SAM-15996 SAM-16003 SAM-16014 SAM-16018	Access Egress Queue-Group Instances: Creation, sharing, redirection, and overrides	IOM3/IMM support for Access Egress Queue Group Instance creation, sharing, redirection (from a FC policer to a SAP egress port queue group), and overrides has been added. This feature applies to Ethernet SAPs on VLL Epipe, VPLS, IES, or VPRN services.	Procedure 16-8 Procedure 43-3 Procedure 67-27 Procedure 68-25 Procedure 70-21 Procedure 71-25
SAM-15955	IPv6 prefix list support: IPv6 prefix-list	The 5620 SAM now supports the concept of matching source and destination IP prefix lists for ACL IP filters and CPM filters. This works in conjunction with feature SAM-12866.	Procedure 44-2 Procedure 44-3 Procedure 44-5 *5620 SAM System Administrator Guide*
SAM-16159	RFE 140655: plcy: as path group regular expressions	This feature provides the ability to combine several AS path regular expressions into one construct (an AS Path Group) for matching in a single route policy entry.	Procedure 22-15 Procedure 22-20
SAM-16160 SAM-16167	Access Egress HSMDA Queue-Groups	The ability to allow redirection of FCs belonging to multiple SAPs on egress to a shared set of queues for Ethernet HSMDAv2 MDAs has been added.	Procedure 16-8 Procedure 43-24 *5620 SAM Statistics Management Guide*
SAM-16922	RFE 128937: New combined-network-ingr-egr Accounting Policy	A new record type (Complete Network Ingress Egress) has been added to accounting policies. The new single record combines information available in network ingress packets, network egress packets, network ingress octets, and network egress octets records.	Section 77.5 Procedure 43-24
SAM-17968	VRRP policy MC-IPsec Non Forwarding events	The 5620 SAM supports creating MC-IPSec Non Forwarding events on VRRP policies to track the MEP state of a DUT.	Procedure 47-1
SAM-19006	DCR 646149: Global Policy Check	Global ACL policies are now checked before distribution to the network. If the policy is empty, a warning is issued due to the potential impact of distributing such a policy to the network.	Procedure 44-1 Procedure 44-2 Procedure 44-3
SAM-19121	DCR 590994: Routing Policy From criteria protocol not listed	The Managed option has been added to the From criteria of a routing policy.	Procedure 22-15
SAM-19177	DCR 629502: Request to add a QoS Description field	A Description field has been added to the QoS policy added under the QoS tab on the SAP form.	Procedure 43-1 Procedure 43-3 Procedure 43-24
SAM-19369	RADIUS authentication request and accounting request scripts	The RADIUS server policy supports separate RADIUS accounting request script and authentication request script configuration. The new configuration replaces the old RADIUS request script configuration.	Procedure 49-4

(16 of 21)

Feature ID	Feature or function	Description	See
SAM-19785	RFE 128459: Port scheduler max-rate and scheduler rate range changes for FP3 IOMs	The port scheduler rate maximum range value has been increased to 400 G. The scheduler rate maximum range value has been increased to 800 G.	*5620 SAM Parameter Guide*
Service management enhancements			
SAM-288	L2-aware NAT on dual stack subscriber	Support for IPv6 host coexistent with an IPv4 L2-aware host under the same subscriber. This, in turn, requires PPPoE anti-spoof configuration on IES and VPRN group interfaces.	Procedures 70-12 and 71-60
SAM-11604	Base routing interfaces respond to traffic when GRT leaking enabled	Base routing instance interfaces reply to traffic originated from a VPRN that is leaked to GRT. GRT leaking is enhanced to enable system interfaces to respond to leaked routes. You can enable GRT self-generated traffic. The VPRN network can access global interfaces on the PE.	Procedure 71-9
SAM-11881	Tethering detection	You can enable tethering detection for an AA group or partition on a Release 5.0 or later 7750 MG.	Procedure 14-2
SAM-12970	Tunnel administrative groups	In releases prior to release 11.0, 5620 SAM steering parameters are applied on tunnel selection profiles. In the 5620 SAM, Release 11.0 and later, steering parameters are enhanced and renamed as tunnel administrative groups, and provide the additional support of SDP selection. Tunnel administrative groups allow services that use a PW template to automatically include or exclude specific provisioned SDPs. You can apply tunnel administrative groups to: • service tunnels • tunnel selection profiles • service PW templates • BGP or BGP AD VPLSs	Chapters 27 and 79
SAM-12990	IPv4 multicast for routed VPLS	The 5620 SAM supports IPv4 multicast over a routed VPLS service.	Chapter 68
SAM-12998	mLDP P2MP LSP support for provider tunnels	The 5620 SAM supports setting the Type of the P2MP LSP of a provider tunnel to mLDP.	Procedure 68-12
SAM-13000	Routed I-VPLS support	The 5620 SAM supports binding an I-VPLS to an L3 access interface, and using I-VPLS services and I-sites to create routed VPLS connectors for composite services.	Section 68.1 Chapter 74 Procedures 68-65, 70-19 and 71-30
SAM-13002	Ignore failed SAP on an Epipe service	The 5620 SAM supports configuring an Epipe service to remain in an Up state when selected SAPs fail by enabling the Hold Service Up On SAP Failure parameter on the SAP.	Procedure 67-27
SAM-13020	VPRN support of BGP confederations	You can configure BGP confederation autonomous systems on VPRN routing instances.	Procedure 71-8
SAM-13026	Open DHCP model	IPv6 configuration enhancements on local user database DHCP and PPP hosts.	Procedure 65-5
SAM-13038	Local user database MSAP defaults for IPoEv6	You can specify a local user database for DHCPv6-triggered host authentication on a capture SAP.	Procedure 65-28

(17 of 21)

Feature ID	Feature or function	Description	See
SAM-13042	Ignore magic number check	You can configure the 5620 SAM to ignore magic number checks in an LCP Echo-Request or Echo-Reply message. The LCP Ignore Magic Number parameter can be configured on an L2TP tunnel group profile, L2TP tunnel profile, and on a PPP policy.	Procedure 23-34
SAM-13048	DHCP relay proxy	Support for Relay Unicast Message configuration on L3 access interfaces and group interfaces on IES or VPRN services.	Procedures 70-1, 70-12, 71-22, and 71-60
SAM-13050	RADIUS-triggered dynamic service creation	The 5620 SAM supports configuring 7750 SR and 7450 ESS nodes to create services using information contained in RADIUS CoA messages instead of manual input.	Chapter 75
SAM-13054	Subscriber services information retrieval	You can retrieve read-only subscriber service (RaBaPol) information from a subscriber host.	Chapter 65 Procedure 65-13
SAM-13056	Default primary and secondary IPv6 DNS server address on IES and VPRN subscriber interface	Support for Default Primary IPv6 DNS Server Address and Default Secondary IPv6 DNS Server Address configuration on IES and VPRN subscriber interface.	Procedures 70-10 and 71-59
SAM-13060	ANCP enhancements	Support for Persistency Database and Idle Filter configuration on GSMP group on VPRN and VPLS service site. Ability to retrieve ANCP subscriber line information from a subscriber instance, as well as from an ANCP static map on an L2 access interface, L3 access interface, aggregation scheduler, or SAP. New RADIUS parameter (Access Loop Option) on RADIUS accounting policy.	Procedures 68-18, 71-13, and 65-15
SAM-13070	Local user database subnet draining with primary/secondary address pools	Local DHCP servers, and local DHCP and PPP hosts, support the configuration of a second host address pool to facilitate subnet draining. You can enable subnet draining on a local DHCP server in a base or VPRN routing instance.	Procedure 22-1, for local DHCP server configuration steps Procedure 65-5, for local user database configuration steps Procedure 65-6, for subnet draining configuration steps
SAM-13072	LLID pre-authentication	NAS Port Bit Specification configuration on subscriber authentication policy. Configuration of a pre-authentication policy on a local user database.	Section 49.1 Procedure 65-5 *5620 SAM System Administrator Guide*
SAM-13074	Local user database VLAN range support	You can configure a VLAN range as a DHCP or PPP local user database host identification criterion.	Procedure 65-5
SAM-13082	Ingress MAC filter on Capture SAP	The 5620 SAM supports configuring a MAC ingress filter on a capture SAP. The Type parameter of the MAC filter must be set to VID.	Procedure 65-28
SAM-13084	Unnumbered model for IPv4 and IPv6 IPoE	Support for Allow Unmatched Subnets configuration on VPRN and IES subscriber interfaces.	Procedures 70-10 and 71-59
SAM-13100	Data-triggered UE authentication	Support for data-triggered UE creation and authentication on WLAN-GWs. Authentication is via an authentication policy, with a configurable authentication hold time.	Procedure 70-13

(18 of 21)

Feature ID	Feature or function	Description	See
SAM-13112	RTSP header and URI classification	RTSP headers are selectable as application filter expression criteria in an AA group policy for a Release 11.0 or later 7450 ESS or 7750 SR, a nd for a Release 4.0 R5 or later 7750 MG.	Procedure 76-1
SAM-13116	RADIUS Export of application group, XML export of charging group	During AA group policy configuration, you can specify an application or application group identifier that is included in accounting records, and a charging group identifier that is available to OSS clients.	Procedure 76-1
SAM-13124	AARP enhancement	On an AARP instance, you can specify the master selection algorithm.	Procedure 76-2
SAM-13130	Focused cflowd	You can configure cflowd samplers to measure RTP and comprehensive performance.	Procedure 14-4
SAM-13132	Time of day policer rate adjustment	You can configure a time-of-day override for an AA policer.	Procedure 76-3
SAM-14200	Filter under NAT SAP	You can specify an ACL IP filter for upstream NAT traffic on a base or VPRN routing instance.	Procedure 24-3
SAM-14202	Protocol number added to AQP match criteria	You can specify a transport-layer protocol as an AQP match criterion.	Procedure 76-5
SAM-14204	HTTP redirect for added as AQP action	You can specify an HTTP redirect as an AQP action.	Procedure 76-5
SAM-14267	Residential summarization groups	AA partitions and unpartitioned AA groups support the configuration of residential DCP groups that specify how to summarize the data that is forwarded to the 5670 RAM. The data can be summarized by subscriber or content-server IP address to help identify regional traffic patterns of interest.	Chapter 76 Procedure 14-2
SAM-14973	5670 RAM: IP detail configuration	Services that support AA can be configured to report the IP addresses of the top users of specific applications and application groups to the 5670 RAM.	Chapter 76 for general information, and the following: Chapter 70, for IES Chapter 67, for VLL Chapter 68, for VPLS Chapter 71, for VPRN
SAM-15694	Strict no ECMP mode for uPRF	You can configure an interface that is not on an ECMP route to drop any ECMP packets by setting the uPRF mode to Strict No ECMP.	Procedure 22-10
SAM-16639	7750 SR firewall	AA session filters are now configurable for a Release 11.0 or later 7750 SR.	Procedure 76-24
SAM-21153	Multiple PPP sessions using one MAC address	In a PPP policy, you can specify how many PPP sessions to allow for one host MAC address. You can also specify whether to allow DHCP sessions on the same circuit as the PPP sessions.	Procedure 54-4
SAM-22113	Application filter entry renumbering	To accommodate the insertion of new application filter entries, you can renumber multiple existing filter entries in one operation.	Chapter 76 Procedure 76-4
OAM and service testing enhancements			

(19 of 21)

Feature ID	Feature or function	Description	See
SAM-1215 SAM-10424 SAM-10443 SAM-13231 SAM-13724	OAM Test Result Structures	The OAM test results database has been re-structured to increase the performance and storage capacity of test and test suite results.	Procedure 32-44 Procedure 77-5 Procedure 77-8 Procedure 77-11 Procedure 77-12 Procedure 77-13
SAM-12870	Twamp Server support extension	Twamp Server support extended to include IPv6	Procedure 13-11
SAM-12872	Ethernet CFM - Symmetric QoS/CoS behavior	A property has been added to allow specifying the Linktrace Response (LTR) value for a MIP.	Procedure 78-1 *5620 SAM Parameter Guide*
SAM-12876	Ethernet CFM Primary VLAN support	The Primary VLAN feature allows an operator to set a VLAN identifier to perform additional ETH-CFM extraction checking. Primary VLAN enabled MEPs (on VPLS and Epipe services) will only perform the additional extraction routines for MEPs configured under the same SAP and that have an enabled Primary VLAN.	Section 78.1 Procedure 78-1 Procedure 68-37 Procedure 67-27
SAM-12880	802.3ah enhancement - EFM passive status	The Ignore EFM State property has been added to allow specifying the effect of a port's EFM-OAS status on the operational state of that port	Procedure 32-42 *5620 SAM Parameter Guide*
SAM-14174	Configurable ping size of up to 1500 bytes for static cpe-check	A configuration option has been added for static routes (IPv4/IPv6) with CPE-check enabled to allow setting the packet length used for ICMP ping test messages.	Procedure 22-13 *5620 SAM Parameter Guide*
SAM-14207	Facility MEP enhancement	ETH-CFM Port & LAG Facility MEPs now support Null encaps in Access and Network modes.	Procedure 78-1
SAM-14209 SAM-15560	Extended VCCV-Ping and VCCV-Trace support for VPLS Test Suite	The 5620 SAM now support the selection of Spoke-SDPs within a VPLS for VCCV-Ping and VCCV-Trace tests	Procedure 32-23 Procedure 32-24 Procedure 77-1
SAM-14211	Align spoke-interface behavior of vprn-ping and vprn-trace with that of a SAP	Spoke interface behavior has been modified to match that of a VPRN SAP. In this way, packets are never forwarded over the spoke interface, but a reply will be made if the prefix is reachable via the spoke interface. Otherwise, the packet is dropped in CPM.	*5620 SAM Parameter Guide*
SAM-15563	VPLS map changes for VCCV-Ping and Trace for PW	The VPLS/MVPLS service map now supports the creation of the VCCV-Ping and VCCV-Trace tests.	Chapter 32
SAM-20357	RFE 130107:VCCV-Ping Test Suite generation for H-VPLS & Service Connector	The OAM VCCV-Ping test has been added to the Test Suite test generation for H-VPLS & Service Connectors	Procedure 32-23 Procedure 77-1
5620 SAM documentation enhancements			
—	Creation of a new *5620 SAM System Administrator Guide*	Consolidates many of the tasks performed by a user with a 5620 SAM admin role into a separate guide. The primary areas covered include: • 5620 SAM and UNIX security management • advanced configuration • routine maintenance The former *5620 SAM Maintenance Guide* has been incorporated into this new guide.	*5620 SAM System Administrator Guide*

(20 of 21)

Feature ID	Feature or function	Description	See
—	Creation of a new *5620 SAM LTE OSS Interface Developer Guide*	Provides information about developing LTE OSS applications, including information about the 3GPP OSS interface components and architecture, understanding the 5620 SAM-O schema in the context of LTE, compliance with 3GPP standards, and typical operational scenarios. The former *5620 SAM 3GPP OSS Interface Developer Guide* and *5620 SAM 3GPP OSS Interface Compliance Statements* documents have been incorporated into this new guide.	*5620 SAM LTE OSS Interface Developer Guide*
—	Parameter search tool added to on-line user documentation	A new Parameter search tool is available in the on-line user documentation. You can search for details about a particular parameter using either its displayed name on the GUI or its OSS (XML) name. You can also use the tool to display all parameters on a form. 2 — 5620 SAM system overview

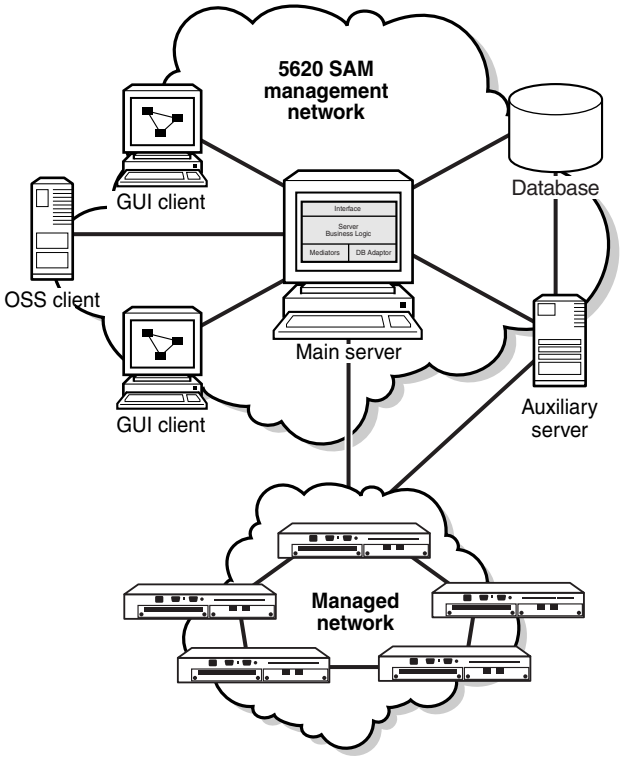
2.1 5620 SAM system overview *2-2*

2.2 About this guide *2-3*

2.1 5620 SAM system overview



The Alcatel-Lucent 5620 Service Aware Manager, or 5620 SAM, enables end-to-end network and service management of Alcatel-Lucent NEs, and limited management of third-party NEs. Third-party NEs are referred to as generic NEs, or GNEs. The 5620 SAM enables you to perform tasks that include the following:

- Provision a network with fast and easy configuration and multi-vendor scripting workflows that reduce risk of error and shorten network deployment time.
- Accelerate setup for integrated IP/optical performance and SLA monitoring with service-aware diagnostics that validate end-to-end services and IP/optical paths.
- Prevent service degradation through end-to-end power control, monitoring, tracing. and fault localization.
- Correlate faults to identify whether the problem resides in the IP or optical layer, and the root cause. This function simplifies troubleshooting and isolates problems before services are affected.

5620 SAM system architecture

A basic 5620 SAM system has client, server, and database components that are deployed in a standalone or redundant configuration. Figure 2-1 shows a simple 5620 SAM management network, which contains the 5620 SAM components, and a managed network of NEs.

Figure 2-1 Standalone 5620 SAM system

A 5620 SAM operator performs network management or system administration tasks using a GUI or OSS client that connects to a main server. The main server sends and receives NE management traffic, and directs optional auxiliary servers to perform tasks such as NE statistics collection. Main and auxiliary servers store information in the same 5620 SAM database.

See the *5620 SAM System Architecture Guide* for detailed system design information.

Supported network management modules

The 5620 SAM provides network management functionality using the following modules:

- SAM-A—OAM tools, service assurance functions, fault correlation using alarms, topology views, and statistics management
- SAM-E—device mediation, equipment navigation and management, security, CLI access, backup and restore, alarm management, real-time equipment statistics, and inventory and reporting
- SAM-O—OSSI package that includes an HTTP SOAP interface for general network management and configuration, a subscription-based JMS interface for event monitoring, and 3GPP-compliant CORBA and TAO interfaces for LTE network management
- SAM-P—service provisioning, templates, and management of customers, subscribers, tunnels, paths, and policies
- Mobile Services Package—LTE-specific package for LTE NE discovery and LTE network management
- Supervision module—a web-based application that provides alarm monitoring based on user-defined views and groups

2.2 About this guide

The *5620 SAM User Guide* provides information about using the 5620 SAM to manage service-aware IP/MPLS networks, including GUI operations, device and network management, and policy and service management.

This guide contains the following volumes:

- Getting started—contains general 5620 SAM information including the following:
  - a system overview
  - feature lists by release
  - basic GUI operation instructions
  - GUI map management
- Device management—contains information about device functions that are not directly related to networking, including the following:
  - device support
  - preparing devices for 5620 SAM management
  - 5620 SAM device and equipment management functions

- Network management—contains information about network functions including the following:
  - general routing and forwarding
  - protocol-specific routing and forwarding
  - traffic management using MPLS and service tunnels
  - fault management
  - OAM diagnostic tests
  - NE redundancy
- Policy management—contains information about configuring and applying 5620 SAM policies that define rules for NE, network, or 5620 SAM operation
- Service management—contains information about managing customer services, including the following:
  - service creation and configuration
  - customer and subscriber management
  - service verification, troubleshooting, and root-cause analysis
  - scheduling of routine, service-related operations

3 — 5620 SAM GUI overview

3.1 5620 SAM GUI overview *3-2*

3.2 Using search functions *3-16*

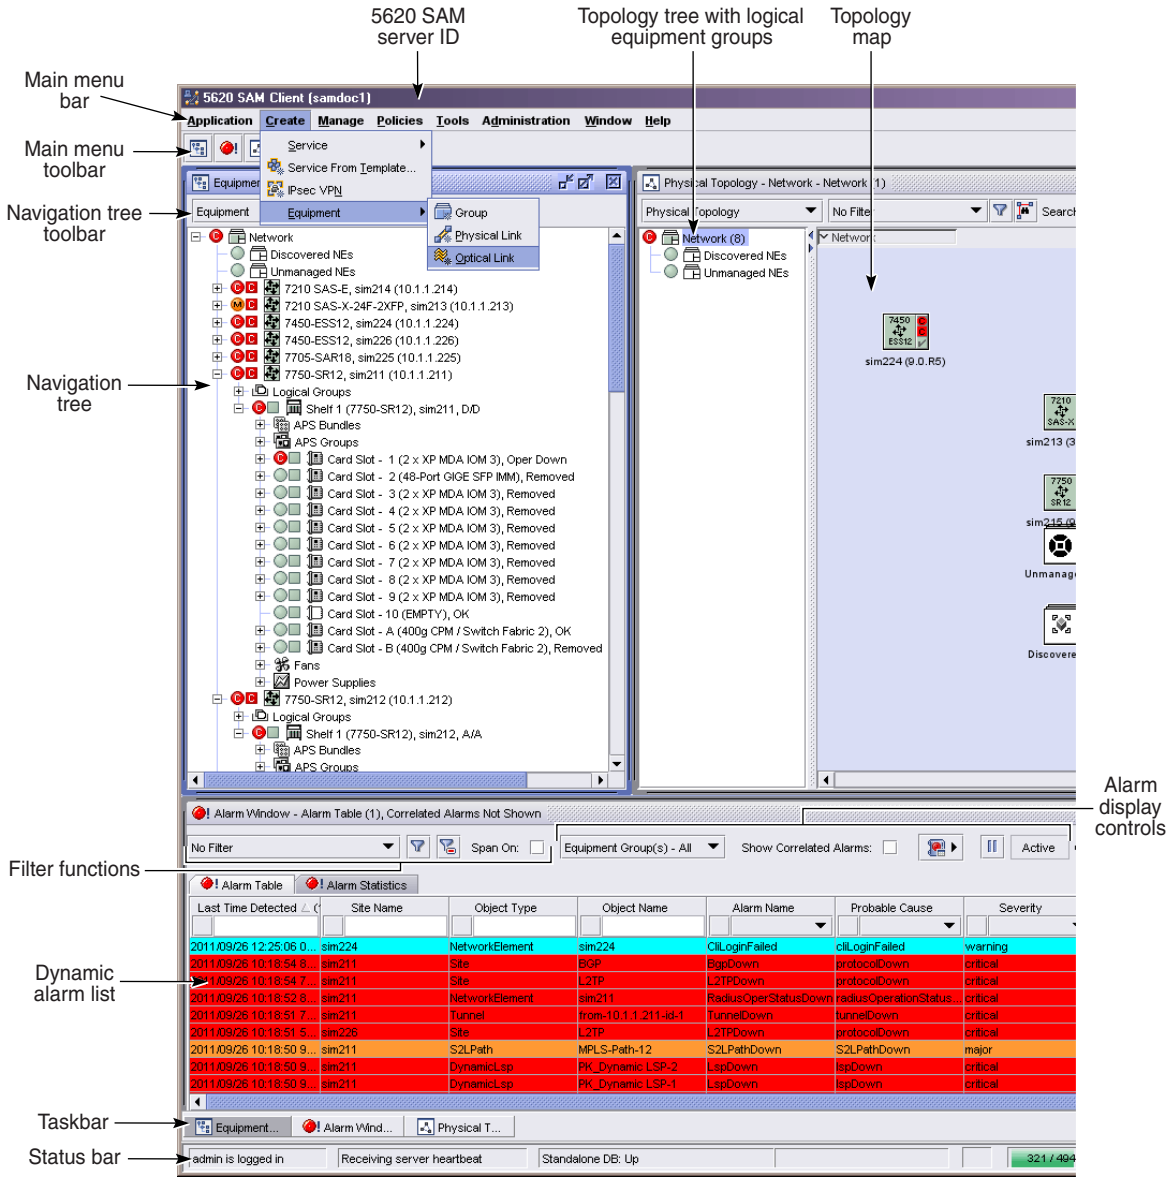
3.3 Workflow to use the 5620 SAM GUI *3-21*

3.4 5620 SAM GUI opening and closing procedures *3-21*

3.5 Basic 5620 SAM GUI operation procedures *3-31*

3.6 5620 SAM GUI user preferences configuration procedures *3-40*

3.7 5620 SAM GUI search procedures *3-45*



3.1 5620 SAM GUI overview

The 5620 SAM GUI on a 5620 SAM client station allows an NOC operator to perform device, network, policy and service management functions. Multiple 5620 SAM GUI clients can connect to a 5620 SAM server.

This chapter describes general GUI operations such as starting and stopping the GUI, configuring GUI user preferences, creating, managing, and customizing workspace elements, basic GUI operations, and performing searches on the GUI.

The main GUI workspace elements are shown in Figure 3-1.The three main windows, which open by default, display the navigation tree, Alarm Window, and topology map.

Figure 3-1 Main 5620 SAM GUI elements

20995

Custom workspaces

The 5620 SAM supports custom workspaces. You can configure menus, toolbars, navigation tree labels, map icon labels, and window displays to suit your operational requirements. You can save and select private and public workspaces, and update saved workspaces after a 5620 SAM upgrade. You must have the required scope of command permissions to customize workspaces. Permissions for workspaces are set by a system administrator. See "5620 SAM custom workspaces" for more information.

Shortcut keys

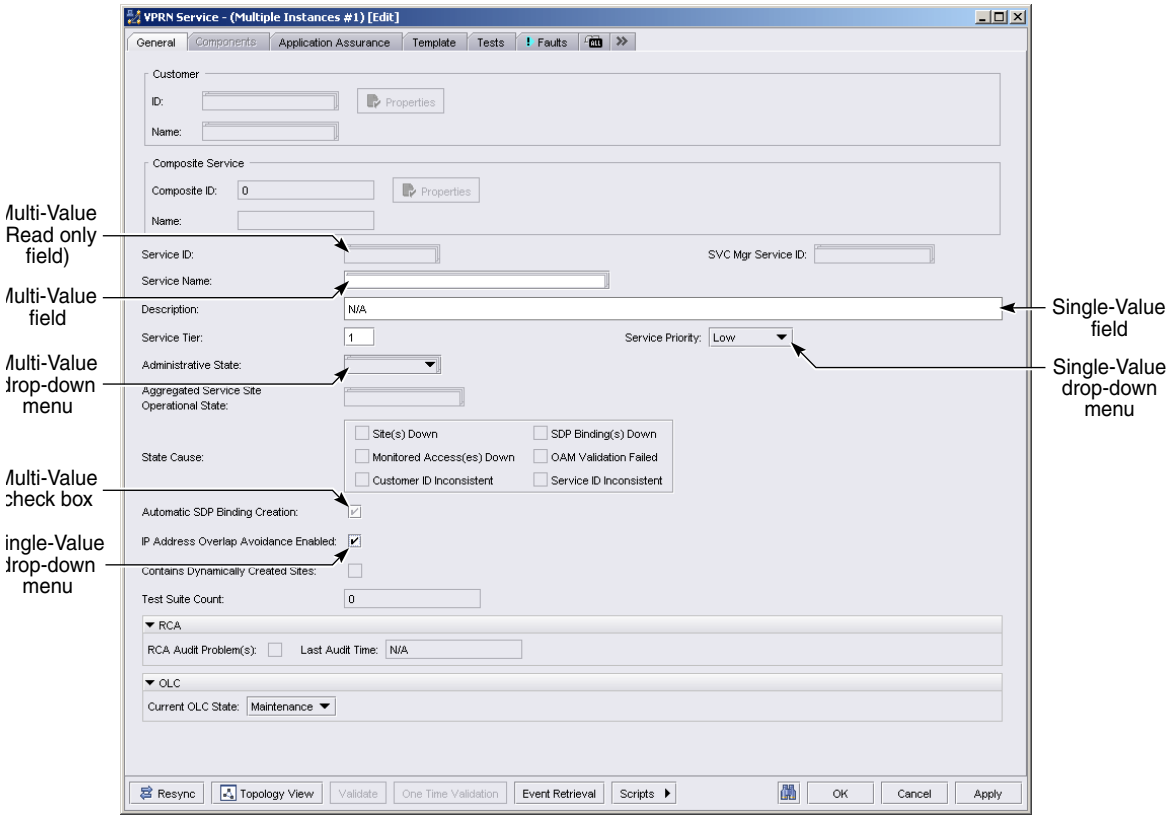
Menu items can be accessed using shortcut keys. To access menu items using the shortcut keys, simultaneously press ALT-*key* where *key* is the underlined letter of a top level of the main menu. For example, ALT-P displays the Policies menu. Pressing a key that corresponds to the underlined letter of a displayed menu item opens that item.

Windows and forms

The 5620 SAM GUI displays windows and forms. The main GUI workspace elements, which are displayed in windows, are the navigation tree, Alarm Window, and topology map. Forms are displayed in response to menu options, icons, or shortcut keys, and are typically used to configure device and 5620 SAM parameters. Forms are also used to display the status of objects, or to perform FCAPS operations. Forms allow searches, display lists and provide options. See "Forms" in section 3.1 for more information.

Multi-edit property forms

The 5620 SAM GUI allows users to configure multi-value fields that are common to all property forms. Multi-edit values include text fields, number fields, mirrored property fields, and combo boxes. Changes made are propagated to all objects that are multi selected. The following apply:



- If a field is read-only it is dimmed.
- Property values that are different across property forms are displayed as a multi-value field and can be edited, if they are not read-only.
- Property values that are the same across property forms are displayed as a single value field.
- If a cursor is displayed in a multi-value field and no value is entered, the field still displays a multi-value when the cursor is moved to another field.
- If a value is entered, the field is no longer multi-value, and the new value is applied to all instances edited when a user applies the changes.
- If a previously populated value is set to blank, and a user applies the change a warning message is displayed. The warning message contains the field names with the corresponding tab names.

Note — The OK and Apply buttons are disabled if a mandatory field is left blank, even if other values have been changed on the form. When the mandatory field is updated, the OK and Apply buttons are enabled.

Example 1: A user edits two objects, one with a description field entered, and the other description field is blank. The multi-value description field on the Multiple Instances (Edit) form is displayed. When the user sets the field value to blank in the Multiple Instances (Edit) form, both the property forms will have a blank description. When the user applies the changes a warning message is displayed.

Figure 3-2 Multi-value property form

23740

5620 SAM clipboard

You can use the 5620 SAM clipboard to save and copy property form identifier links. A property form identifier link is a unique internal address that the 5620 SAM assigns to a form or window. Multiple property form identifier links can be saved to the 5620 SAM clipboard at the same time, and then used for navigating to the forms that they identify. See Procedures 3-15 and 3-16.

Note — The Copy Property Form Identifier is applicable only to property, alarms and statistic forms.

Floating windows

The 5620 SAM GUI has floating windows that you can move, size, hide, and move to the foreground to provide the required workspace to perform a task. By default, the navigation tree window appears on the left side of the GUI, the physical topology map window on the right, and the Alarm Window on the bottom.

If you need to move a window or form to the foreground, click on a taskbar button, choose a window menu item, or press the shortcut keys. If you need to open a closed window or form, select a toolbar icon, choose an application menu item, or press the shortcut keys.

User preferences

You can use the user preferences form to customize the localized client settings for a number of GUI, statistics plotter, script management, and workspace settings to meet your specific operational requirements. Table 3-5 lists the location of user preference information in the 5620 SAM customer documentation suite. You can access the User Preferences form from the Application menu. You can configure user preferences for the following settings:

- Configuration forms, default time zones, span of control, topology windows, alarm windows, to access test objects, to initiate bulk change operation, to display the number of objects on a list form.
- Statistics plotter
- Script management
- Workspace customization

See section 3.6 for more information.

System preferences

You can use system preferences to customize or change the default value for a number of 5620 SAM global settings and functions to meet your specific operational requirements. You need a user account with the Administrator scope of command role to configure system preferences. You can configure system preferences for the following settings and functions:

- General preferences
- Services
- TCA alarms
- Statistics
- STM
- User activity
- OLC state and scheduling
- Policies
- Custom NE properties

Caution — Changing a system preference parameter value may adversely affect the 5620 SAM service or function. Do not change the parameter value from the default without contacting Alcatel-Lucent technical support.

You can access the System Preferences form from the Administration menu. See the system preferences configuration information in the *5620 SAM System Administrator Guide*.

External windows

A window or form in the GUI can be moved out of the main workspace and managed as an external window; for example, on a second monitor. For more information about managing external windows, see Procedure 3-10.

External windows are managed by the operating system (and not the 5620 SAM). They maintain the window icon that is used in the GUI and are placed in a group of open 5620 SAM windows on the operating system taskbar. Any windows or forms that are opened from an external window appear as separate external windows. The 5620 SAM GUI taskbar does not display external windows, but they can be viewed and moved to the foreground using the Window menu. The Window menu also contains options to Close All Internal Windows or Close All External SAM Windows.

Note — An external window or form cannot be moved back to the 5620 SAM GUI. You must close the external window and re-open the window in the GUI.

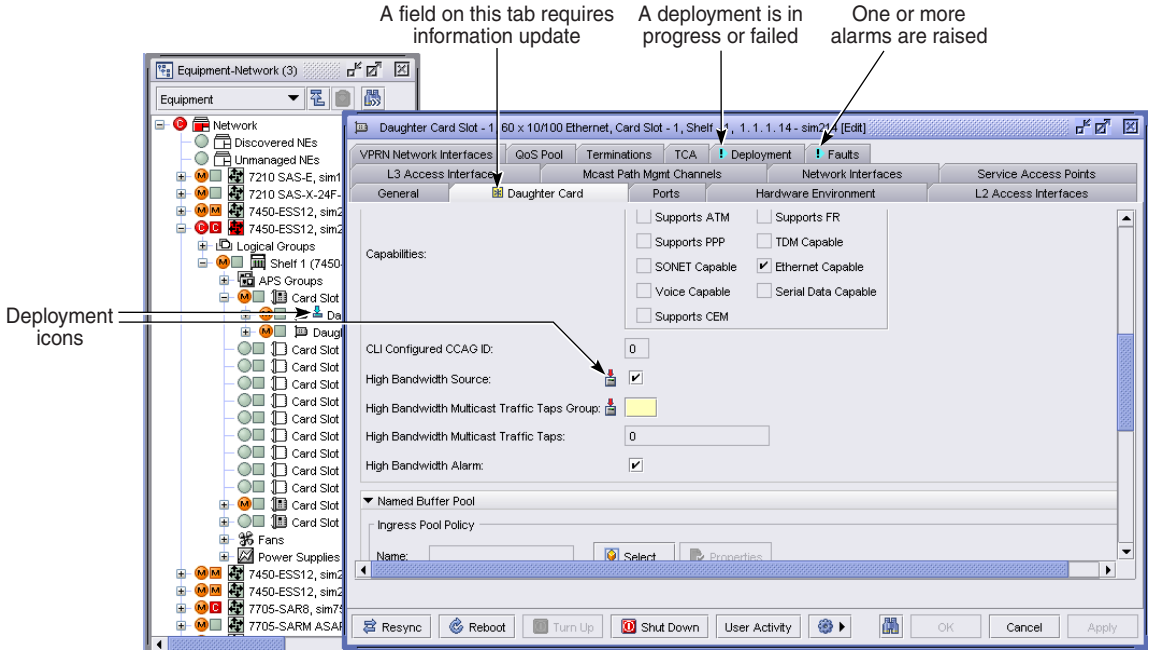
Navigation tree

The navigation tree lists the managed equipment, services, and protocols that are configured on the NE. The navigation tree includes a view selector located on the navigation tree toolbar. The view selector is a drop-down menu that lists the physical and logical network views that are available.

The navigation tree is accessible from the main workspace, configuration forms, and maps.

See chapter 5 for more information about the navigation tree.

Contextual menus



Contextual menus allow you to create, configure, and manage specific parameters for the object and child objects from the navigation tree or from maps. You access the contextual menus by right-clicking on the navigation tree object or on the map object.

See chapter 5 for more information about contextual menus.

Indicators and icons

Indicators and icons inform you of activity that is in progress or requires attention, and can appear and disappear depending on the activity that is occurring in the 5620 SAM, as shown in Figure 3-3.

Figure 3-3 Indicators and icons

22870

For instance, a warning indicator appears on the Deployment tab when a configuration change is not fully deployed to an NE. A warning indicator appears on the Faults tab when the 5620 SAM has raised alarms against the object or a related object. An asterisk appears on a tab or panel title bar to indicate that a field contains incorrect data, or that a mandatory field requires data.

A deployment icon appears beside parameters on an object properties form for which a deployment is in progress or has failed, beside affected navigation tree objects, on info tables in map views, and in list forms.

An asterisk on a tab or panel title bar indicates that a field contains incorrect data, or that a mandatory field requires data.

See chapters 12 and 31, and "Collapsible panels" in this chapter for more information.

Additional Text Find icon

The Additional Text Find icon is available on object property forms. See Procedure 31-5 for more information. You can configure an additional text policy to display specific information about an alarmed object in the additional text column of the dynamic alarm list and on the Alarm Info form.

Task manager

The Task Manager allows 5620 SAM administrators and support personnel to monitor progress of operational tasks. To monitor the 5620 SAM Task Manager, see Procedure 3-23.

The Task Manager monitors the following operations:

- all write operations that are performed from the 5620 SAM GUI; for example, when you click on the Apply or OK buttons
- all write operations that are performed using the OSSI
- some read operations; for example, when you click on the Resync or Collect All buttons

Only 5620 SAM administrators can change the Task Manager default settings. See "To change the 5620 SAM Task Manager default settings" in the *5620 SAM System Administrator Guide*.

Text message

Users can send broadcast messages to some or all active GUI users logged into the 5620 SAM. This is useful for sending maintenance and similar notifications to active users.

See Procedure 3-11 and "To send a broadcast message to 5620 SAM GUI users" in the *5620 SAM System Administrator Guide* for more information.

Maps

Each map displays network objects and information, and provides contextual menus to open forms that display additional information. In the context of a 5620 SAM map, a link object, such as a physical link or service tunnel, is called an edge. An object other than a link between objects, such as an NE or a topology group, is called a vertex.

See chapter 6 for more information on maps.

Alarm Window

The Alarm Window allows you to view and manage incoming alarms from network components which are displayed in the dynamic alarm list and are associated with objects that represent the affected network components.

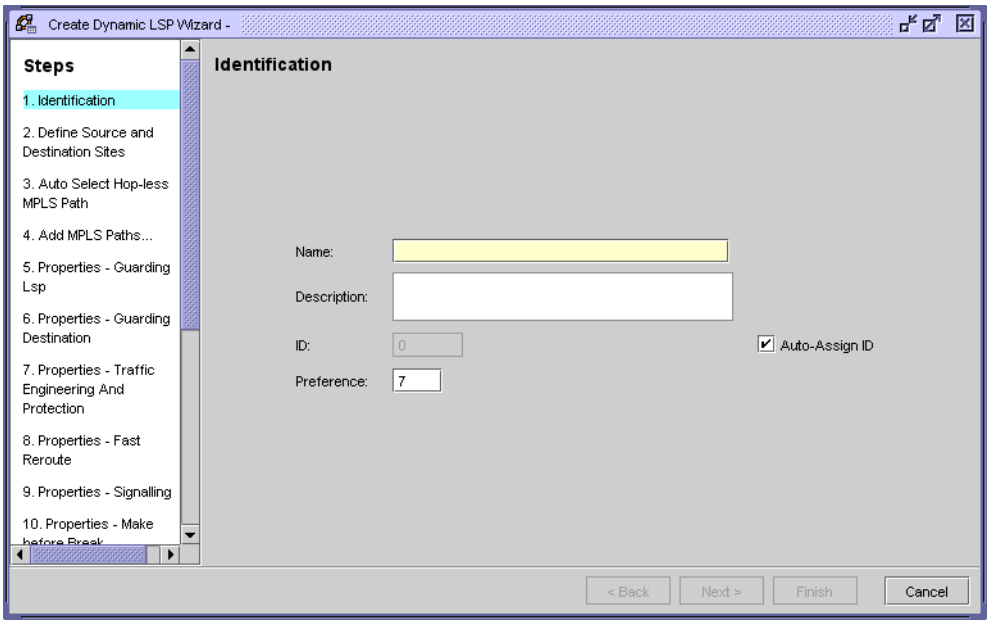
See chapter 31 for more information on the Alarm Window.

Forms

5620 SAM forms are used to do the following:

- configure device and 5620 SAM parameters
- display the status of an object
- perform FCAPS operations

A form can be displayed anywhere in the GUI. A newly opened form is displayed in the foreground. You can do the following:



- organize forms according to operator preference
- compare information on multiple open forms
- navigate quickly to another open form by choosing the form from a list

A form has a title bar that displays object information. The displayed object name is the name specified during object creation. If the object is not named, a default name is used. When a form is minimized, a tool tip displays the title bar information. The Window menu lists the open forms.

Some configuration activities lead the operator through a series of forms, each of which represents a step in the configuration process. Such a form is called a step form. You must click on the Next button to proceed to the next step. Figure 3-4 shows the first step in a step form sequence. When the configuration sequence is complete, you must click on the Finish button to commit the changes. Each step must be performed to complete the configuration activity.

Note — Some steps open a new step form. You must complete the steps in the new form before you can return to the previous form. After you click on the Finish button, the previous form reappears.

Figure 3-4 Step form

More Actions button

Several buttons appear at the bottom of the 5620 SAM configuration forms and on the right panel of list forms, as shown in Figure 3-7, that perform various functions. Buttons that do not fit are available as a menu item when you click on the More Actions button, as shown in Figure 3-6. In addition, some of the buttons may not be visible when you resize a form. The affected buttons become menu items when you click on the More Actions button.

To resize a form, click on the maximize or restore button at the top right corner of the form, or click on a border or corner and drag the border or corner to shrink or enlarge the form.

User Activity button

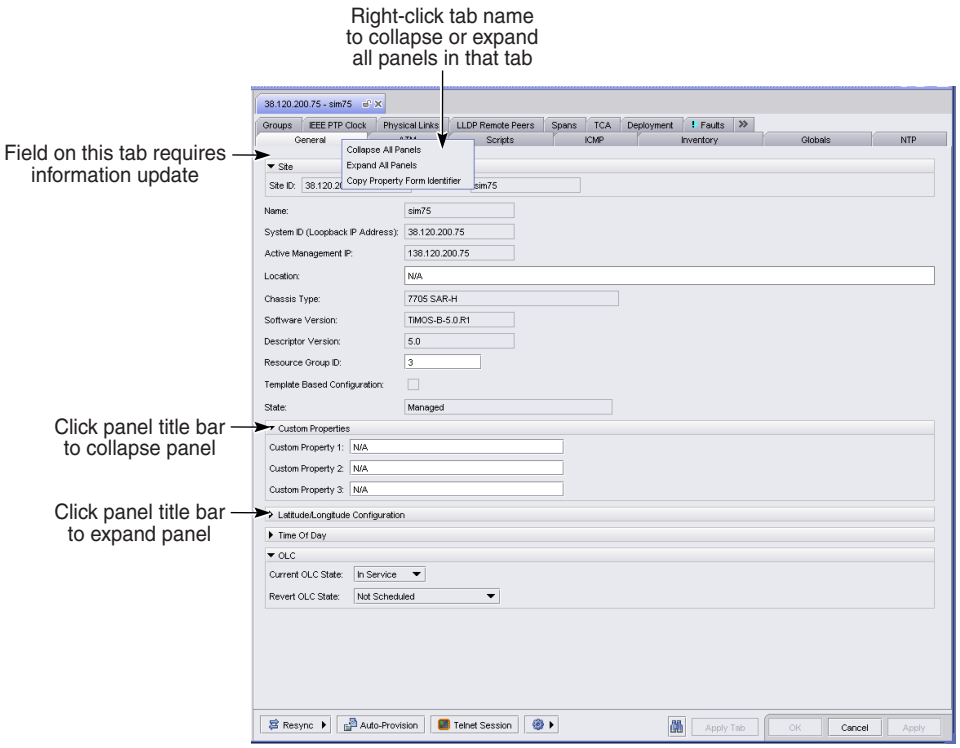
The User Activity button on an object properties form opens a form that lists the recent 5620 SAM user actions performed on the object. See "User activity logging" in the *5620 SAM System Administrator Guide* for more information.

Custom tab display

Some forms in the 5620 SAM open by default with hidden tabs. You can display selected hidden tabs or all tabs while the form is open by clicking on the tab selector or the Show All Tabs button. See Procedure 3-21.

You can also customize the display of tabs on configuration forms, and save your tab display preferences. For specific forms, you can display, hide, or arrange the sequence of tabs according to your operational requirements. See Procedure 3-20. Custom settings for tabs on configuration forms are saved as user preferences. They are not affected by a change of workspaces.

A system administrator can configure the default behavior for custom tab configuration from the System Preferences form. See the *5620 SAM System Administrator Guide*.



Collapsible panels

The 5620 SAM form panels can be collapsed to hide areas that are not of interest to the specific user or expanded to display all areas in a form.

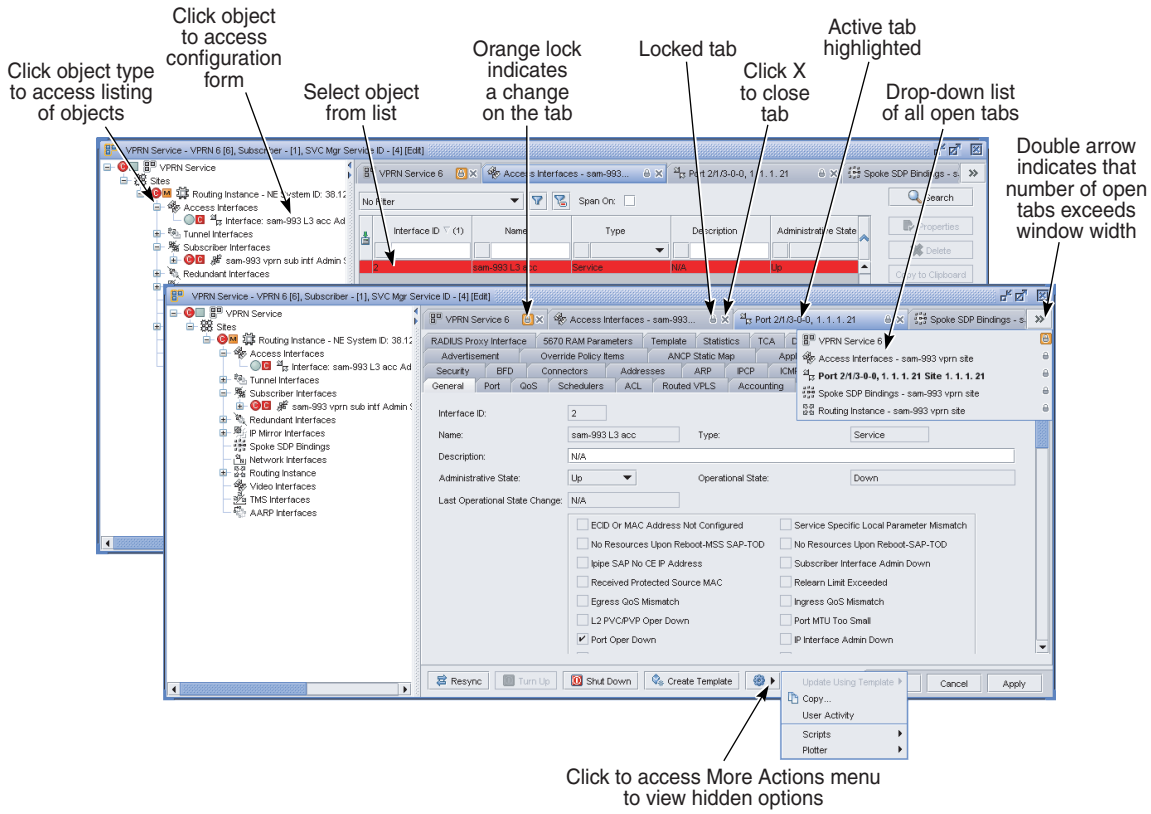
To collapse or expand a panel, click on the title bar of the panel, as shown in Figure 3-5. You can collapse or expand all of the panels on the tab by right-clicking on the tab title and then choosing the Collapse All Panels or Expand All Panels option.

When a configuration form closes, the current state of the panel is saved for that object type. When a user opens a configuration form, the last saved state of the panel is displayed.

Figure 3-5 Collapsible panels in forms

23726

Navigating service configuration forms



Service configuration forms allow you to create and manage services in the 5620 SAM. You can access service configuration forms from the Create menu or the Manage menu.

When you first access a service configuration form, the form displays a navigation tree on the left and the General tab on the right. The navigation tree lists the objects that are configured for the service. To access the configuration forms for the individual objects from the navigation tree, use one of the following methods:

- Click on the object type to access a filterable list form and choose the object.
- Click on the object in the navigation tree.

Figure 3-6 shows both methods of accessing object configuration forms from the navigation tree.

Figure 3-6 Service configuration form navigation

Navigating network element configuration forms

NE configuration forms allow you to create and manage network devices in the 5620 SAM. You can access NE configuration forms from the following locations:

- 5620 SAM GUI navigation tree. See Procedure 13-2 for more information.
- Manage menu
- Physical topology map
- Service tunnel topology map

When you first access an NE configuration form, the form displays a navigation tree on the left and the General tab on the right. The navigation tree lists the devices that are configured on the NE. To access the configuration forms for the individual devices from the navigation tree, click on the object in the navigation tree.

See chapter 5 for information about navigation tree capabilities.

Displaying multiple configuration forms

When you first access a configuration form, the form is unlocked. If you choose another object from the navigation tree, the unlocked form is replaced by the newly selected object configuration form. To lock the configuration form, click on the open lock icon on the configuration form tab, or right-click on the tab and choose lock from the drop-down menu. When the configuration form is locked, the form remains open until the user closes the form. You can add configuration forms to the workspace by choosing objects from the navigation tree and then locking each form.

Note — Locked forms can only be closed (and not unlocked).

Each form is represented by a tab. If the tabs of the open forms exceed the width of the window, double arrows are displayed. Click on the double arrows to display a drop-down menu of the open configuration forms. You can access the open configuration forms from the drop-down menu or from the tabs. Figure 3-6 shows multiple open service configuration forms and the navigation options.

Object configuration forms can be undocked from the main configuration form window by right-clicking on the component tab title and selecting Undock. The undocked form opens in a new window and the configuration form tab is removed from the main configuration form window. Any changes that are made on the undocked object configuration form are immediately sent to the server.

Note 1 — The root object of the configuration form cannot be undocked, for example the IES service configuration form.

Note 2 — List forms cannot be undocked, for example a listing of access interfaces on a site.

Note 3 — Undocking is not supported on (Create) forms.

Note 4 — Any modified tab cannot be undocked

When the mouse point moves over the object form label, a tool tip displays a descriptive label for the form.

Modified configuration forms

If a configuration form is modified, the form changes to locked and the lock icon appears in orange to indicate that a modification occurred.

For service configuration forms, if an object is added to the service configuration, the new object appears in the navigation tree and the configuration form is displayed with the orange lock icon. The icon remains orange until the modifications are saved or discarded.

For equipment configuration forms, if an object is added from the navigation tree, the change will be made immediately. However, if a change, such as adding or removing an object, is made to an equipment configuration form, the change will be reflected on the form immediately, but it will not be reflected on the navigation tree until the Apply Tab, OK, or Apply button has been pressed.

Note — For the NE and composite service configuration forms, changes implemented by pressing the Apply tab apply only to the current object-level tab. Changes implemented by pressing the OK, Apply, or Cancel buttons apply to the entire form.

If you attempt to close a modified configuration form that contains unsaved changes, a message prompts you to specify whether to discard the changes or return to the display. If you attempt to close a modified configuration form that has related forms with unsaved modifications, the message lists the forms that have unsaved changes.

Parameter Search Tool

The Parameter Search Tool is part of the online user documentation that is available under Help→User Documentation in the 5620 SAM client main menu. The tool allows you to view information about parameters and configuration forms in the 5620 SAM. You can select a form name from a list of configuration forms, or you can search using one of three criteria:

- Parameter GUI display name
- Parameter XML name
- Form GUI name

Search results contain information about forms and parameters, including applicable devices, restrictions, the defaults and ranges of parameters, and other information. The information is displayed in HTML format in a web browser. Dynamic links allow you to navigate the tool to access more information, such as parameter options (also called enumerations).

The Parameter Search Tool does not include information about some types of forms or parameters that are specific to the 5620 SAM, such as:

- User preferences
- System preferences
- OLC state
- Faults or Deployment tabs

For parameters not included in the Parameter Search Tool, information is available in the *5620 SAM Parameter Guide*.

See Procedure 3-14 for information about how to use the Parameter Search Tool.

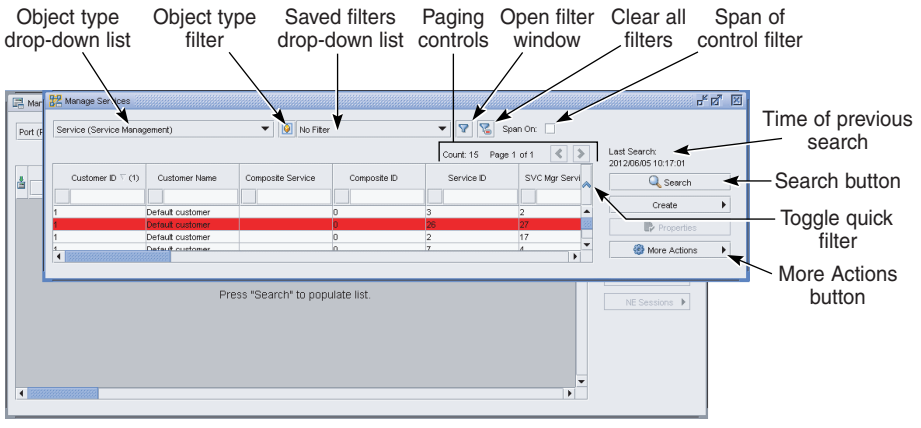
Localized language support

The 5620 SAM GUI supports localized language display. Localized language display, also known as internationalization, displays 5620 SAM GUI text in a specified language. The localized language setting applies to most 5620 SAM GUI objects, except system components and database objects. Contact Alcatel-Lucent support for more information about localized language support.

Note 1 — The 5620 SAM supports localized language settings using predefined strings, and does not translate data to different languages.

Note 2 — The 5620 SAM-O does not support language localization.

3.2 Using search functions



You can search for many types of objects using list forms, maps, and the navigation tree. For lists that do not populate automatically, the result panel displays the following message when you first open the list form:

```
Press "Search" to populate list.
```

After you perform a search, a list form or map enables you to manage the results, for example, view or modify or change object information, or delete objects. Figure 3-14 shows a filterable list form that displays the following information:

- number of returned search items
- time of the most recent search
- filter controls for refining the list of returned search items
- paging controls for browsing through multiple pages of returned search items

Figure 3-7 Filterable list form

If the number of search results exceeds the allowed limit, the 5620 SAM displays a dialog box that indicates the number of results returned. You can use filter options to refine the search criteria and limit the search results.

A search returns one page of results at a time. You can configure the number of items per page on the User Preferences form. The paging controls on a list form become active when the number of items returned exceeds the page limit. You can use these controls to move sequentially through the pages of listed information or jump directly to a specific page.

You can save and reuse multiple search filters in list forms and maps. Only the saved filters of the current object type and ancestor types are available. You can use an advanced filter form to refine the search criteria using literal values, and different types of operators, such as arithmetic and Boolean.

Note — A tab that lists timestamped information, such as the Statistics tab of a properties form, contains a default saved filter for statistics collected in the most recent time period, for example, the last hour. The time period depends on the type of object specified in the object type drop-down menu. See "To modify the default time period of statistics displayed by the Statistics Manager search filters" in the *5620 SAM System Administrator Guide* for more information.

See chapter 6 for information about creating map filters.

Using search filters

When you perform a search from a list form, you can configure filters. A filter is based on a combination of attributes, functions, and values. When searching for objects with an ID value, you can search based on LESS THAN, EQUAL TO, or GREATER THAN. For text-type parameters, you can use advanced search functions, such as EQUALS or CONTAINS. Consider the following.

- You can set filters based on letters, numbers, and special characters.
- The search filters are typically case-insensitive; a search on 'ABC' and 'abc' returns the same list. WILDCARD searches, however, are case-sensitive.

Table 3-1 describes the operation of available 5620 SAM search functions.

Table 3-1 Search functions

Operator	Description
APPROXIMATELY EQUAL	When set to APPROXIMATELY EQUAL, which applies to timestamp fields, such as the Last Time Detected field in the Alarm Window, the search returns only items that match the specified time criterion, which you can specify using 1m resolution.
BETWEEN	When set to BETWEEN, which applies to timestamp fields, such as the Last Time Detected field in the Alarm Window, the search returns only items with a timestamp that is within the specified range. Click on the Select icon beside the column heading filter field to specify a range.
CONTAINS	When set to CONTAINS, the search returns only items that match the entered value. For example, a Description CONTAINS search of 'AB' returns 'ABC Industries' and 'Calgary, AB'. Any empty CONTAINS search returns all items. This search parameter is not case sensitive.

(1 of 2)

Operator	Description
DOES NOT CONTAIN	When set to DOES NOT CONTAIN, the search returns only items that do not match the entered value. For example, a Service Name DOES NOT CONTAIN search of 'epipe' returns only services such as 'IES' services that do not contain 'epipe' as part of the service name. This search parameter is not case sensitive.
EQUALS	When set to EQUALS, the search returns only items that equal the value; for example, Administrative State set to Down.
GREATER OR EQUAL	When set to GREATER OR EQUAL, the search returns only items that have a value greater than or equal to the specified criteria.
GREATER THAN	When set to GREATER THAN, the search returns only items that have a value greater than the specified criteria.
IS BLANK	When set to IS BLANK, the search returns only items that do not have a value. For example, an Associated Template IS BLANK search of services returns services that have no associated template (where the associated template is blank).
IN THE PAST	When set to IN THE PAST, which applies to timestamp fields, such as the Last Time Detected field in the Alarm Window, the search returns only items that have a timestamp that is between the specified time and the present. Click on the clock icon beside the column heading filter field to specify a time criterion.
LESS OR EQUAL	When set to LESS OR EQUAL, the search returns only items that have a value less than or equal to the specified criteria.
LESS THAN	When set to LESS THAN, the search returns only items that have a value less than the specified criteria.
MATCHES ALL	When set to MATCHES ALL, the search returns only items that equal the property values selected; for example, if Monitored Access(es) Down and Site(s) Down are selected, the search returns only items that match all of the selected property values.
MATCHES ANY	When set to MATCHES ANY, the search returns only items that equal at least one of the property values selected; for example, if Monitored Access(es) Down and Site(s) Down are selected, the search returns only items that match one or more of each of the selected property values.
NOT EQUAL	When set to NOT EQUAL, the search returns only items that do not match the selected criteria.
WILDCARD	When set to WILDCARD, you can use the ? character as a single-character wildcard, and * as a multi-character wildcard. For example, a Description WILDCARD search of 'VPRN ?' returns 'VPRN 4' and 'VPRN 8', but not 'VPRN Texas'.

(2 of 2)

Searches using Boolean operators

You can perform advanced searches that use multiple criteria to obtain more precise results. Boolean operators are used to limit and expand searches to the criteria that are specified in the search expressions. Boolean operators can be nested to combine several search expressions into one search expression.

Table 3-2 lists and describes the Boolean search operators.

Table 3-2 Boolean search operators

Boolean operator	Description
AND	When set to AND, the search returns only items that meet all of the specified search criteria.
OR	When set to OR, the search returns only items that meet at least one of the specified search criteria.
NOT	When set to NOT, the search returns only items that do not meet the specified search criteria.

Invalid attributes or values

When a saved search filter contains attributes or values that are not available for the object being searched, the invalid attributes or values are displayed in red text in the filter window. As long as invalid attributes or values exist, the Save button of the filter window is disabled. When a filter with invalid attributes or values is applied, the invalid attributes are not evaluated. For information about using the filter window, see Procedure 3-25.

When a saved search filter contains an invalid attribute, the attribute, function, and value are all displayed in red text in the filter window. The attribute are is surrounded by "**". Both the attribute and value are displayed as a best effort string and may not be internationalized.

When an invalid attribute is selected, the Attribute drop-down is displayed a best effort string that may not be internationalized. If the attribute is not recognized, the Functions drop-down and the Value field display only the corresponding values that are displayed in the filter window. These values cannot be changed until a different attribute is chosen from the Attribute drop-down, at which point they are updated accordingly.

When a saved search filter contains only an invalid value, only the value itself is displayed in red text. The value is surrounded by "**" and may not be internationalized. The Value drop-down does not display a value, but is populated with valid values that can be used to update the filter.

When a saved search filter contains invalid attributes, the filter name is displayed in red text in the saved filters drop-down of a list form. When a filter with invalid attributes is applied from the saved filters drop-down, the invalid attributes are not evaluated. For information about using the saved filters drop-down list, see Procedure 3-35.

Preset filters

When a preset filter is ready to be applied, the saved filters drop-down menu displays an italicized No Filter. Opening the filter window displays the preset filter. Clicking on the Search button applies the filter, and clicking on the Clear All Filters button clears the filter.

Span of control filters

A 5620 SAM GUI user can filter the objects that a map or list form displays, based on the user span of control. By default, the GUI displays only the objects that are included in the View Access and Edit Access spans of the user.

Most 5620 SAM list forms contain a configurable Span On parameter. When the parameter is enabled, only the Edit Access span objects are displayed. On the current form only, the parameter setting overrides the global span of control filter setting on the User Preferences form. When the Span On parameter is displayed on a list form that allows filter creation, the associated filter form contains a drop-down menu that has the following options:

- Span: On—Only Edit Access span objects are displayed.
- Span: Off—View Access and Edit Access span objects are displayed.
- Span: User Preference—The User Preferences span filter setting determines the objects that are displayed.

The Span On parameter setting in a list form defaults to the User Preferences span filter setting. However, 5620 SAM topology maps, do not contain the Span On parameter; instead, topology maps automatically filter the NEs according to the User Preferences span filter setting.

See “Span of control” in the *5620 SAM System Administrator Guide* for more information about spans of control. See Procedure 3-19 for information about configuring the global span of control filter on the User Preferences form.

Equipment group filters

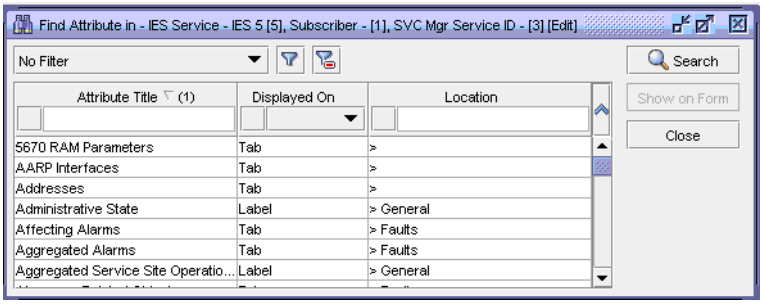
The equipment group filters allow you to search globally for new alarms, historical alarms, managed equipment objects, and managed service objects by equipment that is organized by topology group. See Procedure 6-28 for information about how to create a topology group.

The equipment group filter is created by choosing existing topology groups. The filters can be saved, modified, or deleted. See Procedures 3-37 and 3-38 for information about how to use the equipment group filters.

Equipment group filters can return up to 12 000 elements. If the limit is exceeded, the user is prompted to modify the filter to reduce the number of elements within the limit. Additionally, if you choose an equipment group filter that includes a topology group that has been modified since the filter was applied, an icon appears beside the equipment group filter drop-down list prompting you to press the Search button to update the filter.

Locating attributes on configuration forms

The find attribute function allows you to locate specific attributes on a configuration form.



Note — In this context, attribute refers to the names of tabs, panels, or fields.

Using the Find button located in the bottom right of a configuration form, you can list the attributes in that form. The Find Attribute in list form includes the name, type, and location for all attributes on the configuration form. After you choose the attribute using one of the selection methods described in Procedure 3-27, the tab where the attribute resides appears and the attribute name is highlighted. After you close the list form, the attribute name returns to the default display color. Figure 3-8 shows the Find Attribute in list form.

Note — For configuration forms that can display multiple objects simultaneously, such as the service configuration forms, the search is performed only on the selected object.

Figure 3-8 Find Attribute in list form

3.3 Workflow to use the 5620 SAM GUI

1. Start the 5620 SAM GUI; see section 3.4.
2. Manage objects using the 5620 SAM main menu, contextual menus, navigation tree, and the alarm and map windows; see section 3.5.
3. Configure user preferences for the 5620 SAM GUI for one or more users, if required; see section 3.6.
4. Customize tabs on configuration forms, see Procedures 3-20 and 3-21.
5. Customize 5620 SAM GUI workspace elements to meet your operational requirements; see "5620 SAM custom workspaces".
6. Use list forms to perform filtered searches that return information, and optionally save the filters and listed information to files; see section 3.7.

3.4 5620 SAM GUI opening and closing procedures

The following procedures describe how to open and close the 5620 SAM GUI.

Procedure 3-1 To open a single-user GUI client on a Windows station

Note 1 — You can install more than one single-user client on a station, but you can run only one client instance of a release at a time. For example, a Release 10.0 client and a Release 11.0 client can be open at the same time, but not two Release 11.0 R1 clients.

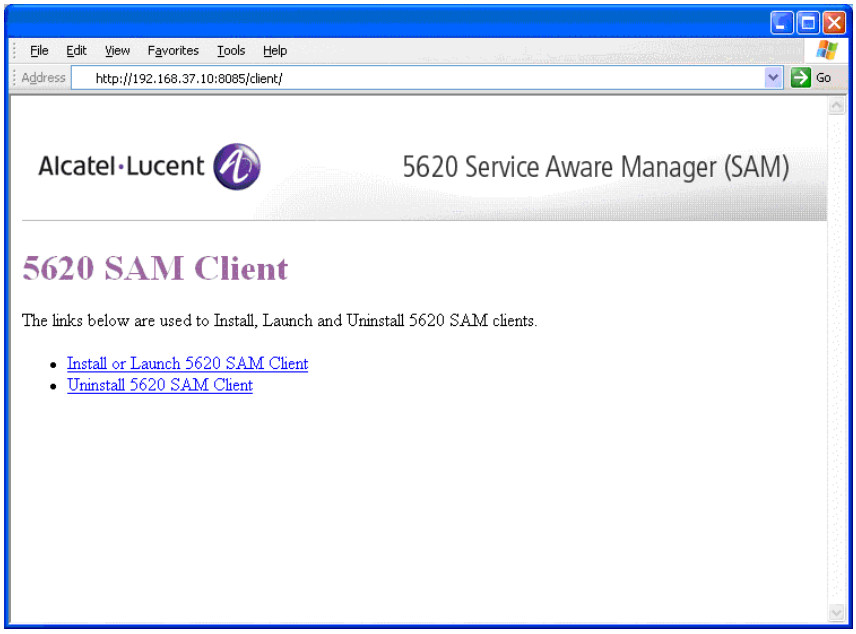
Note 2 — To perform this procedure, you must be one of the following:

- the user who installed the client software
- a user with sufficient permissions on the client files and directories, such as a local administrator

1 Perform one of the following.

a Double-click on the 5620 SAM Client App icon on the Windows desktop.

b Start the client GUI using a web browser; perform the following steps.



i Use the browser to open one of the following URLs:

- http://*server*:8085/client, if SSL is not enabled
- https://*server*:8444/client, if SSL is enabled

where *server* is the IP address or hostname of the 5620 SAM main server

The page shown in Figure 3-9 is displayed.

Figure 3-9 5620 SAM client page

ii Click on the “Install or Launch 5620 SAM Client” link.

iii If you did not use a web browser to install the client, a form opens and prompts you for the client installation location. Use the form to specify the client installation directory, for example, C:\5620sam\client.

c Start the client GUI using a CLI; perform the following steps.

Note — Using a CLI to start the client GUI allows you to specify one or more client startup options.

i Open a command window.

ii Navigate to the 5620 SAM client installation directory. Enter the following commands in the order shown:

drive_ID ↵

cd *install_dir*\nms\bin ↵

where
drive_ID is the drive on which the 5620 SAM client is installed, for example, C:
install_dir is the 5620 SAM client installation location, typically \5620sam\client

iii Enter the following to start the 5620 SAM client using one or more startup options:

nmsclient.bat *option1 option2 ... optionN* ↵

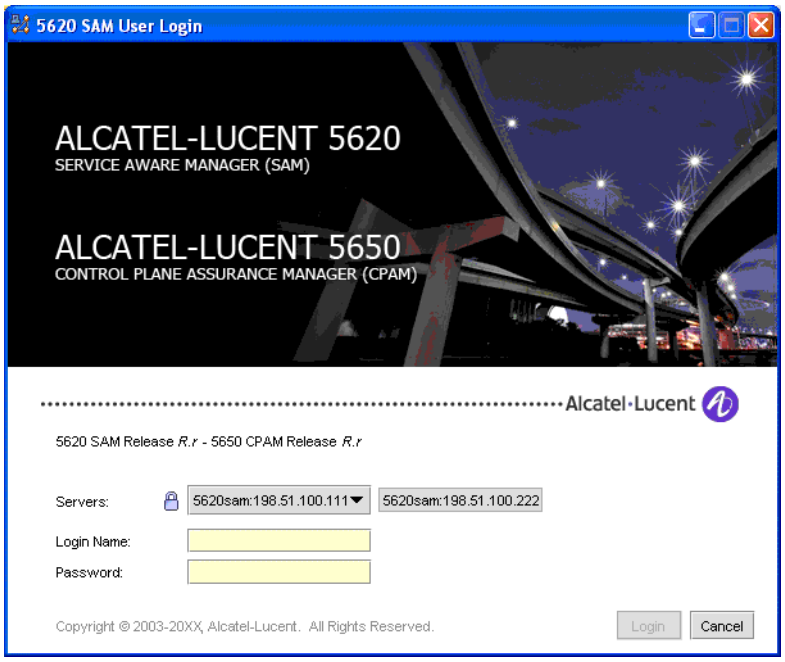
where *option1 option2 ... optionN* represents one or more of the startup options listed in Table 3-3

For example, to force a client update, enter the following:

nmsclient.bat update ↵

Table 3-3 5620 SAM client startup options for Windows

Option	Description
nms_version	Displays the client software version
baseLocale	Starts the client using the base OS locale for string resources such as language, number, date, and time formats
secure	Starts the client using HTTPS to connect to the server
server <*server*:*port*;*server*:*port*...>	Starts the client and specifies the 5620 SAM servers that the client is to check for an update where *server* is an IP address or a DNS name *port* is an HTTP or HTTPS port on the server
update	Starts the client and forces the download and installation of the updated client files. This overrides the local client configuration to ensure that the client and server configurations match. This option is useful for restoring a corrupted client installation. You can restore local configuration variances after the update.



(1 of 2)

Option	Description
retryCount	Starts the client and specifies the number of times to attempt to download a client update
noupdate	Starts the client without performing an update. This option is useful for preserving a specific client configuration that differs from the server configuration.
keepConfig	Starts the client and performs an update, but does not permit the overwriting of the nms-*.xml configuration files in the *install_dir*\nms\config directory, where *install_dir* is the 5620 SAM client installation directory, typically C:\5620sam\client After this option is specified, it remains in effect until the client is started using the "update" option, which then remains in effect.
keepSpecified	Specifies that the files listed in *install_dir*\nms\config\keepFile.txt are not to be overwritten during a client update, where *install_dir* is the 5620 SAM client installation location, typically C:\5620sam\client The keepFile.txt file must contain only one file entry per line, and each entry must be an absolute file path.
connectTimeout [*timeout*]	Specifies a timeout value, in ms, that the client uses for a download-server connection attempt. If the client cannot connect to a server within the timeout period, the operation is aborted. The default is 3000, which specifies 3s. The maximum connection timeout in Windows is 20s.
readTimeout [*timeout*]	Specifies a timeout value, in ms, that the client uses for a download-server file read attempt. If the client cannot obtain a server response to a file request within the timeout period, the file request is aborted. The default is 3000, which specifies 3s. The maximum read timeout in Windows is 20s.
help	Displays the nmsclient.bat usage information and options

(2 of 2)

The 5620 SAM client login form opens. If SSL is enabled, the form displays a padlock icon, as shown in Figure 3-10.

Figure 3-10 Client GUI login form

2 Choose the appropriate 5620 SAM main server from the Server drop-down list.

Note — To display multiple server options in the Server drop-down list, you must configure the client to support multiple server options. See "To configure the display of optional servers on a 5620 SAM client GUI login form" in the *5620 SAM System Administrator Guide* for information.

3 Enter the required Login name and Password information.

Note 1 — If this is the first time that a client connects to the server, you must use admin as the Login Name. Contact your Alcatel-Lucent technical support representative for the default 5620 SAM user account information.

Note 2 — The login name and password used depend on whether client GUI users are authenticated locally or remotely, as determined by the system administrator. Use the login name and password provided by your system administrator.

4 Click on the Login button. The 5620 SAM GUI opens.

5 If the 5620 SAM server is at a higher major release level than the client, the auto-update function may display a dialog box that asks whether you need to remove an older version of JRE. If this occurs, perform one of the following.

- **a** If there is no longer a need for the client to connect to a main server at the older 5620 SAM release level, click on the Yes button. The older JRE version is removed.
- **b** If the client is required for connecting to a main server at the older 5620 SAM release level, click on the No button. The older JRE version is retained.

If you have trouble opening the GUI, see the *5620 SAM Troubleshooting Guide*.

Procedure 3-2 To open a single-user GUI client on a RHEL or Solaris station

Note 1 — You can install more than one single-user client on a station, but you can run only one client instance of a release at a time. For example, a Release 10.0 client and a Release 11.0 client can be open at the same time, but not two Release 11.0 R1 clients.

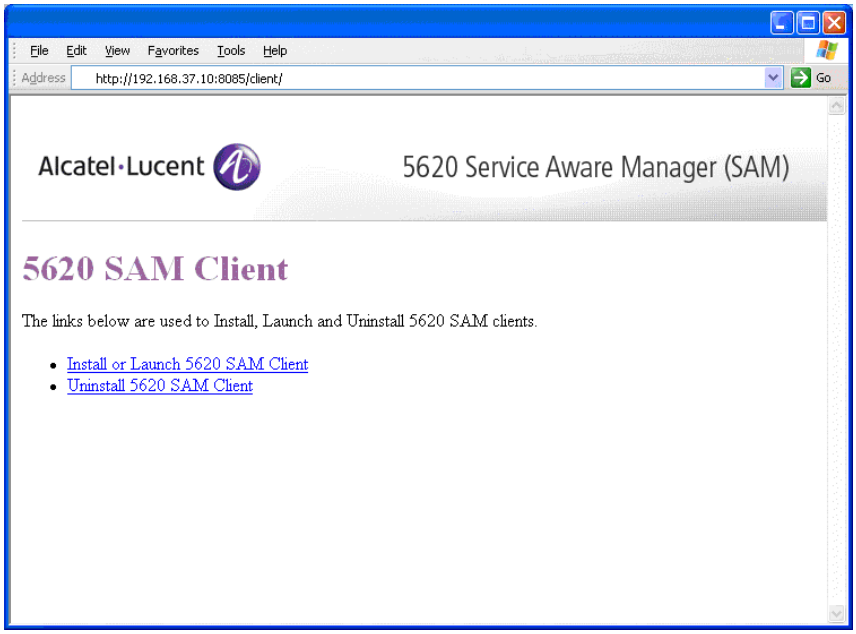
Note 2 — To perform this procedure, you must be one of the following:

- the user who installed the client software
- another user who has read, write, and execute permissions on the client files and directories

1 Perform one of the following.

a Double-click on the 5620 SAM Client App icon on the desktop.

b Start the client GUI using a web browser; perform the following steps.



i Use the browser to open one of the following URLs:

- http://*server*:8085/client, if SSL is not enabled
- https://*server*:8444/client, if SSL is enabled

where *server* is the IP address or hostname of the 5620 SAM main server

The page shown in Figure 3-11 is displayed.

Figure 3-11 5620 SAM client page

ii Click on the “Install or Launch 5620 SAM Client” link.

iii If you did not use a web browser to install the client, a form opens and prompts you for the client installation location. Use the form to specify the current client installation directory, for example, /opt/5620sam/client.

c To start the client GUI using a CLI, perform the following steps.

Note — Using a CLI to start the client GUI allows you to specify one or more client startup options.

i Open a bash console window on the client station.

ii Enter the following to navigate to the 5620 SAM client installation directory:

```
cd install_dir/nms/bin ↵
```

where *install_dir* is the 5620 SAM client installation location, typically /opt/5620sam/client

iii To specify one or more client startup options, enter the following:

```
./nmsclient.bash option1 option2 ... optionN ↵
```

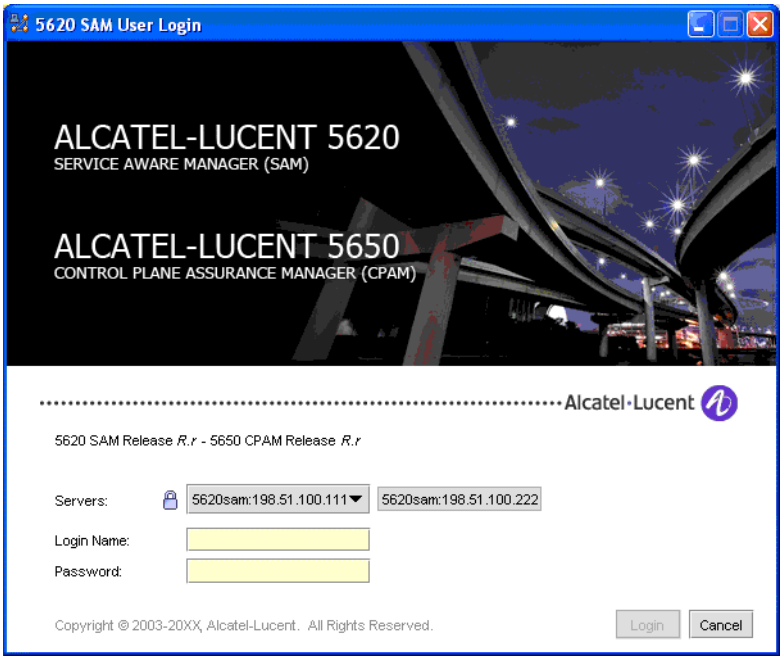
where *option1 option2 ... optionN* represents one or more of the startup options listed in Table 3-4

For example, to force a client update, enter the following:

```
./nmsclient.bash update ↵
```

Table 3-4 5620 SAM client startup options for RHEL and Solaris

Option	Description
nms_version	Displays the client software version
baseLocale	Starts the client using the base OS locale for string resources such as language, number, date, and time formats
secure	Starts the client using HTTPS to connect to the server
server <*server*:*port*;*server*:*port*...>	Starts the client and specifies the 5620 SAM servers that the client is to check for an update where *server* is an IP address or a DNS name *port* is an HTTP or HTTPS port on the server
update	Starts the client and forces the download and installation of the updated client files. This overrides the local client configuration to ensure that the client and server configurations match. This option is useful for restoring a corrupted client installation. You can restore local configuration variances after the update.
retryCount	Starts the client and specifies the number of times to attempt to download a client update



(1 of 2)

Option	Description
noupdate	Starts the client without performing an update. This option is useful for preserving a specific client configuration that differs from the server configuration.
keepConfig	Starts the client and performs an update, but does not permit the overwriting of the nms-*.xml configuration files in the *install_dir*/nms/config directory, where *install_dir* is the 5620 SAM client installation directory, typically /opt/5620sam/client After this option is specified, it remains in effect until the client is started using the "update" option, which then remains in effect.
keepSpecified	Specifies that the files listed in *install_dir*/nms/config/keepFile.txt are not to be overwritten during a client update, where *install_dir* is the 5620 SAM client installation location, typically /opt/5620sam/client The keepFile.txt file must contain only one file entry per line, and each entry must be an absolute file path.
connectTimeout [*timeout*]	Specifies a timeout value, in ms, that the client uses for a download-server connection attempt. If the client cannot connect to a server within the timeout period, the operation is aborted. The default is 3000, which specifies 3s.
readTimeout [*timeout*]	Specifies a timeout value, in ms, that the client uses for a download-server file read attempt. If the client cannot obtain a server response to a file request within the timeout period, the file request is aborted. The default is 3000, which specifies 3s.
help	Displays the nmsclient.bash usage information and options

(2 of 2)

The 5620 SAM client login form opens. If SSL is enabled, the form displays a padlock icon, as shown in Figure 3-12.

Figure 3-12 Client GUI login form

2 Choose the appropriate 5620 SAM main server from the Server drop-down list.

Note — To display multiple server options in the Server drop-down list, you must configure the client to support multiple server options. See "To configure the display of optional servers on a 5620 SAM client GUI login form" in the *5620 SAM System Administrator Guide* for more information.

3 Enter the Login name and Password information required for the server.

Note 1 — If this is the first time that a client connects to the server, you must use admin as the Login Name. Contact your Alcatel-Lucent technical support representative for the default 5620 SAM user account information.

Note 2 — The login credentials that are required depend on whether local or remote user authentication is used for the GUI client. Use the login name and password provided by your system administrator.

4 Click on the Login button. The 5620 SAM GUI opens.

5 If the 5620 SAM server is at a higher major release level than the client, the auto-update function may display a dialog box that asks whether you need to remove an older version of JRE. If this occurs, perform one of the following.

a If there is no longer a need for the client to connect to a main server at the older 5620 SAM release level, click on the Yes button. The older JRE version is removed.

b If the client is required for connecting to a main server at the older 5620 SAM release level, click on the No button. The older JRE version is retained.

If you have trouble opening the GUI, see the *5620 SAM Troubleshooting Guide*.

Procedure 3-3 To open a client GUI through a client delegate server

Perform this procedure to open a 5620 SAM client GUI using the 5620 SAM client delegate software on another station.

1 If you are not in the same physical facility as the client delegate server, log in to the facility using the appropriate access tool, for example, a Citrix gateway.

2 Log in to the client delegate server station.

Note — To specify a client startup option that updates the client software or configuration on a client delegate server, you must be logged in as one of the following users, or the update fails:

- on a RHEL or Solaris station—samadmin
- on a Windows station—the user who installed the client delegate server software, or a local administrator

3 If the client delegate server is installed on a RHEL or Solaris station, redirect the display to the station that you are using, if required. See the appropriate OS documentation for information.

4 Perform one of the following to open the GUI.

a Perform Procedure 3-1 if the client delegate server is on a Windows station.

b Perform Procedure 3-2 if the client delegate server is on a RHEL or Solaris station.

Procedure 3-4 To change to a different 5620 SAM client GUI user

Perform this procedure to change which 5620 SAM user is currently logged in to the client GUI.

1 Choose Application→Switch User from the 5620 SAM main menu. A dialog box appears.

2 Click on the Yes button. The GUI restarts and displays the login form.

3 Log in using the required credentials. The client GUI opens.

Procedure 3-5 To close the 5620 SAM GUI

1 Choose Application→Exit from the 5620 SAM main menu. A dialog box appears.

2 Click on the Yes button. The GUI application closes.

3.5 Basic 5620 SAM GUI operation procedures

The following procedures describe how to navigate and operate the 5620 SAM GUI.

Procedure 3-6 To open or close a main window

The following main GUI elements are displayed in windows:

- navigation tree
- topology map
- Alarm Window

By default, the navigation tree window appears at the left side of the GUI, the topology map window at the right, and the Alarm Window at the bottom.

1 To open a new window, or re-open a window that is closed, perform one of the following:

   a Click on the toolbar icon. If the toolbar or icon is not displayed, you can restore the toolbar; see Procedure 3-19.

   b Choose Application→*window_name* from the main menu, where *window_name* is the name of the window that you need to open.

   c Use the shortcut keys; see "Shortcut keys" in section 3.1.

2 To close a window, perform one of the following:

   a Click on the X icon in the upper right corner of the window.

   b Right-click on the taskbar button for the window you need to close and choose Close from the contextual menu.

Procedure 3-7 To close one or all open forms

Note — When there is unsaved information on a form, you are prompted to save the changes before you close the form.

1 To close a form, perform one of the following.

   a Click on the X in the top-right corner of the form.

   b Click on the Close button.

   c Right-click on a form button on the taskbar and choose Close from the contextual menu.

2 To close all open forms, choose Window→Close All Internal Windows or Close All External SAM Windows from the 5620 SAM main menu.

Note — When you close all internal windows, the navigation tree, topology map, Alarm Window, and any other open windows are closed. See Procedure 3-6 for information about how to re-open windows.

Procedure 3-8 To show or hide a window or form

1 To hide a window or form, perform one of the following:

   a Click on the minimize icon in the upper right corner of the window or form.

   b Click on the taskbar button for the window or form that you need to hide.

2 To move a hidden window or form to the foreground, perform one of the following:

   a Click on the taskbar button for the window or form that you need to move to the foreground.

   b Choose Window→*window_name* from the main menu, where *window_name* is the name of the window or form that you need to move to the foreground.

   c Use the shortcut keys. For more information, see "Shortcut keys" in section 3.1.

Procedure 3-9 To arrange windows and forms

You can optimize the workspace in the SAM GUI by arranging windows and forms.

1 To move a window or form manually, click and drag on the titlebar of the window or form.

2 To resize a window or form, hover over the border of the window or form until the double arrow appears, and click and drag the border.

3 To arrange multiple open forms so that they overlap, choose Window→Cascade from the 5620 SAM main menu. The forms are displayed in the top left of the GUI with the form that is farthest to the right in the foreground.

Note — When forms are arranged using the Cascade and Tile options, the main windows also display in the same arrangement as the forms.

4 To arrange multiple open forms so that they do not overlap, perform one of the following.

   a Choose Window→Tile Vertical from the 5620 SAM main menu. The forms are displayed beside each other.

   b Choose Window→Tile Horizontal from the 5620 SAM main menu. The forms are displayed above each other.

   c Choose Window→Tile Square from the 5620 SAM main menu. The forms are displayed beside and above each other to fill the GUI workspace.

5 To restore windows to their preferred settings, choose Window→Reset to Preferred Sizes from the 5620 SAM main menu.

Procedure 3-10 To move a window or form to an external window

A window or form in the GUI can be moved from the main workspace and managed as an external window; for example on a second monitor, if available. See "External windows" in section 3.1.

1 Click to select the window or form to move to an external window.

2 Perform one of the following:

   a Choose Window→Move to External Window from the 5620 SAM main menu.

   b Right-click on the titlebar of the selected window, and choose Move To External Window from the contextual menu.

3 Click on the titlebar of the window or form and drag to the external monitor, if available.

Note — An external window or form cannot be moved back to the 5620 SAM GUI. You must close the external window and re-open the window or form in the 5620 SAM GUI.

Procedure 3-11 To send a text message to other 5620 SAM users

You can send text messages to another 5620 SAM user or to all active users logged into the 5620 SAM.

1 Choose Application→Text Message from the 5620 SAM main menu. The Text Message window opens.

2 Enter the text message in the text area.

3 Click on the Send To... button. The Select Sessions form opens.

4 Configure the filter criteria to create a filtered list of GUI client sessions, if required.

5 Click on the Search button. A list of active GUI client sessions is displayed.

6 Perform one of the following:

a To choose a single user, click on a GUI client session.

b To choose all GUI client sessions, press CTRL+A

c To choose non-consecutive GUI client sessions, click on a session and press CTRL and choose another session.

7 Click on the OK button. The text message is sent to the specified clients. Messages are uniquely identified with the Client ID number of the sender. You can click on the reply button to reply back to the sender.

Procedure 3-12 To use menus, the toolbar, or shortcuts

1 Start the 5620 SAM GUI.

2 Perform one of the following to open an object.

a Choose an option from the 5620 SAM main menu. An icon for the menu option is displayed beside the option text.

b Click on the menu option icon in the toolbar. You can scroll over a toolbar icon to view a tool tip that describes the icon's function. See Procedure 3-19 for information about configuring or hiding the toolbar.

c Use the shortcut keys. Simultaneously press ALT-*key* where *key* is the underlined letter in the menu item. For example, ALT-P opens the Policies menu. The menu item must be displayed for the shortcut key to work.

Note — Using the CTRL+F4 key to close a form or window may cause problems if the parent form is open. Alcatel-Lucent recommends that to close a form or window, you use the Close button and respond to the subsequent prompt, or click on the X button in the top right corner of the form or window.

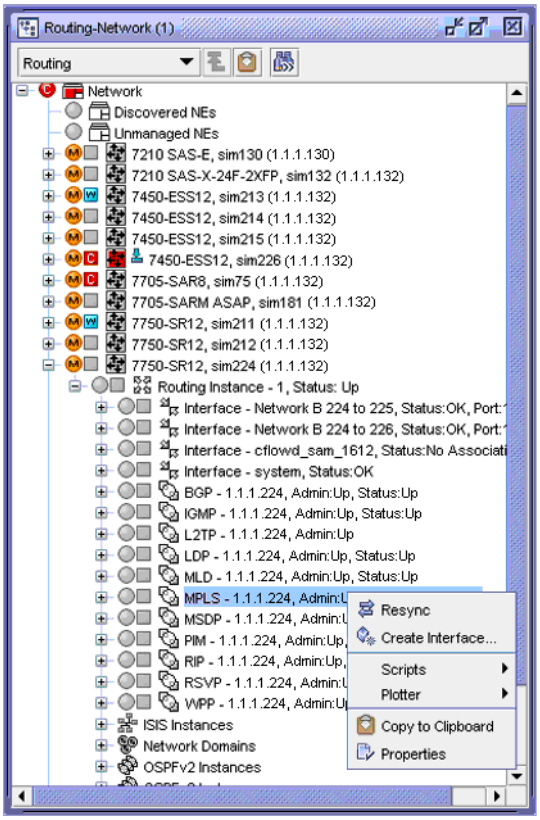
Procedure 3-13 To use menus, windows, and forms to configure or view parameters

1 Start the 5620 SAM client GUI.

2 Open a configuration form using one of the following methods.

a Double-click on the lowest-level navigation tree object to open the object properties form. When you double-click on an object that has child objects, the child object is revealed; when you double-click on an object that has no child objects, the object properties form opens.

b Choose the appropriate 5620 SAM main menu or submenu option.



c Double-click on an object, for example, a customer in a list of customers.

d Click on the task bar button that represents the form.

e Right-click on an object in the navigation tree or Alarm Window and choose the appropriate option from the contextual menu.

Figure 3-13 shows an example of a right-click contextual menu in the navigation tree.

Figure 3-13 Right-click contextual menu example

The appropriate form opens.

3 Configure or view the parameters on the form, as required, using the following methods.

Note — A parameter that has a yellow background is mandatory and must be configured before you can go to the next form or apply the changes on the current form.

a Enter information beside the parameter, as appropriate. For example, type in text to configure the Description parameter.

b Use the drop-down menu to choose an option from a list. For example, choose Access as the port mode on a port configuration form.

c If the configuration form is a step form, follow the form prompts.

d Double-click an object in a row to open a new view or set of configurations. For example, from a list of ports double-click on a row to open the configuration form for that port.

e Right-click on an object in the navigation tree to display additional contextual menu choices, as shown in Figure 3-13.

See the *5620 SAM Parameter Guide* for a list of the configurable parameters.

4 Click on the Apply button to save the configuration changes without closing the form.

5 Click on the appropriate button to complete the configuration.

a Click on the OK button to save the changes and close the form, if the form is other than a step form.

b Click on the Finish button to save the changes in a step form.

c Click on the Turn Up button to activate the object. If the Turn Up button is not visible, click on the More Actions button and choose Turn Up.

d Click on the Shut Down button to deactivate the object. If the Shut Down button is not visible, click on the More Actions button and choose Shut Down.

e Click on the Cancel button to close the form without saving the changes.

f Click on the Close button to close the form without saving the changes.

Note — Using the CTRL+F4 key to close a form or window may cause problems if the parent form is open. Alcatel-Lucent recommends that to close a form or window, you use the Close button and respond to the subsequent prompt, or click on the X button in the top right corner of the form or window.

g Click on the Resync button to ensure that the 5620 SAM and managed devices are synchronized. Resynchronization does not affect the contents of the historical statistics database.

Procedure 3-14 To use the Parameter Search Tool

The Parameter Search Tool contains information about parameters and configuration forms in the 5620 SAM. See "Parameter Search Tool" in section 3.1.

1 Choose Help→User Documentation from the 5620 SAM main menu. A browser window opens with the User Documentation Index displayed.

2 Click on the Parameter Search Tool link. Alternatively, in the Contents panel, expand the Parameter Guide book and click on Parameter Search Tool.

3 Perform any of the following:

Note — You can choose the options from the Contents panel or the display panel.

a Search for a parameter or form name.

i Click on Search parameter and form names. The Search parameter and form names page is displayed.

ii Enter a term in the Search Term field.

iii Choose an option from the Please select a Type drop-down menu.

iv Click on the Search button. A list of results is displayed.

v Choose an entry. Information about the form that is associated with the entry is displayed.

b Display a configuration form from the list.

i Click on Configuration forms. A list of configuration form names is displayed.

ii Choose a configuration form name from the list. Information about the form is displayed.

4 In the Tabs section, click on a tab name to display only the parameters for that tab.

5 Click on a parameter name to view information about that parameter.

Note 1 — To manage the display of information, hover over the MENU box and then choose from the options that appear.

Note 2 — Some parameters are configured from a list of options (called enumerations). To view parameter enumerations, click on the linked text in the “type” field and view the entry for the linked text.

Procedure 3-15 To use the 5620 SAM clipboard

Perform this procedure to copy property form identifier links for objects in the navigation tree or list forms. See 5620 SAM clipboard in section 3.1. For information about using the clipboard to create physical links, see Procedure 6-33.

1 To copy objects to the clipboard from the Equipment view of the navigation tree:

   a Select one or more objects from the equipment list.

   b Click on the Copy to Clipboard icon on the navigation tree window toolbar.

2 To copy objects from a generated or displayed list:

   a Select the object or objects to copy from the list.

   b Click on the Copy to Clipboard button on the list form.

Note — Each time the Copy to Clipboard function is used, the previous clipboard contents are replaced.

Procedure 3-16 To copy a property form to the clipboard

A property form identifier link is a unique internal address that the 5620 SAM assigns to a form or window. For example: *sam://topologyGroup:Network-DiscoveredNes*.

Note — Each time the Copy Property Form Identifier function is used, the previous clipboard contents are replaced.

1 Open a property form and a tab, if required.

2 Perform one of the following:

   a Choose the form and tab that you need to copy and choose Application→Copy Property Form Identifier from the 5620 SAM main menu. The property form identifier link is copied to the clipboard.

   b Choose the form and tab that you need to copy, right-click on the open property form titlebar and choose the Copy Property Form Identifier function. The property form identifier link is copied to the clipboard.

   c Choose the form and tab that you need to copy, right-click on any tab in an open property form and choose the Copy Property Form Identifier function. The tab on the property form identifier link is copied to the clipboard.

3 Close the property form.

Procedure 3-17 To open a property form copied to the clipboard

1 Choose Application→Go To Property form from the 5620 SAM main menu. The Go To Property Form window opens.

2 Click on the Paste button. The last-copied property form identifier link is copied to the clipboard. For example, the tab location on the properties form that was last opened, appears in the label area.

Note — If the clipboard contains multiple objects, only the first object in the clipboard list is pasted.

3 Perform one of the following:

a Click on the OK button. The Go To Property Form window closes and the tab location on the properties form copied to the clipboard, opens.

b Click on the Apply button. The tab location on the properties form copied to the clipboard, opens.

Procedure 3-18 To open property forms from the clipboard menu

1 Choose Application→Clipboard from the 5620 SAM main menu. The Clipboard window opens.

2 Select an object from the Clipboard window. Only one object can be selected.

3 Click on the View Object button. The form for the selected object opens.

3.6 5620 SAM GUI user preferences configuration procedures

The following procedures describe how to configure user preferences for the 5620 SAM GUI.

Procedure 3-19 To configure 5620 SAM user preferences

1 Choose Application→User Preferences from the 5620 SAM main menu. The User Preferences form opens with the General tab displayed.

Table 3-5 lists the tasks that can be configured using the User Preferences form and the location of more information, if applicable. The user preferences are listed by the functional tabs as they appear on the User Preferences form.

Table 3-5 User Preferences tasks and location

Task	See
General tab	
Show Toolbar: To show or hide the toolbar icons under the main menu, including the default set of toolbar icons and a custom workspace set of toolbar icons. You can create a unique set of toolbar icons with each custom workspace.	—
Default Client Time Zone: To configure the default client time zone.	—
Alarm Window panel: To configure the user preferences in the alarm window: • Turn on Audible Alarms • Show Alarm Flags • Show Correlated Alarms by Default. You can also configure the display of correlated alarms from the Alarm window • Enable or disable the display of alarmed equipment in navigation trees for the View Alarmed Object function.	Procedures 31-9, 31-10, 31-11, and 31-12
Configuration Forms panel: To configure user preferences to: • Suppress Containing Window Warning • Suppress Template Generation Message • Suppress Template Execution Warning • Debug STM Mode:To access test objects that are available in the STM • Enable Confirmation for Bulk Change Actions: To specify whether the 5620 SAM displays a confirmation message when an operator initiates a bulk change operation	—
Topology Windows panel: To configure user preferences to: • Suppress Service and Composite Service Map Load Warning • Overlay Type	—
Auto ID Generation panel: To configure user preferences to Access Interface Encap Value (Dot1q only).	—

Listing Forms panel: To configure user preferences to:
• Specify # of items Per Page: To specify the maximum number of objects to display per page on a list form
• Apply User Span Of Control
  • By default, the GUI displays all objects that are in your View Access and Edit Access spans. Use the parameter to display frames that include list forms, maps, and the alarm window.
  • You can temporarily override the global filter setting in a list form or window using the Span On check box, and you can include your span of control in an advanced filter window.
  • You can perform searches using list forms and span of control filters.
  • Procedure 3-29 affects the GUI display of only the user who configures the Apply User Span of Control parameter, and not other users.
	—
	Procedure 3-29
	Section 3.2

Browser Path: To configure or reset the path to a web browser on your local station to access the Supervision Portal from the 5620 SAM main menu.	*5620 SAM Supervision Module User Guide*
Statistics Plotter tab	
To configure the real-time plot configuration user preferences for graphing statistics including: • Default Polling Interval (Seconds) • Maximum Data Retention Time (Seconds)	*5620 SAM Statistics Management Guide*
Script Management tab	

(1 of 2)

Task	See
To configure the script management and templates user preferences for the following: • Enable Command Helper: The Command Helper appears when you click on the designated command helper key in the Script Editor. • Command Helper Key: To identify the keyboard key that is used to access the Command Helper. • GUI Builder in the Editor: To enable or disable the Velocity GUI Builder which is used to create or modify Velocity properties, or test the generated UI.	*5620 SAM Scripts and Templates Developer Guide*
Workspaces tab	
To add or remove custom workspaces or change the sequence of the custom workspace in the Workspace Selector. You can also set a custom workspace as the default workspace. The Workspace Selector allows you to change from the default workspace to your custom workspace.	Procedure 4-6

(2 of 2)

2 Click on the OK button. A dialog box appears.

3 Click on the Yes button and close the User Preferences form.

Procedure 3-20 To customize tabs on configuration forms

You can display, hide, or reorder tabs on a configuration form to customize which tabs are visible for a specific object type.

Note — An administrator can configure the default behavior for custom tab configuration from the System Preferences form. See the *5620 SAM System Administrator Guide*.

1 Open the configuration form for any object.

2 Click on the tab selector on the right side of the form. A drop-down list of tabs is displayed.

3 Perform any of the following, as required:

a To display a hidden tab, choose a tab from the Hidden Tabs and click on the Move to Displayed Tabs button.

b To hide a displayed tab, choose a tab from the Displayed Tabs Order and click on the Move to Hidden Tabs button.

c To reorder a displayed tab, choose a tab and click on the Move Up or Move Down button until it is located at the desired location in the Displayed Tabs Order.

Note 1 — You can select and move multiple tabs.

Note 2 — Tab settings are specific to the selected object type. For example, if you open the Network Element (Edit) form for a 7705 SAR-H and hide all tabs except the General tab, then open the same form for a 9500 MPR, the form displays the General tab and may also display some 9500 MPR specific tabs.

Note 3 — At least one tab must be displayed on a form. If all tabs are moved to the Hidden Tabs, the Save Tab Settings button is disabled.

Note 4 — Mandatory tabs do not appear in the drop-down list of tabs, such as the TCA, Faults, and Deployment tabs.

4 Click on the Save Tab Settings button. The form updates with the specified custom tab configuration.

Caution — If you close the tab selector drop-down list without saving, all unsaved tab preferences are lost.

Note — The Find Attribute window lists all parameters on the form including parameters located on hidden tabs. If you need to temporarily display a parameter located on a hidden tab, click on the Show on Form button. The tab is temporarily displayed on the form.

5 Close the form.

Procedure 3-21 To temporarily display hidden tabs on configuration forms

You can temporarily display hidden tabs on a configuration form. Tabs that are displayed this way are hidden again when you close the form.

1 Open the configuration form for any object.

2 Perform one of the following:

a To temporarily display all hidden tabs, click on the Show All Tabs button on the right side of the form. The form displays all available tabs.

Note — If no available tabs are currently hidden, the Show All Tabs button is disabled.

b To temporarily display one hidden tab, perform the following:

i Click on the tab selector on the right side of the form. A drop-down list of tabs is displayed.

ii Choose a tab from the Hidden Tabs and double-click on it. The form displays the chosen tab.

Note 1 — Hidden tabs that are displayed temporarily are shown in italics under Displayed Tabs Order on the tab selector drop-down list.

Note 2 — If you click the Save Tab Settings button, all temporarily displayed tabs become permanent.

3 Close the form.

Procedure 3-22 To configure the current client time zone

Perform this procedure to specify which time zone the 5620 SAM client will use currently.

1 Click on the Current Client Time Zone button in the bottom right corner of the GUI. The Current Client Time Zone form opens.

2 Perform one of the following:

a Select Use Default Client Time Zone.

b Select Use Specific Client Time Zone and choose a time zone from the list.

3 Click on the OK button. The Current Client Time Zone form closes and a dialog box appears.

4 Click on the OK button.

3.7 5620 SAM GUI search procedures

The following procedures describe how to use the 5620 SAM client GUI to search for and display information.

Procedure 3-23 To monitor the 5620 SAM Task Manager

Perform this procedure to monitor your operational requirements. The Task Manager allows 5620 SAM operators to monitor the progress of operational tasks. Only 5620 SAM administrators can change task monitoring parameters. "To change the 5620 SAM Task Manager default settings", see the *5620 SAM System Administrator Guide* for more information.

Note — You can send the tasks that the Task Manager displays to a file using the OSSI findToFile method. See "Inventory retrieval" in the *5620 SAM XML OSS Interface Developer Guide* for more information.

1 Choose Application→Task Manager from the 5620 SAM main menu. The Task Manager form opens.

The All Users check box only appears for 5620 SAM administrators. If you are a 5620 SAM administrator or a user with an assigned administrator scope of command role, go to step 2 to monitor tasks for all users. Otherwise, go to step 3.

2 Enable the All Users check box to monitor operations that are performed in the 5620 SAM server by all 5620 SAM users. The default is Disabled.

3 Configure the task management filter to monitor the 5620 SAM operations, as required. For example, you can monitor operations based on the server start time, the elapsed time, the status of the operation, or by the user performing the operation.

4 Click on the Search button. Operations that meet the specified search criterion are displayed. The following appear in the Task Manager:

- all write operations that are performed from the 5620 SAM GUI; for example, when you click on the Apply or OK buttons
- all write operations that are performed using the OSSI
- some read operations; for example, when you click on the Resync or Collect All buttons

Note — The Task Manager automatically refreshes when the value of the autoRefreshInterval parameter is reached. The default is 20. You can also click on the Search button to refresh the list of tasks.

5 Double-click on a task to view more information about the task. The Task - Top Level form opens with the General tab displayed.

6 Click on the Tree tab to view a hierarchical display of the task and subtasks.

7 Click on the Sub-Tasks tab to view the subtasks of the task.

8 To view the 5620 SAM GUI or OSS user activity associated with a task, click on the User Activity button. If the User Activity button is not visible, click on the More Actions button and choose User Activity. The Activity form opens and displays additional information about the task. See "User activity logging" in the *5620 SAM System Administrator Guide* for more information.

9 Close the open forms, as required.

Procedure 3-24 To perform a simple search using column headings

1 Open a list form.

2 If available, choose an entry from the object drop-down list.

Note — If you click on the Search button without selecting a specific object type from the list, a default entry may be used.

3 If the filter has not been pre-populated, configure the filter criteria using the filter area of any column heading.

Note 1 — If you enter a value in a filter area of a column heading without specifying an operation from an operation drop-down menu, a default operation is automatically selected.

Note 2 — The operators listed below are available specifically for filtering a list by object timestamp. Each operator allows you to specify the time criteria. Click on the Select icon, if available, beside the column heading filter to specify a range.

- APPROXIMATELY EQUAL, which allows you to specify a time with 1m resolution rather than the 1ms timestamp resolution (default)
- IN THE PAST, which allows you to specify an amount of time before the current time as the filter range, for example, 3 hours after the current time
- BETWEEN, which allows you to specify a Start Time and End Time (If the start and end time are the same, the OK button is disabled.)

Note 3 — Selecting NONE in an operation drop-down menu clears the filter area of the associated column heading.

Note 4 — Clicking on the Toggle Quick Filter button toggles the visibility of the filter areas on or off.

Note 5 — The filter areas of the column headings are disabled if a filter was applied using the filter window, if the filter window is open, or if a saved filter was loaded using the saved filter drop-down list. See Procedure 3-25 for more information about performing an advanced search.

4 Click on the Search button. The results list is displayed based on the filter.

5 To refresh the search results using the currently defined filter, click on the Search button. If applied, the current filter is used even when the filter areas are hidden or closed.

6 Close the List Form.

Procedure 3-25 To perform an advanced search

1 Open a List Form.

2 Click on the Filter button at the top of the form. The filter window opens.

Note — The filter areas of the column headings in a List Form are disabled if a filter is applied using the filter window, if the filter window is open, or if a saved filter was loaded using the saved filters drop-down list. See Procedure 3-24 for more information about performing a simple search using column headings.

3 Configure the filter properties.

i Choose an item from the Attribute drop-down menu.

ii Choose an item from the Function drop-down menu.

iii Choose an item from the Value drop-down menu.

iv Choose a Boolean Operator from the Operators drop-down menu.

v Click on the Add button.

4 Do one of the following.

a To filter additional properties, repeat step 3.

b To modify the search filter, go to step 5.

c If you are finished filtering properties, go to step 6.

5 Modify the search filter, if required.

a Replace a Boolean operator.

i Select a Boolean operator in the summary area.

ii Choose an item from the Operators drop-down menu to replace the selected Boolean operator.

Note 1 — If an entire bracket is selected, all Boolean operators within are replaced at once.

Note 2 — If multiple filtered properties exist, replacing a Boolean operator wraps the properties associated with that operator in brackets.

b Exclude filtered properties.

i Select a filtered property in the summary area.

ii Click on the NOT button to exclude any matching entries from the search results.

Note 1 — If an entire bracket is selected, all filtered properties within are excluded at once.

Note 2 — Selecting an excluded property or a bracket and clicking on the NOT button includes the property or bracket again.

c Replace filtered properties.

i Select a filtered property in the summary area.

ii Configure the filter properties, as described in step 3.

iii Click on the Replace button.

d Delete filtered properties.

i Select a filtered property or a bracket in the summary area.

ii Click on the Delete button to remove the selected filtered properties from the search filter.

Note — Multiple filtered properties can be selected and deleted at once.

e Wrap filtered properties in brackets.

i Click the left mouse button and drag over multiple filtered properties in the summary area to select them.

ii Click on the brackets button to wrap the selected filtered properties in brackets.

Note 1 — Selecting properties that are already wrapped in brackets and clicking on the brackets button unwraps the selected properties.

Note 2 — Properties can only be wrapped or unwrapped if all Boolean operators contained within are matching.

6 Click on the Apply button or the OK button. The results list is displayed based on the filter.

7 If the filter window is open, click on the Close button. The filter window closes.

8 Close the List Form.

Procedure 3-26 To perform a search by specifying endpoints

Use the following procedure to find objects such as service tunnels, MPLS paths, VLAN paths and LSP paths by specifying endpoints.

1 Choose one of the following menu options from the 5620 SAM main menu:

- Manage→MPLS→Dynamic LSPs
- Manage→MPLS→Manual Bypass LSPs
- Manage→MPLS→Static LSPs
- Manage→MPLS→MPLS Paths
- Manage→MPLS→Static LSPs
- Manage→Service Tunnels
- Manage→VLAN→Paths

The Manage filter form opens.

2 Click on the Filter button. The filter window opens.

3 Choose Endpoints from the Select Filter Type drop-down menu. Endpoints is the default option.

Note — If a saved filter is selected or the filter areas of the column headings are populated, Advanced Filter is the default option.

4 Deselect the Any Source check box to pick a source IP address as a search filter. Otherwise, leave the Any Source check box selected to search by any source IP address.

5 Deselect the Any Destination check box to pick a destination IP address as a search filter. Otherwise, leave the Any Destination check box selected to search by any destination IP address.

6 Click on the Apply button. The results list is displayed based on the filter.

7 Click on the Close button to close the filter window.

8 Close the List Form.

Procedure 3-27 To locate an attribute on a configuration form

1 Open a configuration form.

2 Click on the Find button or press CTRL+F. The Find Attribute in list form opens and displays the attributes on the configuration form.

3 Configure the filter criteria and click on the Search button. A list of attributes is displayed.

4 Choose an attribute from the list and perform one of the following:

- **a** Click on the Show on Form button.
- **b** Double-click on the attribute row.
- **c** Press Enter.

On the configuration form, the selected name of the tab, panel, or field is highlighted and the associated tab is displayed.

Note 1 — If a tab is hidden on a form and you click on the Find button, you can choose a parameter from the list that appears in the hidden tab and click on the Show on Form button, the hidden tab is temporarily displayed.

Note 2 — For configuration forms that can display multiple objects simultaneously, such as the service configuration forms, the search is performed only on the selected object.

Procedure 3-28 To filter object types

When an object drop-down list contains more than 10 items, you may click on the Filter for Object Type button to refine your search.

1 Open a List Form.

2 Click on the Filter for Object Type button. The Select Object Type form opens.

3 Configure the filter criteria using the filter area of any column headings.

Note — You can click on the Filter button on the Select Object Type form to open the filter window. See Procedure 3-25 for more information about performing an advanced search.

4 Click on the Search button. The results list is displayed based on the filter.

5 Select an object from the list and click on the OK button. The Select Object Type form closes and the List Form reappears with the new Object Type selected in the Object Type drop-down.

Procedure 3-29 To filter using span of control

On some List Forms, you can create and save a span filter to display objects for your specific span of control. For example, if you need to see objects within the span of control that has been assigned to you, create a span filter. You can also configure user preferences to automatically filter out objects that are not in your span of control.

1 Open a List Form.

2 If available, choose an entry from the object drop-down list.

3 Do one of the following.

a To search using Span of Control from a List Form, go to step 4.

b To search using Span of Control from the filter window, go to step 5.

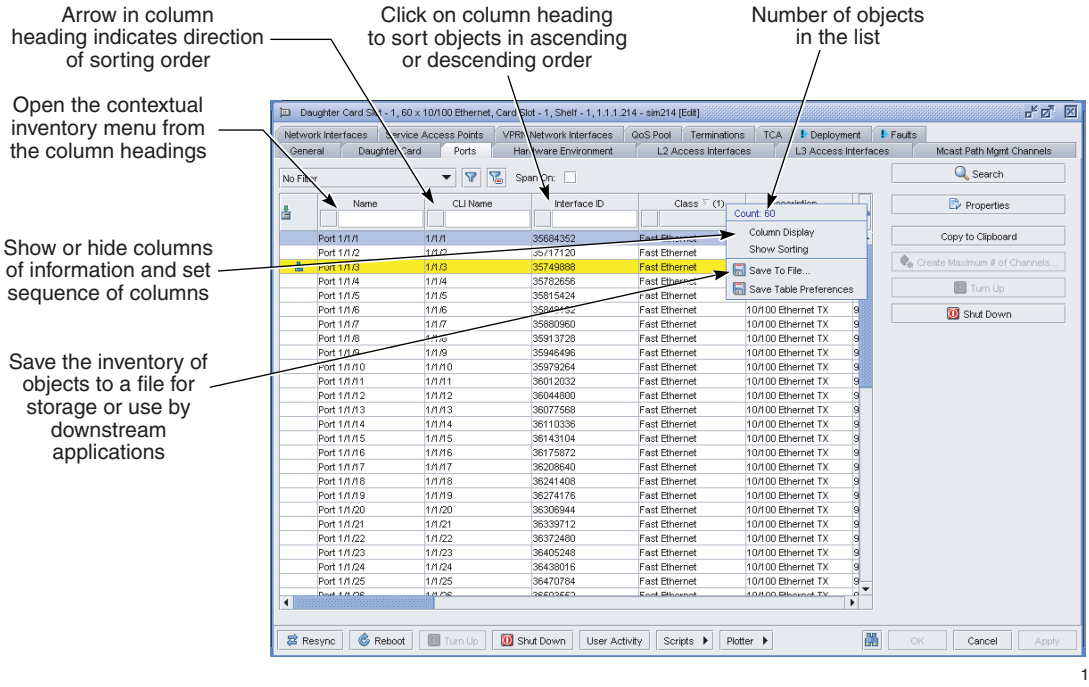
4 Click on the Span On check box. The results list is displayed based on the filter. Go to step 9.

5 Click on the Filter button. The filter window opens.

6 Choose an entry from the Span drop-down list.

Note — An entry from the Span drop-down list is selected based on the Span On check box on the List Form.

7 Click on the Apply button. The results list is displayed based on the filter and the Span On check box is updated.



8 Click on the Close button. The filter window closes.

9 Close the List Form.

Procedure 3-30 To view and manage listed information

Many of the windows and forms are lists of network objects, for example, lists of ports displaying all the ports on a specific card. Figure 3-14 shows the major elements of a list.

Figure 3-14 List elements

17271

On most lists, you can:

- generate inventories of the listed data
- reorganize the information from most important to least important
- remove columns of data that are not of interest
- sort listed information in ascending or descending order

1 Generate a list.

2 Perform an action on the list.

a To generate an inventory of data, right-click on the list heading. The Count indicates the number of objects in the list.

b To remove columns from the table:

i Right-click on the column heading and choose Column Display from the contextual menu. The Column Display window appears.

ii In the Displayed on Table list box, choose the columns that you need to remove from the table and click the left arrow. The specified columns are moved to the Available for Table list box.

Note 1 — Columns that cannot be removed from the table are dimmed in the Displayed on Table list box.

Note 2 — There must be at least one column in a table.

iii To resequence the columns, go to step dii.

iv Perform one of the following.

- Click on the Apply button to apply the configuration changes without closing the form. The specified columns are removed from the table.
- Click on the OK button to apply the changes and close the Column Display window. The specified columns are removed from the table.
- Click on the Cancel button to close the Column Display window.

c To add columns to the table:

i Right-click on the column heading and choose Column Display from the contextual menu. The Column Display window appears.

ii In the Available for Table list box, choose the columns that you need to add to the table and click the right arrow. The specified columns are moved to the Displayed on Table list box.

iii To resequence the columns, perform step dii.

iv Perform one of the following:

- Click on the Apply button to apply the configuration changes without closing the form. The added columns appear in the table.
- Click on the OK button to apply the changes and close the Column Display window. The added columns appear in the table.
- Click on the Cancel button to close the Column Display window.

d To reorganize the information:

i Right-click on the column heading and choose Column Display from the contextual menu. The Column Display window appears.

ii In the Displayed on Table list box, choose the name of the column that you need to move.

iii Click on the up and down arrows to move the column to the appropriate location in the table.

Note — You can move multiple columns simultaneously by choosing more than one column name before you click on the arrows.

iv Perform one of the following.

- Click on the Apply button to apply the configuration changes without closing the form. The columns appear on the table in the new sequence.
- Click on the OK button to apply the changes and close the Column Display window. The columns appear on the table in the new sequence.
- Click on the Cancel button to close the Column Display window.

Note — You can also resequence information by clicking on a column, dragging the column to the right or left, and dropping the column in the appropriate location.

e To sort data based on a column in ascending or descending order, click on the column heading. The down or up arrow changes and indicates the sequence in which the data is sorted.

f To sort data based on multiple columns, perform one of the following:

i Right-click on a column heading and choose Show Sorting from the contextual menu. The Show Sorting form opens. Choose the one or more properties from the Available for Sorting panel and click on the right arrow button. The properties appear in the Used for Sorting panel. Click on the Sort Ascending or Sort Descending, as required.

ii Click on the column heading of the first column by which you need to sort. Press and hold CTRL and click on one or more additional columns in the sequence in which you need to sort the data. The sort sequence appears in brackets after the column name. To change the direction of the sort, click on the heading of any of the selected columns while pressing CTRL.

Note — To navigate quickly through a long sorted list, type a letter to move directly to the first item in the list that starts with that letter.

Table 3-6 describes the order in which different types of data are sorted from the top of the column to the bottom, based on the direction of the arrow in the column header. Figure 3-15 shows an example of information sorted in a column according to the down arrow in the column header.

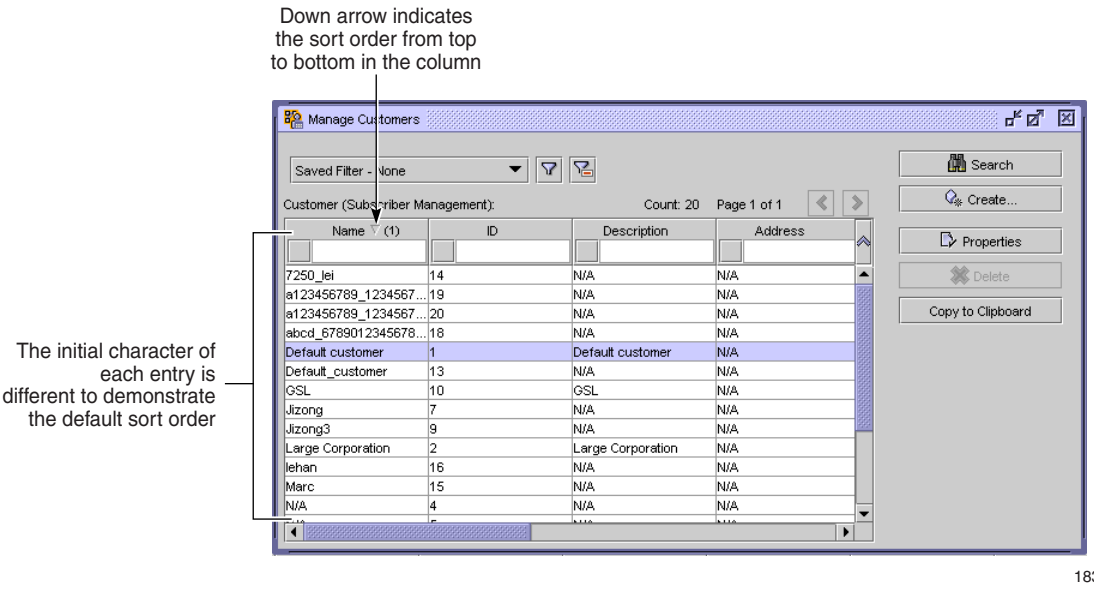


Table 3-6 Sorting listed information

Entry type	Down arrow	Up arrow
Numbers only	Sorted from the lowest number to the highest number	Sorted from the highest number to the lowest number
Letters	Sorted left to right, character by character, in alphabetical order.	Sorted left to right, character by character, in reverse alphabetical order.
Alphanumeric	Sorted left to right, character by character, in the following order: from 0 to 9, then in alphabetical order	Sorted left to right, character by character, in the following order: in reverse alphabetical order, then from 9 to 0
Alphanumeric for IP Address fields[(1)]	Addresses are sorted first by type and then alphanumerically from the lowest to the highest number. For example, IPV4, IPV6 and DNS, in the following order: • 2.1.1.1 • 10.2.2.2 • 21.2.1.1 • 21.10.1.1 • 14:C8AA:0:0:0:0:0:EA • 24AA:C8:0:0:0:0:0:EA	Addresses are sorted first by type and then alphanumerically from the highest to the lowest number. For example, DNS address, IPV6, IPV4 in the following order: • 24AA:C8:0:0:0:0:0:EA • 14:C8AA:0:0:0:0:0:EA • 21.10.1.1 • 21.2.1.1 • 10.2.2.2 • 2.1.1.1
Special characters	Sorted left to right, character by character. The following characters are sorted in the following order before numbers, and uppercase and lowercase letters in a list: (space) ! # $ % & ‘ ( ) * + , . / The following characters are sorted in the following order after numbers in a list, but before uppercase and lowercase letters: : ; < = > ? @ The following characters are sorted in the following order after numbers, and uppercase and lowercase letters in a list: { | } ~	Sorted left to right, character by character. The following characters are sorted in the following order before numbers, and uppercase and lowercase letters in a list: ~ } | { The following characters are sorted in the following order before numbers in a list, but after uppercase and lowercase letters: @ ? > = < ; : The following characters are sorted in the following order after numbers, and uppercase and lowercase letters in a list: / . , + *) (‘ & % $ # ! (space)
Blanks	Blank entries are placed first at the top of the list.	Blank entries are placed last at the bottom of the list.

Note

(1) Sorting on an IP Address field may cause performance issues when the 5620 SAM database is under heavy load.

Figure 3-15 List sort order example

Procedure 3-31 To save listed information to a file

After you list information, as described in Procedure 3-30, you can save a copy of the list for purposes such as the following:

- record keeping
- inventory management
- processing by another application

1 Generate a filtered list, as required.

2 Right-click on a list column heading and choose Save To File from the contextual menu. The Save As form opens.

Note — The 5620 SAM uses the user home directory as the default location for saved files.

3 Use the form to specify the name and location of the file that is to contain the listed information. You can save the information in the following formats:

- plain text
- HTML
- CSV

4 Click on the Save button. The information is saved as specified and the Save as form closes.

Procedure 3-32 To save results list preferences

You can save results list preferences, so when similar searches on similar objects are performed, the output of the list is organized according to your preferences.

1 Open a List Form.

2 Organize the results list according to preference, for example, whether to sort columns of data in ascending or descending order.

3 Right-click on a results list column heading and choose Save Table Preferences from the contextual menu. A dialog box appears to confirm that you need to save the current filter preferences.

Note — Choosing Save Table Preferences from a contextual menu does not save any filter configurations.

4 Click on the Yes button. The results list format is saved.

Each time a similar list is generated for similar objects, for example, if you configured a table preference for generating lists of ports, then each time you list ports, results are displayed according to preconfigured table formats.

5 Close the List Form.

Procedure 3-33 To save search filters

List Forms allow you to save filters for object types. The filters created only apply to the specific object type against which the filter is created and saved, and that object type's descendant objects.

1 Open a List Form

2 Define filter properties, as described in Procedure 3-24 and click on the Filter button, or define filter properties, as described in Procedure 3-25. The filter form opens.

3 Click on the Save... button. The Save Filter form opens.

4 Configure the parameters:

- Filter Name
- Description
- Public

Note — These parameters have pre-populated values when a saved search filter is loaded or selected from the saved filters drop-down list, or if the filter was previously saved.

5 Click on the Save button. The Save Filter form closes. The defined filter is saved for a future search on a similar object type and the configured parameters are populated in the filter window.

6 Click on the Apply button of the OK button to use the filter. The results list is displayed based on the filter.

7 If the filter window is open, click on the Close button. The filter window closes.

8 Close the List Form.

Procedure 3-34 To clear a search filter

Use the following procedure to clear search filters from a List Form or the filter window.

1 Open a List Form.

2 Define filter properties as described in Procedure 3-24 or 3-25.

3 Do one of the following.

a To clear all search filters from a List form, go to step 4.

b To clear the search filter of the filter window, go to step 7.

4 Do one of the following.

a Click on the Clear all Filters button. Any filtered properties are cleared.

Note — Clicking on the Clear all Filters button does not clear or refresh search results.

b Choose No Filter from the saved filters drop-down list. Any filtered properties are cleared and the results list is displayed based on the empty filter. Go to step 11.

5 Click on the Search button. The results list is displayed based on the empty filter.

6 Go to step 11.

7 Click on the Filter button. The filter window opens.

8 Click on the Clear button. Any filtered properties are cleared from the filter window.

9 Click on the Apply button or the OK button. The results list is displayed based on the empty filter.

10 If the filter window is open, click on the Close button. The filter window closes.

11 Close the List Form.

Procedure 3-35 To load a saved search filter

Use the following procedure to load search filters from a List Form or the filter window. See Procedure 6-21 for information about loading a saved filter on a topology map.

1 Open a List Form.

2 Do one of the following.

a To load search filters from a List Form, go to step 3.

b To load search filters from the filter window, go to step 4.

3 Choose an entry from the saved filters drop-down list. The results list is displayed based on the filter. Go to step 11.

Note 1 — Choosing an entry from the saved filters drop-down list disables the filter areas of the column headings.

Note 2 — Only saved filters that are applicable to the current object type and its ancestor types appear in the saved filters drop-down list.

Note 3 — Selecting None from the saved filters drop-down list clears any filtered properties on the current form and immediately refresh the results list.

Note 4 — The contents of the filter window are updated based on the entry selected from the saved filters drop-down list.

4 Click on the Filter button. The filter window opens.

5 Click on the Saved Filters button. The Saved Filters window opens and displays filters that have been saved for the current object type and its ancestor type(s).

6 Select a saved filter in the list.

7 Click on the Load button. All the properties of the filter window are replaced with the contents of the saved filter.

8 If desired, modify the filter and click on the Save button to save it.

Note — The filter is saved using the current object type, regardless of the object type of the saved filter that was loaded.

9 Click on the Apply button or the OK button to use the filter. The results list is displayed based on the filter.

10 If the filter window is open, click on the Close button to close the filter window.

11 Close the List Form.

Procedure 3-36 To delete a saved search filter

Use the following procedure to delete saved search filters from the filter window.

1 Open a List Form.

2 Click on the Filter button. The filter window opens.

3 Click on the Saved Filters button. The Saved Filters window opens.

4 Select a saved filter in the list.

5 Click on the Delete button. The filter is deleted.

6 Close the form.

7 Close the filter window.

8 Close the List Form.

Procedure 3-37 To configure equipment group search filters

On some list forms you can create and save search filters based on pre-existing topology groups.

1 Open a list form, if available, choose an entry from the object drop-down list. The equipment group filter drop-down list displays with Equipment Group(s) - All selected.

2 Choose Select Equipment Groups from the equipment group drop-down list. The Select Equipment Groups form appears with the topology groups listed in the Available column. See Procedure 6-28 for information about how to create a topology group.

3 Perform one of the following:

a To create an equipment group filter.

i In the Available list box, choose the topology groups that you need to include in the filter and click on the right arrow. The specified topology groups are moved to the Filtered by list box.

ii To include data from nodes that are in equipment subgroups in the equipment group filter, select the Include contained Equipment Groups check box.

iii Go to step c.

b To modify an equipment group filter.

i Click on the Saved Filters button. The Save Filter form displays the equipment group filters.

ii Select a filter and click on the Load button. The Save Filter form closes and the selected filter is displayed in the Select Equipment Groups form.

iii Update the selected equipment group filter as required.

iv Go to step c.

c To save an equipment group filter.

i Click on the Save button. The Save Equipment Group Filter displays.

ii Configure the parameters:

- Filter Name
- Description
- Public

Note — The parameters have pre-populated values when a saved equipment group filter is loaded or is selected from the saved filters drop-down list, or if the filter was previously saved.

iii Click the Save button. The Save Equipment Group Filter form closes, the filter is saved, and the Select Equipment Groups form displays the saved equipment group filter.

d Click on the Clear button to clear the current filter from the Select Equipment Groups form.

4 Click on the OK button to apply the filter without saving it. The results list is displayed based on the equipment group filter and any additional filters that are applied to the list. The Last Search value is updated, and the equipment group filter name is displayed in the equipment group filter drop-down list.

5 Close the list form.

Procedure 3-38 To perform a search using equipment group filters

On some list forms, you can create and save a filter based on pre-existing topology groups.

1 Open a list form, if available, choose an entry from the object drop-down list. The equipment group filter drop-down list displays with Equipment Group(s) - All selected.

2 Choose a filter from the equipment group drop-down list. The results list is displayed based on the selected equipment group filter and any additional filters that are applied to the list. The Last Search value is updated.

3 Close the list form.

4 — 5620 SAM custom workspaces

4.1 5620 SAM custom workspaces overview *4-2*

4.2 Workflow to administer 5620 SAM custom workspaces *4-3*

4.3 Workflow to customize 5620 SAM workspaces *4-3*

4.4 Workflow to save and update custom workspaces for a 5620 SAM upgrade *4-4*

4.5 5620 SAM GUI custom workspace procedures *4-4*

4.1 5620 SAM custom workspaces overview

Workspace customization

A workspace is the collection of 5620 SAM GUI elements that you use to manage your network. System-defined workspaces are provided, but you can also create and save your own customized workspaces to simplify navigation and operation according to your requirements. You can customize the following workspace elements:

- Menus: You can create custom menus with user-defined names, remove menu items that you don't need, re-order the sequence in which menu items appear, and add grouping separators and custom mnemonics.
- Toolbar: On the toolbar, you can add or remove menu icon buttons, add custom menu drop-downs, create custom toolbar menus, and change the sequence of toolbar items.
- Tree labels: On the routing and equipment navigation trees, you can choose the information to display in the label text fields, and the order in which it appears.
- Topology map icon labels: Map icons can show up to two custom text labels.
- Window layouts: You can save your window layout preferences.

There are three types of workspaces:

- System-defined: These workspaces are read-only and are provided as part of the 5620 SAM product. System-defined workspaces cannot be modified.
- Private: A private workspace contains your customized settings and is visible only to you and an administrator. When you log in to the 5620 SAM, your default custom workspace is displayed.
- Public: A public workspace is usable by all users on the same server.

You can create new custom workspaces based on the system default workspace or on another custom workspace. You must have the required scope of command permissions to create or modify custom workspaces. Scope of command role and user group workspace permissions are set by the system administrator.

The workspace selector located in the upper right-hand corner of the screen contains a list of system default and custom workspaces, and allows you to quickly replace the current workspace with another from this list.You can add or remove custom workspaces in the workspace selector, and change the order in which workspaces appear in the list. See Procedures 4-6 and 4-7.

5620 SAM upgrades and custom workspace updates

New releases of the 5620 SAM may contain newly-introduced menu items. You can add these new menu items to the custom workspaces of an earlier release. You can export custom workspaces to a specified directory, and import them later into an upgraded version of the 5620 SAM. After an upgrade, the 5620 SAM lists all newly-introduced menu items, which you can add to the imported workspace as required. See Procedure 4-11.

Custom tab display

You can also customize the display of tabs on configuration forms, and save your tab display preferences. For specific forms, you can display, hide, or arrange the sequence of tabs according to your operational requirements. See Procedure 3-20.

Custom settings for tabs on configuration forms are saved as user preferences. They are not affected by a change of workspaces.

4.2 Workflow to administer 5620 SAM custom workspaces

A system administrator performs the following tasks to configure users and permissions for custom workspaces:

1. Configure the scope of command roles for workspaces; see the *5620 SAM System Administrator Guide*.
2. Add or delete workspaces in a User Group, as required; see the *5620 SAM System Administrator Guide*.

4.3 Workflow to customize 5620 SAM workspaces

1. Assess your operational requirements to determine your workspace element needs.
2. Create a custom workspace; see Procedure 4-1.
3. Customize menus; see Procedure 4-1.
4. Customize toolbars; see Procedure 4-2.
5. Customize tree labels; see Procedure 4-3.
6. Customize topology map icon labels; see Procedure 4-4.
7. Customize window layouts; see Procedure 4-5.
8. Add or remove custom workspaces and arrange their sequence in the workspace selector; see Procedure 4-6.
9. Delete a workspace when it is no longer required; see Procedure 4-8.

Note — You can also customize the display of tabs on configuration forms, and save your tab display preferences. For specific forms, you can display, hide, or arrange the sequence of tabs according to your operational requirements. See Procedures 3-20 and 3-21.

4.4 Workflow to save and update custom workspaces for a 5620 SAM upgrade

1. Export custom workspaces to a specified directory; see Procedure 4-9.
2. Perform an upgrade on the 5620 SAM.
3. Import workspaces from a directory into the 5620 SAM; see Procedure 4-10.
4. Update the custom workspace of an earlier 5620 SAM release with a new menu item from a later release; see Procedure 4-11.

4.5 5620 SAM GUI custom workspace procedures

The following procedures describe how to create and manage custom workspaces in the 5620 SAM.

Procedure 4-1 To customize menus

Perform this procedure to customize menus in a new workspace or to modify menus in an existing workspace.

You must have the required scope of command permissions to customize workspaces.

1 Open the Workspace form. Perform one of the following:

a Create a new workspace based on the system default workspace:

i Choose Application→Manage Workspaces from the 5620 SAM main menu. The Manage Workspaces form opens.

ii Click on the Create button. The Workspace (Create) form opens.

iii Configure the parameters:

- Name
- Description
- Scope

Note — Based on your assigned scope of command role and permissions, you can configure the scope. Otherwise, Private will be set by default and cannot be modified.

b Create a new workspace based on an existing custom workspace:

i Choose Application→Manage Workspaces from the 5620 SAM main menu. The Manage Workspaces form opens.

ii Choose a custom workspace in the list as the basis for the new workspace and click on the properties button. The Workspace (Edit) form opens.

iii Click on the Copy button.

iv Configure the parameters:

- Name
- Description
- Scope

Note — Based on your assigned scope of command role and permissions, you can configure the scope. Otherwise, Private will be set by default and cannot be modified.

c Modify an existing custom workspace:

i In the workspace selector, select the custom workspace you need to modify.

ii Choose Application→Customize Current Workspace from the 5620 SAM main menu.

Alternatively, you can select a custom workspace from the list on the Manage Workspaces form and click on the Properties button.

The Workspace (Edit) form opens.

Note 1 — You cannot modify a system default workspace using the Customize Current Workspace option.

Note 2 — You must have the required scope of command to customize an existing workspace.

2 Click on the Menus tab.

The All Menu Items panel contains a list of all available menu items in the 5620 SAM. The Custom Menu panel contains a list of all menu items in the custom workspace.

3 Expand items as required in the All Menu Items panel and Custom Menu panel.

4 In the Custom Menu panel, remove any menu items that are not required in the workspace. To remove, select the items and delete using the right-click menu or the keyboard.

Consider the implications of removing menu items from your workspace. For example, do not delete the User Preferences or Manage Workspaces menu items. These items are required for later custom workspace configuration and access to other workspaces.

5 Add menu items to the Custom Menu panel as required. Select items in the All Menu Items panel. You can click and drag, right click, or use the keyboard to copy selected menu items to the Custom Menu panel.

The orange check box beside an item in the All Menu Items panel indicates whether the sub-menu items for that menu item are all used, partially used, or not used in the Custom Menu. Check box symbols are described in the Legend at the bottom of the Workspace form. The check boxes reduce the need to compare sub-menus between the All Menu Items panel and the Custom Menu panel.

6 Move items in the Custom Menu panel as required. You can click and drag items, or use right click or the keyboard to cut, copy and paste selected menu items to other locations in the Custom Menu panel.

If you hold the CTRL key while dragging, the drop action changes from move to copy.

7 Rename items in the Custom Menu panel as required. Select the item, right-click and choose Rename, then type a name and press Enter.

Modified menu items are displayed in blue.

8 Add grouping separators in sub-menus, as required. Right click in the location where you need to add a separator and choose Add Separator.

9 Edit the mnemonic for an item in the Custom Menu panel. Perform the following:

i Select the item, right-click, and choose Edit Mnemonic. A drop-down opens.

ii Choose a letter from the drop-down and click OK.

The mnemonic letter is underlined in the menu item name and is used with the CTRL key as a keyboard shortcut. The mnemonic for each item in a sub-menu must be unique.

10 Add a new custom menu in the Custom Menu panel. Select an item, right-click, and choose Add Menu. A new menu item appears under the selected item. Type a name for the new item and press Enter.

If you right-click on empty space in the panel, the new menu item appears as the last item in the list.

You can use new menus to contain custom menus for functions you use often.

11 To locate a sub-menu item in the Custom Menu panel, you can display the menu path for the item. Perform the following:

i In the All Menu Items panel, select an item, right-click, and choose Show in Custom Menu Tree.

A dialog box displays the path for the item in the Custom Menu. If the item appears more than once in the Custom Menu tree, multiple paths are displayed.

ii Click on the OK button to close the dialog box.

12 To locate a sub-menu item in the All Menu Items panel, you can display the menu path for the item. Perform the following:

i In the Custom Menu panel, select an item, right-click, and choose Show in All Menu Items Tree.

A dialog box displays the path for the item in the All Menu Items panel.

ii Click on the OK button to close the dialog box.

13 Click on the OK button. A dialog box is displayed.

14 Click on the Yes button. The Workspace form closes.

Note — When you modify the current workspace, the workspace selector displays Workspace Out of Sync. Select the current workspace from the workspace selector drop-down to update to the modified settings.

Procedure 4-2 To customize toolbars

The 5620 SAM toolbar contains icon buttons that allow quick access to menu items. Custom toolbars can also contain drop-down menus. Perform this procedure to add or remove buttons and menus, and to change the order of buttons and menus on the toolbar.

1 Open the Workspace form as described in step 1 of Procedure 4-1.

2 Click on the Toolbar tab.

The Custom Menu panel contains a list of all the menu items in the custom workspace. The Appear on Toolbar panel displays a list of all items displayed as buttons or menus on the toolbar.

3 Expand items as required in the Custom Menu panel and Appear on Toolbar panel.

4 In the Appear on Toolbar panel, remove any items that are not required on the toolbar. To remove, select the items and use the right-click menu or the keyboard to delete.

5 Add menu items to the Appear on Toolbar panel as required. Select items in the Custom Menu panel. You can click and drag, right click, or use the keyboard to copy selected items to the Appear on Toolbar panel.

When you add a menu item that contains a sub-menu, a drop-down for the item is added to the toolbar. When you click on the drop-down on the toolbar, the sub-menu items are displayed. Menu items that contain sub-menus are displayed with a folder icon in the Workspace panels.

When you add an item with no sub-menu, the item appears on the toolbar as an icon button. Menu items with no sub-menus are displayed with unique identifying icons.

Menu items without icons can only be pasted in a menu folder. For example, menu items in the Window menu do not display icons.

The orange check box beside an item in the Custom Menu panel indicates whether the sub-menu items for that menu item are all used, partially used, or not used in the custom toolbar. Check box symbols are described in the Legend at the bottom of the Workspace form.

6 Move items in the Appear on Toolbar panel as required. You can click and drag items, or use right click or the keyboard to cut, copy and paste selected menu items to other locations in the Appear on Toolbar panel.

If you hold the CTRL key while dragging, the drop action changes from move to copy.

7 Rename items in the Appear on Toolbar panel as required. Select the item, right-click and choose Rename, then type a name and press Enter.

Modified menu items are displayed in blue.

8 Add a custom menu item in the Appear on Toolbar panel. Select an item, right-click, and choose Add Menu. A new menu item appears under the selected item. Type a name for the new item and press Enter.

If you right-click on empty space in the panel, the new menu item appears as the last item in the list.

You can use new menus to contain custom menus for functions you use often.

9 To locate a sub-menu item in the Custom Menu panel, you can display the menu path for the item. Perform the following:

i In the Appear on Toolbar panel, select an item, right-click, and choose Show in Custom Menu Tree.

A dialog box displays the path for the item in the Custom Menu. If the item appears more than once in the Custom Menu tree, multiple paths are displayed.

ii Click on the OK button to close the dialog box.

10 Click on the OK button. A dialog box is displayed.

11 Click on the Yes button. The Workspace form closes.

Note — When you modify the current workspace, the workspace selector displays Workspace Out of Sync. Select the current workspace from the workspace selector drop-down to update to the modified settings.

Procedure 4-3 To customize tree labels

In the 5620 SAM GUI, objects in the Equipment and Routing navigation trees are displayed with icons and labels. Labels are displayed as text fields separated by commas. Each label type corresponds to specific information. For example, the Software Version label type displays in the text field as the release number of the NE.

You can customize the display of text labels for tree objects by selecting the label types that appear and the order in which they appear. You can select and order up to two label types for objects at the top level of the tree, and up to five label types at the NE level. Labels for the Unmanaged NEs, Discovered NEs or Network Groups objects cannot be customized.

Perform this procedure to customize the labels for Equipment and Routing navigation tree objects.

1 Open the Workspace form as described in step 1 of Procedure 4-1.

2 Click on the Tree tab and choose the tree type from the drop-down menu.

3 Object types and text fields are displayed in a table. In the Equipment Group (All) table row, perform the following:

   i Click on the table cell below Text Field #1 and choose a label type from the drop down menu.The selected label type appears in the table cell. On the navigation tree, specific information for the label type will appear in the Text Field #1 position for the object.

   ii Click on the table cell below Text Field #2 and choose a label type from the drop down menu.The selected label type appears in the table cell.

4 Continue for the remaining rows in the table, as required. For Network Element rows, you can configure up to five text fields. Some label types appear below more than one text field heading. You can specify the display sequence of these labels by choosing which text field to display them in.

Note 1 — Click on Restore Defaults to reset text fields to the default values for the tree type in view.

Note 2 — The label types for each object are displayed in navigation tree tooltips.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Workspace form closes.

Note — When you modify the current workspace, the workspace selector displays Workspace Out of Sync. Select the current workspace from the workspace selector drop-down to update to the modified settings.

7 Close the Manage Workspaces form.

Procedure 4-4 To customize topology map icon labels

By default, topology map icons include a descriptive label. For example, the label on a managed device icon on the service topology map includes the service name and the IP address of the device.

Perform this procedure to customize labels for topology map icons.

1 Open the Workspace form as described in step 1 of Procedure 4-1.

2 Click on the Topology tab. A list of topology map icons is displayed in a table.

3 Select a topology map icon. The table row is highlighted.

4 Click in the highlighted row below Text Field #1 and Text Field #2 to select the information to display for the map icon label.

5 Repeat steps 3 and 4 to customize additional icon labels.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button to save the changes and close the dialog box.

8 Close the Manage Workspaces form.

Note — When you modify the current workspace, the workspace selector displays Workspace Out of Sync. Select the current workspace from the workspace selector drop-down to update to the modified settings.

Procedure 4-5 To customize window layouts

Perform this procedure to select the window layout that appears when the 5620 SAM opens. You can select the system default or the current window layout. See Procedure 3-9 for information about how to arrange windows in the 5620 SAM GUI.

1 Open the Workspace form as described in step 1 of Procedure 4-1.

2 Click on the Window Layout tab.

3 Set the Window Layout to specify the window layout when the 5620 SAM opens. Select one of the following:

- Default (Default)—The navigation tree, Alarm Window, topology map and the main GUI client will open at the system default size and location
- Set to Current (Custom)—The navigation tree, Alarm Window, topology map, and the main GUI client will open at the currently displayed size and location

4 Click on the OK button. A dialog box appears.

5 Click on the Yes button and close the Manage Workspaces form.

Note — When you modify the current workspace, the workspace selector displays Workspace Out of Sync. Select the current workspace from the workspace selector drop-down to update to the modified settings.

Procedure 4-6 To add or remove a workspace in the workspace selector

Perform this procedure to add or remove custom workspaces or change the sequence of workspaces in the workspace selector, or to set a custom workspace as the default workspace.

1 Choose Application→User Preferences from the 5620 SAM main menu. The User Preferences form opens.

2 Click on the Workspaces tab. A list is displayed of the workspaces that are currently listed in the workspace selector.

3 Add a workspace to the workspace selector. Perform the following:

- **i** Click on the Add button. The Add Workspace form opens. A list is displayed of the workspaces not currently in the workspace selector.
- **ii** Choose a workspace from the list.
- **iii** Click on the OK button. The Add Workspace form closes and the workspace is displayed in the list on the Workspaces tab of the User Preferences form.

4 Set the default workspace that displays when the 5620 SAM opens. Choose the workspace in the list and click on the Set as Default button.

5 Remove a workspace from the workspace selector. Choose a workspace in the list on the Workspaces tab and click on the Delete button.

Note 1 — You cannot remove the System_Default_All workspace from the workspace selector.

Note 2 — If a user has the deleted workspace as the default workspace, their new default workspace is System_Default_All and the workspace selector displays “Workspace Out of Sync”.

6 Change the sequence of workspaces in the workspace selector. Choose a workspace in the list on the Workspaces tab and click on the Move Up or Move Down buttons.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The User Preferences form closes. The workspace selector drop-down in the top right corner of the menu bar is updated with the new settings.

Procedure 4-7 To change to another workspace using the workspace selector

Note — You must add a custom workspace to the workspace selector before you can select it. See Procedure 4-6.

1 Click on the workspace selector drop-down in the top right corner of the display.

2 Choose a workspace in the list. The 5620 SAM GUI is displayed using the settings from the selected workspace. The workspace selector displays the workspace currently in use.

Procedure 4-8 To delete a workspace from the 5620 SAM

Perform this procedure to permanently delete a custom workspace from the 5620 SAM. You must have the required scope of command permissions to delete a custom workspace. System default workspaces cannot be deleted.

1 Choose Application→Manage Workspaces from the 5620 SAM main menu. The Manage Workspaces form opens.

2 Choose a workspace in the list and click on the Delete button. A dialog box opens.

3 Click on the Yes button to confirm the action.

4 Close the Manage Workspaces form.

Note 1 — When you delete the current workspace, the workspace selector displays “Workspace Out of Sync”. Select another workspace in the workspace selector.

Note 2 — If a user is deleted from 5620 SAM, the private workspaces of the user are deleted from the database.

Procedure 4-9 To export custom workspaces

You can save custom workspaces by exporting them, and then import them later into upgraded versions of the 5620 SAM. Perform this procedure to export workspaces, based on your scope of command permissions.

1 Choose Application→Manage Workspaces from the 5620 SAM main menu. The Manage Workspaces form opens.

2 Perform one of the following:

a To export all custom workspaces, click on the Export All button. The Export Directory window opens.

If you have workspace permissions enabled, all public and private workspaces can be exported. If you have workspace permissions disabled, only private workspaces can be exported.

b To export selected multiple workspaces, choose the custom workspaces in the list and click on the Export button. The Export Directory window opens.

c To export a single custom workspace, choose the workspace in the list and click on the Export button. The Export Directory window opens.

Alternatively, you can click on the Properties button for a selected custom workspace to open the Workspace (Edit) form, then click on the Export button.

Note — If you do not have permissions to export a workspace the Export button is disabled.

3 Specify the export directory in the Save In drop-down menu or create a directory or folder. A warning is displayed.

4 Click on the Yes button to create or overwrite the directory. The selected workspace files are exported to the specified directory on the server.

Procedure 4-10 To import a workspace

Perform this procedure to import 5620 SAM workspaces that were previously saved as exported workspaces. For information about how to export workspaces, see Procedure 4-9.

1 Choose Application→Manage Workspaces from the 5620 SAM main menu. The Manage Workspaces form opens.

2 Click on the Import button to import previously exported workspaces. The Import Directory window opens.

3 Use the Look In drop-down menu to choose the directory from which to import a workspace.

Note — If you need to overwrite the user name or overwrite existing workspaces, select either the Overwrite User Name or the Overwrite Existing Workspace(s) check box. Based on your user permissions, some of the options may not be configurable.

4 Click on the Open button. The imported workspaces are added to the Manage Workspaces form.

Note — You cannot import the same workspace multiple times. A warning message is displayed.

Procedure 4-11 To add new menu items to a saved custom workspace after a 5620 SAM upgrade

When you upgrade to a later release of the 5620 SAM, you can update your custom workspaces of an earlier release by adding menu items that are new in the later release. You can view the new menu items and add them to custom workspaces imported from an earlier release.

After an upgrade, the workspace is auto-created from an existing saved GUI preference file if it exists on the local file system, with a *username_hostname* workspace name. If this name exists, the workspace name will be *username_hostname_timestamp*. When you log in to the client after an upgrade, the custom workspace is displayed.

Perform this procedure to add new menu items to an existing custom workspace of an earlier release.

Note 1 — You must have the required scope of command role and permissions to view or add new menu items.

Note 2 — The New Menu Items function is available after an upgrade to the 5620 SAM.

1 Choose Application→Manage Workspaces from the 5620 SAM main menu. The Manage Workspaces form opens.

2 Choose one of the following:

- **a** Import a saved workspace from an earlier 5620 SAM release. See Procedure 4-10.
- **b** After an upgrade, when you log in as an existing user, select a custom workspace from an earlier 5620 SAM release.

3 Click on the Properties button. The Workspace (Edit) form opens. The All Menu Items option is displayed by default.

4 Configure the parameters, if required:

- Name
- Description
- Scope

5 From the All Menu Items drop-down menu, choose New Menu Items. A list of menu items newly-introduced in the 5620 SAM since the earlier release is displayed.

6 Add menu items to the Custom Menu panel as required. See Procedure 4-1.

7 Select the Finished adding New Menu Items check box to update the workspace.

Note — After the Finished adding New Menu Items check box is selected and you click on the Apply or OK buttons, the New Menu Items drop-down is no longer displayed and you can no longer view the New Menu Items list.

8 Click on the Apply or OK button. A dialog box appears.

9 Click on the Yes button and close the Workspace (Edit) form.

5 — 5620 SAM navigation tree overview

5.1 Navigation tree overview *5-2*

5.2 Basic navigation tree procedures *5-11*

5.1 Navigation tree overview

The navigation tree lists the managed equipment, services, and protocols that are configured on the NE. The navigation tree includes a view selector located on the navigation tree toolbar. The view selector is a drop-down menu that lists the physical and logical network views that are available.

The navigation tree is accessible from the main window, configuration forms, and maps.

You can choose the following views:

- Equipment—displays the physical objects that the 5620 SAM manages
- OSPF—displays the OSPF objects in the network
- IS-IS—displays the IS-IS objects in the network
- Routing—displays the device routing instances and child objects such as the network interfaces and the configured protocols
- Ring Group—displays the ring group objects that the 5620 SAM manages

You can use the navigation tree to search for specific objects such as NEs, shelves, cards, and ports in the physical and logical network views. See Procedure 5-1 for information about searching for objects using the navigation tree.

Table 5-1 describes the objects in the equipment view of the navigation tree that the 5620 SAM allows you to create and manage.

Note — The device properties forms include a navigation tree that is displayed on the left of the form. The root of the device properties form navigation tree is the device.

Table 5-1 5620 SAM navigation tree object descriptions — Equipment view

Object	Description
Routing	The network — contains the routers, devices, and topology groups, including the default Discovered NEs and Unmanaged NEs topology groups
NE, topology group	The second level in the hierarchy
CCAG, ISA-AA groups, ISA-Tunnel groups, ISA-LNS groups, ISA-NAT groups, ISA-Video groups, LAG, IGH, shelf	The third level in the hierarchy
APS groups	Located under the shelf object; contain the APS groups for a device
Card	Located under the shelf object
Daughter card	A child object of the card object
Bundles	A child object of the daughter-card object; a group of DS0 channels on a SONET- or TDM-capable daughter card
Port	A child object of the daughter-card object

(1 of 2)

Object	Description
Channel, sub-channel, timeslot	Child objects of the port object
Fans	Located under the shelf object(1)
Power Supplies	Located under the shelf object(1)

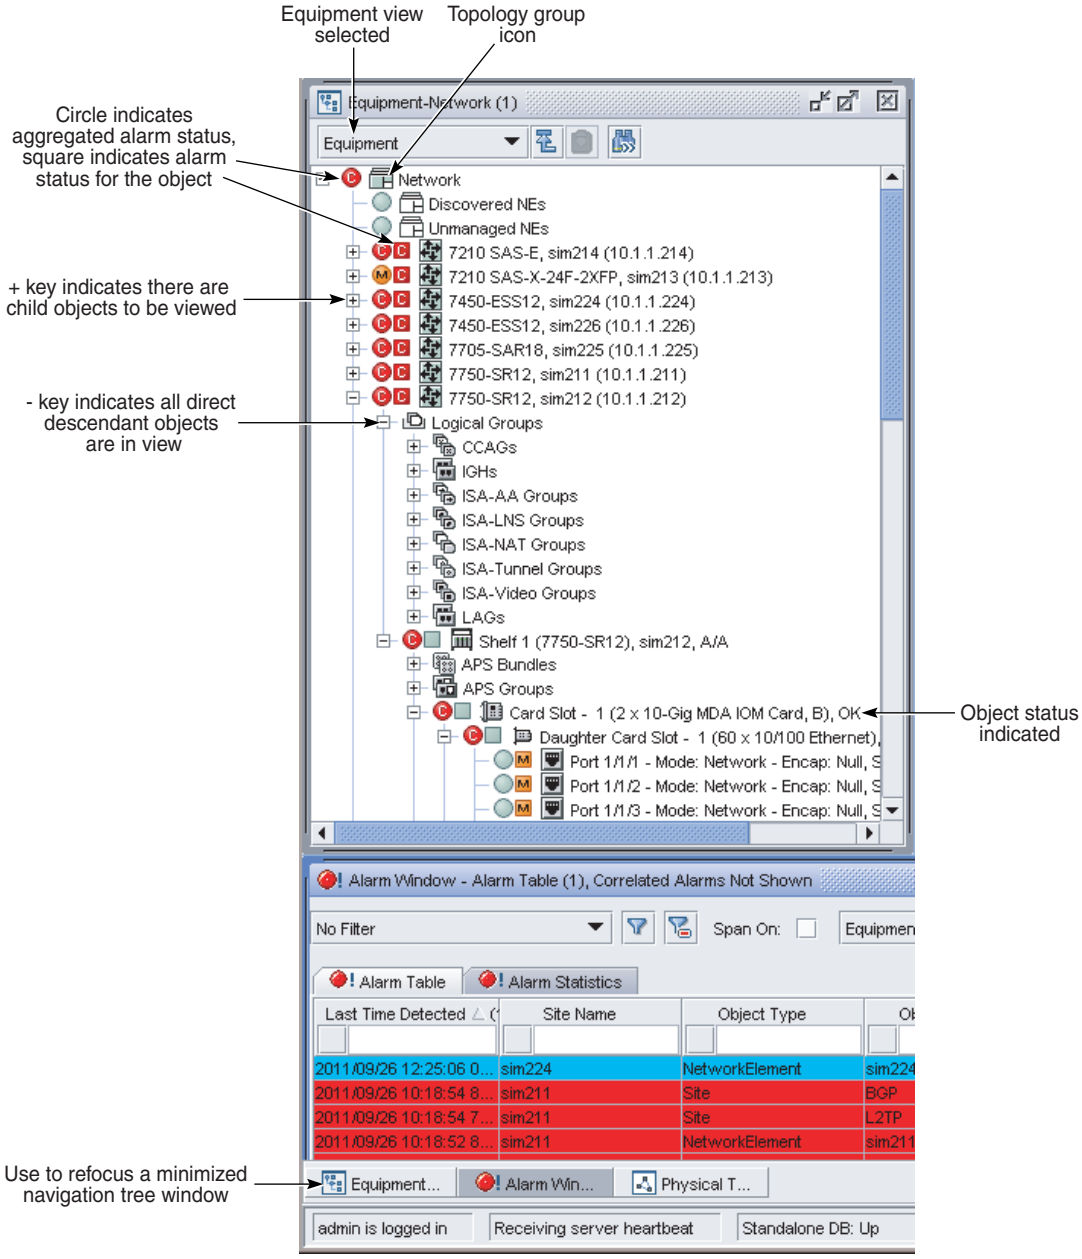
(2 of 2)

Note
(1) This object is not supported on 1830 PSS nodes.

You can use the following methods to view and manage objects in the 5620 SAM navigation tree:

- Double-click on an object or press the + key when the object is selected to open the object and to display the child objects.
- Double-click on an object or press the - key when the object is selected to close the object and to hide the child objects. A + key to the left of the map object indicates that the object contains child objects. For example, a topology group that contains one or more child topology groups has a + key to the left of the topology group in the navigation tree.
- Click on an object and use the cursor keys to navigate the object hierarchy. In the Equipment view, for example, you can navigate from the device to the ports and channels.
- Right-click on an object to open the contextual menu and choose a function. The menu options are specific to the object type. See "Contextual menus" in this section for more information.

Note — Keyboard-based navigation-tree operations may not function as expected when you open the client GUI using a third-party access tool, for example, a Citrix server.



The navigation tree uses color highlights to display object status information such as the current alarm level and the aggregated alarm status. The operational and administrative states of an object are displayed in text form beside the object icon, as are the object type and description.

The circle icon to the left of the topology group icon represents the aggregated alarm status for the group. It represents the most serious alarm against descendant device.

The topology group icon is divided into three sections. The top right square represents the most severe state of all descendant devices. The bottom right square represents the most severe state of all descendant links. The bottom section of the topology group icon represents the most severe state of the devices and edges that are immediately descendant of the group. See chapter 31 for more information about viewing alarm status information in a map navigation tree. To troubleshoot alarms using topology maps, see *5620 SAM Troubleshooting Guide*.

Figure 5-1 shows some of the navigation tree objects that you can manage using the Equipment view.

Figure 5-1 5620 SAM navigation tree objects - Equipment view

18030

Using the navigation tree toolbar

The navigation tree toolbar consists of the view selector, the Make Root At Top Level button, and the Copy to Clipboard button. Figure 3-1 shows the navigation tree toolbar. See Procedure 3-15 for information about using the Copy to Clipboard button.

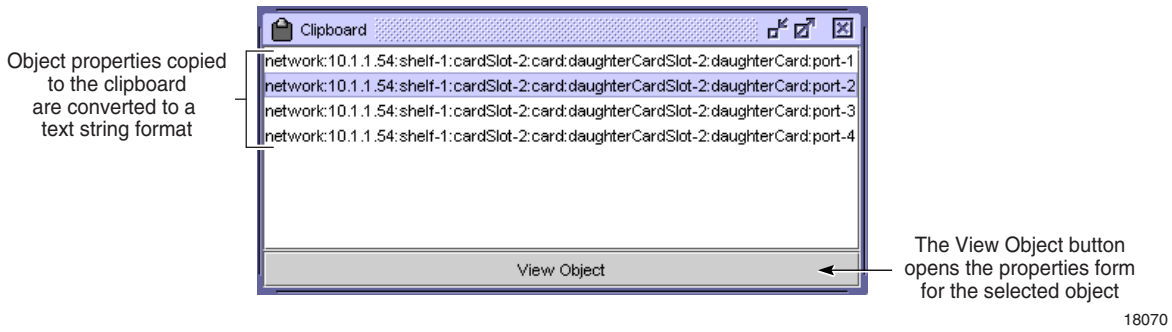
Make Root At Top Level button

The Make Root At Top Level button restores the navigation tree to the default root. For example, in the equipment view, if you redefine the root of the tree as a card and click on the Make Root At Top Level button, the navigation tree refreshes with the default root, which is the network. The Make Root At Top Level button is enabled only when the root is not the network. The Make Root At Top Level button is available only for the equipment view.

Make Root and Make Root In New Tree menu options

The navigation tree contextual menus provide Make Root and Make Root In New Tree menu options that allow you to redefine the root of the tree. These menu options, along with the Make Root At Top Level button, help orient users in densely populated navigation trees. The menu options are available only for the equipment view. See "Contextual menus" in this section for more information about using these functions.

Copy to Clipboard button and Clipboard window



Using the Copy to Clipboard button on the navigation tree toolbar, you can copy the identifier of one or more 5620 SAM objects to the Clipboard window. You can then open the Clipboard window from the Application menu to retrieve the identifier and paste it into another application. You can also choose an object identifier in the Clipboard window and click on the View Object button to open the object properties form. The elements in an object identifier are delimited using colons (:).

The Copy to Clipboard button is on list forms and on the list tabs of properties forms. You can use the button to copy configurable and read-only text fields. The button is enabled when at least one object is selected.

Note — The Clipboard window keeps the object identifier from only the most recent copy action. After you copy an object identifier to the clipboard, if you click on the Copy to Clipboard button again to copy another object identifier, the second copy action overwrites the previously copied identifier in the Clipboard window.

Figure 5-2 shows the Clipboard window. See Procedure 3-15 for more information about using the clipboard function.

Figure 5-2 Clipboard window

Paste from Clipboard button

After using the Copy to Clipboard button to copy object identifiers to the Clipboard window, you can use the Paste from Clipboard button on the physical link properties form to set multiple parameters at one time using the copied object identifiers. See Procedure 6-33 for information about using the Paste from Clipboard button.

Contextual menus

Each object in the 5620 SAM navigation tree has a contextual menu that opens when you right-click on the object. Contextual menus are also accessible when you right-click on map objects.

You can use the contextual menus to do the following:

- create objects
- configure object properties
- perform maintenance functions
- change the state of objects
- open a different management interface, for example, a CLI
- designate an object as the root object in the navigation tree

The contextual menu options are specific to the object type. Table 5-2 lists the contextual menu options in alphabetical order.

Table 5-2 Contextual menu options

Option name	Description
Add to Ring Group	The Add to Ring Group menu option specifies whether to add the device to a group.
Alternate Element Manager	The Alternate Element Manager option opens an alternate EMS client on the 5620 SAM client station. The option is available for GNEs only, and only when the EMS client application is specified in the GNE configuration or in the associated GNE profile.
Configure Card	The Configure Card option opens the Create Card properties form that allows you to create a card configuration for the slot. You assign a supported card type to the slot. The options available are displayed with check marks beside them in the Supported Card Types parameter. The Equipped Card Type displays the card type that is physically in the slot. When the configured card types are correct, you can change the Administrative State as required.
Configure Daughter Card	The Configure Daughter Card option opens the Daughter Card (Create) form that allows you to create a daughter card configuration for the slot. You assign a supported daughter card type to the daughter card slot. The options are displayed with check marks beside them in the Supported Daughter Card Types area of the form. The Equipped Daughter Card Type displays the daughter card type that is physically in the slot. When the configured card types are correct, you can change the Administrative State as required.
Copy to Clipboard	The Copy to Clipboard option copies the MDA information to the clipboard.

(1 of 6)

Option name	Description
Create APS Group	The Create APS Group menu option opens the APS Group (Create) form that allows you to create and manage SC APS groups and MC APS groups on the shelf.
Create APS Protection Bundle	The Create APS Protection Bundle menu option opens the Create Multilink Bundle form, which allows you to create and manage APS protection bundles. You must create an APS working bundle before you can create an APS protection bundle or add members to the APS bundle.
Create APS Protection Channel	The Create APS Protection Channel menu option opens the APS Channel, Protection (Create) form that allows you to create and manage APS protection channels.
Create APS SONET Channel	The Create APS SONET Channel menu option opens the SONET Channel (Create) form that allows you to create the APS common configuration.
Create APS Working Bundle	The Create APS Working Bundle menu option opens the Create Multilink Bundle form, which allows you to create and manage APS working bundles. You must create an APS working bundle before you can create an APS protection bundle or add members to the APS bundle.
Create APS Working Channel	The Create APS Working Channel menu option opens the APS Channel, Working (Create) form that allows you to create and manage APS working channels.
Create Bundle Members	The Create Bundle Members option opens the Add Bundle Member form, which allows you to add members to an APS bundle or a multilink bundle.
Create Bundle	The Create Bundle option opens the APS Bundle Display configuration form or the Create Multilink Bundle configuration form, which allows you to create a group of DS0 channel groups on a channelization-capable MDA. You configure bundle parameters and add bundle members. When the Create Bundle option is used to open the APS Bundle Display configuration form, the DS0 channel groups that you create provide bidirectional APS protection on IMA bundles. When the Create Bundle option is used to open the Create Multilink Bundle configuration form, the DS0 channel groups that you create provide a mechanism to distribute data across multiple links to achieve higher bandwidth on a SAP. You can create IMA group bundles on channelized ASAP MDAs.
Create CCAG	The Create CCAG option opens the CCAG (Create) form, which allows you to create a cross-connect aggregation group. You define CCAG properties, configure CCAG parameters, and configure CCAG members.
Create Channel	The Create Channel option allows you to create channels on ports with available channels.
Create Group	The Create Group contextual menu option opens the Group (Create) form to create a topology group in the equipment view of the navigation tree and on the appropriate topology maps.
Create IGH Members	The Create IGH Members option opens the Create IGH Member configuration form which allows you to configure IGH member ports.
Create IGH	The Create IGH option opens the IGH (Create) form, which allows you to create an IGH. You define IGH properties, and configure IGH subgroups and members.

(2 of 6)

Option name	Description
Create ISA-AA Group	The Create ISA-AA Group option opens the ISA-AA Group (Create) form, which allows you to create an ISA-AA group and ISA-AA partitions. You define ISA-AA group and ISA-AA partition properties, configure ISA-AA group and ISA-AA partition parameters, and specify ISA-AA members.
Create ISA-Tunnel Group	The Create ISA-Tunnel Group option opens the ISA-Tunnel Group (Create) form, which allows you to create an ISA-Tunnel group. You define ISA-IPsec properties, configure ISA-IPsec parameters, and specify ISA-IPsec members.
Create ISA-LNS Group	The Create ISA-LNS Group option opens the ISA-LNS Group (Create) form, which allows you to create an ISA-LNS group. You define ISA-LNS properties, configure ISA-LNS parameters, and specify ISA-LNS group members.
Create ISA-NAT Group	The Create ISA-NAT Group option opens the ISA-NAT Group (Create) form, which allows you to create an ISA-NAT group. You define ISA-NAT properties, configure ISA-NAT parameters, and specify ISA-NAT group members.
Create ISA-Video Group	The Create ISA-Video Group option opens the ISA Video Group (Create) form, which allows you to create an ISA-Video group. You define ISA-Video properties, configure ISA-Video parameters, and specify ISA-Video group members.
Create LAG Members	The Create LAG Members option opens the Create LAG Member configuration form where you define LAG member ports.
Create LAG	The Create LAG option opens the Create LAG configuration form. You define LAG properties, configure LAG parameters, configure LAG subgroups and members, and configure LACP.
Create Maximum # of Channels	The Create Maximum # of Channels option allows you to automatically create all of the channels on ports with available channels. This option is available for OC3, OC12, DS3 ASAP, E3 ASAP, APS Common ports, and APS SONET VTG ports.
Create Ring Group	The contextual menu option for a network is Create Ring Group, which is used to group devices to be able to create VLAN or VPLS ring groups.
Delete	For daughter cards, bundles, ports, and channels, the Delete option deletes the selected object when the object and everything contained in the object is set to administratively down. For topology groups, and IGH groups, the Delete option deletes the selected group object once all objects in the group have been removed from the group. For SC APS Bundle objects, the Delete option deletes the APS common configuration from the APS group. For all other objects where the Delete option is available, the Delete option deletes the object and all contained objects from the network. This option is not available for the network (root) topology group.
Discovery Manager	On the physical topology map background, the Discovery Manager option opens the Discovery Manager (Edit) form. You can create NE discovery rules and discover NEs. See chapter 10 for information about discovering NEs and creating discovery rules.

(3 of 6)

Option name	Description
Duplicate Links	On the physical topology map background, the Duplicate Links option displays a drop-down menu. You can choose either the Highlight Duplicate Links or Delete Duplicate Links option. It is possible for both a manual link and a discovered physical link to exist on the same two endpoints. When this happens, a duplicate link alarm is raised. This alarm only occurs on point-to-point links and when both endpoints are ports or LAGS. You can identify such duplicate links by choosing the Highlight Duplicate Links option. You can remove these duplicate links by choosing the Delete Duplicate Links option. This action prompts you with a warning and then delete all of the manually created physical links. This alarm is not raised on existing manual links (for example, those in place after a database upgrade).
Equipment	On the physical topology map background, the Equipment option opens a Group (Create) form to create a descendant topology group for the selected group in the navigation tree. For physical topology maps, you can also choose the Create Physical Link option to create links between map objects.
Force Mode	The Force Mode menu option forces an upgrade of the hardware.
Highlight MTU Mismatch	On the physical topology map background, the Highlight MTU Mismatch option is used to highlight MTU mismatches between physical ports. When the configured MTU on two or more endpoints do not match, an alarm is raised to notify the operator of a possible configuration error. This is supported on both point-to-point and broadcast physical links. MTU mismatches can also be discovered by conducting an RCA audit. See Procedure 80-6 for more information.
Highlight Nearest Customer Links	On the physical topology map background, the Highlight Nearest Customer Links option is used to highlight the nearest customer links between nodes. See "LLDP" in chapter 22 for more information.
Highlight Nearest Non-TPMR Links	On the physical topology map background, the Highlight Nearest Non-TPMR Links option is used to highlight the nearest Non-Two Port MAC Relay links between nodes. See "LLDP" in chapter 22 for more information.
Highlight Upper Layer Adjacency Links	On the physical topology map background, the Highlight Upper Layer Adjacency Links option is used to display hidden links between nodes.
List	From the contextual menu for the default Discovered NEs topology group, the List option opens the Discovered NEs form with a list of newly discovered NEs or the Unmanaged NEs form with a list of newly added Unmanaged NEs.
Make Flat Map for Group	The Make Flat Map for Group option opens a flat map of the topology group.
Make Root	The Make Root option makes the selected object the root of the navigation tree. The default root is the network.
Make Root In New Tree	The Make Root In New Tree option opens another navigation tree window with the selected object as the root of the tree.
NE Sessions	The NE Sessions option opens a Telnet session, an SSH session, an FTP file browser session, or an SSH file browser session with the selected device in the equipment view of the navigation tree.
Open URL	The Open URL option opens the Web browser to manage the GNE.

(4 of 6)

Option name	Description
Properties	The Properties option opens the property form for the selected object. This form allows you to view read-only information and to configure parameters associated with the selected object. If the Copy button is available, you can use the Copy button to create topology groups in the network using the same parameter information.
Reboot	The Reboot option specifies that the selected card in the chassis is re-initialized. For the 7705 SAR-M, if the Reboot option is issued from Daughter Card Slot 1, then all daughter cards will be rebooted. However, if the Reboot option is issued from Daughter Card Slot 3, then only that daughter card will be rebooted. The Reboot option is not available if Daughter Card Slot 2 is selected.
Reference	On the physical topology map background, the Reference option takes a snapshot of the physical topology at a specific time. Any deviation from this checkpoint can then be subsequently shown. You can choose from the following options: • Reference all Discovered Links in NE Group - checkpoints all currently discovered links that exist. Any object that was previously checkpointed and is operationally down is left untouched. Any object that goes operationally down in the future is not removed, but is simply marked as operationally down. • Clear Reference for All Discovered Links in NE Group - clears all object checkpoints. Any object that is operationally down (shown as a red link) is removed from the database. Any non-checkpointed object that becomes operationally down in the future is removed from the system. • Cleanup all Discovered Links in NE Group - keeps the current checkpoint set for objects that are operationally up, but removes checkpoints from objects that are operationally down. This is the same as the Clear Reference for All Discovered Links in NE Group option, but only affects operationally down objects.
Remove	From a service tier contextual menu on the composite service topology map navigation tree, the Remove option deletes the service from the network in a composite service tier. In a composite service, deleting a service is not the same as removing a service from a composite service. Deleting a service removes the service from the 5620 SAM database. To avoid a service outage, be certain of the action that you are taking. See Procedure 74-10 for more information about removing a service from a composite service.
Remove Card	The Remove Card option deletes the card from the slot when the slot and everything contained in the slot is changed to administratively down.
Remove From Ring Group	The Remove From Ring Group option removes the specified device from the ring group. The devices are not deleted; they remain in the equipment view of the navigation tree.
Remove Ring Group	The Remove Ring Group option removes the specified ring group. The devices contained in the ring group are not deleted; they remain in the equipment view of the navigation tree.
Resync	The Resync menu option specifies that SNMP MIB and CLI information bases are reread to resynchronize them with the 5620 SAM, which also resynchronizes the network management settings with the device. Resynchronization does not impact the contents of the historical statistics database.

(5 of 6)

Option name	Description
Scripts	The Scripts option is available to users with the appropriate scope of command roles. This option allows you to associate scripts and templates to object types directly from the navigation tree or from map objects without having to navigate through the Scripts tool. The Scripts option displays a drop-down menu. You can choose from the Add Script and Manage Scripts option. The menu also lists Associated scripts and templates. The type of script or template is identified by the icon located to the left of the script or template name. • The Add Script option opens the Select Script(s) window. From this window you can associate existing scripts and templates to the selected object type. You can also edit and create scripts and templates from the Select Script(s) window. • The Manage Scripts option allows you to add and remove script and template associations with the selected object type. You can also access the Scripts option from the configuration form.(1) See "Creating and executing scripts" in the *5620 SAM Scripts and Templates Developer Guide* for more information.
Shut Down	The Shut Down option specifies that the selected object is changed to administratively down. The object's OLC state automatically changes to Maintenance if the "Enable Automatic OLC State change" parameter is enabled. See "5620 SAM component configuration" in the *5620 SAM System Administrator Guide* for more information.
Shut Down MC LAG	The Shut Down MC LAG option specifies that the MC LAG is changed to administratively down.
Shut Down Peer	The Shut Down Peer option specifies that the MC peer is changed to administratively down.
Soft Reset	The Soft Reset option resets the card. A soft reset is preferable to a reboot, as it results in minimal downtime. A soft reset causes the card to stop all processes it is running and restart.
Turn Up MC LAG	The Turn Up MC LAG option specifies that the MC LAG is changed to administratively up.
Turn Up Peer	The Turn Up Peer option specifies that the MC peer is changed to administratively up.
Turn Up	The Turn Up option specifies that the selected object is changed to administratively up. The object's OLC state automatically changes to In Service if the "Enable Automatic OLC State change" parameter is enabled. See "5620 SAM component configuration" in *5620 SAM System Administrator Guide* for more information.
View CCM	The View CCM option opens the properties form for the CCM which is associated with the selected CPM.
View CPM	The View CPM option opens the properties form for the CPM which is associated with the selected CCM.

(6 of 6)

Note

(1) The Scripts option may be located under the More Actions button if more than one option exists for the configuration form.

5.2 Basic navigation tree procedures

Use the following procedures to manage equipment using the navigation tree.

Procedure 5-1 To search for objects in the navigation tree

You can use the navigation tree to find specific objects such as NEs, shelves, cards, and ports for the physical and logical network views.

1 To search for an object using the expandable search panel:

- **i** Click on the Find button on the navigation tree or press CTRL+F. The search panel appears.
- **ii** Configure the parameters, as required. The parameters available for configuration depend on the selected view.
- **iii** Click on the Find button in the search panel or press Enter. The first matching object is selected and expanded in the navigation tree.
- **iv** To find additional matching objects, click on the Next button or press F3. The next matching object is selected and expanded in the navigation tree.
- **v** To return to the previous matching object in the navigation tree, click on the Previous button or press Shift+F3.
- **vi** If required, click on the Clear button to clear all parameters configured in step ii.
- **vii** To close the search panel, click on the Find button at the top of the navigation tree window or press CTRL+F .

2 To search for an object using the Find parameter at the top of the navigation tree window:

Note 1 — This step applies only to the equipment and routing views.

Note 2 — Up to 200 instances can be displayed at a time.

Note 3 — The Next and Previous buttons are enabled when more than one object meets the criteria.

- **i** Configure the Find parameter with the search criteria. For example, a number, an IP address, a name, a software version, or any attribute that has been defined in the label. See Procedure 4-3 for more information about customizing labels for a workspace.
- **ii** Press Enter. The first matching object is selected and expanded in the navigation tree.
- **iii** To find additional matching objects, click on the Next button or press F3. The next matching object is selected and expanded in the navigation tree.
- **iv** To return to the previous matching object in the navigation tree, click on the Previous button or press Shift+F3.

Procedure 5-2 To make a selected object the root of the navigation tree

Use the Make Root option of the contextual menu to make a selected object the root of the navigation tree. The Make Root option is only available in the Equipment view. See section 5.1 for information about the navigation tree objects that support the menu option.

The Make Root option of the contextual menu is not available for an object that is positioned one object level below the root of the tree. For example, in a navigation tree where the device is the root of the tree, the LAG object and the shelf object do not support the Make Root option.

Right-click on the navigation tree object that you want to make the root of the tree and choose Make Root from the contextual menu. The navigation tree is refreshed with the selected object as the root of the tree. The Make Root At Top Level button is enabled.

See Procedure 5-4 for information about restoring the default root of the navigation tree.

Procedure 5-3 To make a selected object the root of another navigation tree

Use the Make Root In New Tree option of the contextual menu to make a selected object the root of another navigation tree.

Note — Up to seven navigation tree windows can be open at the same time and each tree must have a different root when it is first created.

The Make Root In New Tree menu option is only available in the equipment view. The Make Root In New Tree option is not available in the contextual menu for the root object of a tree. See section 5.1 for information about the navigation tree objects that support the menu option.

Right-click on the navigation tree object that you want to make the root of another navigation tree and choose Make Root In New Tree from the contextual menu. Another navigation tree window appears with the selected object as the root of the tree.

Procedure 5-4 To restore the default navigation tree root

The default root of the navigation tree is the network object. When the root is not the network object, the Make Root At Top Level button is enabled.

Click on the Make Root At Top Level button in the navigation tree toolbar to restore the default root of the tree. See section 3.1 for more information about the Make Root At Top Level button.

6 — 5620 SAM topology map management

6.1 5620 SAM topology map management overview *6-2*

6.2 5620 SAM topology map types *6-14*

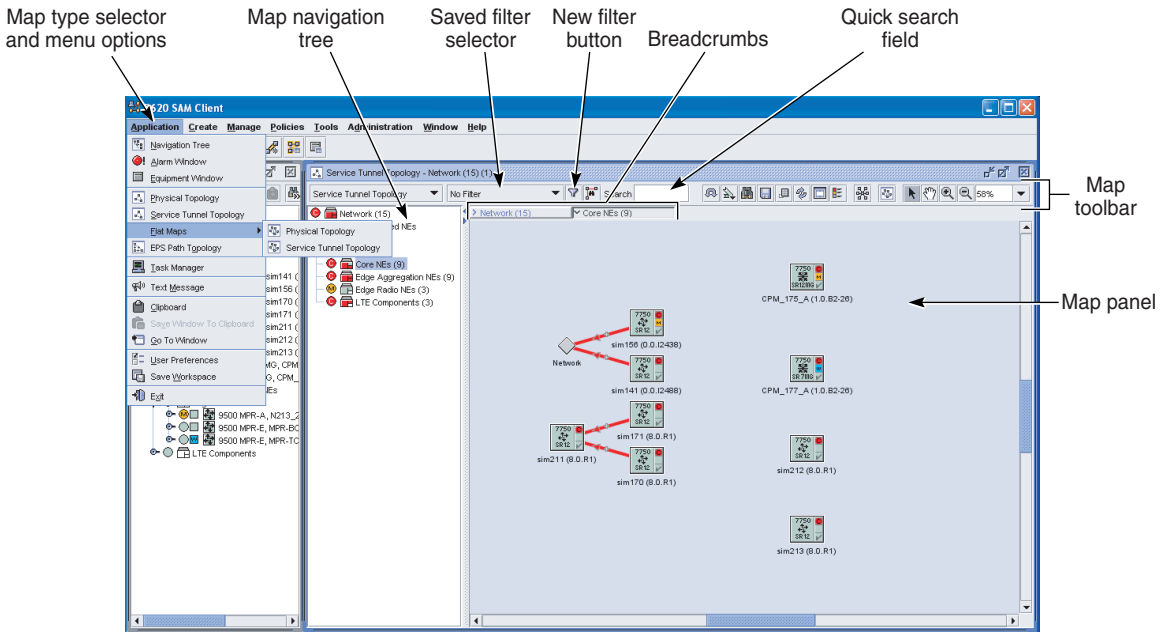
6.3 Working with topology maps *6-23*

6.4 Workflow to use 5620 SAM topology maps *6-26*

6.5 Basic 5620 SAM topology map procedures *6-27*

6.6 5620 SAM topology map configuration procedures *6-34*

6.7 5620 SAM topology map management procedures *6-44*



6.1 5620 SAM topology map management overview

The following 5620 SAM network topology maps are available:

- physical
- service tunnel
- service
- EPS path
- composite service
- LSP path
- LSP cross-connect

Each map displays network objects and information, and provides contextual menus to open forms that display additional information. In the context of a 5620 SAM map, a link object, such as a physical link or service tunnel, is called an edge. An object other than a link between objects, such as an NE or a topology group, is called a vertex. Figure 6-1 shows the main map elements.

Figure 6-1 Map elements

Map window

The map window includes the following:

- a title bar
- a map panel that displays the network objects
- a navigation tree that lists the topology groups
- a toolbar, which consists of a view selector, saved filter selector, quick-search field, and buttons that perform various functions

The title bar of the map window displays the following information:

- map type, for example, Physical Topology
- path from the network root to the currently displayed topology group; each step in the path is called a breadcrumb
- map number, for example, the first or the tenth map opened

Map panel

The map panel is associated logically with the map navigation tree. As the user navigates through the topology groups in the map navigation tree, the contents displayed on the map panel change. The topology group that is selected in the map navigation tree is the group that is displayed on the map panel.

When you double-click on a topology group object, the contents of the group on the map panel are displayed and the group is selected and opened in the map navigation tree. When you double-click on other map objects, such as routers or links, their property form opens. Right-click on any map object to display a contextual menu.

When map objects are linked between different topology groups, the line representing the connection terminates on a map object called a connector. The connector indicates that the endpoint of the link resides in another topology group. The label of the connector icon is the name of the topology group to which the link points. Connector objects do not have contextual menus.

When a physical link is created between a port or LAG managed by the 5620 SAM and an unmanaged object, the unmanaged object is called a remote endpoint. The remote endpoint label is configured by the user when the physical link is created.

You can configure a background image to display in the map panel for a topology group, for example, a map image of North America. You can position device icons and topology group icons in the map of the network to reflect their relative geographic locations.

Selecting map objects

Click on the Select Tool button to select an object on the map. To select multiple objects, press the Shift key and click on each object that you want to select, or draw a selection rectangle around all of the objects that you want to select on the topology map. You can also press CTRL-A to select all of the objects on a map.

You can select one or more objects and view them in a separate map by right-clicking on the selection and choosing Show Only Selected. The map is then filtered to display only the selected objects and the links between them. Links to other objects are excluded. To revert to the previous view, right-click in the map and choose Cancel Show Only.

When multiple objects are selected, you can press the F3 key to shift the map focus to the next object, and press CTRL-F3 to shift the map focus to the previous object.

You can also select all of the NEs that are attached to an NE by selecting one or more NE and right-clicking and choosing Select Attached.

To deselect a selected NE, press the CTRL key and click on the NE.

Moving map objects

The 5620 SAM allows you to move map objects in the following ways:

- in the map panel; for example, to add a router to a topology group by dragging and dropping the router object to the topology group object in the map panel
- from the map panel to the map navigation tree; for example, to add a router to a topology group by dragging and dropping the router object from the map panel to the topology group object on the map navigation tree
- after discovery by using either the or by moving the tiled icons to a new map panel location
- between two maps
- in the map navigation tree; for example, to make a topology group the immediate descendant of another topology group by dragging and dropping one topology group object to another topology group object in the map navigation tree

When a topology group is created, users with Topology Mgmt privileges can populate the group from the topology map by dragging and dropping map objects into the group in the map panel or in the map navigation tree, or from the map panel to the map navigation tree.

Note — You cannot move map objects to or from groups that are not within your span of control.

By default, users can move map objects and change the layout of the objects on the map, however the changes are not saved to the database when the map is closed. The ability to save changes to the layout of topology maps is controlled by scope of command roles and access permissions. Permissions are set by using 5620 SAM security configuration forms. See "5620 SAM user security tasks" in the *5620 SAM System Administrator Guide* for more information about setting access privileges.

The Reload button icon indicates when you move a map object and change the layout of the objects. The Reload button icon changes to indicate whether moving a map object and changing the layout of the objects is saved to the database. See "Map toolbar" in this section for more information about the Reload button.

Note — When you move a map object in the map panel, the X,Y coordinates for the map object change. If you have update and execute scope of command access permission, this change affects all users that display the map view and the topology group.

Connectors can only be moved in the map panel. Connectors cannot be moved to another topology group.

Finding map objects quickly

The Search field beside the toolbar buttons allows you to quickly locate a map object. When you enter a text string in the Search field and press ↵, the 5620 SAM searches each object name in the map for the string. If a match is found, the map focus shifts to the object. If multiple matches are found, you can press the F3 key to shift the map focus to the next object, and press CTRL-F3 to shift the map focus to the previous object.

Links and link groups

The topology maps display single links and multiple links that connect two map objects. Links are used to represent the physical connectivity between two NEs or logical connectivity, such as service tunnels. The map uses an arrow to display the direction of a unidirectional link. Multiple links between 2 objects are grouped, by default, as one link with no defined direction. Bidirectional links are displayed with no defined direction. A link group is displayed with a plus sign located on the link object. You can right-click on the plus sign and choose Expand Group to view all of the associated links. The expand threshold of links on the topology maps displays up to 10 links.

When you double-click on a single link, the properties form for the link opens. When you double-click on the link group object for multiple links, a list form opens displaying all of the links that belong to the link group. For the physical, service tunnel, and LSP maps, a list form opens regardless of whether there is one link or multiple links in the link group.

A bidirectional link group is displayed with a plus sign icon located in the middle of the link object. A unidirectional link or link group is displayed using an arrow icon on the object pointing in the direction of the path.

The color of a single link object is determined by the status of each link endpoint. The color of a link group object is determined by the most serious alarm that is raised for a link in the link group.

Breadcrumbs

Breadcrumbs are buttons that are displayed along the top of the map panel. Breadcrumbs indicate, from left to right, the hierarchy of the topology groups to the group currently displayed in the map panel. The default top of the hierarchy, the breadcrumb at far left, is the entire network. Click on a breadcrumb to open the map for the corresponding group.

Map navigation tree

The following network topology maps display a map navigation tree:

- physical map
- service tunnel map

You can use the map navigation tree:

- for non-linear navigation to any topology group on the map
- to display the topology group hierarchy starting from the entire network

The map navigation tree displays:

- topology groups, including group names
- status of the topology groups

When you click on a map object in the map navigation tree, the contents of the object are displayed in the map panel, and the map object is selected. See section 5.1 for more information about the navigation tree.

Contextual menus for objects in the map navigation tree

To open a contextual menu for an object, right-click on a map object in the map navigation tree. See Table 5-2 for more information about contextual menu options.

Map toolbar

The map toolbar allows you to manage a 5620 SAM map view. The toolbar is above the map panel in the map window. Figure 6-2 shows the map toolbar elements.

Figure 6-2 Map toolbar elements

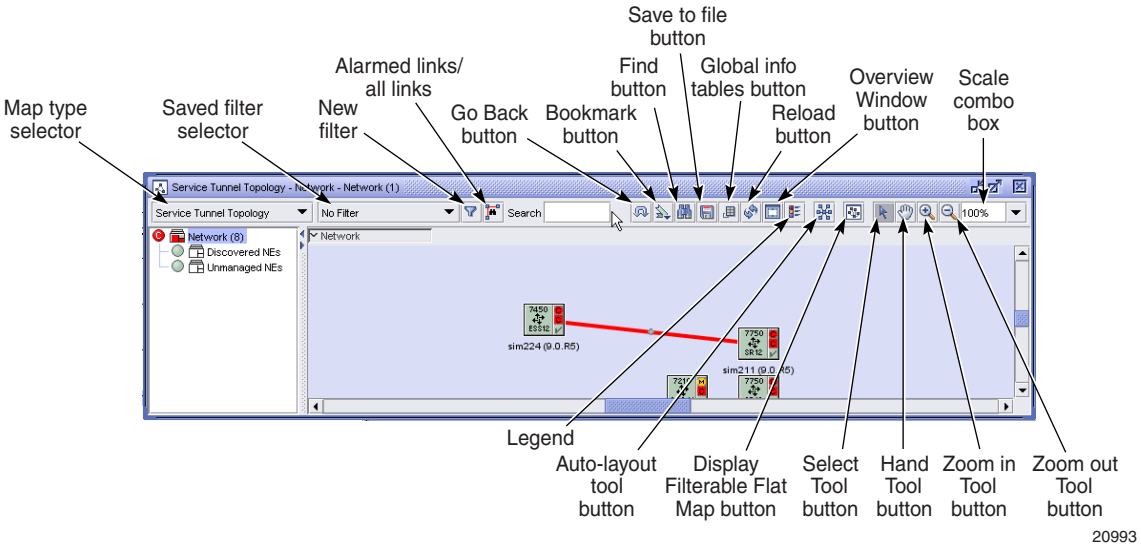


Table 6-1 describes the map toolbar elements.

Caution 1 — Applying an information table configuration to many objects on the map may take a long time.

Caution 2 — When you reload a map from the database, the database is unavailable during the loading period.

Caution 3 — The current composite service map is redrawn when you click on the Rearrange by Service Tiers button, and the prior layout of the composite service map cannot be recalled.

Caution 4 — After you click on the Auto-Layout Tool button and confirm the action, any existing map layout is overwritten and cannot be recovered. If you are satisfied with the layout of the icons on the map, do not use the Auto-Layout Tool button.

Table 6-1 Map toolbar elements descriptions

Toolbar element name	Description
Map type selector	The map type selector is a drop-down menu that lists the map view options that you can choose to specify the view. The map type selector offers the following views: • Physical Topology • Service Tunnel Topology
New Filter button 	A filter allows you to apply one or more object filters to a map view, to narrow the range of objects that are displayed. Filters can be saved for future searches on similar objects. When a filter is applied, the name of the filter is displayed on the saved filter selector. Only the objects that the filter returns are displayed, with the following exceptions: • If one link endpoint is displayed, the other endpoint is also displayed, even when the filter excludes the endpoint. • If a filter does not include a link filter, only the links between the returned NEs are displayed. Filters can be saved as private or public. You can apply a span of control to public filters to filter out objects that are not in the current user span of control. Public filters can only be changed by the user who created them. Private filters appear only for the user who creates them. Click on the Filter button to create and save filters that specify the objects displayed in a map. You can create a filter based on a combination of search criteria. Figure 6-4 shows the navigation buttons that you can use to create, apply, and save a map filter. See Procedure 6-20 for more information about creating a topology map filter. See chapter 3 for more information about configuring filters.
Alarmed links/All links shown button 	Click on the Alarmed links/All links shown button to specify any of the following on the topology map: • all links • only link groups with associated alarms • only specific links with associated alarms • link groups and the specific links within the link groups with associated alarms The Alarmed links/All links shown button options are: • All links shown (default)—the icon is displayed in white and all links are displayed on the map. • Show Only Alarmed—the icon is displayed in yellow and only link groups with associated alarms are displayed on the map. • Enable Alarm Link Pullout—the icon is displayed in yellow and links with associated alarms are displayed on the map. The link groups containing the pulled out alarm links with unknown physical characteristics are displayed in grey.
Go Back button 	Click on the Go Back button to navigate between previously viewed topology groups. For example, if you are viewing Router Group 1 then view Router Group 2, click on the Go Back button to return to Router Group 1. The Go Back button only functions in one map type; both previously viewed topology groups must be the same map type.
Bookmark button 	Bookmarks are used to create shortcuts to frequently visited locations on a map. Click on the Bookmark button and choose to add a bookmark or manage existing bookmarks.
Find button 	Click on the Find button to search for network objects on a map. You can choose to search for specific vertices or edges. A list form opens that allows you to configure specific criteria to filter the results of your search. See chapter 3 for information about performing searches. When the network object is found, the map navigation tree displays the topology group that contains the object. If necessary, the 5620 SAM scrolls to the part of the map where the object is located.

(1 of 3)

Toolbar element name	Description
Save To File button 	Click on the Save To File button to save the map view or the full map. You can choose the location to save the map image and the file type. See Procedure 6-8 for more information about using the Save To File button.
Global Info Tables button 	Click on the Global Info Tables button to create information table configurations, apply information table configurations globally, or turn the global information table option off. See Procedures 6-14 and 6-15 for more information about using the Global Info Tables button. See Caution 1 above.
Reload Button indicating no database changes  Reload Button indicating database changes 	Click on the Reload button to load the topology map from the 5620 SAM database. The topology map is updated to display the latest configurations. The Reload button icon changes to indicate whether moving a map object and changing the layout of the object is saved to the database. See Caution 2 above.
Overview Window button 	Click on the Overview Window button to open the Overview window. Use the Overview window to pan the entire map, or a specific group or service, and the area that you want to view. Figure 6-3 shows the Overview window.
Legend button 	Click on the Legend button to open a contextual menu that displays a list of map legend types if multiple legends are available, or opens the Legend form. Choose a legend type from the contextual menu to open the Legend form with the appropriate legend tab displayed. Depending on the map type, the following legend types are available: • icons—displays the icons used to identify objects; always appears • colors—displays the color scheme used to identify map objects • highlight sessions—displays the highlight sessions for the current map, and allows you to clear one or more sessions • other legend types that apply to a type of map
Rearrange by Service Tiers button 	The Rearrange by Service Tiers button is available only for composite service topology maps. Figure 6-13 shows the composite service map. Click on the Rearrange by Service Tiers button to organize the composite service tier icons in the map panel by service tier. The service tier icons are displayed in the following order from the top of the panel: • tier 1 icons (typically IES and VPRN services) • tier 2 icons (typically VPLS and MVPLS) • tier 3 icons (typically satellite HVPLS and VLL services) • tier 4 icons (typically VLAN services) . . . • tier n icons (user-assigned) See Caution 3 above.

(2 of 3)

Toolbar element name	Description
Auto-Layout button[1] 	Click on the Auto-layout button to lay out the map icons. The layout options are: • Circular — emphasizes ring and star topologies in networks. Objects are grouped according to the network structure and arranged in circles or radial tree structures. • Smart Organic—emphasizes inherent data groupings and symmetries. This information helps with understanding the interconnections of complex structures. • Endpoint Layout (VPLS, VLL, mirror, and composite service sites only) - all endpoints are snapped close to the associated parent site. The Auto-Layout tool is useful when: • many newly discovered NEs are tiled together on the map and difficult to view • a large number of network device icons are spread out across the map and cannot be easily viewed without zooming out After you click on the Auto-Layout button, icons with links between them are placed closer together in the center of the map. Icons without links are placed on the periphery of the linked icons. See Caution 4 above.
Display Filterable Flat Map button 	Click on the Display Filterable Flat Map button to quickly display a flat map of the current topology map view. You can also view a flat map on the 5620 SAM by choosing Application→Flat Maps from the 5620 SAM main menu.
Select Tool button 	Click on the Select Tool button to select and move an object on the map or to view object information. You can select and move multiple objects by pressing the Shift key and clicking on each object you want to select, or by drawing a selection rectangle around all the objects you want to select on the topology map.
Hand Tool button[2] 	Click on the Hand Tool button to switch to a pan mode. Click on the background to move the contents of the map in any direction. When you are in the pan mode and you scroll over an object, you can select and move an object on the map or view object information. You can select and move multiple objects by pressing the Shift key and clicking on the object you need to select.
Zooming in  and zooming out  using a mouse or toolbar buttons[3]	The ability to zoom in and out on a map allows you to view hundreds of map objects at once to see the scope of the network, or view the information for one NE. Click on the Zoom in Tool and Zoom out Tool buttons and click on the map to resize the objects in a map or use the mouse wheel to zoom in and zoom out of topology maps. Click on the map and roll the mouse wheel forward to zoom in or roll the mouse wheel backward to zoom out. Each roll of the mouse wheel brings the map objects closer or further. When a map is at a low zoom level, the icons are displayed at a reduced size, link lines are thinner and labels are hidden. Labels are displayed when you click on the reduced icon. When a map is viewed at a high zoom level, the icons are displayed at normal size, link lines are thicker and labels are displayed.
Scale combo box	Use the scale combo box to increase or decrease the map zoom. You can choose a zoom percentage value from 25% to 300%, or fit all objects in the window from the drop-down menu. The scale combo box displays the current scale of the map.

(3 of 3)

Notes

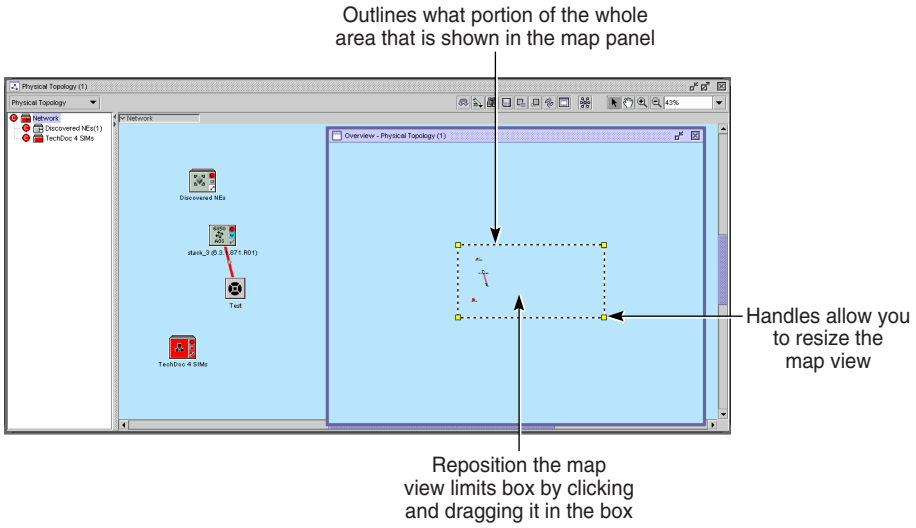
(1) You can also apply the auto-layout option to a contiguous group by right-clicking on one of the selected objects. See Procedure 6-22 for information about using the auto-layout function.

(2) To temporarily activate the panning function, press and hold the space bar, and then click in the map panel.

(3) Object icons are displayed at a reduced size in a flat map.

Figure 6-3 shows the Overview window.

Figure 6-3 Overview window



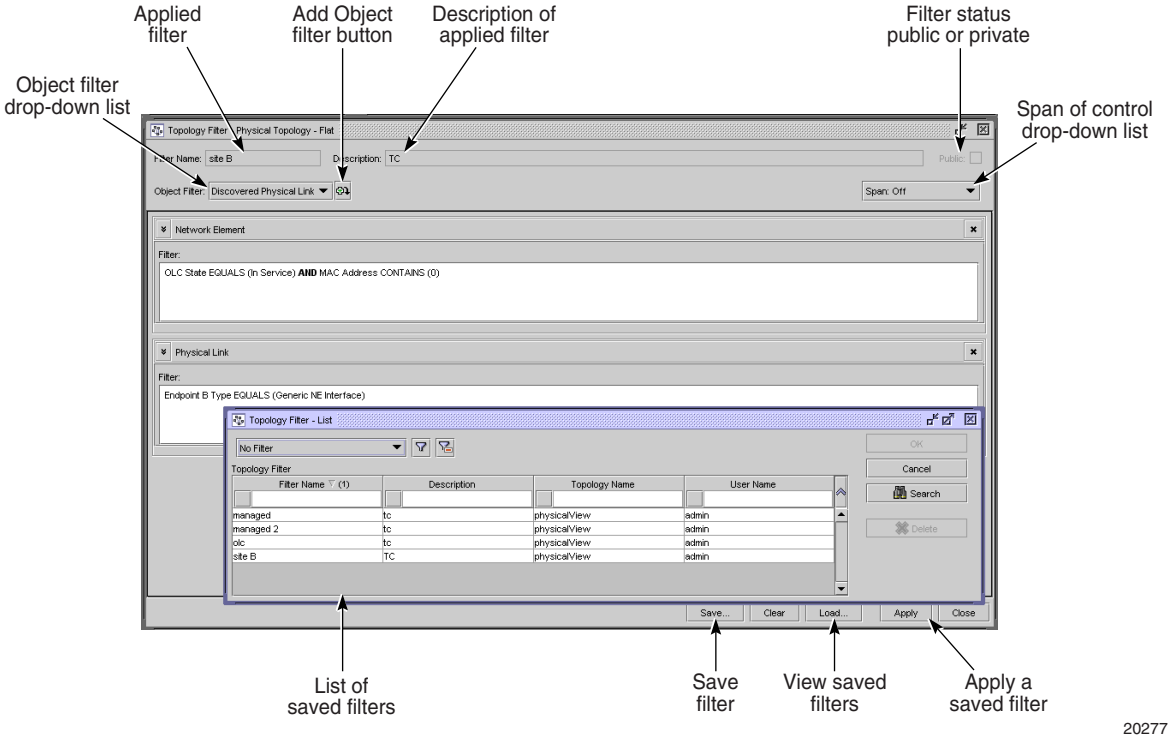


Figure 6-4 shows the navigation buttons that you can use to create, apply, and save a map filter.

Figure 6-4 Filtered map form

Zooming in and out

The ability to zoom in and out on a map allows you to view hundreds of map objects at once to see the scope of the network, or view the information for one NE. See Procedure 6-11 for information about zooming functions.

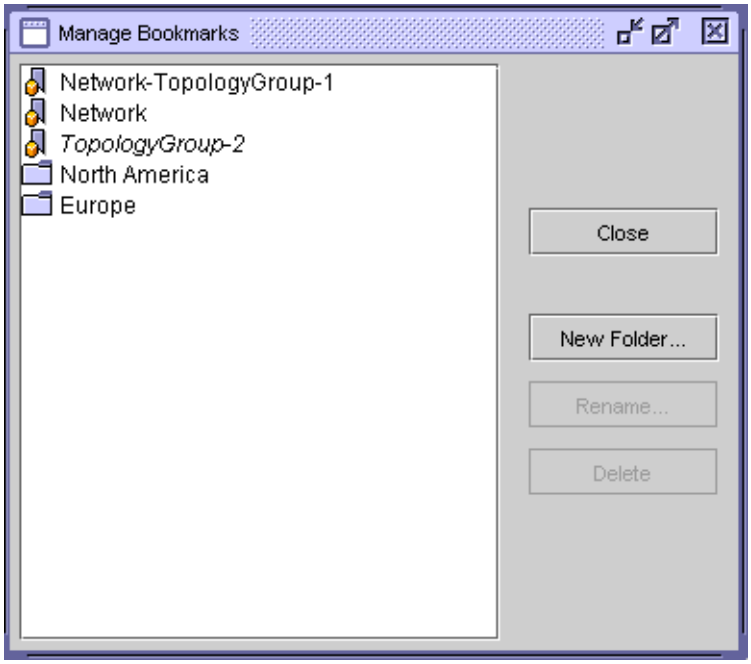
When a map is viewed at a low zoom level, the icons are displayed at a reduced size, link lines are thinner and labels are hidden. Labels are displayed when you click on the reduced icon. When a map is viewed a a high zoom level, icons are displayed at normal size, link lines are thicker and labels are displayed.

Bookmarks

You can bookmark frequently visited areas of the map for easier navigation when you return to those locations. Bookmarks are associated with a map view. To use the bookmark, you must be in the same view where you created the bookmark or a view that shares the same group, for example, a topology group that belongs to both the physical topology map and the service tunnel map. Otherwise, the bookmark menu option is disabled.

You can access the bookmark drop-down menu using the Bookmark button on the map toolbar. Figure 6-2 shows the Bookmark button. The bookmark menu is divided into two sections and separated by a horizontal line. The top section of the drop-down menu contains the bookmark management functions, and the bottom section contains the user-created dynamic list of bookmarks.

The list of bookmarks is updated when you add, remove, group, or rearrange the bookmarks. The menu items can be bookmarks or folders, which can expand to display more bookmarks or folders.



Note — A large number of bookmarks is difficult to manage. Bookmarks should be organized in folders for better usability and easier management. Alcatel-Lucent recommends that you create a maximum of 1000 bookmarks.

When a bookmark is selected, the map panel displays the bookmarked topology group. The map navigation tree expands to display the topology group.

When a valid bookmarked topology group is moved to another group, the bookmark for the group is updated to correspond to the new location of the group. If the bookmark location is not valid, for example, a topology group was deleted since the bookmark was created, an invalid bookmark message is displayed. The map panel remains unchanged.

Click on the Add Bookmark menu option to add the topology group currently viewed in the map panel as a bookmark. Click on the Manage Bookmarks menu option to open the Manage Bookmarks form. Figure 6-5 shows the Manage Bookmarks form.

Figure 6-5 Manage Bookmarks form

The Manage Bookmarks form has a list panel on the left in which the bookmarks and folders are listed in a tree structure. You can drag and drop bookmarks and folders in and out of other folders in the list panel. Select a bookmark or folder for editing. Click on an empty area to deselect the tree object. Double-click on a top-level folder to open the folder and display its contents. A turner to the left of the descendant folder object in the list panel indicates that the folder contains descendant objects, such as bookmarks or other folders.

The names of invalid bookmarks, and bookmarks and folders that are not from the current view, are displayed in italics.

The following buttons with which you can perform different actions are displayed to the right of the list panel:

- Close—used to close the Manage Bookmarks form. All changes in the form are saved when you click on the Close button.
- New Folder—used to create a folder in the list panel. The Folder Properties dialog box appears.
  - If a folder is selected in the list panel, the new folder that is an immediate descendant object of the selected folder.
  - If no folder is selected in the list panel, the new folder is created as a top-level folder.
- Rename—used to rename a folder or bookmark. The Rename dialog box appears. The Name field contains the name of the selected folder or bookmark. This button is enabled only when a folder or bookmark is selected in the list panel.
- Delete—used to delete a selected folder or bookmark from the list panel. This button is enabled only when a folder or bookmark is selected.

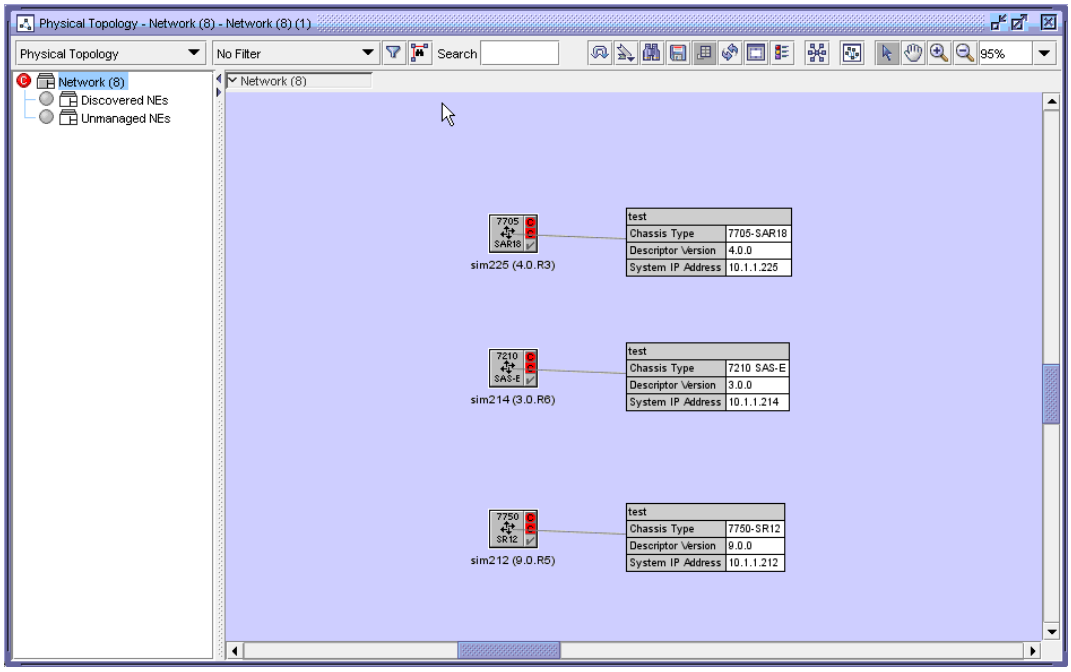
Information tables

You can configure information tables that are displayed beside map objects. An information table contains specific values, such as an NE chassis type, software descriptor, and system address. Information tables are displayed beside each map object to which the configuration applies. You can drag and drop information tables on topology maps, but the new table location is not saved with the map.

Note — You cannot apply an information table configuration to link groups or topology groups.

Multiple information tables can be applied to map objects, but only one table is displayed at a time. Tab indicators appear on the information table to indicate that multiple information tables apply to the map object. To cycle through the applied information tables, click on the information table and press the Tab key.

You can specify that information tables are displayed only during a mouse-over operation, which is when the mouse pointer passes over an object. You can also specify whether an information table contains a header. Header display is enabled by default and cannot be disabled for mouse-over tables. See Procedure 6-14 for more information. Mouse-over supports cycling between tables by pressing the Tab key.



The following types of information tables can be applied to map objects:

- global—available for all map types
- selected—available for all map types
- highlight—available for maps that support the highlight function
- others that apply to a specific map type

Global Info Tables

When one or more information table configurations are available for a map type, you can apply an information table configuration to all map objects using the Global Info Tables button. You can also use this button to turn the global information table configuration off. See Procedure 6-15 for more information about how to use the Global Info Tables feature. Figure 6-6 shows a map view with an information table configuration applied to all map objects.

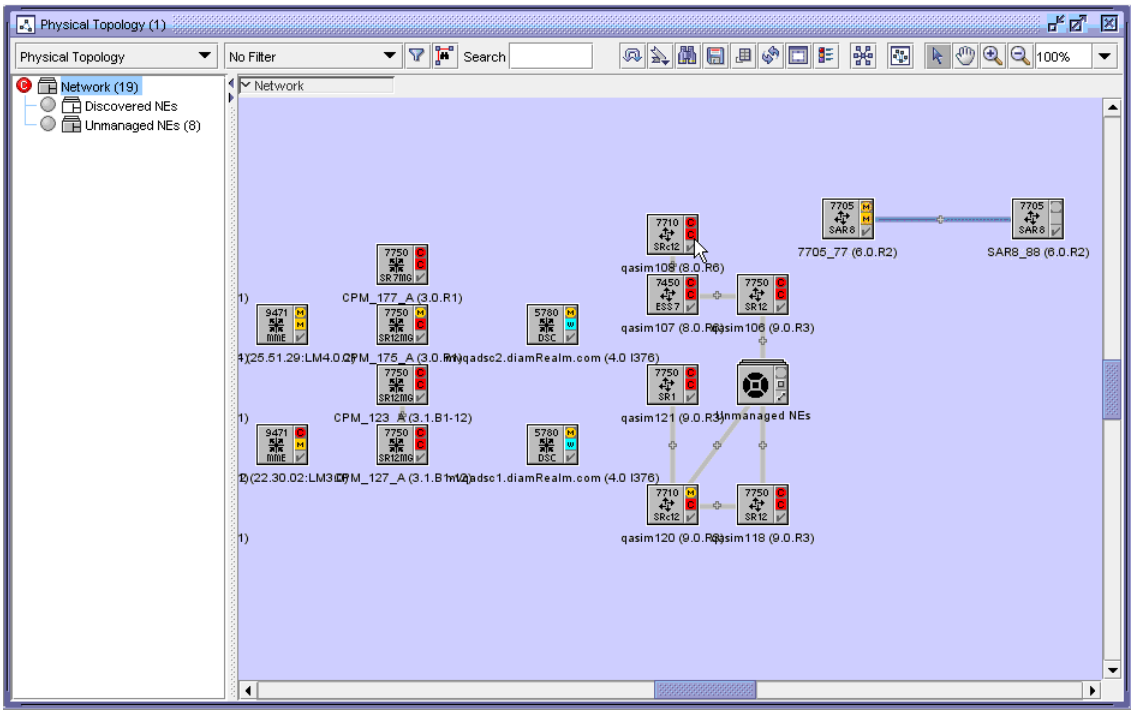
Figure 6-6 Applied global information table configuration

Selected Info Tables

You can apply an information table configuration to one map object or a selected group of map objects by right-clicking on the object or selected group. You can also use this contextual menu to turn the selected information table configuration off. See Procedure 6-16 for information about how to use the Selected Info Tables feature.

Map Highlight Info Tables

On a map that supports the highlight function, you can apply an information table configuration to a map highlight by right-clicking on an existing highlight session from the Highlight Sessions tab of the Legend-*topology* form. You can also use this contextual menu to turn the highlight information table configuration off. See Procedure 6-17 for more information about how to use the Map Highlight Info Tables feature.



6.2 5620 SAM topology map types

This section details the types of maps available to the 5620 SAM.

Physical topology map

The physical topology map is available by choosing Application→Physical Topology from the 5620 SAM main menu. The physical topology map is used to view and manage Layer 1 objects, including the logical grouping of devices. Figure 6-7 shows the physical topology map.

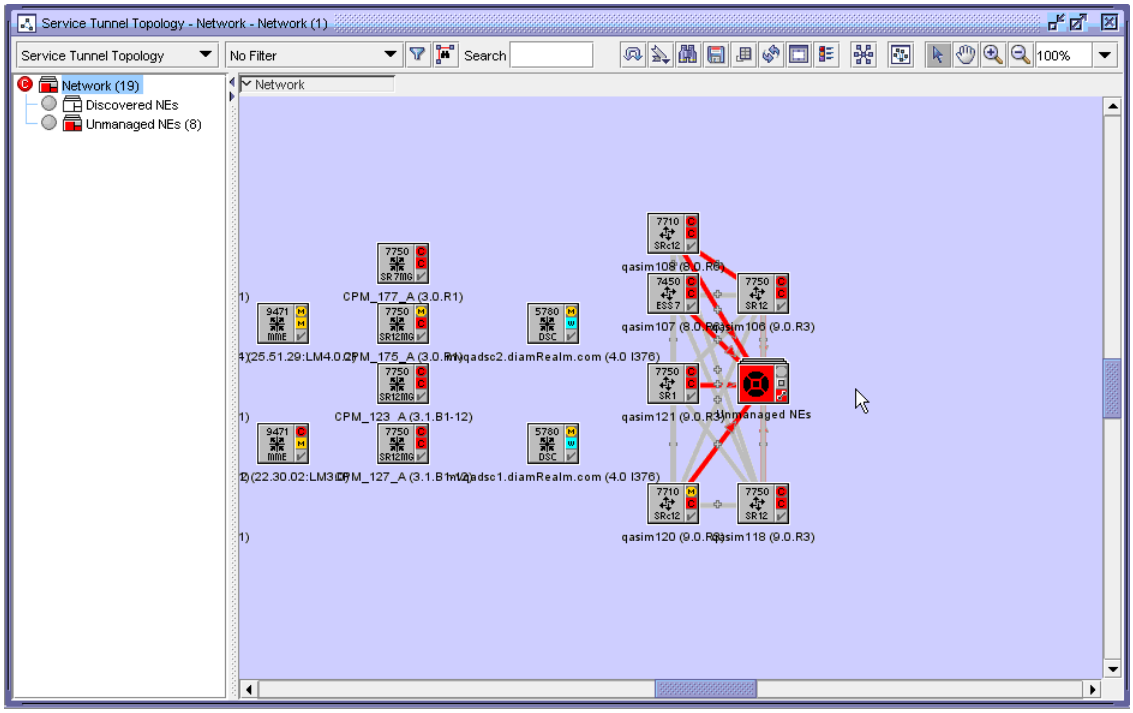
Figure 6-7 Physical topology map

The physical topology map is open in the working panel by default when the 5620 SAM client GUI starts.

The following apply to link objects in the physical topology map:

- The following colors indicate link status:
  - Red—the link has failed
  - Light gray—the link is in service
  - Green—the link is new
  - Blue—the link is in standby or backup mode
  - Dark gray—the link is unknown
  - Purple—the link is being diagnosed
  - Magenta—the link carries hidden links
  - Yellow—the LAG link is degraded (one or more links in the LAG have failed)
- For aggregated 1+1 HSB microwave radio links on a 7705 SAR, the following colors indicate link status:
  - Red—the MW radio link is down
  - Blue—the MW radio link is up
  - Yellow—the MW radio link has a problem
- For expanded, unidirectional 1+1 HSB microwave radio links on a 7705 SAR, the following colors indicate link status:
  - Red—the unidirectional radio link has a problem and the MW radio link is down
  - Green—the MW radio link is in service
  - Blue—the MW radio link is in standby mode
  - Yellow—the unidirectional radio link has a problem but the MW radio link is up

- If endpoint B of a physical link is on an unmanaged device, the status of the physical link is the same as the status of endpoint A, which is on a 5620 SAM-managed device.
- A LAG link is represented as a single physical link. However, if you right-click on a LAG link, the form that opens provides information and configuration options for the entire LAG link. For example, the Endpoint Info tab on the Discovered Physical Link form shows the link endpoints as LAG endpoints rather than physical ports, and allows the operator to open the LAG properties form.



Menu options for physical topology map background

To open a contextual menu for the map background, right-click on the map background. See Table 5-2 for contextual menu option information.

Service tunnel topology map

A service tunnel topology map is available on the 5620 SAM by choosing Application→Service Tunnel Topology from the 5620 SAM main menu. The Service Tunnel Topology map is displayed, as shown in Figure 6-8.

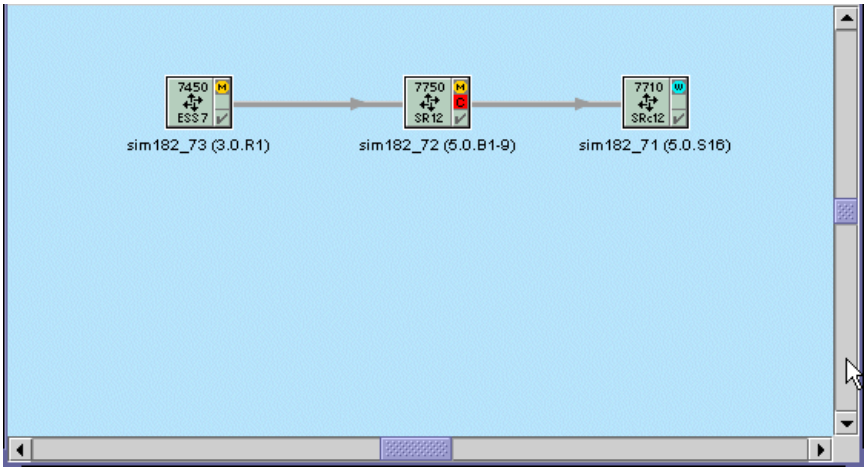
Figure 6-8 Service tunnel topology map

Icons in the service path topology map represent devices. The color of the device icon represents the status of the device. Red means that the device is down. Green means that the device is up. Yellow means that the device is being synchronized. Purple means that the device is in a suspended management state. See chapter 10 for information about device discovery and management states.

Link groups between devices represent service tunnels. When a link group is red, at least one tunnel in the link group is down. For link groups between managed devices, right click on the link group icon to list and edit tunnels in the link group. For link groups between managed and unmanaged devices, right-click on the link group icon to open contextual menus and submenus which allow you to open additional information forms for the service tunnel, including the properties form.

EPS path topology maps

An EPS path topology map is available on the 5620 SAM by choosing Application→EPS Path Topology from the 5620 SAM main menu. The EPS path topology map displays a static representation of mobile network objects and EPS paths. Each network object icon represents an aggregate of all network objects of that type. For SGWs and PGWs, the icon represents an aggregate of all instances of that gateway type and all network objects that contain instances of that type. Each EPS path link represents an aggregate of all EPS paths of a specific type.



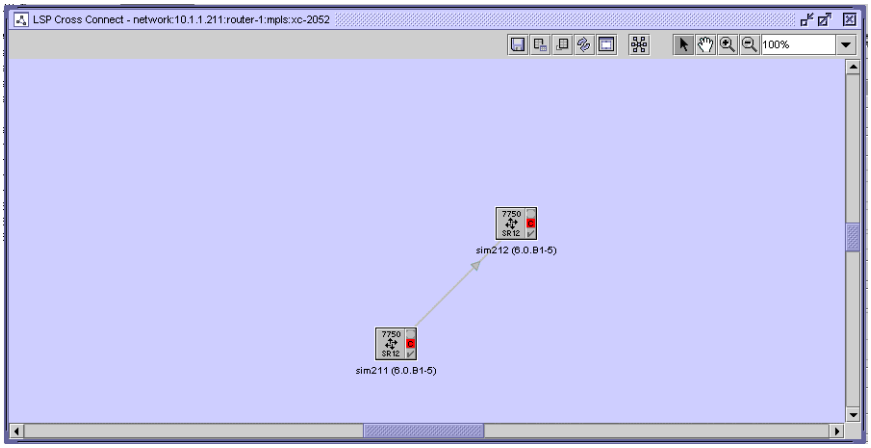
See the *5620 SAM LTE EPC User Guide* and the *5620 SAM LTE RAN User Guide* for information about EPS paths in LTE networks.

LSP path topology map

An LSP path topology map is available from the MPLS Path form and the LSP Path form. See Procedure 6-3 to view the map from the MPLS Path form. See Procedure 6-4 to view the map from the LSP Path form.

The LSP path topology map is used to view a specific provisioned, actual, or CSPF LSP path in the context of its source, and transient and destination hops. Figure 6-9 shows an LSP path topology map.

Figure 6-9 LSP path topology map



When you view the LSP path topology map, hops are linked by straight lines, where each line represents a sub-path between two hops of the LSP path. The direction of each path is indicated by an arrow. Green lines indicate provisioned paths, and gray lines indicate actual paths.

LSP cross-connect topology map

An LSP cross-connect topology map is available from the LSP Path form. To view the map from the LSP Path form, see Procedure 6-6.

The LSP cross-connect topology map is used to view a specific LSP cross-connect in the context of its source, and transient and destination hops. Figure 6-10 shows the LSP cross-connect topology map.

Figure 6-10 LSP cross-connect map

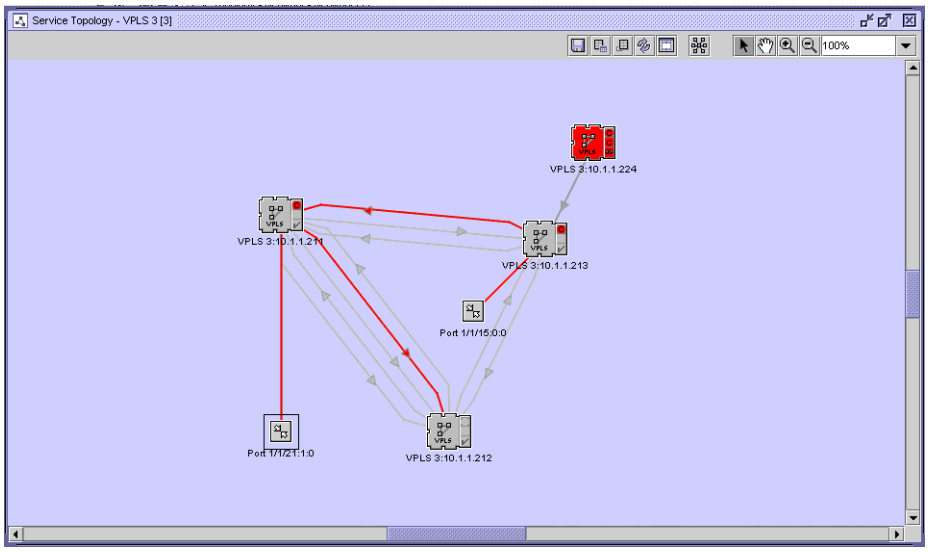
Flat maps

Flat maps provide a complete network view without topology groups. A flat topology map can display up to 1000 objects. You can narrow the range of objects that are displayed by creating and saving filters and filter definition trees.

A flat map is available on the 5620 SAM by choosing Application→Flat Maps from the 5620 SAM main menu. The following flat map types are available:

- Physical Topology
- Service Tunnel Topology

A flat map is used to view a large number of network objects and link groups. You can double-click on a NE in the flat map to display the object properties. For example, when you double-click on an NE, a property form opens, from which you can view or configure the NE parameters.



Object icons in a flat map are displayed at a reduced size, link lines are thinner, and object information is not displayed. Flat maps support the following, as do other 5620 SAM topology maps:

- mouse-based navigation
- zooming
- NE and link status colors
- searching
- filtering

Service topology maps

You can open a topology map for a selected service from the Manage Services form by clicking on the Topology View button. Figure 6-11 shows a service topology map. Large NE icons represent managed devices. Small NE icons represent unmanaged devices. The label of an NE icon indicates the service name and the NE IP address.

Figure 6-11 Service topology map

The symbol and color in the top-right corner of the managed device icon represents the aggregated alarm status, which is the most severe alarm on any service that includes the device. The symbol immediately below the aggregated alarm status and the color of the icon indicate the alarm status for the currently displayed service site. A red icon indicates that the service site is down. A green icon indicates that the service site is up.

A port icon represents a managed access interface. A port label includes the port number and the inner and outer port encapsulation values. A service site can support up to 20 SAPs. When the number of SAPs on a service site exceeds 20, the SAPs on the site are grouped into a SAP group, represented by a SAP group icon. When the number of SAPs drops below 20, the SAP group icon is replaced with the icons for the individual SAPs. To view the list of SAPs in a SAP group, right-click on the SAP group icon and choose List L2 Access Interface or List L3 Access Interface, depending on the service type. The corresponding Site form for the service opens with the L2 Access Interface or L3 Access Interface tab displayed.

SAP aggregation group icons represent SAP aggregation groups configured for a VLL Apipe on the 7705 SAR. The SAP aggregation group is linked to the service site and each of the individual SAPs. To hide the associated SAPs for a SAP aggregation group, right-click on the SAP aggregation group icon and choose Hide SAPs. Choose Show SAPs to show them again.

A line between two map objects represents a link or group of links. Links between device icons represent service circuits. Links between device icons and port icons represent the binding of an access port or interface to a service. The symbol and color in the bottom right corner of the managed device icon represents the connectivity alarm status. During a resynchronization of the managed device, the icon represents the resynchronization status, and is yellow. The status is inherited from the link endpoints. A plus sign icon located in the centre of the link indicates a bidirectional group link. An arrow icon located on the link indicates a unidirectional link and identifies the direction of the path.

Right-clicking on a managed site, port, or link opens a contextual menu that allows you to perform functions that include the following:

- choose layout options
- open an object properties form
- turn up or shut down an object
- create a service object
- create a service object from a template, if a template is bound to the service
- delete an object
- open a CLI session
- manage scripts
- plot statistics
- display or highlight service topology features

You can view multiple services on a map at the same time if the services are selected from the Manage Services form during map creation.

Service segmentation

A service segmentation view is also available to aid in conceptualizing complex services. Segments are logical grouping of interconnected sites, services, and bindings. The segmentation view is available for VPLS and VLL services.

A service segment is considered to be a portion of a single service that extends to multiple sites connected within that segment. It is based on the service type through one of the possible connection topologies (for example, mesh, PBB tunnels, a switching VLL, rings, and so on), without having to pass through any connectors such as spokes, CCAGs, or SCPs (SAP-to-SAP).

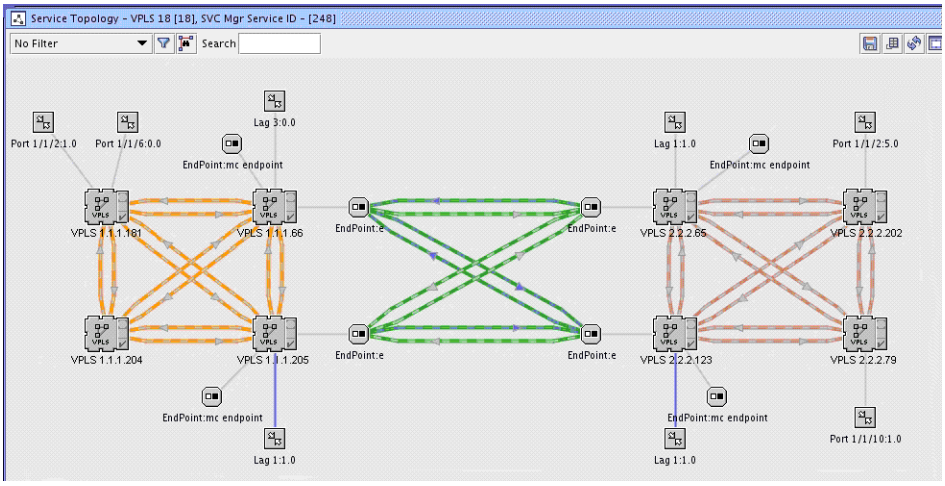
General examples of segments in Layer 2 service topologies include:

- A simple pair or single spoke/mesh SDP binding comprises one segment
- A mesh of a multi-NE VPLS service comprises one segment
- A multi-NE mesh with a spoke SDP to a single NE comprises two segments
- Each mesh of VSIs forms a segment (applicable to H-VPLS)

Just a few examples of the many possible service-specific segmentation configurations include scenarios such as the following:

- H-VPLS (Inter-Metro with redundant spoke SDPs):
  - One application of H-VPLS is the connection of two or more geographically-dispersed VPLS domains belonging to the same customer. Two spoke SDP connections are used to connect each VPLS between the two metros, either in a redundant PW spokes topology or under STP protocol. The redundant spokes comprise one segment, while each VPLS will also comprise one or more segments, depending on their specific configurations.
- VLL Switching:
  - For a VLL service at a switching router, a terminating PE device has at least one VLL SAP, while a switching PE device has a VLL instance which cross-connects two spoke bindings. All VLL instances of such a service must have the same service ID, and if the VLL has one or more switching sites, it must have at least two terminating sites. In this scenario, the primary and redundant spoke SDPs on the same network endpoint are considered to be in the same segment.
- PBB:
  - In a PBB configuration, the B-VPLS is considered a service tunnel, from the I-VPLS or I-Epipe perspective. Therefore, the sites connected via a B-VPLS (that is, having the same ISID) are considered to be in one segment.
  - I-Sites bound to the same PBB tunnel (B-VPLS) and having the same ISID exist in the same segment.
  - Epipe sites bound to same PBB tunnel (B-VPLS) exist in the same segment

Whenever you modify a service, the following actions can trigger segment creation, modification, or deletion in a segmented service view:



- Adding or removing service sites
- Creating or deleting spoke and/or mesh bindings (either through the 5620 SAM GUI or CLI)
- Creation or deletion of VLAN Uplinks by 5620 SAM

You can access the segmented view of a service by right-clicking on an empty portion of the background in the service's topology view. A contextual menu allows you to activate or de-activate the segmented view for the service.

In a segmented view, the outlined links of all spoke bindings, mesh bindings, or VLAN Uplinks are colored in the same distinct way for the segment they belong to. However, there are currently only 19 different colors available for use in showing service segments. If all the colors for a specific service are used, a warning message is logged to indicate this.

Figure 6-12 shows an example of how the 5620 SAM displays the segmented view of an H-VPLS Metro-to-Metro service.

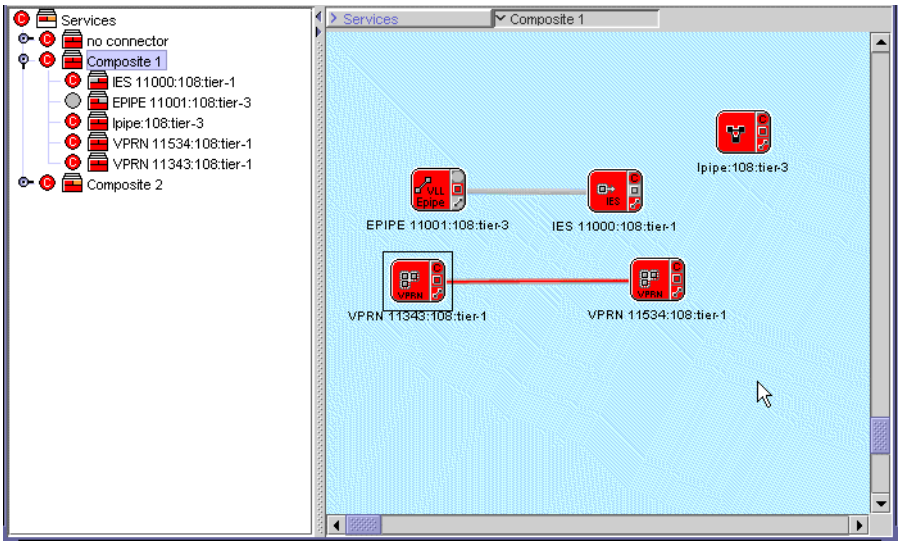


Figure 6-12 Service segmentation example

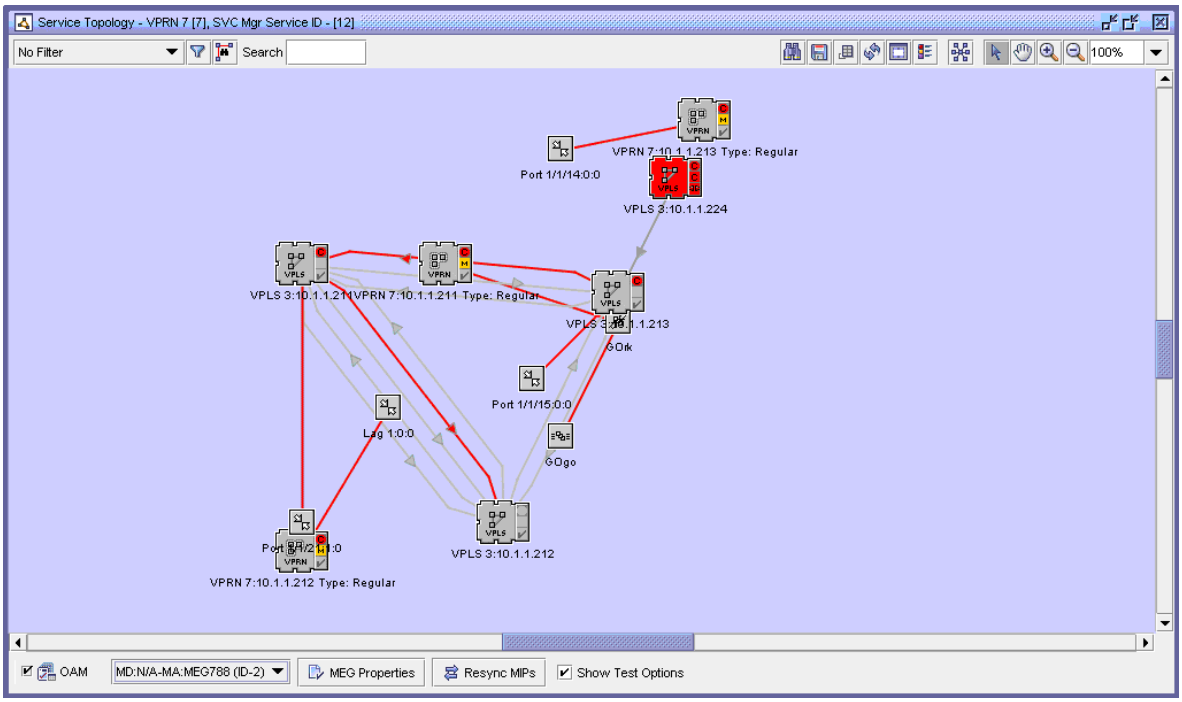
Composite service topology maps

You can use the 5620 SAM to view composite service topology and flat topology maps. Figure 6-13 shows a sample composite service topology map. When you open a flat topology view map, the navigation tree is not part of the map.

Figure 6-13 Composite service topology map

In a composite service topology map, you can use the navigation tree at the left side to display the composite service and service tier hierarchy starting from the services object. The map navigation tree displays the following:



- composite services and service tiers, including service name and tier number
- status of the composite services and their tiers

The map toolbar for the composite service topology map includes the Rearrange by Service Tiers button. See Table 6-1 in this section for more information.

Double-click on a composite service object in the map panel to display the service objects that belong to the composite service. Double-click on the service objects to display the service sites and access interfaces. The links or groups of links between the service sites and access interfaces are also displayed.

In the composite service topology map, all service objects in the composite service are displayed simultaneously. The service sites, access interfaces, and the links or groups of links between them are also displayed. The navigation tree is thus not required in this view. Figure 6-14 shows a sample composite service flat topology map.

Figure 6-14 Composite service flat topology map

You can right-click on an object icon or link group icon to turn up, shut down, or display the properties form for the item.

You can also perform Ethernet CFM diagnostics directly from the composite service flat map.

6.3 Working with topology maps

This section details different methods of managing 5620 SAM capabilities from the topology view.

Modifying a service from the topology view

The topology view for a service provides a graphical representation of the various components and their interconnections. You can also use this view to add, modify, or just navigate to service components. This provides an alternative approach to performing these functions from the navigation tree view in the service configuration forms.

Working from the topology view can expedite the creation of the components, since many of the fields you would ordinarily have to set in the configuration forms will be automatically populated using this approach. The configuration forms can also be accessed directly at any time from this view by right-clicking a component. This allows quick access to conduct more detailed component configuration.

Services that can be modified from their topology views include VPLS, VPRN, VLL, IES, and composite services. See the appropriate service management chapter for procedures that describe how to modify services from the topology view.

Managing OAM diagnostics from the topology view

A 5620 SAM operator can configure and execute OAM diagnostic tests from the service topology or composite service flat topology view. A right-click contextual menu of test types and test operations allows a GUI user to perform many test-management tasks. The OAM diagnostic functions on the map are enabled and disabled using a selector in the map window.

5620 SAM OAM diagnostic test management using the service topology map is supported for the following service types:

- VLAN, excluding 9500 MPR VLAN
- VLL Epipe
- VPLS
- VPRN

The 5620 SAM OAM diagnostic test management functions are also available for composite services using the composite service flat topology map.

You can use a contextual menu option to open a test-creation form for selected map objects such as NEs, SAPs, SDPs, MEPs, and MIPs. The form is automatically populated with the information for the selected objects. After you apply the test configuration, you can use the map to execute the test and view the results. A test result summary is viewable using statically displayed or mouse-over global info tables that are shown beside the object that initiates the test. By default, the info table for a tested object displays the five most recent test results; you can enable or disable the display of individual or all results.

The general OAM contextual menu options that are available include the following:

- Create OAM Tests—lists the tests that are appropriate for the service type and selected objects; choosing a test type opens the pre-populated test-creation form
- Select OAM Tests—opens a filterable list form from which you can choose previously created tests associated with one or two objects

Note — The tests that are listed using the Select OAM Tests option do not include generated tests, or manually added first-run or last-run tests in a test suite.

See Procedure 6-27 for information about enabling basic OAM-related map functions.

Working with Ethernet CFM objects

You can configure and manage Ethernet CFM objects such as MEGs, MEPs, and MIPs using the Ethernet CFM contextual menu option. MEPs and MIPs are represented iconically. For example, a SAP or SDP binding object can have a graphical connector to MEPs and MIPs, and a site object can be connected to a B-VPLS MEP.

Within a MEG, MEPs can be divided into logical groupings called sub-groups. A MEG which contains sub-groups is called a Global MEG. When created, a Global MEG has by default one subgroup.

A service topology map displays only one MEG at a time. The MEG is selectable using a drop-down list in the map window when the OAM function on the map is enabled. The CFM objects associated with the currently selected MEG are displayed.

For a MEP, the following attributes are displayed:

- the MEP level, as a number inside the icon
- the MEP direction, as the up or down direction in which the icon points
- the MEP administrative state, as the icon color
- the MEG sub-group to which the MEP belongs, as the icon outline color.

Note — For composite services, MEP generation does not occur for for VLAN uplinks and overlapping service sites.

When the Show Test Options check box is enabled, the roles assigned to MEPs for Test Suite Generation are displayed beside the MEP icons. The roles are Target, Source, and Hub or Spoke. See Procedure 6-27.

For a MIP, only the level is displayed.

The displayed Ethernet CFM contextual menu options for MEPs and MIPs depend on the Ethernet CFM configuration, for example, the MD level and whether MEPs and MIPs are already in the MEG.

When an operator right-clicks on the map background, the Ethernet CFM options are:

- global MEG creation, which opens a configuration form populated with the selected sites or all service sites, if none are selected.
- addition of a service to an existing global MEG

When the selected object is a SAP, you can create, view, change and delete MEPs. See Procedure 78-1 for information about configuring MEPs. You can enable, disable, and view MIPs. Enabling a MIP creates a MIP only when the configuration supports this function.

When the selected object is a VLAN uplink, a solid line is displayed between the two SAPs and an OAM icon is displayed above the port icons. Right-click on the OAM icon to display the following Ethernet CFM options:

- Edit MEP
- Delete MEP
- Disable MIP
- Change MEG Sub Group

When the selected object is an SDP binding, you can enable, disable, and view the associated MEPs.

Note — When you enable a MIP on a SAP or SDP binding, the 5620 SAM creates a MEG site if one does not exist, and uses explicit MHF creation.

6.4 Workflow to use 5620 SAM topology maps

1. Familiarize yourself with the components and basic operations of 5620 SAM maps. See sections 6.1 and 6.5 for more information.
2. Determine the map type you want to use. See section 6.2 for more information.
   - Select service maps to show which NEs are used by the services.
   - Select topology maps to show the relationship between NEs in a routing domain.
3. Configure map layout and object information tables. See section 6.6 for more information.
4. As required, create map filters to narrow the range of objects displayed. See section 6.6 for more information.
5. As required, create topology groups and populate the groups with devices to organize the network. See section 6.7 for more information.
6. As required, create physical links between managed and unmanaged devices to configure L1 management. See section 6.7 for more information.

6.5 Basic 5620 SAM topology map procedures

Use the following procedures to perform basic map management tasks.

Procedure 6-1 To open a map from the 5620 SAM main menu

1 Choose Application from the 5620 SAM main menu.

2 Choose a type of map to view from the menu options:

- Physical Topology to view Layer 1 network connectivity
- Service Tunnel Topology to view service tunnels
- Flat Maps→Physical Topology
- Flat Maps→Service Tunnel Topology
- EPS Path Topology

The appropriate map opens and displays the network objects.

See Procedure 6-7 for information about using the map elements. See Procedure 6-9 to list or view object information from a map. See section 6.1 for information about the map views.

Procedure 6-2 To open a service topology map

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Create an appropriate filter and click on the Search button. A list of services is displayed.

3 Select one or more services in the list and click on the Topology View button. A dialog box appears.

4 Click on the Yes button to continue. The Service Topology map opens.

See Procedure 6-7 for information about the map elements. See Procedure 6-9 to list or view object information from a map. See section 6.1 for information about the map views.

Procedure 6-3 To open an MPLS provisioned path map from the MPLS Path form

1 Choose Manage→MPLS→MPLS Paths from the 5620 SAM main menu. The Manage MPLS Paths form opens.

2 Create an appropriate filter and click on the Search button. A list of MPLS paths is displayed.

3 Select an MPLS path in the list and click on the Properties button. The MPLS Path configuration form for the MPLS path opens.

4 Click on the Provisioned Path tab. The hops of the MPLS path appear in a list.

5 Select a hop in the list and click on the Topology View button. The MPLS provisioned path map opens showing the hops between the devices.

See Procedure 6-7 for information about the map elements. See Procedure 6-9 to list or view object information from a map. See section 6.1 for information about the map views.

Procedure 6-4 To open a dynamic LSP path map from the LSP Path form

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Create an appropriate filter and click on the Search button. A list of dynamic LSPs is displayed.

3 Select a dynamic LSP in the list and click on the Properties button. The Dynamic LSP (Edit) form opens.

4 Click on the LSP-Path Bindings tab. The LSP paths appear in a list.

5 Select an LSP path in the list and click on the Properties button. The LSP-Path Binding (Edit) form opens.

6 Perform one of the following:

a View the topology for provisioned paths:

i Click on the Provisioned Path tab. The hops of the LSP path appear in a list.

ii Select a hop in the list and click on the Topology View button. The LSP path map opens showing the hops between the devices.

b View the topology for actual paths:

i Click on the Actual Path tab. The hops of the actual path appear in a list.

ii Select a hop in the list and click on the Topology View button. The LSP path map opens showing the actual path hops between the devices.

c View the topology for CSPF paths:

i Click on the CSPF Path tab. The hops of the CSPF path appear in a list.

ii Select a hop in the list and click on the Topology View button. The LSP path map opens showing the CSPF path hops between the devices.

See Procedure 6-7 for information about the map elements. See Procedure 6-9 to list or view object information from a map. See section 6.1 for information about the map views.

Procedure 6-5 To open a flat map

1 Perform one of the following.

a Open a flat physical topology map.

i Choose Application→Flat Maps→Physical Topology from the 5620 SAM main menu. The Topology Filter - Physical Topology - Flat filter form opens.

ii Go to step 2.

b Open a service tunnel topology map.

i Choose Application→Flat Maps→Service Tunnel Topology from the 5620 SAM main menu. The Topology Filter - Service Tunnel Topology - Flat filter form opens.

ii Go to step 2.

See Procedure 6-7 for information about the map elements. See Procedure 6-9 to list or view object information from a map. See section 6.1 for information about the map views.

2 Perform one of the following:

a Perform Procedure 6-20 to create a filter definition.

b Perform Procedure 6-21 to load and apply a saved filter.

3 View the map.

4 Close the map.

Procedure 6-6 To open a dynamic LSP cross-connect topology map

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Create an appropriate filter and click on the Search button. A list of dynamic LSPs is displayed.

3 Choose an LSP in the list and click on the Properties button. The Dynamic LSP (Edit) form opens.

4 Click on the Cross Connects tab. The cross-connects of the LSP path appear in a list.

5 Choose a cross-connect in the list and click on the Topology View button. The LSP path map opens and displays the cross-connects between the devices.

See Procedure 6-7 for information about the map elements. See Procedure 6-9 to list or view object information from a map. See section 6.1 for information about the map views.

Procedure 6-7 To view and understand map elements

1 Open a map, as described in Procedures 6-1 to 6-6.

2 View the map elements, which can include the following:

- device icons, which each display one of the following background colors to represent connectivity status and SNMP reachability
  - red—down or unreachable
  - yellow—resynchronizing or discovering
  - purple—management suspended
  - green—normal

  The icon in the top-right corner of a device icon represents the most serious alarm raised against the device.
  The icon in the middle right hand side of a device icon represents the alarm status for the device.

The icon in the bottom right corner of a device icon represents the connectivity to the device. During resynchronization, the icon represents the resynchronization status; for example, yellow.

- topology group icons, which have the following characteristics:
  - The background color white indicates that the topology group does not contain any descendant objects.
  - The color and icon in the upper left corner of the topology group icon indicate the most severe alarm on any of the devices in the group.
  - The color of the upper middle section of a topology group icon indicates the aggregated connectivity status of the devices in the group.
  - The color of the upper right corner of the topology group icon indicates the aggregated link status of the links in the group.

- composite service icons, which have the following characteristics:
  - The color and icon in the upper left corner of the composite service icon indicate the most severe alarm on any of the devices in the composite service.
  - The color of the upper middle section of the composite service icon indicates the aggregated connectivity status of the devices in the composite service.
  - The color of the upper right corner of the composite service icon indicates the aggregated link status of the links in the composite service.

- service tier icons in composite service maps, which have the following characteristics:
  - The color and icon in the upper left corner of the composite service icon indicate the most severe alarm on any of the devices in the service.
  - The color of the upper middle section of the composite service icon indicates the aggregated connectivity status of the devices in the service.
  - The color of the upper right corner of the composite service icon indicates the aggregated link status of the links in the service.

Procedure 6-8 To save a map to a file

You can use the Save to File button to save a portion of a map or the entire map to a file. You can save the file in JPEG, BMP or PNG format.

1 Open a map.

2 Click on the Save To File button. The save options are displayed in the drop-down menu.

3 Choose a type of view from the drop-down menu:

- Choose Save Map View to save the current view.
- Choose Save Full Map to save the entire map view.

The Save form opens.

4 Save the results.

i To choose a directory for the file, use the Save In parameter.

ii To create a filename, use the File Name parameter.

iii Choose BMP, JPEG, or PNG from the File of Type drop-down menu.

iv Click on the Save button. The map view is saved to the specified file.

Procedure 6-9 To view object information from a map

1 Open a map.

2 Right-click on one of the following objects:

- device icon
- plus sign icon in the centre of a link or link group
- port of a generic or unmanaged NE that indicates the endpoint of a link, path, tunnel, or service
- topology group icon

The appropriate contextual menu appears.

3 Choose a contextual menu option. The following are examples of the options available, depending on the type of object selected.

- Choose Properties to open the properties form for the object.
- Choose Scripts to open the properties form for an NE with the Scripts tab displayed.

Procedure 6-10 To manage the topology map window

The topology map panel and navigation tree panel are separated by a vertical split bar that you can use to control the panels. You can change the size, and hide, or show the map panel or the navigation tree panel.

1 To change the size of the map panel and the navigation tree panel, drag the vertical split bar to the left or right to control the amount of space used for the map panel and the navigation tree.

2 To hide the navigation tree panel, click on the vertical split bar left-facing arrow icon. The tree panel is hidden.

3 To show the map navigation tree panel, click on the vertical split bar right-facing arrow icon. The tree panel opens.

4 To hide the map panel, click on the vertical split bar right-facing arrow icon. The map panel is hidden.

5 To show the map panel, click on the vertical split bar left-facing arrow icon. The map panel opens.

Procedure 6-11 To zoom in and zoom out on a map

1 Open a map.

2 Perform one of the following:

- **a** Use the mouse wheel to zoom in and zoom out. Perform the following steps.
  - **i** Click on the map.
  - **ii** To zoom in, roll the mouse wheel forward.
  - **iii** To zoom out, roll the mouse wheel backward.
- **b** Use the Zoom In Tool and Zoom Out Tool. Perform the following steps.
  - **i** Click on the Zoom in Tool or Zoom out Tool button.
  - **ii** Move the mouse pointer into the map panel. The pointer changes to a magnifying glass containing a + or - sign.
  - **iii** Click on the area of the map you want to expand or contract. The map expands or contracts. Continue clicking until the desired zoom level is reached.
  - **iv** Use the opposite button and an equal number of clicks to return the map to its default setting.
  - **v** To return to the pointer icon, click on the Select Tool button in the toolbar.

3 Use the Scale combo box to specify a zoom level, and press ↵.

Procedure 6-12 To display only selected map objects

1 Open a map.

2 Select the objects.

3 Right-click on the selected objects and choose Show only Selected from the contextual menu. The map refreshes to display only the selected objects, and the word Hidden is displayed in the map panel to indicate that some objects are currently hidden.

4 To restore the previous map view, right-click in the map panel and choose Cancel Show Only from the contextual menu.

Procedure 6-13 To display only highlighted map objects

1 Open a map.

2 Click on the Legend button in the toolbar and choose Highlight Sessions from the drop-down menu. The Legend form opens with the Highlight Sessions tab displayed.

3 Select one or more highlight sessions in the list.

4 Right-click on the selected highlight sessions and choose Show Only Highlighted from the contextual menu. The map refreshes to display only the highlighted objects, and the word Hidden is displayed in the map panel to indicate that the non-highlighted objects are currently hidden.

5 To restore the previous map view, right-click in the map panel and choose Cancel Show Only from the contextual menu. The map refreshes to display the previous view.

Note — You can also restore the previous map view by right-clicking on the selected highlight sessions in the Legend form and choosing Cancel Show Only from the contextual menu.

6.6 5620 SAM topology map configuration procedures

Use the following procedures to perform map configuration tasks.

Procedure 6-14 To create an information table configuration

You can create an information table configuration for all map objects, selected map objects, or map highlights. See Procedure 6-15 to apply a configuration to all map objects. See Procedure 6-16 to apply a configuration to selected map objects. See Procedure 6-17 to apply a configuration to highlighted map objects.

1 Open a map.

2 Click on the Global Info Tables button. A drop-down menu opens with the information table configurations displayed.

3 Select the Configure menu item. The *topology_view* Info Table Configurations form opens.

4 Click on the Create button. The *topology_view* - Info Table Configuration form opens.

5 Configure the Configuration Name parameter.

6 For each map object type, click on the associated check box to select the attribute for display in the information table.

Note — If an applicable attribute is not selected for a specific object type, an information table is not displayed when you apply an information table configuration to objects of that type.

7 Click on the OK button. The *topology_view* - Info Table Configuration form closes, and the new configuration is listed on the *topology_view* - Info Table Configurations form.

8 Close the *topology_view* - Info Table Configurations form.

Procedure 6-15 To enable or disable a global information table

The Global Info Tables button allows you to view an information table for all map objects. An information table configuration must be created before it can be applied. See Procedure 6-14 for information about creating an information table configuration.

1 Open a map.

2 Click on the Global Info Tables button. A drop-down menu opens with the information table configurations displayed.

3 Perform one of the following:

a Select a radio button to apply an existing global information table configuration. The map is refreshed with the corresponding information table displayed beside the map objects.

b Click on the Off button. The global information table feature is disabled.

Procedure 6-16 To enable or disable a selected information table

The Selected Info Tables menu option allows you to view an information table for a map object, or a group of map objects. An information table configuration must be created before it can be applied to a map object or a group of map objects. See Procedure 6-14 for information about creating an information table configuration.

1 Open a map.

2 Right-click on a map object or a selection of map objects. A drop down menu opens.

3 Choose Selected Info Tables. A drop down menu opens with a list of information table configurations and an Off option.

4 Perform one of the following:

- **a** Choose an information table configuration. The map view is refreshed with the configured information table displayed beside the map objects.
- **b** Choose the Off option. The selected information tables for the selected map objects are no longer displayed.

Procedure 6-17 To re-enable or disable map highlights

1 Open the required map.

2 Click on the Legend button in the toolbar and choose Highlight Sessions from the drop-down menu. The Legend form opens with the Highlight Sessions tab displayed.

3 Perform one of the following:

- **a** Re-enable a disabled highlight. Perform the following steps.
  - **i** Select the check box in the Active column for the highlight.
  - **ii** Click on the Apply button. The map view is refreshed with the highlight displayed.
- **b** Disable the highlight. Perform the following steps.
  - **i** Deselect the check box in the Active column for the highlight.
  - **ii** Click on the Apply button. The map view is refreshed. The highlight and the associated information tables are no longer displayed.

4 Click on the Close button. The Legend - *topology* form closes.

Procedure 6-18 To enable or disable a highlight information table

You must create an information table configuration before you can apply the configuration to a map highlight. See Procedure 6-14 for information about creating an information table configuration.

1 Open the required map.

2 Click on the Legend button in the toolbar and choose Highlight Sessions from the drop-down menu. The Legend form opens with the Highlight Sessions tab displayed.

3 Select one or more highlight sessions in the list.

4 Right-click on the selected highlight sessions and choose Highlighted Info Sessions from the contextual menu. A drop-down menu opens with a list of information table configurations and an Off option.

5 Perform one of the following.

a Choose an information table configuration. The map view is refreshed with the specified information table displayed beside the highlighted map objects.

b Choose the Off option. The map view is refreshed and does not display information tables for the highlighted map objects.

Note — When a highlight is disabled or deleted, the map does not display the information tables that are associated with the highlight.

6 Click on the Close button. The Legend - *topology* form closes.

Procedure 6-19 To delete a map highlight

1 Open a map.

2 Click on the Legend button in the toolbar and choose Highlight Sessions from the drop-down menu. The Legend form opens with the Highlight Sessions tab displayed.

3 Click on a map highlight to select it.

4 Right-click on the selected highlight and choose Delete. A dialog box appears.

5 Click on the Yes button. The highlight is deleted.

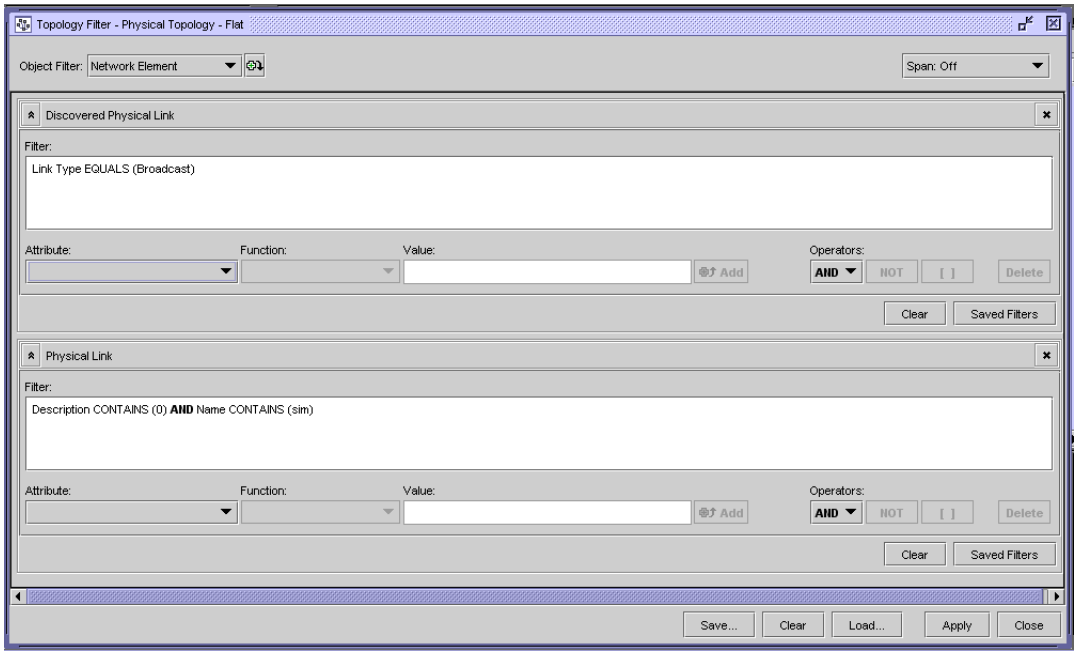
6 Click on the Close button. The Legend - *topology* form closes.

Procedure 6-20 To create a map filter

Perform this procedure to configure a filter to restrict the objects in a map view. You can save the filter for searches on similar objects.

1 Open a map.

2 Click on the New Filter button. The Topology Filter - *topology_view* form opens.



3 Choose an object filter from the Object Filter drop-down menu. Table 6-2 lists the filter options for each map type.

Table 6-2 Map filter options

Type of map	Filter options
Physical topology	Discovered Physical Link Network Element Optical Link Physical Link
Service tunnel topology	Network Element Tunnel

4 Click on the Add Object Filter button. The selected object filter is displayed in the filter panel as shown in Figure 6-15.

Figure 6-15 Map filter

5 Choose one or more of the object filters to create the filter. See chapter 3 for information about creating filters.

6 Configure the Span parameter.

7 Perform one of the following:

a Click on the Apply button to apply the filter and not save the filter. The map view is refreshed to display only the map objects defined in the filter. The filter selector displays Filter Applied.

b Perform the following steps to save the filter.

i Click on the Save button. The Save Filter form opens.

ii Configure the parameters:

- Filter Name
- Description
- Public

8 Click on the Save button. The Save Filter form closes.

9 Close the Topology Filter - *topology_view* form.

Procedure 6-21 To load and apply a saved filter to a topology map

See Procedure 6-20 for information about creating a filter definition tree.

1 Open a map.

2 Click on the saved filter selector and choose a filter from the drop-down list.

The 5620 SAM applies the filter and the map view is refreshed to display only the map objects specified in the filter. The filter name is displayed in the saved filter selector.

Procedure 6-22 To auto-layout icons on a map

Caution — After you click on the Auto-Layout button and confirm the action, the existing map layout is overwritten and cannot be recovered.

1 Open a map.

2 Perform one of the following:

a Auto-layout all of the icons on the map.

i Click on the Auto-Layout Tool button and choose one of the following options:

- Circular - emphasizes ring and star topologies in networks. Objects are grouped according to the network structure and arranged in circles or radial tree structures.
- Smart Organic - emphasizes inherent data groupings and symmetries. This information helps with understanding the interconnections of complex structures.
- Endpoint Layout (VPLS, VLL, mirror, and composite service sites only) - all endpoints are snapped close to the associated parent site.

A dialog box appears.

ii Click on the Yes button.

b Auto-layout a group of icons on the map.

i Select multiple objects.

ii Right-click on an object in the group, choose Layout Selected, and choose one of the following options from the contextual menu:

- Circular
- Smart Organic
- Endpoint Layout (VPLS, VLL, mirror, and composite service sites only)

A dialog box appears.

iii Click on the Yes button.

The map layout changes so that icons with links between them are closer together, and icons without links between them are moved to the periphery.

Procedure 6-23 To search for a specific network object

1 Open a map.

2 Perform one of the following:

a To search for a network object by typing the name, or part of the name of the network object:

i Click on the Find button in the map toolbar.

ii Choose Find Vertex or Find Link. The Find *object* form opens.

iii Configure the filter criteria and click on the Search button. A list of objects is displayed.

Note — The search function is case sensitive.

iv Select an object in the list.

b To search for a network object by pasting the name of the network object from the clipboard:

i Click on the network object that you want to locate from the equipment view of the navigation tree or from a generated or displayed list.

ii Click on the Copy to Clipboard icon to copy the network object name to the clipboard.

iii Click on the Find button.

iv Choose Find Vertex or Find Link. The Find Object form opens.

v Click on the Paste button. The network object that you copied to the clipboard is displayed in the Find object with label containing text field.

Note — Only the first item listed on the clipboard is pasted in the Find object with label containing text field of the Find Object form.

c Use the Quick-search field on the map window. Perform the following steps.

i Type part or all of the object name in the Quick-search field beside the toolbar icons.

ii Press ↵. The map shifts to display the first object that matches the search criterion.

iii Press F3 to shift the map focus to the next matching object, if the search finds multiple matches.

iv Press CTRL-F3 to shift the map focus to the previous matching object, if the search finds multiple matches.

v Go to step 5.

3 Click on the OK button.

a If a match is found, the map panel displays the topology group that contains the object and the map navigation tree expands to display the group. If necessary, the map panel scrolls to the portion of the map where the object is displayed.

b If multiple matches are found, the Find Object form opens with a drop-down list of all of the search results. Go to step 4.

4 Select a network object and click on the OK button. The map panel displays the topology group that contains the object and the map navigation tree expands to display the group. If necessary, the map panel scrolls to the portion of the map where the object is displayed.

5 Manage the object, as required.

Procedure 6-24 To create a bookmark

See section 6.1 for more information about the bookmark function.

1 Open a map.

2 Locate the topology group that you want to bookmark.

Note — Bookmarks are associated with a map view. To use the bookmark after it is created, you must be in the same view where you created the bookmark or a view that shares the same group, for example, a topology group that belongs to both the physical topology map and the service tunnel map.

3 Click on the Bookmarks button and choose Add Bookmark. A bookmark for the currently displayed topology group is created.

Procedure 6-25 To manage bookmarks

See section 6.1 for more information about the bookmark function.

1 Open a map, as described in Procedures 6-1 to 6-6.

Note — Bookmarks are associated with a map view. To use the bookmark after it is created, you must be in the same view where you created the bookmark or a view that shares the same group, for example, a topology group that belongs to both the physical topology map and the service tunnel map.

Bookmarks that were not created in the map view currently displayed, or that are invalid, are disabled and cannot be selected. In the Manage Bookmarks form, these bookmarks appear in italics.

2 Click on the Bookmarks button and choose Manage Bookmarks. The Manage Bookmarks form opens.

3 Perform one of the following:

a Create a top-level folder to manage the bookmarks.

i Click on the New Folder button. The Folder Properties form opens.

ii Enter the name of the new folder in the Name field and click on the OK button. A new top-level folder is added to the list panel.

b Create a folder in an existing folder.

i Select an existing folder in the list panel and click on the New Folder button. The Folder Properties form opens.

ii Enter the name of the new folder in the Name field and click on the OK button. A new folder is added to the list panel inside the existing folder.

c Organize your bookmarks and folders. Drag and drop bookmarks and folders in and out of other folders in the list panel.

d Rename a bookmark or folder.

i Select an existing bookmark or folder in the list panel and click on the Rename button. The Rename form opens with the existing name in the Name field.

ii Change the text in the Name field and click on the OK button. The name of the bookmark or folder is modified.

e Delete a bookmark or folder.

i Select a bookmark or folder that you want to delete in the list panel.

ii Click on the Delete button. The selected bookmark or folder is removed from the list panel and the bookmark drop-down menu on the map toolbar.

4 Click on the Close button to close the Manage Bookmarks form and save the changes.

Procedure 6-26 To change the map background image

To view the map background image examples provided by the 5620 SAM, navigate to the background directory in the 5620 SAM client Installation directory, for example, /nms/images/map/background.

When adding your own map image to the directory, ensure that the file type is GIF and that the size is a maximum of 2000 × 2000 pixels.

The default background image is defaultBackgroundImage.gif.

1 Open a map, as described in Procedures 6-1 to 6-6.

2 In the map navigation tree, right-click on the topology group for which you want to change the map background image and choose Properties from the contextual menu. The Group - Network (Edit) form opens.

3 Modify the Background Image parameter to specify a new map image file, for example, n_america.gif.

4 Click on the OK button. A dialog box appears.

5 Click on the Yes button to proceed. The background image for the topology group changes to the selected image.

6.7 5620 SAM topology map management procedures

Use the following procedures to perform map management tasks.

Procedure 6-27 To use OAM diagnostic functions on service topology and composite service flat topology maps

Perform this procedure to enable the OAM diagnostic functions on a service topology or composite service flat topology map, and use the basic OAM controls in the map window. See the other procedures in this chapter for information about using specific elements such as the toolbar buttons and info tables.

1 Create a service topology map by selecting the service in the Manage Services form and clicking on the Topology View button.

2 Select the OAM check box at the bottom left of the map window.

3 To manage one or more objects, select the objects and right-click on the set of objects to choose an option from the contextual menu.

4 To select a MEG to display, choose the MEG from the drop-down list of available MEGs at the bottom of the map window.

Note — You can also create a MEG directly from the topology map by right-clicking on an empty portion of the map to open a contextual menu. Select Ethernet CFM→Create Global MEG. Refer to Procedure 32-5 for detailed information.

5 To view the properties of the selected MEG, click on the MEG Properties button at the bottom of the window. The Global Maintenance Entity Group (Edit) form opens with the General tab displayed. The service displayed on the map is listed on the Service tab.

6 To resynchronize the MIPs in the selected MEG, click on the Resync MIPs button at the bottom of the window.

7 To display the Test Generation Options for MEPs in the selected MEG, enable the Show Test Options check box at the bottom of the map window. See "Working with Ethernet CFM objects" in section 6.3.

8 Use the other procedures in this chapter to refine the map contents or display object properties, as required.

9 Use the right-click contextual menu options to configure and manage OAM objects, as required. See "Managing OAM diagnostics from the topology view" in section 6.1 for a functional description of the available contextual menu options for OAM diagnostics.

Procedure 6-28 To create a topology group

Note — A topology group can contain a maximum of 500 NEs.

1 Open the Group (Create) form using one of the following methods.

   a Choose Create→Equipment→Group from the 5620 SAM main menu.

   b Right-click on the Network icon in the equipment view of the navigation tree and choose Equipment→Create Group from the contextual menu.

2 Configure the parameters:

   - Group Name
   - Description
   - Background Image

3 Click on the Apply button.

4 Click on the Spans tab.

5 Click on the Add button. The Select Span(s) - Equipment Group form opens with a list of available spans.

6 Select one or more spans to apply to the topology group.

7 Click on the OK button. The Select Span(s) - Equipment Group form closes and a dialog box appears.

8 Click on the OK button to confirm the action.

   After the topology group is created, an object for the topology group is displayed in the equipment navigation tree, and on the appropriate topology maps.

Procedure 6-29 To populate a topology group

Note — A topology group can contain a maximum of 500 NEs.

1 Choose Application→Physical Topology, or Service Tunnel Topology from the 5620 SAM main menu. The appropriate map window opens.

2 Populate topology groups, as required,

a Click on a map object in the map panel, for example, a router or router group, and drag the object onto the topology group object to which you want the map object to belong in the:

- map panel
- map navigation tree

The map object becomes a descendant object of the topology group.

b Click on a topology group object in the map navigation tree and drag the object onto another group object in the map navigation tree to which you want the group object to belong. The topology group object becomes a descendant object of another group object.

Procedure 6-30 To modify a topology group and create topology groups with the same parameter settings

1 Right-click on the topology group object on the map for which you want to modify the parameters and choose Properties from the contextual menu. The Group (Edit) form opens.

2 Modify the parameters as required.

3 Click on the Apply button. A dialog box appears.

4 Click on the Yes button to save the changes.

5 If required, click on the Copy button to create more topology groups based on the same parameter information. A Group (Create) form opens with the existing parameter information.

6 Edit the parameter information as required.

7 Click on the OK button. The Group (Create) form closes.

8 Close the Group (Edit) form.

Any changes to the properties of a topology group appear immediately on the equipment navigation tree and the appropriate topology maps.

Procedure 6-31 To delete a topology group

When you delete a topology group object, the topology group cannot contain any devices or descendant topology groups.

1 Choose Application→Physical Topology, or Service Tunnel Topology from the 5620 SAM main menu. The appropriate map window opens.

2 Drag and drop all devices and descendant topology groups from the topology group that you want to delete to another topology group or the root group, for example, the network.

3 Right-click on the topology group object that you want to delete on the map and choose Delete from the contextual menu. A dialog box appears.

4 Click on the Yes button to proceed. The topology group is deleted.

Procedure 6-32 To modify a service or composite service using the topology view

You can use the service topology or composite service flat topology view to add, modify, or navigate to service components. The service configuration form can also be accessed directly at any time from this view by right-clicking any component. This allows quick access to conduct more detailed component configuration.

1 Perform one of the following.

   a Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

   b Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure a search filter, if required, and click on the Search button. A list of services or composite services is displayed.

3 Perform one of the following.

   a Select a service and click on the Topology View button. The Service Topology map opens.

   b Select a composite service and click on the Flat Topology View button. The Composite Service Flat Topology View map opens.

4 Right-click on the map background, or on one or more selected service sites, or individual components (for example, a SAP) to display a contextual menu of configuration options. When you choose an option, a configuration form opens. If you choose to create an OAM test, the appropriate test configuration form opens.

5 See the appropriate service management chapter for information about modifying a specific service type or Chapter 32 for information on performing OAM diagnostic tests.

Procedure 6-33 To create a physical link

The MDA type for both physical link endpoints must be the same. Only one physical link can be configured on a port.

Users with Device Mgmt privileges can create, modify, and delete physical links.

1 Open the Physical Link (Create) form using one of the following methods.

   a Choose Create→Equipment→Create Physical Link from the 5620 SAM main menu.

   b Right-click on the topology map background in the equipment view of the navigation tree and choose Equipment→Physical Link from the contextual menu.

2 Configure the parameters:

- Name
- Description
- Endpoint A Type
- Endpoint B Type
- Notes

3 Configure the parameters in the Endpoint A panel by performing one of the following.

   a If you set the Endpoint A Type parameter in step 2 to Port, go to step 4.

   b If you set the Endpoint A Type parameter in step 2 to Network Element, go to step 5.

   c If you set the Endpoint A Type parameter in step 2 to LAG, go to step 6.

4 Configure the parameters in the Endpoint A - Port panel by performing one of the following steps.

a Use the Select Endpoint A - Port - Physical Link form to search for a port.

i Click on the Select button in the Endpoint A – Port panel to choose a managed endpoint for the physical link. The Select Endpoint A - Port - Physical Link form opens.

ii Use the configurable filter and click on the Search button to generate a list of ports.

iii Select a port and click on the OK button. The Select Endpoint A - Port - Physical Link form closes and the port parameter information is displayed in the Endpoint A - Port panel of the Physical Link (Create) form.

b Choose a port from the equipment navigation tree.

i Select a port object and click on the Copy to Clipboard button. The port information is copied to the clipboard.

ii Click on the Paste from Clipboard button in the Endpoint A - Port panel of the Physical Link (Create) form. The port parameter information is displayed in the Endpoint A - Port panel.

5 Configure the parameters in the Endpoint A - Network Element panel by performing one of the following steps.

a Use the Select Endpoint A - Network Element - Physical Link form to search for a port.

i Click on the Select button in the Endpoint A panel to choose a managed endpoint for the physical link. The Select Endpoint A - Network Element - Physical Link form opens.

ii Use the configurable filter and click on the Search button to generate a list of NEs.

iii Select an NE and click on the OK button. The Select Endpoint A - Network Element - Physical Link form closes and the NE parameter information is displayed in the Endpoint A - Network Element panel of the Physical Link (Create) form.

b Choose an NE from the equipment navigation tree:

i Select an NE and click on the Copy to Clipboard button. The NE information is copied to the clipboard.

ii Click on the Paste from Clipboard button in the Endpoint A - Network Element panel of the Physical Link (Create) form. The NE parameter information is displayed in the Endpoint A - Network Element panel.

6 Configure the parameters in the Endpoint A - LAG panel by performing one of the following steps.

a Use the Select Endpoint A - LAG - Physical Link form to search for a port.

i Click on the Select button in the Endpoint A panel to choose a managed endpoint for the physical link. The Select Endpoint A - LAG - Physical Link form opens.

ii Use the configurable filter and click on the Search button to generate a list of NEs.

iii Select an NE and click on the OK button. The Select Endpoint A - LAG - Physical Link form closes and the NE parameter information is displayed in the Endpoint A - LAG panel of the Physical Link (Create) form.

b Choose an NE from the equipment navigation tree:

i Select an NE and click on the Copy to Clipboard button. The NE information is copied to the clipboard.

ii Click on the Paste from Clipboard button in the Endpoint A - LAG panel of the Physical Link (Create) form. The NE parameter information is displayed in the Endpoint A - LAG panel.

7 Configure the parameters in the Endpoint B panel by performing one of the following.

a If you set the Endpoint B Type parameter in step 2 to Port, go to step 8.

b If you set the Endpoint B Type parameter in step 2 to Network Element, go to step 9.

c If you set the Endpoint B Type parameter in step 2 to Unmanaged NE, go to step 11.

d If you set the Endpoint B Type parameter in step 2 to LAG, go to step 12.

8 Configure the parameters in the Endpoint B - Port panel by performing one of the following.

a Use the Select Endpoint B - Port - Physical Link form to search for a port.

i Click on the Select button in the Endpoint B panel to choose a managed endpoint for the physical link. The Select Endpoint B - Port - Physical Link form opens.

ii Use the configurable filter and click on the Search button to generate a list of ports.

iii Select a port and click on the OK button. The Select Endpoint B - Port - Physical Link form closes and the port parameter information is displayed in the Endpoint B - Port panel of the Physical Link (Create) form.

b Choose a port from the equipment navigation tree.

i Select a port object and click on the Copy to Clipboard button. The port information is copied to the clipboard.

ii Click on the Paste from Clipboard button in the Endpoint B - Port panel of the Physical Link (Create) form. The port parameter information is displayed in the Endpoint B - Port panel.

9 Configure the parameters in the Endpoint B - Network Element panel by performing one of the following.

a Use the Select Endpoint B - Network Element - Physical Link form to search for a port.

i Click on the Select button to choose a managed endpoint for the physical link. The Select Endpoint B - Network Element - Physical Link form opens.

ii Use the configurable filter and click on the Search button to generate a list of NEs.

iii Select an NE and click on the OK button. The Select Endpoint B - Network Element - Physical Link form closes and the NE parameter information is displayed in the Endpoint B - Network Element panel of the Physical Link (Create) form.

b Choose an NE from the equipment navigation tree:

i Select an NE and click on the Copy to Clipboard button. The NE information is copied to the clipboard.

ii Click on the Paste from Clipboard button in the Endpoint B - Network Element panel of the Physical Link (Create) form. The NE parameter information is displayed in the Endpoint B - Network Element panel.

10 If the Endpoint B is an unmanaged NE that the 5620 SAM recognizes as an unmanaged mobile NE such as an eNodeB, go to step 14.

11 Configure the parameters in the Endpoint B - Unmanaged NE panel:

- Unmanaged - Name
- Unmanaged - Management Address
- Unmanaged - Description

Note — If the 5620 SAM is to manage endpoint B, configure the Unmanaged - Name parameter with the management IP address of the unmanaged NE.

When the 5620 SAM discovers the NE, the unmanaged endpoint of the physical link is updated with the newly managed NE on the topology map.

12 Configure the parameters in the Endpoint B - LAG panel by performing one of the following.

a Use the Select Endpoint B - LAG - Physical Link form to search for a port.

i Click on the Select button in the Endpoint B panel to choose a managed endpoint for the physical link. The Select Endpoint B - LAG - Physical Link form opens.

ii Use the configurable filter and click on the Search button to generate a list of ports.

iii Select a port and click on the OK button. The Select Endpoint B - LAG - Physical Link form closes and the port parameter information is displayed in the Endpoint B - LAG panel of the Physical Link (Create) form.

b Choose a port from the equipment navigation tree.

i Select a port object and click on the Copy to Clipboard button. The port information is copied to the clipboard.

ii Click on the Paste from Clipboard button in the Endpoint B - LAG panel of the Physical Link (Create) form. The port parameter information is displayed in the Endpoint B - Port panel.

13 Go to step 17.

14 Click on the Select button in the Endpoint B - Unmanaged NE (LTE) panel to choose an unmanaged mobile NE such as an eNodeB. The Select Unmanaged NE - Physical Link form opens.

15 Use the configurable filter and click on the Search button to generate a list of unmanaged mobile NEs for example, eNodeB devices.

16 Select an unmanaged mobile NE and click on the OK button. The Select Unmanaged NE - Physical Link form closes and the NE information is displayed in the Endpoint B - Unmanaged NE (LTE) panel of the Physical Link (Create) form.

17 Click on the OK button to close the form. The physical link is created between the two endpoints and can be viewed from the physical topology map.

Procedure 6-34 To modify a physical link and create physical links with the same parameter settings

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Physical Link from the object drop-down list.

3 Configure the filter criteria and click on the Search button.

4 Select a physical link in the list and click on the Properties button. The Physical Link (Edit) form opens.

5 Modify the parameters as required.

6 Click on the Apply button to save the changes.

7 If required, click on the Copy button to create more physical links based on the same parameter information. If the Copy button is not visible, click on the More Actions button and choose Copy. A Physical Link (Create) form opens with the existing parameter information.

8 Edit the parameter information as required.

9 Click on the OK button. The Physical Link (Create) form closes.

10 Close the Physical Link (Edit) form.

After a physical link is created, you can view the link on the physical topology map.

Procedure 6-35 To manage link referencing

You can select one or more links to manage link referencing.

1 Select the links. Hold down the shift key and right-click the links to be managed.

2 Hold down the shift key and right-click on the topology map background in the equipment view of the of the navigation tree and choose Reference from the contextual menu. Choose from one of the following options.

   a To reference the links that you have chosen, choose Reference Selected Discovered Links.

   b To clear the references, choose Clear Reference for All Selected Links.

   c To clean up references (removing the Reference for links that are down), choose Cleanup Selected Discovered Links.

Note 1 — If you select no links, right-clicking on the topology map background will give you the following options (in the Reference contextual menu):

- Reference All Discovered Links in NE Group (in which case, References will be created only for links in the open/active topology group).
- Clear Reference for All Discovered Links in NE Group
- Cleanup All Discovered Links in NE Group

Note 2 — You can also reference links and clear references using the Discovered Link Property form (for a single link) and the Manage Equipment form (for multiple links). See Procedure 6-38.

Procedure 6-36 To delete a physical link

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Physical Link from the object drop-down list.

3 Configure the filter criteria and click on the Search button.

4 Select a physical link in the list and click on the Delete button. A dialog box appears.

5 Click on the Yes button to proceed. The physical link is deleted.

Note — When a NE is unmanaged or removed, all the physical links that terminate on the ports or on the NE itself are deleted.

Procedure 6-37 To configure bandwidth availability on physical links

Use this procedure to configure bandwidth parameters on links being used by service CAC.

Note — This capability is only available if service CAC has been configured. See "To configure service CAC to automatically bind PBB tunnels" in the *5620 SAM System Administrator Guide*.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Perform one of the following.

   a Choose Discovered Physical Link from the object drop-down menu.

   b Choose Physical Link from the object drop-down menu.

3 Configure the filter criteria and click on the Search button.

4 Select a physical link in the list and click on the Properties button. The Physical Link (Edit) form opens.

5 Click on the Bandwidth tab.

6 Select the Endpoint A or the Endpoint B tab.

7 Configure the following endpoint bandwidth parameters:

- Bandwidth (%)
- Used Bandwidth (Mbps)
- Utilization Threshold (%)

8 Configure the following effective bandwidth parameters:

- Name
- Bandwidth (Mbps)
- Booking Factor (%)
- Utilization Threshold (%)
- Used Bandwidth (Mbps)

9 To view a summary of bandwidth usage for all tunnels and services currently using the physical link, click on the Bandwidth Usage tab.

10 Click on the OK button. The Physical Link (Edit) form closes.

11 Close the Manage Equipment form.

Procedure 6-38 To view and modify discovered physical link properties

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Discovered Physical Link from the object drop-down list.

3 Configure the filter criteria, if required, and click on the Search button.

4 Select a discovered physical link in the list and click on the Properties button. The Discovered Physical Link (Edit) form opens with the General tab displayed.

5 Configure the following parameters, if required:

- Name
- Description

6 Perform one of the following to configure the link reference information, if required.

a Click on the Reference Discovered Links button. If the Reference Discovered Links button is not visible, click on the More Actions button and choose Reference Discovered Links. The parameters in the Reference panel are populated with reference information.

b Click on the Clear Reference button. If the Clear Reference button is not visible, click on the More Actions button and choose Clear Reference. The parameters in the Reference panel are reset.

7 Select the appropriate tab to view other information, as required.

8 Click on the OK button. The Discovered Physical Link (Edit) form closes.

9 Close the Manage Equipment form.

Procedure 6-39 To switch from a backup/standby protected link to an in-service protected link on a 9500 MPR device

1 In the Physical topology map, right-click on the protected link between two 9500 MPR NEs which is indicated in blue, and select Expand Group. The links expand to show the backup/standby link in blue, and the in-service link in green.

2 To switch the standby/backup link to in-service and the in-service link to backup/standby, right-click on the relevant port or card and select Properties. The Physical Port (Edit) form opens.

3 Click on the Protection tab. From the Equipment Protection Scheme parameter and the Receiver Protection Scheme parameter, select the Commands option.

4 Click on the Apply button. A dialog box appears.

5 Click on the Yes button. The Physical Port (Edit) form closes.

7 — 5620 SAM scheduling

7.1 Scheduling overview *7-2*

7.2 Workflow to manage scheduling *7-4*

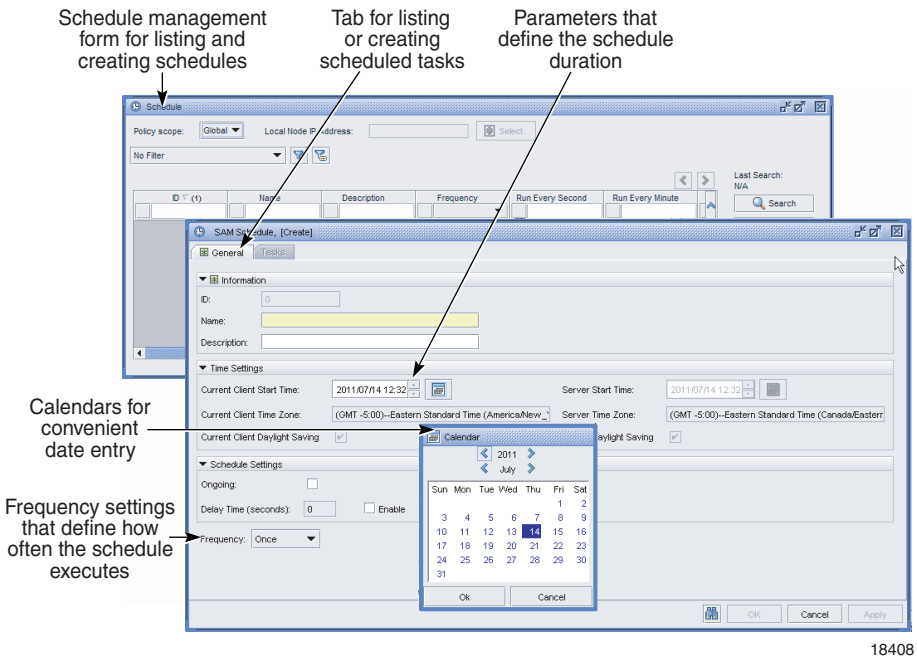
7.3 Scheduling procedures *7-5*

7.1 Scheduling overview

The 5620 SAM scheduling functions allow the creation of 5620 SAM-based schedules for the automatic execution of tasks at designated times.

You can associate a schedule that you create using the 5620 SAM with a task that supports scheduling. A task such as running an STM test suite can be immediately processed, scheduled for later execution, or retained for future use. A task that is associated with a schedule is called a scheduled task. A scheduled task must be created in the configuration form for the task. For example a STM test suite scheduled task must be created in the STM test suite configuration form. After scheduled tasks are created they are associated with a schedule.

A 5620 SAM schedule is configurable for one-time or ongoing task execution. You can optionally specify the time at which an ongoing schedule is to stop functioning.



To simplify creating 5620 SAM-based schedules when the user and server are in different time zones, the 5620 SAM converts and displays schedule times specific to the user and server. For example, if a user in Ottawa wants to schedule a task on a 5620 SAM server in London, the 5620 SAM calculates the time difference and displays the user and server local times.

User time zones are configured in the user preferences form. If a time zone is not configured on the main server, the 5620 SAM uses the default time zone on the single-user client or client delegate server station, If the default time zone is not one of the 5620 SAM time zone options, the 5620 SAM displays the time zone ID and uses the UTC value without the time zone offset.

The 5620 SAM displays whether daylight saving time is in effect for the client and the server. Daylight saving time is specified for the user start time and is based on the client time zone. Daylight saving time does not specify the current time and end time.

Figure 7-1 shows the Schedule management form and the SAM Schedule configuration form.

Figure 7-1 Schedule management and configuration forms

SAM schedules

A SAM schedule exists only in the 5620 SAM and is not deployed to the target NEs. When a configured SAM schedule run time arrives, the 5620 SAM executes the associated task and compiles the task results for presentation to 5620 SAM clients.

A delay time for executing SAM scheduled runs can be configured to delay the execution of a run within a scheduled task in cases when a previously scheduled run is still executing. The 5620 SAM attempts to execute the new run at the configured delay time; if the run cannot execute at the delay time, the 5620 SAM skips the scheduled run. When a previous run completes and the next scheduled run is triggered, the run executes and is not delayed, whether a delay time is configured.

The SAM schedule functionality in the 5620 SAM uses the 5620 SAM server time zone to trigger the scheduled tasks.

A 5620 SAM-based schedule supports the following tasks:

- STM test suites. See chapter 77 for more information about STM test suites.
- NE software upgrades. See “NE maintenance overview” in the *5620 SAM System Administrator Guide* for more information about NE software upgrades.

Consider the following when you create a SAM schedule or a scheduled task.

- Ensure that scheduled tasks are run sufficiently far apart to allow one task to finish before the next starts. Otherwise, the next occurrence of the task is skipped or delayed, if the delay time is configured.
- Do not create schedules that overlap, as no validation is performed to ensure that a newly configured schedule does not overlap with an existing schedule.

- A new SAM scheduled task is shut down by default and must be turned up before it can be executed with one exception. Scheduled software upgrade tasks associated with all NE types are by default auto-enabled.
- Users with write access permissions to a specific schedule package can view or delete all the created schedules and scheduled tasks related to the package. Other users can only view schedules. See "5620 SAM user security tasks" in the *5620 SAM System Administrator Guide* for more information about user permissions.
- By default, the 5620 SAM associates a scheduled task with the user account that is used to create the scheduled task. You can assign a different user account to a scheduled task. The user account must have the assigned scope of command role that is appropriate for the task, or the 5620 SAM does not execute the scheduled task.
- When you create a scheduled task that runs on a daily, weekly, or monthly schedule, you must reset the scheduled task when daylight savings time is in effect. See Procedure 7-8 for information about resetting schedules.
- If a schedule is not synchronized with the server time, you must reset the scheduled task. See Procedure 7-8 for information about resetting schedules
- SAM schedules are not distributed to the target NEs.
- You cannot delete a schedule that has a dependency, for example, one that is associated with a task.
- One minute is added to the default start and end time values of a 5620 SAM-based schedule to allow time for schedule configuration.
- A monthly SAM schedule with the Run Every Month or Run Every Months parameter configured uses a 30-day interval.
- When you create a monthly SAM schedule using the Run Every parameter and specify a date that does not exist for the specified months, the last date of the month is used. For example, if you create a monthly scheduled task, starting January 31st, the scheduled task will run on February 28th, March 31st and April 30th when those months are specified in the schedule.

7.2 Workflow to manage scheduling

1. Create a task, such as an STM test suite, that supports the 5620 SAM scheduling function.
2. Create or modify a SAM schedule. See Procedure 7-1 for more information.
3. Associate a task with the schedule. See Procedure 7-2 or 7-3 for more information.
4. For a SAM scheduled task that requires user account privileges other than the default privileges, assign a different user account to the scheduled task. See Procedure 7-4 for more information.
5. Turn up the scheduled task. See Procedure 7-5 for more information.

6 After the schedule executes the task, review the current status of the SAM scheduled task. See Procedure 7-6 for more information.

7 As required, perform one of the following.

a execute the scheduled task immediately; see Procedure 7-7 for more information

b reset the scheduled task; see Procedure 7-8 for more information

c delete the scheduled task; see Procedure 7-9 for more information

d delete the schedule; see Procedure 7-10 for more information

7.3 Scheduling procedures

Use the following procedures to manage 5620 SAM schedules and scheduled tasks.

Procedure 7-1 To configure a SAM schedule

1 Choose Tools→Schedules→Schedule from the 5620 SAM main menu. The Schedule form opens.

2 Perform one of the following:

a To create a schedule, click on the Create button. The SAM Schedule (Create) form opens with the General tab displayed.

b To configure an existing schedule, perform the following steps.

i Choose SAM Schedule from the object drop-down list.

ii Configure the filter criteria. A list of schedules is displayed.

iii Select an entry in the list and click on the Properties button. The SAM Schedule (Edit) form opens with the General tab displayed.

Note 1 — You can modify a schedule only when you are logged in as the user who is assigned to the schedule. To assign a different user account to the schedule, perform Procedure 7-4.

Note 2 — You cannot modify a schedule that is in use by a scheduled task.

3 Configure the parameters:

- Name
- Description
- Current Client Start Time
- Current Client End Time
- Ongoing
- Delay Time (seconds)
- Enable
- Frequency

The Current Client End Time parameter is configurable when the Ongoing parameter is disabled and the Frequency parameter value is set to a value other than Once.

Note — If you are creating a schedule to apply to policy audits, the Frequency parameter must be set to a value greater than 15 minutes.

When a SAM Schedule is not Ongoing and is assigned to a task, the 5620 SAM raises an alarm when the Current Client End Time expires.

4 Perform one of the following that corresponds to the Frequency parameter value that is specified in step 3:

a When the parameter is set to Once, go to step 5.

b When the parameter is set to Per Second, configure the following parameters:

- Run Every Second
- Run Every Seconds

c When the parameter is set to Per Minute, configure the following parameters:

- Run Every Minute
- Run Every Minutes

d When the parameter is set to Per Hour, configure the following parameters:

- Run Every Hour
- Run Every Hours

e When the parameter is set to Per Day, configure the following parameters:

- Run Every Day
- Run Every Days
- Run Every

f When the parameter is set to Per Week, configure the following parameters:

- Run Every Week
- Run Every Weeks
- Run Every

The Run Every parameter is not configurable when the Ongoing parameter is enabled.

g When the parameter is set to Per Month, configure the following parameters:

- Run Every Month
- Run Every Months
- Run Every

The Run Every parameter is not configurable when the Ongoing parameter is enabled.

5 Click on the OK button to save the changes. The SAM Schedule (Create) form closes and the Schedule form reappears.

6 Close the Schedule form.

Procedure 7-2 To associate a task with a 5620 SAM schedule

1 Perform one of the following.

a Assign a SAM schedule to a task.

i Open the properties form for a task that supports SAM schedules, such as an STM test suite.

ii Click on the Schedule button. The *task_name* (Edit) form opens, go to step 2.

b View scheduled tasks associated with a SAM schedule.

i Choose Tools→Schedules→Schedule from the 5620 SAM main menu. The Schedule form opens.

ii Choose SAM Schedule (Schedule) from the object drop-down list.

iii Configure the filter criteria. Click on the Search button. A list of SAM schedules is displayed.

iv Select a SAM schedule in the list and click on the Properties button. The SAM Schedule (Edit) form opens.

v Click on the Tasks tab button. A list of scheduled tasks appears.

vi Choose a task from the list. Click on the Properties button to view the scheduled tasks.

2 Configure the parameters:

- Scheduled Task Name
- Scheduled Task Description
- Administrative State

Note — When you set the Administrative State parameter to Enabled, the scheduled task goes into effect, according to the schedule parameters. Ensure that the task is appropriately configured before you set the parameter to Enabled.

3 Click on the Select button to choose a schedule. The Select Schedule - STM Scheduled Task *task_name* form opens with a list of schedules.

Note — The form lists only the schedules that are associated with the current 5620 SAM user.

4 Select a schedule in the list and click on the OK button. The Select Schedule - STM Scheduled Task *task_name* form closes and the scheduled task is displayed on the STM Scheduled Task (Create) form.

5 Click on the OK button. The STM Scheduled Task (Create) form closes.

6 Close the SAM Schedule (Edit) or task properties form.

7 Close the Schedule form if the form is open.

Procedure 7-3 To modify a scheduled task

Note — You can modify a SAM scheduled task only when you are logged in as the user who is assigned to the SAM scheduled task. To assign a different user account to the SAM scheduled task, perform Procedure 7-4.

1 Choose Tools→Schedules→Scheduled Task from the 5620 SAM main menu. The Scheduled Task form opens.

2 Choose SAM Scheduled Task from the object drop-down list.

3 Configure the filter criteria. A list of scheduled tasks is displayed.

4 Select a scheduled task in the list and click on the Properties button. The scheduled task (Edit) form opens.

5 Modify the parameters, as required.

6 Click on the OK button. The SAM Scheduled Task (Edit) form closes and the Scheduled Task form reappears.

7 Close the Scheduled Task form.

Procedure 7-4 To assign a different user account to a SAM scheduled task

Perform this procedure to associate a SAM scheduled task with a different user account. By default, the 5620 SAM associates a scheduled task with the user account that is active when the SAM scheduled task is created.

Note — The 5620 SAM does not execute a SAM scheduled task unless the scheduled task is associated with an existing 5620 SAM user account. If you delete the user account that is associated with a SAM scheduled task, you must assign a different user account to the SAM scheduled task. Only a 5620 SAM user with an assigned administrator scope of command role can assign a user account to a SAM scheduled task.

1. Choose Tools→Schedules→Scheduled Task from the 5620 SAM main menu. The Scheduled Task list form opens.
2. Choose SAM Scheduled Task (schedule) from the object drop-down list.
3. Configure the filter criteria. A list of SAM scheduled tasks is displayed.
4. Select a scheduled task and click on the Reassign User button. A dialog box informs you that the new user must have the appropriate access permissions to manage the scheduled task. See "5620 SAM user security tasks" in the *5620 SAM System Administrator Guide* for information about scope of command roles and access permissions.
5. Set the Change Current User To parameter.
6. Click on the OK button.

Procedure 7-5 To turn up or shut down a scheduled task

1. Choose Tools→Schedules→Scheduled Task from the 5620 SAM main menu. The Scheduled Task form opens.
2. Choose SAM Scheduled Task (Schedule) from the object drop-down list.
3. Configure the filter criteria. A list of scheduled tasks is displayed.
4. Select an entry in the list and click on the Task Action button.
5. Choose one of the following from the menu that appears:
   a. Turn Up—enable the scheduled task. The administrative state changes to enabled.
   b. Shut Down—disable the scheduled task. The administrative state changes to disabled.
6. Close the Scheduled Task form.

Procedure 7-6 To view the current status of a SAM scheduled task

1 Choose Tools→Schedules→Scheduled Task from the 5620 SAM main menu. The Scheduled Task form opens.

2 Choose SAM Scheduled Task from the object drop-down list.

3 Configure the filter criteria. A list of SAM scheduled tasks is displayed.

4 Select a SAM scheduled task in the list.

5 Click on the Task Action button and choose View Result from the menu that appears.

6 View the Execution Status indicator. The value is one of the following:

- None
- In Progress
- Skip Requested
- Skipped
- Stop Requested
- Stopped
- Succeeded
- Failed
- Delay Requested
- Delayed
- Started

7 View the Status indicator. The value is one of the following:

- Running—The scheduled task is running.
- Not Running—The scheduled task is not running.
- Completed—The scheduled task execution completed successfully.

8 Close the Scheduled Task form.

Procedure 7-7 To execute a SAM scheduled task

1 Turn up the SAM scheduled task, as described in Procedure 7-5.

2 Choose Tools→Schedules→Scheduled Task from the 5620 SAM main menu. The Scheduled Task form opens.

3 Choose SAM Scheduled Task from the object drop-down list.

4 Configure the filter criteria. A list of SAM scheduled tasks is displayed.

5 Select an entry and click on the Task Action button.

6 Choose Execute from the menu that appears. The 5620 SAM executes the SAM scheduled task.

7 Close the Scheduled Task form.

8 Perform Procedure 7-6 to view the SAM scheduled task execution status, if required.

Procedure 7-8 To reset a scheduled task

1 Choose Tools→Schedules→Scheduled Task from the 5620 SAM main menu. The Scheduled Task form opens.

2 Choose SAM Scheduled Task from the object drop-down list.

3 Configure the filter criteria to list tasks that the administrative state is enabled, and click on the Search button. A list of scheduled tasks is displayed.

4 Select a scheduled task in the list.

5 Click on the Task Action button and choose Shut Down from the menu that appears. The Turn Up button is enabled.

6 Click on the Task Action button and choose Turn Up from the menu that appears. The Shut Down button is enabled.

7 Close the Scheduled Task form.

Procedure 7-9 To delete a scheduled task

Note — You can delete a SAM scheduled task only when you are logged in as the user who is assigned to the SAM scheduled task. To assign a different user account to the SAM scheduled task, perform Procedure 7-4.

1 Choose Tools→Schedules→Scheduled Task from the 5620 SAM main menu. The Scheduled Task form opens.

2 Choose SAM Scheduled Task from the object drop-down list.

3 Configure the filter criteria. A list of scheduled tasks is displayed.

4 Select a scheduled task in the list.

5 Click on the Task Action button and choose Shut Down from the menu that appears. The Delete button is enabled.

6 Click on the Delete button. A dialog box appears.

7 Click on the Yes button. The 5620 SAM deletes the scheduled task.

8 Close the Scheduled Task form.

Procedure 7-10 To delete a schedule

Note 1 — You cannot remove a schedule that is associated with a scheduled task; you must first delete the scheduled task.

Note 2 — You can delete a SAM scheduled task only when you are logged in as the user who is assigned to the SAM scheduled task. To assign a different user account to the SAM scheduled task, perform Procedure 7-4.

1 Perform Procedure 7-9 to delete the scheduled tasks associated with the schedule.

2 Choose Tools→Schedules→Schedule from the 5620 SAM main menu. The Schedule form opens.

3 Choose SAM Scheduled from the object drop-down list.

4 Configure the filter criteria. A list of schedules is displayed.

5 Select a schedule in the list and click on the Delete button. A dialog box appears.

6 Click on the Yes button. The 5620 SAM deletes the schedule.

7 Close the Schedule form.

Device management

8 — Device support

8.12 Workflow to manage 7710 SR devices *8-25*

8.13 7750 MG support *8-28*

8.14 7750 SR support *8-28*

8.15 Workflow to manage 7750 SR devices *8-29*

8.16 7950 XRS support ***8-32***

8.17 Workflow to manage 7950 XRS devices ***8-34***

8.18 9471 WMM support ***8-37***

8.19 9500 MPR and 9500 MPRe support ***8-37***

8.20 eNodeB support ***8-38***

8.21 OmniSwitch support ***8-38***

8.22 Workflow to manage OmniSwitch devices ***8-43***

8.23 GNE support ***8-46***

8.24 Workflow to manage GNEs ***8-49***

8.1 Device support overview

The 5620 SAM can manage the following Alcatel-Lucent devices:

- 1830 PSS-1
- 1830 PSS-4
- 1830 PSS-16
- 1830 PSS-32
- 1830 PSS-32s
- 5780 DSC
- 7210 SAS-D 6F 4T
- 7210 SAS-D 6F 4T ETR
- 7210 SAS-E
- 7210 SAS-M 24F
- 7210 SAS-M 24F 2XFP
- 7210 SAS-M 24F 2XFP ETR
- 7210 SAS-T
- 7210 SAS-T ETR
- 7210 SAS-X 24F 2XFP
- 7450 ESS
- 7705 SAR
- 7710 SR
- 7750 MG
- 7750 SR
- 7750 SR-c4
- 7750 SR-c12
- 7750 SR-12E
- 7950 XRS-20
- 7950 XRS-16c
- 9471 WMM
- 9500 MPR
- 9500 MPRe
- eNodeB
- OS 6250M
- OS 6250SME
- OS 6400
- OS 6450
- OS 6850
- OS 6855
- OS 6900
- OS 9600
- OS 9700
- OS 9700E
- OS 9800
- OS 9800E
- OS 10K

The 5620 SAM also provides limited management support for generic NEs, which are typically non-Alcatel-Lucent devices using SNMP.

For core-network devices such as the 7450 ESS, 7710 SR, and 7750 SR, the 5620 SAM supports the current software release and the three immediately previous major releases. For example, a 5620 SAM, Release 11.0 system can manage a 7750 SR, Release 11.0, 10.0, 9.0, or 8.0. Older device releases are not supported.

For devices other than core-network devices, the 5620 SAM release support varies. See the *5620 SAM Network Element Compatibility Guide* for specific device support information.

Caution — When a device introduces a maintenance release, you must ensure that your 5620 SAM software supports the new device release before you upgrade the device to the new release. You may need to upgrade the 5620 SAM to support the new device release. See the *5620 SAM Network Element Compatibility Guide* for more information.

The 5620 SAM GUI displays a device feature or function only if the device supports the feature or function. The 5620 SAM user documentation describes the major variations in support, including device-specific procedures for specific implementations, but does not describe the following minor GUI variations for different devices:

- partial support for the parameter list on a form
- partial support for the buttons and tabs on a form

The following documents describe 5620 SAM support for specific device releases:

- *5620 SAM Network Element Compatibility Guide*—lists the device releases and functions that the 5620 SAM supports
- *5620 SAM Parameter Guide*—lists and describes the supported parameters; includes device-specific variations in parameter defaults and ranges

See the device user documentation for information about device functions, parameters, and CLI commands that are outside the scope of the 5620 SAM documentation. Contact Alcatel-Lucent technical support for specific network or facility considerations.

Note 1 — You can use an OSS client to configure many of the functions available on the 5620 SAM GUI. See "Communication with the 5620 SAM server" in the *5620 SAM XML OSS Interface Developer Guide* for information about using an OSS client.

Note 2 — You can use 5620 SAM scripts and templates to configure managed devices. See "Script and template management" in the *5620 SAM Scripts and Templates Developer Guide* for more information.

Device-specific workflows

The *5620 SAM User Guide* describes the management of many devices; however 5620 SAM management of some devices, for example, optical and LTE devices, is described in other guides. Each device-specific section in this chapter contains one of the following:

- if the information is contained in the *5620 SAM User Guide*, a workflow in this chapter describes the high-level steps that are required to manage the device, including how to:
  - commission and discover the device
  - configure and manage device objects
  - configure and manage the policies and services associated with the device
- a reference to the guide that describes 5620 SAM management of the device

8.2 Workflow to prepare 5620 SAM to manage devices

The following workflow describes the high-level steps that are required to prepare the 5620 SAM to perform network management. This workflow is common to all 5620 SAM-managed devices.

This workflow and the device-specific workflows in this chapter assume that you have performed the following prerequisite tasks:

- installed the 5620 SAM software, as described in the *5620 SAM | 5650 CPAM Installation and Upgrade Guide*
- installed the physical device as per the appropriate device-specific hardware user documentation
- integrated the 5620 SAM with other Alcatel-Lucent products, such as the 5650 CPAM or another third-party product, if required. See the *5620 SAM Integration Guide* for information.

1 Review the 5620 SAM GUI functionality in order to view, configure, and manage the device.

a Perform basic GUI operations to allow you to perform device, network, policy, and service management functions, create custom workspaces, customize user preferences, and perform GUI search functions; see chapter 3.

b Manage equipment using the equipment navigation tree; see chapter 5.

c Manage equipment using topology maps; see chapter 6.

d Perform 5620 SAM scheduling functions as required, to allow the automatic execution of tasks at designated times; see chapter 7.

2 Perform all required 5620 SAM and UNIX security management tasks for accessing and securing the managed device. See “NE user and device security” in the *5620 SAM System Administrator Guide* for more information.

i Implement the user security measures required to protect all 5620 SAM data, software, and hardware, and monitor the system and network for any security threats.

ii Set up all required 5620 SAM user accounts and user groups with the required scope of command roles, span of control permissions, and the ongoing monitoring and management of those accounts. As required, review the 5620 SAM permissions, access levels, and descriptions of all pre-defined scope of command roles and profiles.

3 Perform advanced configuration tasks on the 5620 SAM as required, to meet your specific operational requirements for managing the device. See “5620 SAM Advanced configuration tasks” in the *5620 SAM System Administrator Guide* for information.

a Configure, maintain, and administer the 5620 SAM operational environment including software and license components, system components, network functions, and system preferences.

b Perform the required tasks to maintain 5620 SAM system redundancy, and as required, monitor or perform any maintenance activity switching or switchovers.

c Use the 5620 SAM database manager to view, configure, and monitor the 5620 SAM database, which contains the managed device configurations.

4 Review the 5620 SAM support for the device; see this chapter and the *5620 SAM Network Element Compatibility Guide*.

5 Proceed to the device-specific workflows in this chapter to determine which functions can be performed on the device, and then configure the functions.

8.3 1830 PSS support

The 1830 Photonic Service Switch product family provides CWDM, DWDM, and OTN capabilities. Photonic networking increases flexibility and operational automation. The 5620 SAM supports the following 1830 PSS devices:

- 1830 PSS-1 - edge aggregation device; the supported variants are the following:
  - 1830 PSS-1 AHP amplifier
  - 1830 PSS-1 GBE edge devices
  - 1830 PSS-1 MD4H edge device
- 1830 PSS-4 - edge device
- 1830 PSS-16 - end office device
- 1830 PSS-32 - central office device
- 1830 PSS-32s - client-line device

The following documents describe 5620 SAM management and configuration of the 1830 PSS:

- *5620 SAM User Guide*—Describes management of optical devices which does not differ from other network elements
- *5620 SAM Optical User Guide*—Describes 1830 PSS discovery, configuration, and management using the 5620 SAM
- *5620 SAM Optical Parameter Reference*—Provides a list of all optical device parameters that the 5620 SAM supports

8.4 5780 DSC support

The 5620 SAM allows you to view the properties for the equipment, instance, Diameter proxy agent, and policy charging rules for the 5780 DSC. The 5780 DSC is represented in the 5620 SAM equipment navigation tree. The instance, Diameter proxy agent, and policy charging rule properties are viewable using the Manage→Mobile Core→DSC Instances 5620 SAM main menu option.

The *5620 SAM LTE EPC User Guide* describes 5780 DSC discovery and management using the 5620 SAM.

8.5 7210 SAS support

This section describes the 5620 SAM support for Alcatel-Lucent 7210 SAS devices.

7210 SAS-D support

The 7210 SAS-D is an intelligent Ethernet edge-demarcation device that extends enhanced Carrier Ethernet VPN service delivery to the CE. The license for a 7210 SAS-D is based on the chassis type. The 5620 SAM supports the following chassis types:

- 7210 SAS-D 6F 4T
- 7210 SAS-D 6F 4T ETR

Note — The 5620 SAM supports only access mode for 7210 SAS-D 6F 4T ETR ports.

7210 SAS-E support

The 7210 SAS-E is a Carrier Ethernet CE device that is typically owned and managed by a customer. Using software based on the 7750 SR OS and managed by the 5620 SAM, the 7210 SAS-E extends Carrier Ethernet VPN services to the CE. The 7210 SAS-E can also be deployed as an aggregation device for smaller sites.

7210 SAS-E daughter cards

The 7210 SAS-E supports an integrated 2 × 12-Gig IOM card on a single chassis. The equipment navigation tree displays a card slot with one daughter card that contains 12 × 100/1000 Ethernet SFP ports and 12 × 10/100/1000 Ethernet ports.

7210 SAS-M and 7210 SAS-X support

The 7210 SAS-M is a CE device that provides MPLS-enabled metropolitan and WAN Carrier Ethernet service delivery, Ethernet-based mobile backhaul, and residential service access.

The 7210 SAS-X is an MPLS-enabled Ethernet aggregation device for small and medium-sized networks that provides business, mobile backhaul, and residential services. It is similar to the 7210 SAS-M, but has 10Gb/s uplink ports, enhanced traffic management, greater scalability, and hierarchical QoS functions.

The 5620 SAM supports the following 7210 SAS-M and 7210 SAS-X chassis types:

- 7210 SAS-M 24F
- 7210 SAS-M 24F 2XFP
- 7210 SAS-M 24F 2XFP ETR
- 7210 SAS-X 24F 2XFP

Note — If you use the CLI or BOF to change the mode of a 7210 SAS-M from Access Uplink to Network, or from Network to Access Uplink, you must unmanage and remanage the device. The mode is shown on the Uplink Mode tab of the shelf properties form.

7210 SAS-T support

The 7210 SAS-T is an Ethernet access device that provides demarcation for services managed to the customer edge and Ethernet aggregation in smaller network locations. The 7210 SAS-T is equipped with the following ports:

- 12 × 10/100/1000 Ethernet SFP
- 10 × 10/100/1000Base-TX copper
- 4 × 10GigE XFP

Ports can be configured in access or uplink mode.

The 5620 SAM supports the following chassis variants:

- 7210 SAS-T 12F 10T 4XFP
- 7210 SAS-T 12F 10T 4XFP ETR

The 7210 SAS-T ETR supports Power over Ethernet (PoE) connections on ports 19, 20, 21, and 22. See Procedure 16-18 for more information.

System resource profile

The 5620 SAM supports system resource allocation on 7210 SAS devices using the system resource profile. You can configure system resources to suit your network requirements by assigning more resources to functions that are used extensively, and fewer resources to functions that are used less. Unused functions can be disabled, and their resources made available for other functions. Not all functional areas are configurable for all devices. System resource profile functional areas and applicable devices are listed in Table 8-1.

Table 8-1 System resource profile

Function	Applicable NE chassis
G8032 fast flood	7210 SAS-M, Release 4.0 R6 or later, in network mode only
SAP ingress internal ACL	7210 SAS-D, Release 5.0 R1 or later 7210 SAS-M and 7210 SAS-X, Release 4.0 R6 or later 7210 SAS-T, Release 6.0 R2 or later
SAP egress internal ACL	7210 SAS-D, 7210 SAS-M and 7210 SAS-X, Release 5.0 R1 or later 7210 SAS-T, Release 6.0 R2 or later
SAP ingress QoS	7210 SAS-D, 7210 SAS-E, 7210 SAS-M, and 7210 SAS-X, Release 5.0 R1 or later 7210 SAS-T, Release 6.0 R2 or later
Queues	7210 SAS-X, Release 5.0 R4 or later
Router	7210 SAS-M (in network mode), Release 6.0 R1 or later 7210 SAS-X, Release 6.0 R1 or later
Ethernet CFM	7210 SAS-D, Release 5.0 R1 or later 7210 SAS-M, Release 4.0 R6 or later 7210 SAS-T, Release 6.0 R2 or later

Note — Configuration changes for G8032 fast flood, Queues, and Router are boot-time enabled, and take effect during the next NE reboot. Changes to all other functions are run-time enabled and take effect immediately, if sufficient resources are available.

System resources are allocated in units called chunks. The number of chunks and the chunk size vary by device chassis. Table 8-2 lists the chunk size for each chassis type.

Table 8-2 System Resources

NE chassis	Chunk size (# of entries)	Total available chunks
7210 SAS-D	512	See the device scaling guide or your Alcatel-Lucent technical support representative for more information.
7210 SAS-E	256	
7210 SAS-M	512	
7210 SAS-T	512	
7210 SAS-X	512	

Resources are allocated by assigning a value from the applicable range. A value of 0 disables the function. The sum of resources allocated must not exceed the total available resources for the system. If you assign more than the allocated number of chunks, functions are disabled.

For ACL and QoS functions, configuring system resources is accomplished in two steps. First, divide overall system resources among the main functional areas: SAP ingress internal ACL, SAP egress internal ACL, and SAP ingress QoS. Second, allocate the resources specified for each functional area to the criteria within that function, such as MAC, IPv4, and 64 or 128-bit IPv4/v6. The total number of chunks assigned to the criteria must not exceed the number of chunks allocated to the function. When you specify a value of MAX, the system allocates resources as required on a first come, first served basis, up to the available limit.

See Procedure 13-20 and the 7210 SAS documentation for more information about system resource allocation.

8.6 Workflow to manage 7210 SAS devices

The following workflow describes the sequence of high-level tasks required to commission, configure, and manage 7210 SAS NEs and services. This workflow assumes that the physical devices have been installed.The management functions are supplemental to the general management functions described in section 8.2.

1. Determine configuration requirements for the installed device; see this chapter, the *5620 SAM Network Element Compatibility Guide*, and the *5620 SAM Parameter Guide* for device specific information.
2. Commission the device for 5620 SAM management; see chapter 9 for more information. Configure polling policies as described in Procedure 9-5.
3. Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions; see chapter 10 for more information.
4. As required, manage and configure equipment; see chapter 12 for more information about equipment management and configuration. Additionally, configure the following:
   - **a** split horizon groups as described in Procedure 16-16
   - **b** LAGs as described in Procedures 14-10 and 14-11
   - **c** frame-based accounting as described in Procedure 13-19
   - **d** system resource profile as described in Procedure 13-20
   - **e** dry contact sensors as described in Procedure 15-3
   - **f** channelized TDM ports as described in Procedure 16-14
5. Create security policies and management access filters for NEs, and create NE user accounts that provide secure NE access using RADIUS or TACACS+ authentication. See “NE user and device security” in the *5620 SAM System Administrator Guide* for more information.
6. If required, perform NE maintenance functions such as backing up and restoring device configurations, upgrading device software, and monitoring deployment of configuration changes to devices. See “NE maintenance” in the *5620 SAM System Administrator Guide* for more information.

7 Create equipment inventories of managed devices; see chapter 17 for more information.

8 As required, perform additional device management functions such as the following:

- **a** TCP enhanced authentication between NEs. See “TCP enhanced authentication” in the *5620 SAM System Administrator Guide* for more information
- **b** threshold-crossing alarms; see chapter 19 for more information
- **c** bulk configuration changes; see chapter 20 for more information
- **d** automatic provisioning; see chapter 21 for more information

9 Configure NE routing and forwarding; see chapter 22 for general routing and forwarding information. As required, configure specific routing and forwarding functions such as the following:

- **a** NE protocols; see chapter 23 for more information.
- **b** MPLS and LSPs; see chapter 25 for more information.
- **c** service tunnels to carry service traffic; see chapter 27 for more information.
- **d** Lawful Intercept; see chapter 28 for more information
- **e** IPsec; see chapter 29 for more information
- **f** 5620 SAM alarm policies; see chapter 31 for more information
- **g** OAM diagnostic tests; see chapter 32 for more information

10 As required, configure redundancy in the managed network using functions such as the following:

- **a** VRRP; see chapter 33 for more information
- **b** APS; see chapter 34 for more information
- **c** MC peer groups; see chapter 36 for more information
- **d** MC endpoint groups; see chapter 38 for more information
- **e** MC LAG groups; see chapter 39 for more information
- **f** MC synchronization groups; see chapter 40 for more information
- **g** MC ring groups; see chapter 41 for more information

11 Create 5620 SAM policies that define the conditions for 5620 SAM management functions; see chapter 42 for general information about 5620 SAM policy management. As required, configure specific policy types such as the following:

- **a** QoS policies; see chapter 43 and Procedures 43-2, 43-4, 43-5, 43-7, 43-9, 43-11, 43-13, 43-19, and 43-27 for more information
- **b** multicast policies; see chapter 45 for more information

c time of day policies; see chapter 46 for more information

d VRRP policies; see chapter 47 for more information

e auto tunnels policies; see chapter 48 for more information

f 802.1x policies; see chapter 50 for more information

g PBB MRP policies; see chapter 51 for more information

h connection profile policies; see chapter 53 for more information

i service PW template policies; see chapter 73 for more information

j residential subscriber policies; see chapter 54 for more information

k remote network monitoring policies; see chapter 55 for more information

l constraint policies; see chapter 56 for more information

m NAT policies; see chapter 57 for more information

n format and range policies; see chapter 58 for more information

12 Configure services and related functions; see chapters 61 and 62 for general service information. As required, configure specific services and related functions such as the following:

a virtual ports; see chapter 63 for more information

b customers; see chapter 64 for more information

c residential subscribers of customer services; see chapter 65 for more information

d VLL Epipe services as described in Procedure 67-1

e VLL Cpipe services to provide point-to-point connectivity between customer access ports; see chapter 67 for more information

f VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain as described in Procedure 68-7. See chapter 68 for more information.

g mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 69 for more information

h IES to provide an IP interface between customer traffic and the Internet; see chapter 70 for more information

i composite services to connect various types of services; see chapter 74 for more information

j 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions such as running OAM diagnostics; see chapter 7 for more information

k OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 77 for more information

l Ethernet Connectivity Fault Management; see chapter 78 for more information

m RCA audit; see chapter 80 for more information

8.7 7450 ESS support

The Alcatel-Lucent 7450 Ethernet Service Switch supports service-aware Ethernet aggregation across IP/MPLS-based networks, providing VPLS, VLL and advanced IP services. The 7450 ESS supports a wide range of interfaces.

A Network Domain feature allows users to determine which network ports are eligible to transport traffic of individual SDPs. This information is used for the SAP-ingress queue allocation algorithm applied to VPLS SAPs. See chapter 22 for more information.

The 5620 SAM provides network management functions for the 7450 ESS.

The 7450 ESS OAM toolkit includes ITU-TY.1731 with Synthetic Loss Measurement (SLM), IEEE 802.1ag, IEEE 802.3ah, Ethernet local management interface (E-LMI), VPLS OAM and service mirroring. This toolkit is also integrated into the 5620 SAM.

8.8 Workflow to manage 7450 ESS devices

The following workflow describes the sequence of high-level tasks required to commission, configure, and manage 7450 ESS NEs and services. This workflow assumes that the physical devices have been installed. The management functions are supplemental to the general management functions described in section 8.2.

1 Determine configuration requirements for the installed device; see this chapter, the *5620 SAM Network Element Compatibility Guide*, and the *5620 SAM Parameter Guide* for device specific information.

2 Commission the device for 5620 SAM management; see chapter 9 for more information. Configure polling policies as described in Procedure 9-4.

3 Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions; see chapter 10 for more information.

4 As required, manage and configure equipment; see chapter 12 for more information about equipment management and configuration. Additionally, configure the following:

a mixed mode as described in Procedure 15-6

b IEEE 1588 PTP clock as described in Procedures 15-14 and 15-15

5 Create security policies and management access filters for NEs, and create NE user accounts that provide secure NE access using RADIUS or TACACS+ authentication. See “NE user and device security” in the *5620 SAM System Administrator Guide* for more information.

6 If required, perform NE maintenance functions such as backing up and restoring device configurations, upgrading device software, and monitoring deployment of configuration changes to devices. See “NE maintenance” in the *5620 SAM System Administrator Guide* for more information.

7 Create equipment inventories of managed devices; see chapter 17 for more information.

8 As required, perform additional device management functions such as the following:

- **a** TCP enhanced authentication between NEs. See “TCP enhanced authentication” in the *5620 SAM System Administrator Guide* for more information
- **b** card migration; see chapter 18 for more information
- **c** threshold-crossing alarms; see chapter 19 for more information
- **d** bulk configuration changes; see chapter 20 for more information
- **e** automatic provisioning; see chapter 21 for more information

9 Configure NE routing and forwarding; see chapter 22 for general routing and forwarding information. As required, configure specific routing and forwarding functions such as the following:

- **a** NE protocols; see chapter 23 for more information
- **b** MPLS and LSPs; see chapter 25 for more information
- **c** service tunnels to carry service traffic; see chapter 27 for more information
- **d** Lawful Intercept; see chapter 28 for more information
- **e** IPsec; see chapter 29 for more information
- **f** ISA-Video; see chapter 30 for more information
- **g** 5620 SAM alarm policies; see chapter 31 for more information
- **h** OAM diagnostic tests; see chapter 32 for more information

10 As required, configure redundancy in the managed network using functions such as the following:

- **a** VRRP; see chapter 33 for more information
- **b** APS; see chapter 34 for more information
- **c** MC peer groups; see chapter 36 for more information
- **d** MC endpoint groups; see chapter 38 for more information
- **e** MC LAG groups; see chapter 39 for more information
- **f** MC synchronization groups; see chapter 40 for more information
- **g** MC ring groups; see chapter 41 for more information

11 Create 5620 SAM policies that define the conditions for 5620 SAM management functions; see chapter 42 for general information about 5620 SAM policy management. As required, configure specific policy types such as the following:

- **a** QoS policies; see chapter 43 for more information
- **b** filter policies; see chapter 44 for more information
- **c** multicast policies; see chapter 45 for more information
- **d** time of day policies; see chapter 46 for more information
- **e** VRRP policies; see chapter 47 for more information
- **f** auto tunnels policies; see chapter 48 for more information
- **g** RADIUS-based accounting policies; see chapter 49 for more information
- **h** 802.1x policies; see chapter 50 for more information
- **i** PBB MRP policies; see chapter 51 for more information
- **j** connection profile policies; see chapter 53 for more information
- **k** service PW template policies; see chapter 73 for more information
- **l** residential subscriber policies; see chapter 54 for more information
- **m** remote network monitoring policies; see chapter 55 for more information
- **n** constraint policies; see chapter 56 for more information
- **o** NAT policies; see chapter 57 for more information
- **p** format and range policies; see chapter 58 for more information

12 Configure services and related functions; see chapters 61 and 62 for general service information. As required, configure specific services and related functions such as the following:

- **a** virtual ports; see chapter 63 for more information
- **b** customers; see chapter 64 for more information
- **c** residential subscribers of customer services; see chapter 65 for more information
- **d** VLL Apipe, Cpipe, Epipe, Fpipe, and Ipipe services to provide point-to-point connectivity between customer access ports; see chapter 67 for more information
- **e** VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 68 for more information
- **f** mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 69 for more information
- **g** IES to provide an IP interface between customer traffic and the Internet; see chapter 70 for more information

h VPRN services to provides a virtual IP network that connects multiple customer sites; see chapter 71 for more information

i composite services to connect various types of services; see chapter 74 for more information

j Application Assurance to provide deep-packet inspection and application-based subscriber traffic management; see chapter 76 for more information

k 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions such as running OAM diagnostics; see chapter 7 for more information

l OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 77 for more information

m Ethernet Connectivity Fault Management; see chapter 78 for more information

n RCA audit; see chapter 80 for more information

8.9 7705 SAR support

The 7705 SAR is an IP/MPLS aggregation and mobile backhaul router for the mobile RAN. Located at cell sites, the 7705 SAR uses PW over MPLS to aggregate mobile 2G and 3G traffic that it backhauls to the core network. The 7705 SAR supports ATM, TDM, and Ethernet.

7705 SAR MWA support

A packet microwave card is required to support MWA. The first four ports of the card are microwave aware. An MW link must be configured to enable MWA. MW link support includes 1+0 and 1+1 HSB protection. When configuring 1+1 HSB, each of the two radios is assigned a role of main radio or spare radio. By default, the main radio assumes the active status and the spare radio assumes the standby status. For 1+0 protection, MPT-HC, MPT-HCv2 and MPT-MC are supported. For 1+1 HSB protection, MPT-HC and MPT-HCv2 are supported.

1+1 HSB protection is displayed in the 5620 SAM physical topology map. The protection state is shown on the links, and 1+1 links are grouped in a common link group. The expansion of radio links on the physical map displays eight links. See section 6.2 for more information about the 5620 SAM physical topology map.

Note 1 — If the 9500 MPRe (version 4.2, standalone) is discovered before the 7705 SAR (single NE with 1+0 protection), the radio link is not shown on the topology map. Only after discovering the 7705 SAR will the radio link be shown on the topology map between the 7705 SAR and the 9500 MPRe.

Note 2 — 1+1 HSB protection is only supported between two 7705 SAR NEs.

The following protection types are supported:

- Radio Protection Switching (RPS)
  RPS is always supported in 1+1 radio configurations (HSB). RPS is implemented directly on a pair of MPTs.
- Transmission Protection Switching (TPS)
  TPS is always supported in 1+1 HSB radio configurations.
- Equipment Protection Switching (EPS)
  EPS protects the MPT and cables connecting the MPT to the IDU. RPS protection always assumes the MPT EPS.

See Procedure 15-11 for more information about configuring an MW link. See Procedure 15-12 for more information about configuring an MW link member.

7705 SAR NEtO support

The 5620 SAM supports an integrated MCT from the port or NE level on the 7705 SAR-8 and 7705 SAR-18. The MCT is distributed with a NEtO client in the 5620 SAM. The configuration of radio parameters is through the MCT. See Procedure 13-24 for more information about starting the MCT from the NE level.

7705 SAR auxiliary alarm daughter cards

The 7705 SAR supports an auxiliary alarm daughter card. This is a unique card that interfaces with real-time systems. The following inputs and outputs are available:

- 24 digital inputs that can connect to dry contacts of security sensors, HVAC systems, and telecom systems
- Two analog inputs for monitoring battery voltage; each supports a range of 0 to 75V and has configurable thresholds for alarms and events on each port
- Eight dry-contact relay outputs that interface to external audible, visual, or telecom equipment using NO or NC contact pins

The inputs and outputs are listed on the Ports tab of the daughter card slot properties form, in the same manner as ports on a data-plane daughter card. Each input or output has configurable parameters. The name specified for each input or output must be unique within the device.

7705 SAR 6-port E&M daughter cards

The 7705 SAR supports a six-port E&M daughter card. The configuration of ports and channels on this daughter card is similar to the 16-port DS1/E1 ASAP daughter card. You create a channel under each port, and a channel group under each channel.

The following configuration restrictions and limitations apply to ports and channels on the six port E&M daughter card:

- A port can have only one channel.
- A channel can have only one channel group.
- A channel group must be in Access mode and use CEM encapsulation.
- A channel group MTU is not configurable.

Only CESoPSN Cpipe SAPs can be created on the daughter card.

7705 SAR 12-port SDI card

The 7705 SAR-8 and 7705 SAR-18 support a 12-port Serial Data Interface card. The SDI card includes four connectors, each of which supports three ports. Each port in a three-port connector must be configured to work on the same interface type. The ports operate in access mode and can be configured to work with the following interfaces:

- RS232
- V.35
- X.21

RS232 interfaces support CEM encapsulation.

V.35 and X.21 interfaces support FR, CEM, HDLC, cHDLC, and IPCP encapsulation.

7705 SAR Power Injector card

The 7705 SAR-8 and 7705 SAR-18 support a Power Injector card to deliver power and data to an MPT radio. Up to four Power Injector cards can be installed on the 7705 SAR-8, and up to eight Power Injector cards can be installed on the 7705 SAR-18.

7705 SAR Optical Add/Drop Mux cards

The 7705 SAR-8 and 7705 SAR-18 support an Optical Add/Drop Mux (OADM) card in 1, 2, 4, and 8-colour variants. These cards increase bandwidth in a fiber network.

7705 SAR CSMv2 card

The 7705 SAR-8 supports a CSMv2 card. All of the 7705 SAR adapter cards are supported with the CSMv2. The 16p ASAPv1 does not support IP interfaces with the CSMv2. The CSMv2 card is similar in function to the CSMv1 card, however, the CSMv2 supports more deep channelized MDAs.

Note — A router cannot have a mix of CSMv1 and CSMv2 cards. To convert a router with CSMv1 hardware to CSMv2 hardware, the appropriate configuration files must be transferred to the new CSMv2.

7705 SAR 2 × 10-Gig Bridged Ethernet XFP + 1 × 2.5G Virtual Ethernet card

The 2 × 10-Gig Bridged Ethernet XFP + 1 × 2.5G Virtual Ethernet card connects to and from access rings carrying a high concentration of traffic. The 7705 SAR-8 supports up to 6 cards and the 7705 SAR-18 supports up to 12 cards. A single card can be installed on the 7705 SAR-8 and 7705 SAR-18.

The 2 × 10-Gig Bridged Ethernet XFP + 1 × 2.5G Virtual Ethernet card is also supported on the 7705 SAR-M ASAP and 7705 SAR-M with fan variants.

A number of 7705 SAR nodes in a ring typically aggregate traffic from customer sites, map the traffic to a service, and connect to an SR node. The SR node acts as a gateway point out of the ring. A 10GigE ring allows higher bandwidth services and aggregation on a per 7705 SAR basis.

In a deployment of a 2 × 10-Gig Bridged Ethernet XFP + 1 × 2.5G Virtual Ethernet card, each 7705 SAR node in the ring is connected to the east and west side of the rings over two different 10GigE ports. If 10GigE is the main uplink, two cards per 7705 SAR-8 are required for redundancy. With two cards per 7705 SAR-8 node, east and west links of the ring can be terminated on two different cards, reducing the impact of potential hardware failure. At initialization, the MAC address of the virtual port is programmed automatically. The card can operate in either LAN or WAN mode.

7705 SAR 6-port FXS Adapter card

The 7705 SAR-8 and 7705 SAR-18 support a 6-port FXS Adapter card that transports a large number of voice circuits from one 7705 SAR location to another 7705 SAR location, connected to a PBX. The card can also be configured for a PLAR application, which is typically used outside of a PBX network.

For a PBX application, the signal is terminated on an FXO interface at a 7705 SAR hub location that is connected to a PBX. The FXO interface can be either on an 8-port FXO Adapter card or 8-port Voice & Tele-protection card that is installed in a 7705 SAR-8 or 7705 SAR-18 chassis at the 7705 SAR-8 hub location. For a PLAR application, the signal is terminated on an FXS interface on either another 6-port FXS Adapter card or an 8-port Voice & Tele-protection card that is installed in a 7705 SAR-8 or 7705 SAR-18 chassis.

The 6-port FXS Adapter card has six FXS ports. Each port provides a short-reach, on-premises analog interface to an analog telephone set.

For standard TDM, the network interface can be a T1/E1 or OC3/STM1 channelized interface. For MPLS, an Ethernet, T1/E1, OC3/STM1 channelized MLPPP, or OC3/STM1 clear channel interface can be used.

The 6-port FXS Adapter card can be configured in access mode only.

7705 SAR 8-port FXO Adapter card

The 7705 SAR-8 and 7705 SAR-18 support an 8-port FXO Adapter card providing multiple FXO analog interfaces for connection to a PBX. The FXO analog interfaces can be connected over the MPLS network via a TDM pseudo wire (Cpipe) to an FXS interface on an 8-port Voice and Teleprotection card. The remote end can also be an FXS interface in a TDM multiplexer connected to the 7705 SAR by a T1/E1 interface. Each FXO interface separates the analog signal into two streams, one stream for voice and another for control signaling.

7705 SAR 10-port 1GigE/1-port 10GigE X-Adapter card

There are two versions of the 10-port 1GigE/1-port 10GigE X-Adapter card. The CLI identifier for version 1 is x-10GigE and for version 2, the CLI identifier is x-10GigE-v2. Both versions are identical except that version 2 is equipped with a hardware-based encryption engine that supports features such as IPsec.

The 10-port 1GigE/1-port 10GigE X-Adapter card can be configured for ten 1-gigabit ports or one 10-gigabit port. When configured for a one 10-gigabit port, the card can operate in either LAN or WAN mode. The card is supported on the 7705 SAR-18.

7705 SAR 8-port GigE SFP card (-48/+24 VDC)

There are three versions of the 8-port Gigabit Ethernet Adapter card. Version 1 and 2 are identical except that version 2 has more memory to support larger tables, such as FIBs and ACLs. Version 2 supports the full IPv6 subnet range for IPv6 static routes and interface IP addresses. Version 3 is identical to version 2 except that it is equipped with a hardware-based encryption engine that supports features such as IPsec. All versions are supported on the 7705 SAR-8 and the 7705 SAR-18.

7705 SAR Packet Microwave card

The 7705 SAR-8 and 7705 SAR-18 support the Packet Microwave card, 4 × MWA Gig Ethernet (2 TX, 2 SFP) + 4 × Gig Ethernet SFP. The 7705 SAR-8 supports up to 6 of these cards and the 7705 SAR-18 supports up to 12 cards. The first four ports of the Packet Microwave card are microwave ports and can be linked to a 9500 MPRe device.

7705 SAR Voice & Tele-Protection MDA

The 7705 SAR-8 and 7705 SAR-18 support the Voice & Tele-Protection MDA. The 7705 SAR-8 supports up to 6 cards and the 7705 SAR-18 supports up to 12 cards. Ports 1 and 2 support C37.94 interfaces, ports 3 and 4 support G.703 Co-directional interfaces, ports 5 and 6 support FXO interfaces, and ports 7 and 8 support FXS interfaces.

7705 SAR-A

The 7705 SAR-A is equipped with integrated twelve-port Ethernet MDA daughter cards. Depending on the variant, the 7705 SAR-A can support the configuration of eight Gig Ethernet, four Fast Ethernet, and eight T1/E1 ports. The two 7705 SAR-A daughter card variants are:

- integrated 12-port Ethernet, 8-port T1/E1, -48 VDC MDA
- integrated 12-port Ethernet, -48 VDC MDA

7705 SAR-F

The 7705 SAR-F integrates eight-port Ethernet v3 and 16-port DS1/E1 v2 ASAP MDA functions in one chassis. When the 5620 SAM discovers a 7705 SAR-F, the integrated MDAs are automatically configured and displayed in the equipment tree.

7705 SAR-H

The 7705 SAR-H is a hardened router and is based on the 7705 SAR-8, 7705 SAR-18, 7705 SAR-F, and 7705 SAR-M functionality. The 7705 SAR-H variants are:

- 7705 SAR-H high voltage shelf (88-264V AC/DC)
- 7705 SAR-H low voltage shelf (–48/–60 and +24 VDC)

The 7705 SAR-H provides firewall functions and applies a firewall to a layer 3 network, management, or CPM interface. The 7705 SAR-H firewall is a stateful firewall that provides the highest level of security. Stateful operation is a key feature in preventing DoS attacks from reaching the TCP/IP stacks of applications. The 7705 SAR-H employs a zone-based virtual firewall design.

The 5620 SAM allows you to configure the MDA mode of some MDA types on the 7705 SAR-H. There are two MDAs:

- Compact MDA, which is integrated in Slot 1 and has 8 Ethernet ports. The ports are configurable in the network or access mode.
  - ports 1 and 2 are gigabit Ethernet ports
  - ports 3 and 4 are combo ports
  - ports 5,6,7,8 are PoE port types
- Combo MDAs, which are modular type and used in Slot 2 and Slot 3, are configurable
  - ports 1 and 2 are serial ports
  - ports 3 and 4 are TDM ports

The 7705 SAR-H supports power supply tray objects which are automatically provisioned.

7705 SAR-M

The 7705 SAR-M variants are equipped with an integrated 7-port Ethernet card. Depending on the variant, a 7705 SAR-M may have an integrated 16-port channelized DS1/E1 ASAP card or a module slot. The 7705 SAR-M variants are:

- fan-cooled chassis with integrated 7-port Ethernet card, integrated 16-port channelized DS1/E1 ASAP card, and module slot
- fan-cooled chassis with integrated 7-port Ethernet card and module slot
- passively cooled chassis with integrated 7-port Ethernet card and integrated 16-port channelized DS1/E1 ASAP card
- passively cooled chassis with integrated 7-port Ethernet card

The following module cards can be inserted in the module slot:

- GPON module
- DSL module
- DCM
- 1 Colour Optical Add/Drop Mux module (OADM)

The DSL module includes a port with eight XDSL lines. The DCM includes one port with four SHDSL lines and one port with two XDSL lines. Except for 802.1x, 802.1ab LLDP, line loopbacks, and LAGs, all services and limitations which apply to Ethernet ports also apply to DCM and DSL modules.

7705 SAR-W

The 7705 SAR-W is equipped with an integrated daughter card that supports five data plane Ethernet ports: three SFP cages and two RJ-45 ports. The Ethernet ports are classified as permanent connections with primary surge protection. Depending on the variant of the card, the two RJ-45 ports will or will not support PoE. When the card is required to support NLOS/LOS microwave radio powered by PoE, the card needs RJ-45 ports with PoE capability. When PoE is not required, a low-cost and low-powered non-PoE card variant is available.

8.10 Workflow to manage 7705 SAR devices

The following workflow describes the sequence of high-level tasks required to commission, configure, and manage 7705 SAR NEs and services. This workflow assumes that the physical devices have been installed. The management functions are supplemental to the general management functions described in section 8.2.

1. Determine configuration requirements for the installed device; see this chapter, the *5620 SAM Network Element Compatibility Guide*, and the *5620 SAM Parameter Guide* for device specific information.
2. Commission the device for 5620 SAM management; see chapter 9 for more information. Configure polling policies as described in Procedure 9-4.
3. Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions; see chapter 10 for more information.
4. As required, manage and configure equipment; see chapter 12 for more information about equipment management and configuration. Additionally, configure the following:
   - **a** TWAMP server as described in Procedure 13-11
   - **b** ICMP extensions as described in Procedure 13-21
   - **c** QoS ingress aggregate rates on the 7705 SAR-M as described in Procedure 13-23
   - **d** Launch an MCT from a 9500 MPR NE connected to a 7705 SAR as described in Procedure 13-24
   - **e** Timing synchronization as described in Procedure 15-7
   - **f** IEEE 1588 PTP clock as described in Procedures 15-8 and 15-9
   - **g** NTP as described in Procedure 15-10
   - **h** Microwave links and mw-link members as described in Procedures 15-11 and 15-12
   - **i** auxiliary alarm definitions as described in Procedure 15-13

j PoE ports as described in Procedures 16-19 and 16-20

k channelized TDM ports as described in Procedure 16-21

5 Create security policies and management access filters for NEs, and create NE user accounts that provide secure NE access using RADIUS or TACACS+ authentication. See "NE user and device security" in the *5620 SAM System Administrator Guide* for more information.

6 If required, perform NE maintenance functions such as backing up and restoring device configurations, upgrading device software, and monitoring deployment of configuration changes to devices. See "NE maintenance" in the *5620 SAM System Administrator Guide* for more information.

7 Create equipment inventories of managed devices; see chapter 17 for more information.

8 As required, perform additional device management functions such as the following:

a TCP enhanced authentication between NEs. See "TCP enhanced authentication" in the *5620 SAM System Administrator Guide* for more information

b threshold-crossing alarms; see chapter 19 for more information

c bulk configuration changes; see chapter 20 for more information

d automatic provisioning; see chapter 21 for more information

9 Configure NE routing and forwarding; see chapter 22 for general routing and forwarding information. As required, configure specific routing and forwarding functions such as the following:

a NE protocols; see chapter 23 for more information

b MPLS and LSPs; see chapter 25 for more information

c service tunnels to carry service traffic; see chapter 27 for more information

d Lawful Intercept; see chapter 28 for more information

e IPsec; see chapter 29 for more information

f 5620 SAM alarm policies; see chapter 31 for more information

g OAM diagnostic tests; see chapter 32 for more information

10 As required, configure redundancy in the managed network using functions such as the following:

a VRRP; see chapter 33 for more information

b APS; see chapter 34 for more information

c MC LAG groups; see chapter 39 for more information

11 Create 5620 SAM policies that define the conditions for 5620 SAM management functions; see chapter 42 for general information about 5620 SAM policy management. As required, configure specific policy types such as the following:

a QoS policies; see chapter 43 for more information. Additionally, configure a fabric profile as described in Procedure 43-26.

b filter policies; see chapter 44

c multicast policies; see chapter 45 for more information

d VRRP policies; see chapter 47 for more information

e auto tunnels policies; see chapter 48 for more information

f 802.1x policies; see chapter 50 for more information

g PBB MRP policies; see chapter 51 for more information

h connection profile policies; see chapter 53 for more information

i service PW template policies; see chapter 73 for more information

j residential subscriber policies; see chapter 54 for more information

k constraint policies; see chapter 56 for more information

l NAT policies; see chapter 57 for more information

m format and range policies; see chapter 58 for more information

n firewall policies; see chapter 60 for more information

12 Configure services and related functions; see chapters 61 and 62 for general service information. As required, configure specific services and related functions such as the following:

a virtual ports; see chapter 63 for more information

b customers; see chapter 64 for more information

c residential subscribers of customer services; see chapter 65 for more information

d VLL Apipe, Cpipe, Epipe, Fpipe, Ipipe, and Hpipe services to provide point-to-point connectivity between customer access ports; see chapter 67 for more information

e VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 68 for more information

f mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 69 for more information

g IES to provide an IP interface between customer traffic and the Internet; see chapter 70 for more information

h composite services to connect various types of services; see chapter 74 for more information

i 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions such as running OAM diagnostics; see chapter 7 for more information

j OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 77 for more information

k Ethernet Connectivity Fault Management; see chapter 78 for more information

l RCA audit; see chapter 80 for more information

8.11 7710 SR support

The Alcatel-Lucent 7710 SR is a modular, multi-service edge router that aggregates subscriber traffic over a variety of interfaces. It is based on the Alcatel-Lucent 7750 SR, and is typically deployed in distributed hub sites and enterprise customer offices to extend IP services to the network edge.

The 7710 SR chassis is optimized for the delivery of data, voice and video services, and supports up to 4 or up to 12 interfaces of various types and speeds.

8.12 Workflow to manage 7710 SR devices

The following workflow describes the sequence of high-level tasks required to commission, configure, and manage 7710 SR NEs and services. This workflow assumes that the physical devices have been installed. The management functions are supplemental to the general management functions described in section 8.2.

1 Determine configuration requirements for the installed device; see this chapter, the *5620 SAM Network Element Compatibility Guide*, and the *5620 SAM Parameter Guide* for device specific information.

2 Commission the device for 5620 SAM management; see chapter 9 for more information. Configure polling policies as described in Procedure 9-4.

3 Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions; see chapter 10 for more information.

4 As required, manage and configure equipment; see chapter 12 for more information about equipment management and configuration. Additionally, configure channelized TDM ports as described in Procedure 16-22.

5 Create security policies and management access filters for NEs, and create NE user accounts that provide secure NE access using RADIUS or TACACS+ authentication. See “NE user and device security” in the *5620 SAM System Administrator Guide* for more information.

6 If required, perform NE maintenance functions such as backing up and restoring device configurations, upgrading device software, and monitoring deployment of configuration changes to devices. See “NE maintenance” in the *5620 SAM System Administrator Guide* for more information.

7 Create equipment inventories of managed devices; see chapter 17 for more information.

8 As required, perform additional device management functions such as the following:

- **a** TCP enhanced authentication between NEs. See “TCP enhanced authentication” in the *5620 SAM System Administrator Guide* for more information
- **b** threshold-crossing alarms; see chapter 19 for more information
- **c** bulk configuration changes; see chapter 20 for more information
- **d** automatic provisioning; see chapter 21 for more information

9 Configure NE routing and forwarding; see chapter 22 for general routing and forwarding information. As required, configure specific routing and forwarding functions such as the following:

- **a** NE protocols; see chapter 23 for more information
- **b** MPLS and LSPs; see chapter 25 for more information
- **c** service tunnels to carry service traffic; see chapter 27 for more information
- **d** Lawful Intercept; see chapter 28 for more information
- **e** IPsec; see chapter 29 for more information
- **f** 5620 SAM alarm policies; see chapter 31 for more information
- **g** OAM diagnostic tests; see chapter 32 for more information

10 As required, configure redundancy in the managed network using functions such as the following:

- **a** VRRP; see chapter 33 for more information
- **b** APS; see chapter 34 for more information
- **c** MC peer groups; see chapter 36 for more information
- **d** MC endpoint groups; see chapter 38 for more information
- **e** MC LAG groups; see chapter 39 for more information
- **f** MC synchronization groups; see chapter 40 for more information
- **g** MC ring groups; see chapter 41 for more information

11 Create 5620 SAM policies that define the conditions for 5620 SAM management functions; see chapter 42 for general information about 5620 SAM policy management. As required, configure specific policy types such as the following:

- **a** QoS policies; see chapter 43 for more information
- **b** filter policies; see chapter 44 for more information
- **c** multicast policies; see chapter 45 for more information

d time of day policies; see chapter 46 for more information

e VRRP policies; see chapter 47 for more information

f auto tunnels policies; see chapter 48 for more information

g RADIUS-based accounting policies; see chapter 49 for more information

h 802.1x policies; see chapter 50 for more information

i PBB MRP policies; see chapter 51 for more information

j connection profile policies; see chapter 53 for more information

k service PW template policies; see chapter 73 for more information

l residential subscriber policies; see chapter 54 for more information

m remote network monitoring policies; see chapter 55 for more information

n constraint policies; see chapter 56 for more information

o NAT policies; see chapter 57 for more information

p format and range policies; see chapter 58 for more information

12 Configure services and related functions; see chapters 61 and 62 for general service information. As required, configure specific services and related functions such as the following:

a virtual ports; see chapter 63 for more information

b customers; see chapter 64 for more information

c residential subscribers of customer services; see chapter 65 for more information

d VLL Apipe, Cpipe, Epipe, Fpipe, and Ipipe services to provide point-to-point connectivity between customer access ports; see chapter 67 for more information

e VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 68 for more information

f mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 69 for more information

g IES to provide an IP interface between customer traffic and the Internet; see chapter 70 for more information

h VPRN services to provides a virtual IP network that connects multiple customer sites; see chapter 71 for more information

i composite services to connect various types of services; see chapter 74 for more information

j 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions such as running OAM diagnostics; see chapter 7 for more information

k OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 77 for more information

l Ethernet Connectivity Fault Management; see chapter 78 for more information

m RCA audit; see chapter 80 for more information

8.13 7750 MG support

The 5620 SAM supports the discovery and management of the 7- or 12-slot Alcatel-Lucent 7750 MG. The 7750 MG can be configured with an SGW instance and a PGW instance in an LTE network.

The following documents describe 5620 SAM management and configuration of the 7750 MG:

- *5620 SAM LTE EPC User Guide*—Describes 7750 MG discovery, configuration, and management using the 5620 SAM
- *5620 SAM LTE Parameter Reference*—Describes 7750 MG device parameters as represented in the 5620 SAM schema, in addition to parameters on LTE and LTE service forms in the 5620 SAM GUI

8.14 7750 SR support

The Alcatel-Lucent 7750 SR is a multi-service edge router designed for service providers, cable MSO, and enterprise customers that deliver residential, business and mobile services through an IP/MPLS network.

The 5620 SAM supports the following 7750 SR chassis types:

- 7750 SR-1
- 7750 SR-7
- 7750 SR-12
- 7750 SR-c4
- 7750 SR-c12
- 7750 SR-12E

7750 SR-c4

The 7750 SR-c4, which supports up to 4 CMAs or 2 MDAs, has a forwarding capacity of 40 Gb/s, native uplink support, and a faster control plane processor than the 7750 SR. The ICM-2 is a preconfigured MDA that you cannot add or delete using the 5620 SAM.

The 7750 SR-c4 supports the following CMAs and MDAs:

- 7750 SR-c4 CFM-C4-XP
- 7750 SR-c4 IOM-C4-XP
- 5-port GIGE XP SFP CMA

- 1-port GIGE XP SFP CMA
- DC PEM

7750 SR-c12

The 7750 SR-c12, which supports up to 12 CMAs or 6 MDAs, has a forwarding capacity of 40 Gb/s, native uplink support, and a faster control plane processor than the 7750 SR.

7750 SR-12E

The 7750 SR-12E, which supports up to 12 CMAs or 6 MDAs, can deliver up to 200Gb/s per slot with full switch fabric redundancy. All features and applications supported by the 7750 SR-12 are supported on the 7750 SR-12E.

8.15 Workflow to manage 7750 SR devices

The following workflow describes the sequence of high-level tasks required to commission, configure, and manage 7750 SR NEs and services. This workflow assumes that the physical devices have been installed. The management functions are supplemental to the general management functions described in section 8.2.

1 Determine configuration requirements for the installed device; see this chapter, the *5620 SAM Network Element Compatibility Guide*, and the *5620 SAM Parameter Guide* for device specific information.

2 Commission the device for 5620 SAM management; see chapter 9 for more information. Configure polling policies as described in Procedure 9-4.

3 Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions. See chapter 10 for more information.

4 As required, manage and configure equipment. See chapter 12 for more information. Additionally, configure the following:

   a mixed mode; see Procedure 15-6 for more information

   b IEEE 1588 PTP clock; see Procedures 15-8 and 15-9 for more information

5 Create security policies and management access filters for NEs, and create NE user accounts that provide secure NE access using RADIUS or TACACS+ authentication. See “NE user and device security” in the *5620 SAM System Administrator Guide* for more information.

6 If required, perform NE maintenance functions, such as the following:

   a backing up and restoring device configurations

   b upgrading device software

   c monitoring deployment of configuration changes to devices

   See “NE maintenance” in the *5620 SAM System Administrator Guide* for more information.

7 Create equipment inventories of managed devices. See chapter 17 for more information.

8 As required, perform additional device management functions, such as the following:

- **a** TCP enhanced authentication between NEs. See “TCP enhanced authentication” in the *5620 SAM System Administrator Guide* for more information
- **b** card migration; see chapter 18 for more information
- **c** threshold-crossing alarms; see chapter 19 for more information
- **d** bulk configuration changes; see chapter 20 for more information
- **e** automatic provisioning; see chapter 21 for more information

9 Configure NE routing and forwarding. See chapter 22 for general routing and forwarding information. As required, configure specific routing and forwarding functions, such as the following:

- **a** NE protocols; see chapter 23 for more information
- **b** MPLS and LSPs; see chapter 25 for more information
- **c** service tunnels to carry service traffic; see chapter 27 for more information
- **d** Lawful Intercept; see chapter 28 for more information
- **e** IPsec; see chapter 29 for more information
- **f** ISA-Video; see chapter 30 for more information
- **g** 5620 SAM alarm policies; see chapter 31 for more information
- **h** OAM diagnostic tests; see chapter 32 for more information

10 As required, configure redundancy in the managed network using functions such as the following:

- **a** VRRP; see chapter 33 for more information
- **b** APS; see chapter 34 for more information
- **c** MC peer groups; see chapter 36 for more information
- **d** MC endpoint groups; see chapter 38 for more information
- **e** MC LAG groups; see chapter 39 for more information
- **f** MC synchronization groups; see chapter 40 for more information
- **g** MC ring groups; see chapter 41 for more information

11 Create 5620 SAM policies that define the conditions for 5620 SAM management functions. See chapter 42 for general information about 5620 SAM policy management. As required, configure specific policy types, such as the following:

- **a** QoS policies; see chapter 43 for more information
- **b** filter policies; see chapter 44 for more information
- **c** multicast policies; see chapter 45 for more information
- **d** time of day policies; see chapter 46 for more information
- **e** VRRP policies; see chapter 47 for more information
- **f** auto tunnels policies; see chapter 48 for more information
- **g** RADIUS-based accounting policies; see chapter 49 for more information
- **h** 802.1x policies; see chapter 50 for more information
- **i** PBB MRP policies; see chapter 51 for more information
- **j** connection profile policies; see chapter 53 for more information
- **k** service PW template policies; see chapter 73 for more information
- **l** residential subscriber policies; see chapter 54 for more information
- **m** remote network monitoring policies; see chapter 55 for more information
- **n** constraint policies; see chapter 56 for more information
- **o** NAT policies; see chapter 57 for more information
- **p** format and range policies; see chapter 58 for more information

12 Configure services and related functions. See chapters 61 and 62 for general service information. As required, configure specific services and related functions, such as the following:

- **a** virtual ports; see chapter 63 for more information
- **b** customers; see chapter 64 for more information
- **c** residential subscribers of customer services; see chapter 65 for more information
- **d** VLL Apipe, Cpipe, Epipe, Fpipe, and Ipipe services to provide point-to-point connectivity between customer access ports; see chapter 67 for more information
- **e** VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 68 for more information
- **f** mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 69 for more information
- **g** IES to provide an IP interface between customer traffic and the Internet; see chapter 70 for more information

h VPRN services to provides a virtual IP network that connects multiple customer sites; see chapter 71 for more information

i composite services to connect various types of services; see chapter 74 for more information

j Application Assurance to provide deep-packet inspection and application-based subscriber traffic management; see chapter 76 for more information

k 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions, such as running OAM diagnostics; see chapter 7 for more information

l OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 77 for more information

m Ethernet Connectivity Fault Management; see chapter 78 for more information

n RCA audit; see chapter 80 for more information

8.16 7950 XRS support

The Alcatel-Lucent 7950 XRS is a large-scale routing system that is designed for core deployments. The 5620 SAM supports the management of the 7950 XRS including device discovery, equipment management, routing management, OAM, MPLS, QoS policies, and services.

Variants

The 5620 SAM supports the 7950 XRS-20 and the 7950 XRS-16c. The core feature set of the two variants is the same, but there are some physical differences that are described below.

7950 XRS-20

The 7950 XRS-20 has 20 XMA daughter card slots, which can be configured with XMA cards or compact XMA cards. The shelf includes two CCMs that support flash memory modules.

7950 XRS-16c

The 7950 XRS-16c is a lower capacity variant of the 7950 XRS. The shelf has 16 XMA daughter card slots, which can be configured only with compact XMA cards. Unlike the 7950 XRS-20, the 7950 XRS-16c shelf does not have a CCM. The flash memory modules are connected to the CPM.

Shelf components

You can monitor and manage the following 7950 XRS shelf components using the 5620 SAM navigation tree:

- CCMs
- XCM card slots; each slot has two XMA daughter card slots
- CPM card slots
- SFM card slots
- fan trays
- PEQ power supply trays

The number of the preceding components depends on the variant of the 7950 XRS.

The shelf components are N+1 redundant. The fan tray and power supply tray objects are automatically discovered and provisioned, and require no configuration using the 5620 SAM. See chapter 13 for more information about configuring shelf objects.

CCMs

The 7950 XRS-20 shelf includes two CCMs that support operator access to the routing system. You can view and monitor CCM and flash memory module properties from the CCM properties form. The CCMs are automatically detected and provisioned.

Each CCM includes three flash memory modules which can be viewed and monitored by the 5620 SAM. The “cf1” module is an internal flash module that is embedded in the system. The “cf2” and “cf3” modules are external compact flash slots.

XCM and XMA cards

The 7950 XRS-20 shelf includes ten XCM card slots that can be configured with XCM X20 cards. The 7950 XRS-16c shelf includes eight XCM card slots that can be configured with XCM X16 cards. Each XCM card can house up to two XMA cards for a total of twenty XMAs per 7950 XRS-20 shelf or sixteen XMAs per 7950 XRS-16c shelf. XMA card slots can also be configured with a compact XMA card, or C-XMA card. The 7950 XRS-16c can be configured only with C-XMA cards. The 5620 SAM supports the management of the following XMA/C-XMA types on the 7950 XRS:

- 20-port 10 GE SFP+ C-XMA
- 2-port 100 GE CFP C-XMA
- 6-port 40 GE QSFP C-XMA
- 40-port 10 GE SFP+ XMA
- 4-port 100 GE CXP XMA

Note — To configure the 40-port 10 GE SFP+ XMA or 4-port 100 GE CXP XMA cards on the 7950 XRS-20, you must configure SFM X20 B cards on the shelf. You cannot configure the XMA cards if the shelf is configured with SFM X20 cards.

CPM cards

The 7950 XRS shelf includes two redundant CPM card slots. Each slot is automatically provisioned with CPM X20 or CPM X16 cards, depending on the variant of the 7950 XRS.

On the 7950 XRS-20, each CPM card slot has an association with a CCM. If one of the components is removed, the appropriate status is applied to the corresponding CPM or CCM. In the 5620 SAM navigation tree, the CPM in Card Slot A is associated with CCM A. The CPM in Card Slot B is associated with CCM B.

On the 7950 XRS-16c, each CPM X16 card includes three flash memory modules, which can be viewed and monitored with the 5620 SAM. There is no associated CCM for the CPM X16.

SFM cards

The 7950 XRS shelf includes eight SFM card slots. SFM card slots on the 7950 XRS-20 can be configured with SFM X20 or SFM X20 B cards. SFM card slots on the 7950 XRS-16c can be configured with SFM X16 or SFM X16 B cards. You cannot configure a mix of SFM card types cards on one shelf. All configured slots must contain the same type of SFM card. Seven SFM cards must be operational to provide full capacity to the XCM cards, and one SFM card is redundant. At least one SFM card must be configured for the system to function.

8.17 Workflow to manage 7950 XRS devices

The following workflow describes the sequence of high-level tasks required to commission, configure, and manage 7950 XRS NEs and services. This workflow assumes that the physical devices have been installed. The management functions are supplemental to the general management functions described in section 8.2.

1. Determine configuration requirements for the installed device; see section 8.16, the *5620 SAM Network Element Compatibility Guide*, and the *5620 SAM Parameter Guide* for device specific information.
2. Commission the device for 5620 SAM management; see chapter 9 for more information.
3. Configure polling policies, as described in Procedure 9-4.
4. Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions. See chapter 10 for more information.
5. If required, configure and manage equipment. See chapter 12 for more information.
6. Create security policies and management access filters for NEs, and create NE user accounts that provide secure NE access using RADIUS or TACACS+ authentication. See ”NE user and device security” in the *5620 SAM System Administrator Guide* for more information.

7 If required, perform any of the following NE maintenance functions:

- **a** Back up and restore the device configurations.
- **b** Upgrade the device software.
- **c** Monitor deployment of configuration changes to devices.

See “NE maintenance” in the *5620 SAM System Administrator Guide* for more information.

8 Create equipment inventories of the managed devices. See chapter 17 for more information.

9 If required, perform any of the following additional device management functions:

- **a** TCP enhanced authentication between NEs. See “TCP enhanced authentication” in the *5620 SAM System Administrator Guide* for more information
- **b** threshold-crossing alarms; see chapter 19 for more information
- **c** bulk configuration changes; see chapter 20 for more information
- **d** automatic provisioning; see chapter 21 for more information

10 If required, configure any of the following NE routing and forwarding functions. See chapter 22 for more information.

- **a** NE protocols; see chapter 23 for more information
- **b** MPLS and LSPs; see chapter 25 for more information
- **c** service tunnels; see chapter 27 for more information
- **d** lawful intercept; see chapter 28 for more information
- **e** alarm policies; see chapter 31 for more information
- **f** OAM diagnostic tests; see chapter 32 for more information

11 As required, configure redundancy in the managed network using functions such as the following:

- **a** VRRP; see chapter 33 for more information
- **b** MC peer groups; see chapter 36 for more information
- **c** MC endpoint groups; see chapter 38 for more information
- **d** MC LAG groups; see chapter 39 for more information
- **e** MC synchronization groups; see chapter 40 for more information
- **f** MC ring groups; see chapter 41 for more information

12 Create 5620 SAM policies that define the conditions for the 5620 SAM management functions. See chapter 42 for general information about 5620 SAM policy management. If required, configure any of the following policy types:

- **a** QoS policies; see chapter 43 for more information
- **b** filter policies; see chapter 44 for more information
- **c** multicast policies; see chapter 45 for more information
- **d** time of day policies; see chapter 46 for more information
- **e** auto tunnel policies; see chapter 48 for more information
- **f** 802.1x policies; see chapter 50 for more information
- **g** PBB MRP policies; see chapter 51 for more information
- **h** service PW template policies; see chapter 73 for more information
- **i** remote network monitoring policies; see chapter 55 for more information
- **j** constraint policies; see chapter 56 for more information
- **k** format and range policies; see chapter 58 for more information

13 If required, configure any of the following services and related functions. See chapters 61 and 62 for general service information.

- **a** customers; see chapter 64 for more information
- **b** VLL Epipe and Ipipe services to provide point-to-point connectivity between customer access ports; see chapter 67 for more information
- **c** VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 68 for more information
- **d** mirror services for troubleshooting customer traffic issues or for use with lawful intercept; see chapter 69 for more information
- **e** IES to provide an IP interface between customer traffic and the Internet; see chapter 70 for more information
- **f** VPRN services to provides a virtual IP network that connects multiple customer sites; see chapter 71 for more information
- **g** composite services to connect various types of services; see chapter 74 for more information
- **h** schedules and scheduled tasks to automate 5620 SAM service management functions, such as running OAM diagnostics; see chapter 7 for more information
- **i** OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 77 for more information
- **j** Ethernet CFM; see chapter 78 for more information
- **k** RCA audit; see chapter 80 for more information

8.18 9471 WMM support

The 9471 WMM provides MME and SGSN functions, terminating signaling traffic from UE, base stations, SGW, and other MME and SGSN to provide mobility functions and network access. The 9471 WMM equipment is represented in the 5620 SAM equipment navigation tree. Configurable parameters are displayed in the WMM instance. 5620 SAM support for the 9471 WMM includes the following:

- configuration management
- fault management
- PM statistics retrieval and storage
- pooling and bulk provisioning functions
- inventory management

The following documents describe 5620 SAM management and configuration of the 9471 WMM:

- *5620 SAM LTE EPC User Guide*—Describes 9471 WMM discovery, configuration, and management using the 5620 SAM
- *5620 SAM LTE Parameter Reference*—Describes 9471 WMM device parameters as represented in the 5620 SAM schema, in addition to parameters on LTE and LTE service forms in the 5620 SAM GUI

8.19 9500 MPR and 9500 MPRe support

The Alcatel-Lucent 9500 MPR is a microwave digital radio that supports PDH and Ethernet to migrate from TDM to IP. The 9500 MPR provides a generic, modular IP platform for multiple network applications, such as 2G, 3G, HSDPA, and WiMAX to accommodate broadband services.

The 9500 MPRe is the standalone, fully outdoor application of the MPT-MC ODU, with no shelf unit. The 9500 MPRe provides fixed or mobile Ethernet site backhauling and supports converged MPLS metro networks.

The following documents describe the 5620 SAM discovery, management, configuration, and administration of 9500 MPR/9500 MPRe devices.

- *5620 SAM User Guide*— Describes the tasks required to discover, configure, and manage 9500 MPR/9500 MPRe devices which do not differ from other device types managed by the 5620 SAM.
- *5620 SAM MPR User Guide*—Describes the unique tasks required to commission 9500 MPR/9500 MPRe devices, configure and manage the device objects, and configure and manage the policies and services associated with the device.
- *5620 SAM System Administrator Guide*—Describes the tasks required for security management, advanced configuration, and routine maintenance required for 9500 MPR/9500 MPRe devices and other device types.
- *5620 SAM Parameter Guide*—Provides a description of all GUI parameters that the 5620 SAM supports for 9500 MPR/9500 MPRe devices along with other device types.

8.20 eNodeB support

The eNodeB is an enhanced BTS system for UE access to the LTE RAN network and LTE services in the 700 MHz spectrum. The eNodeB is available as a compact or distributed system that consists of a BBU and a compact TRDU or distributed RRH component. Metro cell variants are also supported.

The following documents describe 5620 SAM management and configuration of the eNodeB:

- *5620 SAM LTE RAN User Guide*—Describes eNodeB discovery, configuration, and management using the 5620 SAM
- *5620 SAM LTE Parameter Reference*—Describes eNodeB device MIM parameters as represented in the 5620 SAM schema, in addition to parameters on LTE and LTE service forms in the 5620 SAM GUI

8.21 OmniSwitch support

The Alcatel-Lucent OmniSwitch family of devices is a group of Enterprise and Metro Ethernet LAN switches. The 5620 SAM supports the OmniSwitch chassis types listed in Table 8-3.

Table 8-3 5620 SAM OmniSwitch support

Family	Characteristics	AOS release supported	Chassis and cards support
OS 6250	Layer 2+ Fast Ethernet Stackable LAN family of switches which includes the OS 6250SME (small and medium enterprise) for the enterprise segment, and the OS 6250M, for the Metro access segment.	Release 6.6.4 or later	Non-PoE chassis • OS 6250-8M (Metro) • OS 6250-24M (Metro) • OS 6250-24MD (Metro) • OS 6250-24 (SME) PoE chassis • OS 6250-P24 (SME)
OS 6400	Stackable layer 2+ GigE LAN switch available in 24 or 48-port variants. Up to eight switches can be linked to form a stack.	Release 6.4.5 or later	Non-PoE chassis • OS 6400-24 • OS 6400-48 PoE chassis • OS 6400-P24 • OS 6400-P48 Fiber chassis • OS 6400-U24 • OS 6400-U24D

(1 of 4)

Family	Characteristics	AOS release supported	Chassis and cards support
OS 6450	Stackable GigE LAN switch available in 10-, 24-, or 48-ports variants, with optional upgrade paths for 10 GigE stacking, 10 GigE uplinks, and Ethernet (Metro) services.	Release 6.6.4 or later	Non-PoE chassis • OS 6450-10 • OS 6450-10L • OS 6450-24 • OS 6450-48 PoE chassis • OS 6450-P10 • OS 6450-P10L • OS 6450-P24 • OS 6450-P48 Fiber chassis • OS 6450-U24 Expansion port models • OS 6450-XNI-U2 • OS 6450-GNI-U2 • OS 6450-GNI-C2 Light models • OS 6450-C24-L • OS 6450-P24-L • OS 6450-C48-L • OS 6450-P48-L
OS 6850	Stackable layer 2/3 GigE fixed configuration switch available in 24 or 48-port variants. Up to eight switches can be linked to form a stack.	—	Non-PoE chassis • OS 6850-24 • OS 6850-24X • OS 6850-48 • OS 6850-48X • OS 6850-U24X • OS 6850-24L • OS 6850-48L PoE chassis • OS 6850-P24 • OS 6850-P24X • OS 6850-P48 • OS 6850-P48X • OS 6850-P24L • OS 6850-P48L
OS 6850E	The OS 6850E is the next evolution of the OS 6850. In addition to supporting the features of the OS 6850, the areas of enhancements for OS 6850E include form factor, new transceiver support, and new stacking mode.	Release 6.4.5 or later	Non-PoE chassis • OS 6850E-24 • OS 6850E-24X • OS 6850E-48 • OS 6850E-48X • OS 6850E-U24X PoE chassis • OS 6850-P24 • OS 6850E-P24X • OS 6850E-P48 • OS 6850E-P48X

(2 of 4)

Family	Characteristics	AOS release supported	Chassis and cards support
OS 6855	Stackable layer 2/3 GigE switch specifically built for IP network deployments where environmental operating conditions are unusually demanding. The OS 6855 is available with up to 24 gigabit ports and four combo ports.	Stackability only on OS6855-U24X chassis, Release 6.4.5 or later	Fiber chassis • OS 6855-U10 • OS 6855-U24 • OS 6855-U24X (stackable) Copper with PoE chassis • OS 6855-14 • OS 6855-24
OS 6900	The OS 6900 is a family of standalone aggregation switches that consists of two models: the OS 6900-X20 (640 Gb/s) and the OS 6900-X40 (1.28 Tb/s). The OS 6900-X40 has 40 fixed SFP+ ports, and two expansion slots. The OS 6900-X20 has 20 fixed SFP+ ports, and one expansion slot. Both models provide 1+1 redundant hot-swappable power supplies and a field-replaceable fan tray. Each expansion slot is capable of supporting 120 Gb/s of bandwidth.	Release 7.3.1 or later	XNI cards (supported on both model types) • OS-XNI-U12: Supports 12 SFP+ ports • OS-XNI-U4: Supports 4 SFP+ ports
OS 9600 (1)	A five-slot chassis supporting one CMM and four network interface modules. It offers a wide range of GigE and 10GigE interfaces and power-over-Ethernet to support IP telephones, WLAN access points and video cameras. The OS 9600 supports a maximum of two load sharing power supplies.	—	CMM cards • OS9600-CMM • OS9700-CMM • OS9800-CMM Network interface cards • 2-port 10GigE XFP • 6-port 10GigE XFP • 20-port Fast Ethernet (10/100 – SW upgradable to 10/100/1000) RJ45 and 2-port GigE (100/1000) SFP • 24-port GigE SFP • 24-port GigE (10/100/1000) RJ45 • 24-port GigE (10/100/1000) RJ45 w/PoE • OS9-GNI-P24: 24-port (10/100/1000) TX (RJ-45) PoE support • 48-port GigE (10/100/1000) MRJ21
OS 9700 (1)	A high-density ten-slot chassis with two slots for control and eight slots for network interfaces supporting an aggregation of up to 192 GigE ports or 48 10GigE ports. Designed for smart continuous switching operation, the two center slots are dedicated to CMMs allowing redundant configurations. The OS 9700 supports a maximum of three power supplies.	—	
OS 9800 (1)	A high performance 18-slot switch supporting 16 slots for GigE and/or 10-GigE network interface modules. An additional two slots are reserved for primary and redundant CMMs. The OS 9800 supports a maximum of four power supplies.	—	

(3 of 4)

Family	Characteristics	AOS release supported	Chassis and cards support
OS 9700E [2]	The OS 9700E is a high performance switch offering eight slots for GigE and/or 10-GigE Network Interface (NI) modules. Additional two slots are reserved for primary and redundant Chassis Management Modules (CMMs).	Release 6.4.5 or later	Network interface cards • OS9-GNI-C24E: 24-port 10/100/1000 with RJ-45 support • OS9-GNI-U24E: 24-port 1000base-X with SFP/MiniGBIC support • OS9-GNI-P24E: 24-port (10/100/1000) T/TX (RJ-45) PoE+ support • OS9-XNI-U2E: 2-port unpopulated 10-GigE with XFP support • OS9-XNI-U12E: Deployment fails if MPLS license is installed. Does not support MPLS/VPLS operations.
OS 9800E [2]	The OS 9800E is a high performance switch offering 16 slots for GigE and/or 10-GigE Network Interface (NI) modules. An additional two slots are reserved for primary and redundant Chassis Management Modules (CMMs).		
OS 10K [3]	The OS 10K is a high-capacity, high-performance modular Ethernet LAN switch that provides 5.12 Tb/s of switching performance. The OS 10K has a 12 slot chassis configuration: 4 slots for CMM/fabric cards; and 8 slots for XNI or GNI cards that provide Ethernet, GigE, and 10-GigE capabilities.	Release 7.3.1 or later	CMM and CFM cards • OS10K-CMM • OS10K-CFM XNI cards • OS10K-XNI-U32E: 32 unpopulated 10G SFP+ transceiver connectors • OS10K-XNI-U32S: 32 unpopulated 10G SFP+ transceiver connectors • OS10K-XNI-U16E: 16 unpopulated 10G SFP+ transceiver connectors GNI cards • OS10K-GNI-U48E: 48 SFP transceiver connectors • OS10K-GNI-C48E: 48 auto-sensing ports, each port is configurable as 10BaseT, 100BaseTX, or 1000BaseT QNI cards • OS10K-QNI-U4: 40-Gig network interface with pluggable QSFP transceiver connectors • OS10K-QNI-U8: 40-Gig network interface with pluggable QSFP transceiver connectors

(4 of 4)

Notes

(1) The 5620 SAM also supports the OS 9000 series of LAN switches which includes the OS 9600, OS 9700, and OS 9800.

(2) The 5620 SAM also supports the OS 9000E series of LAN switches which includes the OS 9700E and OS 9800E.

(3) The behavior of the power supplies is controlled by power management. You will see a power failure alarm even though power supplies are connected to the OS 10K chassis and is not being used by the 10K node. The 10K power management puts power supply into an inactive (down) state, if it is not required.

Caution 1 — OmniSwitch devices do not support automatic synchronization with the 5620 SAM database when you use the CLI to make configuration changes. To ensure that you are viewing accurate OmniSwitch information in the 5620 SAM, you must resynchronize the NE by clicking on the appropriate Resync button.

Caution 2 — OmniSwitch NEs do not send trap notifications for all MIB changes on the NE. To ensure that you are viewing the current configuration information in the 5620 SAM, you must resynchronize of the NE by clicking on the appropriate Resync button.

OmniSwitch LAG objects

OmniSwitch NEs support static and dynamic LAGs. When you create a static LAG, you can add ports as LAG members. The ports that you select as members of a dynamic LAG are first placed into an Unassigned Dynamic LAG Members group. The OmniSwitch uses LACP to dynamically assign ports from an Unassigned Dynamic LAG Members group to the appropriate LAG. When a port is assigned to a dynamic LAG, the port is removed from the Unassigned Dynamic LAG Members group.

You can create VLANs, use 802.1Q framing, configure QoS conditions, and enable other networking functions on a LAG, which is treated the same as physical link.

OmniSwitch LAG support includes:

- up to 32 LAGs on an OS 6250, OS 6400, OS 6450, OS 6850, OS 6850E, or OS 6855 on a stack of OmniSwitch devices
- up to 128 LAGs on an:
  - OS 9600, OS 9700, and OS 9800
  - OS 9700E or OS 9800E
  - OS 6900, Release 7.2.1 or later
  - OS 10K
- two, four, or eight Ethernet links in a LAG
- access or network LAGs

Using WebView to manage an OmniSwitch

You can configure and manage an OmniSwitch using the WebView application, an Alcatel-Lucent web-based element management tool that runs on an OmniSwitch. WebView supports the following web browsers:

- Internet Explorer 6.0 or later for Windows
- Netscape 7.1 for Windows

- Netscape 7.0 for Solaris
- Mozilla Firefox 10.0 or later for RHEL

Note — The web browser must have cookies and Java enabled.

See the appropriate OmniSwitch *Switch Management Guide* for information about configuring and using WebView. See chapter 13 for information about opening WebView using the 5620 SAM GUI.

8.22 Workflow to manage OmniSwitch devices

The following workflow describes the sequence of high-level tasks that are required to commission, configure, and manage OmniSwitch NEs and services. The workflow assumes that the physical devices are installed. The management functions are supplemental to the general management functions described in section 8.2.

1. Determine the configuration requirements for installed devices. See this chapter, the *5620 SAM Network Element Compatibility Guide*, and the *5620 SAM Parameter Guide* for specific device information.
2. Commission the device for 5620 SAM management; see Procedure 9-2 and chapter 9.
3. Perform 5620 SAM discovery of the commissioned network devices, and optionally configure SSH2 security for CLI sessions; see chapter 10.
4. As required, manage and configure equipment. See chapter 12 for more information about equipment management and configuration. Additionally, configure:
   - **a** LLDP; see Procedure 13-12.
   - **b** Ethernet diagnostics; see Procedures 13-26, 13-27, and 13-28.
   - **c** LAGs; see Procedures 14-12 and 14-13.
   - **d** running configuration; see Procedure 15-16.
   - **e** health monitoring; see Procedure 15-17.
   - **f** stacks; see Procedure 15-30.
   - **g** CPU temperature threshold; see Procedure 15-31.
   - **h** Ethernet ports; see Procedure 16-23.
   - **i** PoE ports; see Procedure 16-24.
5. Create RADIUS, TACACS+, or LDAP security policies. See “NE user and device security” in the *5620 SAM System Administrator Guide* for more information.

6 If required, perform any of the NE maintenance functions, such as:

a back up and restore device configurations.

b certify and synchronize device configurations.

c perform on-demand software upgrades or ISSUs.

d perform a software licence upgrade to allow OS 6250SME and OS 6450 NEs to perform in the Ethernet (Metro) role and support the OmniSwitch Ethernet (Metro) features.

e view a NE file system using an FTP file browser.

f monitoring the deployment of configuration changes to devices.

See "NE maintenance" in the *5620 SAM System Administrator Guide* for more information.

7 Create equipment inventories of managed devices. See chapter 17.

8 As required, perform additional device management functions, such as the following:

a TCP enhanced authentication between NEs. See "TCP enhanced authentication" in the *5620 SAM System Administrator Guide* for more information.

b threshold-crossing alarms; see chapter 19.

c bulk configuration changes; see chapter 20.

d automatic provisioning; see chapter 21.

9 Configure NE routing and forwarding. See chapter 22 for general routing and forwarding information. Additionally, configure the following, as required:

a OmniSwitch routing instances or VRF instances; see Procedures 22-5 and 22-1.

b UDP relay and DHCP Snooping on OmniSwitch routing instances; see Procedure 22-6.

c OmniSwitch L3 interfaces; see Procedures 22-11 and 22-12.

d OmniSwitch static routes; see Procedure 22-14.

10 As required, configure additional specific routing and forwarding functions, such as the following:

a NE protocols; see chapter 23. Additionally, configure:

- RIP; see Procedure 23-8.
- OSPF; see Procedures 23-24 to 23-31.
- PIM; see Procedures 23-39 and 23-40.
- IGMP; see Procedure 23-47.
- bridging; see Procedures 23-63 and 23-64.

b MPLS and LSPs; see chapter 25.

c service tunnels to carry service traffic; see chapter 27. Additionally, configure Ethernet ring elements; see Procedure 27-7.

d Lawful Intercept; see chapter 28.

e IPsec; see chapter 29.

f 5620 SAM alarm policies; see chapter 31.

g OAM diagnostic tests; see chapter 32. Additionally, configure ping and traceroutes; see Procedures 32-38, 32-40, and 32-41.

11 As required, configure redundancy in the managed network using functions such as the following:

a VRRP; see chapter 33.

b APS; see chapter 34.

12 Create 5620 SAM policies that define the conditions for 5620 SAM management functions. See chapter 42 for general information about 5620 SAM policy management. As required, configure specific policy types such as the following:

a QoS policies, actions, and conditions; see Procedures 43-34, 43-35, and 43-36, and chapter 43.

b filter policies; see chapter 44.

c multicast policies; see chapter 45.

d VRRP policies; see chapter 47.

e auto tunnels policies; see chapter 48.

f 802.1x policies; see chapter 50.

g PBB MRP policies; see chapter 51.

h AOS Ethernet service policies; see chapter 52.

i connection profile policies; see chapter 53.

j service PW template policies; see chapter 73.

k residential subscriber policies; see chapter 54.

l constraint policies; see chapter 56.

m NAT policies; see chapter 57.

n format and range policies; see chapter 58.

13 Configure services and related functions. See chapters 61 and 62 for general service information. As required, configure specific services and related functions such as the following:

a virtual ports; see chapter 63.

b customers; see chapter 64.

c residential subscribers of customer services; see chapter 65.

d VLAN services; see Procedures 66-1, 66-2, 66-3, 66-8, and 66-9, and chapter 66.

e VLAN groups; see chapter 66.

f VLL Apipe, Cpipe, Epipe, Fpipe, and Ipipe services to provide point-to-point connectivity between customer access ports; see chapter 67.

g VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 68.

h mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 69.

i IES to provide an IP interface between customer traffic and the Internet; see chapter 70.

j composite services to connect various types of services; see chapter 74.

k 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions such as running OAM diagnostics; see chapter 7.

l OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 77.

m Ethernet Connectivity Fault Management; see Procedure 78-5 and chapter 78.

n RCA audit; see chapter 80.

8.23 GNE support

The 5620 SAM provides limited SNMP management support of GNEs. Typically GNEs are non-Alcatel-Lucent devices, but the Alcatel-Lucent 9400 AWY and 9500 MSS-1c are treated as GNEs by the 5620 SAM. 5620 SAM support for GNEs is limited to the following:

- discovery and display on topology maps (GNE only, not its interfaces)
- inclusion in the navigation tree (GNE only, not its interfaces)
- physical link creation and representation
- generic trap translation into 5620 SAM alarms
- status polling using enterprise MIB object interface alarms

- telnet, SSH, and web sessions can be launched
- provisioning using CLI scripts
- inclusion in a service instance created with scripts from, and managed by, the 5620 SAM.

Note 1 — By default, only the 5620 SAM admin user, or an operator with an assigned admin scope of command role, can manage GNE profiles and alarm catalogues. A non-admin user requires the genericne scope of command role to manage GNE profiles.

Note 2 — To create, modify, or delete a GNE alarm catalogue or mapping, you require a trapmapper scope of command role with write, update, and execute permissions.

Note 3 — From a 5620 SAM discovery and management perspective, the Alcatel-Lucent 9400 AWY and 9500 MSS-1c are considered to be GNEs. See Procedure 9-9 for information about how to discover and manage these device types.

GNE device discovery and polling in the 5620 SAM are configured using the same methods that are used for Alcatel-Lucent devices, but the 5620 SAM uses preconfigured scripts to manage and unmanage a GNE. See the chapter 10 for information about device discovery. See chapter 20 for information about creating CLI scripts using the 5620 SAM Scripts tool.

Statistics support

The 5620 SAM supports the collection of a limited set of statistics counters from standard system, interface, and routing MIBs on GNEs. These statistics are processed and presented in the same manner as statistics from other devices. You can view GNE statistics on the Statistics tab of a GNE interface properties form, retrieve them using the OSSI, and display them graphically using the 5620 SAM Statistics Plotter.

Note 1 — To collect or view GNE statistics from routing MIBs, you require a valid 5650 CPAM license that has a third-party router quantity greater than zero.

Note 2 — If persistent SNMP indexes are not enabled on a GNE, one or more GNE interface indexes may change after a GNE reboots. This can cause a mismatch between the statistics records collected before the reboot and the current interface indexes. The 5620 SAM takes no action to identify or correct such a mismatch.

See “Statistics collection configuration” in the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

Alarm support

By default, the 5620 SAM supports a limited number of standard system and interface SNMP traps for GNEs. The 5620 SAM monitors SNMP reachability and interface status, and raises a standard alarm for each the following events:

- coldStart—The GNE restarts.
- linkDown—An interface goes out of service.
- linkUp—An interface returns to service.

Note — When the 5620 SAM drops or fails to receive an SNMP trap from a GNE, the trap is lost. The 5620 SAM is unable to request that a GNE resend an SNMP trap.

You can configure the 5620 SAM to raise user-defined alarms in response to specific GNE traps using alarm catalogues. See section 9.2 for information about configuring user-defined alarms for GNEs.

GNE alarm catalogues

An alarm catalogue is a set of trap-to-alarm mappings that can be associated with a GNE profile. A GNE profile can have at most one alarm catalogue, but each catalogue can contain up to 150 alarm mappings. When a mapping is administratively disabled, the 5620 SAM raises no alarm in response to an associated trap from a GNE.

An alarm mapping can be static, which means that it maps to a specific alarm, or the mapping can use one or more transform functions that extend the mapping customization. A transform function defines conditions that enable the dynamic mapping of a trap to an alarm that is created using varbind values in an SNMP trap PDU. For example, you can use a transform function to assign a specific alarm name, severity, or probable cause to an alarm based on varbind values.

You can use a 5620 SAM GUI or OSS client to configure GNE alarm catalogues and alarm mappings. The GUI supports the following methods:

- configuration forms—for object creation, modification, viewing, and deletion

  See chapter 9 for information about managing GNE alarm catalogues using configuration forms.
- XML API script—for object creation and modification only

  A script template for alarm catalogue configuration is available at the following location:

  install_dir/nms/sample/xmlapi/AlarmCatalogue-Template.txt

  where *install_dir* is the 5620 SAM main server installation directory, typically /opt/5620sam/server

See "Creating and executing scripts" in the *5620 SAM Scripts and Templates Developer Guide* for information about using the Scripts tool.

An OSS client can also retrieve a catalogue or a subset of the alarm mappings in a catalogue using the standard methods.

When the 5620 SAM receives a GNE trap that is not one of the supported standard traps or a mapped trap in an alarm catalogue, the 5620 SAM drops the trap. When the 5620 SAM receives a high trap volume and must discard traps that it cannot process, it does not distinguish between standard and user-defined traps. To conserve system resources, Alcatel-Lucent recommends that you configure a GNE to send only the required traps to the 5620 SAM.

Traps that map to user-defined alarms require extra processing by the 5620 SAM and are managed in a separate, resource-limited queue. When this queue fills, the 5620 SAM discards some of the traps and raises an alarm. You can monitor the queue length using the 5620 SAM Resource Manager.

GNE trap sequencing and throttling support are configurable in a GNE profile. After the 5620 SAM finishes throttling traps from a GNE or encounters a trap sequence error, it resynchronizes the discovered device MIBs.

8.24 Workflow to manage GNEs

The following workflow describes the sequence of high-level tasks that are required to commission, configure, and manage GNEs and services. The workflow assumes that the physical devices are installed. The management functions are supplemental to the general management functions described in section 8.2.

1 Non-admin users require an assigned GNE scope of command role to manage GNEs. See section 9.1 and the *5620 SAM System Administrator Guide* for more information.

2 Perform the commissioning preconfiguration on the GNE before the 5620 SAM can manage it by creating a GNE profile. See section 9.1 for more information.

3 As part of a GNE profile creation, you can optionally map SNMP traps from GNEs to user-defined 5620 SAM alarms in an alarm catalogue. See section 9.1 for more information.

4 Create a mediation policy with the same SNMP settings that were specified during the GNE preconfiguration; see chapter 10.

5 Perform 5620 SAM discovery of the commissioned GNEs, and optionally configure SSH2 security for CLI sessions; see chapter 10.

6 As required, manage and configure equipment. See chapter 12 for more information about equipment management and configuration.

7 As required, configure additional specific routing and forwarding functions, such as the following:

   a NE protocols; see chapter 23. Additionally, configure:

      - RIP; see Procedure 23-8.
      - OSPF; see Procedures 23-24 to 23-31.
      - PIM; see Procedures 23-39 and 23-40.
      - IGMP; see Procedure 23-47.
      - bridging; see Procedures 23-63 and 23-64.

   b MPLS and LSPs; see chapter 25.

c service tunnels to carry service traffic; see chapter 27. Additionally, configure Ethernet ring elements; see Procedure 27-7.

d Lawful Intercept; see chapter 28.

e IPsec; see chapter 29.

f 5620 SAM alarm policies; see chapter 31.

g OAM diagnostic tests; see chapter 32. Additionally, configure ping and traceroutes; see Procedures 32-38, 32-40, and 32-41.

8 Create 5620 SAM policies that define the conditions for 5620 SAM management functions. See chapter 42 for general information about 5620 SAM policy management. As required, configure specific policy types such as the following:

a QoS policies, actions, and conditions; see Procedures 43-34, 43-35, and 43-36, and chapter 43.

b filter policies; see chapter 44.

c multicast policies; see chapter 45.

d VRRP policies; see chapter 47.

e auto tunnels policies; see chapter 48.

f 802.1x policies; see chapter 50.

g PBB MRP policies; see chapter 51.

h AOS Ethernet service policies; see chapter 52.

i connection profile policies; see chapter 53.

j service PW template policies; see chapter 73.

k residential subscriber policies; see chapter 54.

l constraint policies; see chapter 56.

m NAT policies; see chapter 57.

n format and range policies; see chapter 58.

9 Configure services and related functions. See chapters 61 and 62 for general service information. As required, configure specific services and related functions such as the following:

a virtual ports; see chapter 63.

b customers; see chapter 64.

c residential subscribers of customer services; see chapter 65.

d VLAN services; see Procedures 66-1, 66-2, 66-3, 66-8, and 66-9, and chapter 66.

e VLAN groups; see chapter 66.

f VLL Apipe, Cpipe, Epipe, Fpipe, and Ipipe services to provide point-to-point connectivity between customer access ports; see chapter 67.

g VPLS to provide virtual LAN connectivity that connects multiple customer sites in a bridged domain; see chapter 68.

h mirror services for troubleshooting customer traffic issues or for use with Lawful Intercept; see chapter 69.

i IES to provide an IP interface between customer traffic and the Internet; see chapter 70.

j composite services to connect various types of services; see chapter 74.

k 5620 SAM schedules and scheduled tasks to automate 5620 SAM service management functions such as running OAM diagnostics; see chapter 7.

l OAM diagnostic tests into suites of manual and automatically-generated tests using the Service Test Manager; see chapter 77.

m Ethernet Connectivity Fault Management; see Procedure 78-5 and chapter 78.

n RCA audit; see chapter 80.

9 — Device commissioning and management

9.1 Device commissioning overview *9-2*

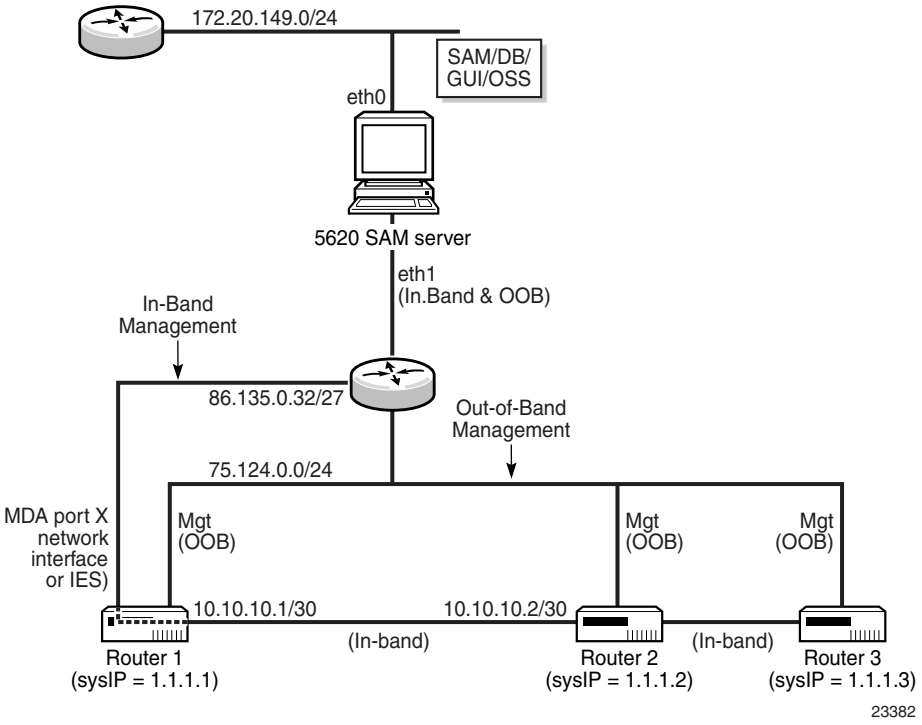
9.2 GNE commissioning overview *9-6*

9.3 Workflow to commission Alcatel-Lucent devices *9-9*

9.4 Device commissioning procedures *9-10*

9.5 Workflow to commission GNEs *9-24*

9.6 GNE commissioning procedures *9-25*



9.1 Device commissioning overview

An Alcatel-Lucent device or GNE requires preconfiguration before 5620 SAM management of the device is possible. When the preconfiguration is complete, the 5620 SAM can discover the device, as described in chapter 10. See section 9.3 for the device commissioning workflow.

In-band and out-of-band management

The 5620 SAM supports the in-band and out-of-band management of devices. Figure 9-1 shows an example of in-band and out-of-band management.

Figure 9-1 Example of in-band and out-of-band management

When you configure only in-band management, management traffic between the 5620 SAM and a device is transmitted through any port that is configured for network access, except the management port. For in-band management, the 5620 SAM sends management traffic to the device system IP address, or to an optionally specified L3 management interface.

When you configure only out-of-band management, management traffic between the 5620 SAM and a device is transmitted through the management port of the device. For out-of-band management, the 5620 SAM sends management traffic to the management IP address of the device.

When a device is configured for in-band and out-of-band management, one method provides management redundancy for the other. However, if the in-band and out-of-band IP addresses are the same, the 5620 SAM cannot determine which NE interface is active, and management redundancy is compromised. If the in-band and out-of-band IP addresses are the same on a newly discovered NE, the 5620 SAM raises an alarm.

Note 1 — The OmniSwitch does not support management redundancy.

Note 2 — The 5620 SAM uses one SNMP trap target for in-band and out-of-band management. The 5620 SAM SNMP IP address must be routable from each IP address when in-band and out-of-band management are used. See the device documentation for information about configuring an SNMP trap target.

The type of management is determined during device discovery. When the device is discovered using its management IP address, system IP address, or L3 interface IP address, the in-band and out-of-band addresses are synced in the 5620 SAM. This enables configuration of management redundancy, if both in-band and out-of band are available. In each case, a valid route to the device must exist. See chapter 10 for more information about the discovery process.

In Figure 9-1, an out-of-band management route allows a ping from the 5620 SAM to the management IP address of Router 1 (192.168.10.1/32). The in-band connection sends management packets to the system IP address on Router 2 (12.12.12.2/32) on MDA port X.

Caution — Do not use the 5620 SAM to modify the configuration of the in-band port. If the port is shut down, network visibility is lost.

Note — In Figure 9-1, the IP addresses for Router 1 and 2 each end with /mask. This value needs to changed for another value. Many values can be selected but the following values are most common:

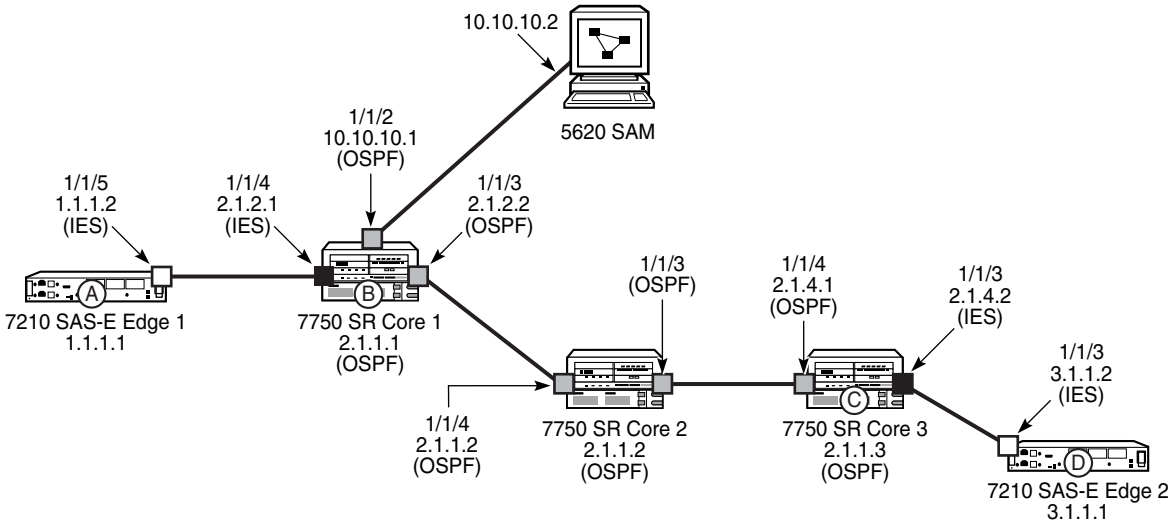
- /31 for two hosts
- /30 for two hosts with network and broadcasts numbers
- /24 for 254 hosts

Some device types require configuration in addition to the SNMP configuration before they can be managed by the 5620 SAM. See the appropriate part of this section for device-specific management information.

7705 SAR management bandwidth

Some additional bandwidth management configuration is required with the 5620 SAM, if you want to transmit on in-band management on the 7705 SAR. Currently, if in-band and out-of-band management are both used, then the 7705 SAR will only transmit on the out-of-band management out-of-preference if that route exists.

You need to configure 5620 SAM so that each 7705 SAR with out-of-band management connectivity has the following parameter values:



- Active Management IP - In Band
- Auto Revert to Preferred - True or False
- Management IP selection - in Band Preferred

See Procedure 9-4 for the steps on how to configure these values.

7210 SAS in-band and out-of-band management

The 7210 SAS supports in-band and out-of-band management. The 7210 SAS-D and 7210 SAS-E support static routes, but do not support an IGP or SDPs. The example network shown in Figure 9-2 and the associated configuration steps describe the configuration required to enable 7210 SAS-E in-band management using static routes that are distributed to an IGP, which, in the example, is OSPF.

Figure 9-2 Example 7210 SAS-E in-band management network

Ⓐ static-route 10.10.10.0/24 next-hop 2.1.2.1, static-route 2.1.1.0/24 next-hop 2.1.2.1

Ⓑ static-route 1.1.1.1/32 next-hop 1.1.1.2, Distribute the static routes to OSPF

Ⓒ static-route 3.1.1.1/32 next-hop 3.1.1.2, Distribute the static routes to OSPF

Ⓓ static-route 10.10.10.0/24 next-hop 2.1.4.2, static-route 2.1.1.0/24 next-hop 2.1.4.2

Legend:
- Access uplink port
- Access port
- Network port

20259

The following configuration steps are required to set up the example network:

1 Using the CLI, configure the SNMP security parameters on the devices that you need to discover. See Procedure 9-1 for more information.

2 Perform the following steps on Core 1.

- Configure an interface on port 1/1/2 that connects to the 5620 SAM server interface.
- Configure an interface on port 1/1/3, which is connected to Core 2.
- Create an L3 interface on port 1/1/4 by creating an IES.
- Create a static route to Edge 1.
- Create an ASBR OSPF (area 0.0.0.0) instance on the system and enable OSPF on the interfaces to Core 2 and the 5620 SAM server.
- Create a routing policy to distribute the static route to OSPF.

3 Perform the following steps on Core 2.

- Configure an L3 interface on port 1/1/4, which is connected to Core 1.
- Configure an L3 interface on port 1/1/3, which is connected to Core 3.
- Enable OSPF (area 0.0.0.0) on the system and the interfaces connected to Core 1 and Core 3.

4 Perform the following steps on Core 3.

- Create an L3 interface on port 1/1/4, which is connected to Core 2.
- Create an L3 interface on port 1/1/3, which is connected to Edge 2.
- Create a static route to Edge 2.
- Create an ASBR OSPF (area 0.0.0.0) instance on the system and enable OSPF on the interface to Core 2.
- Create a routing policy to distribute the static route to OSPF.

5 Perform the following steps on Edge 2.

- Create an IES L3 interface on port 1/1/3, which is an uplink port.
- Create static routes that direct traffic to the IES L3 interface.

6 Perform the following steps on Edge 1.

- Create an IES L3 interface on port 1/1/5, which is configured as an uplink port.
- Create static routes to direct traffic to the IES L3 interface.

7 Ensure that each 7210 SAS-E can ping the network interface IP address which is configured on the 5620 SAM main server.

8 Ensure that the 5620 SAM main server can ping the system IP address of each 7210 SAS-E.

9 Configure an in-band polling policy using the 5620 SAM. See Procedure 9-5 for more information.

Firewalls and management bandwidth

The ports between 5620 SAM components, and between the 5620 SAM system and the managed devices, must be open through firewalls to allow proper operation of the software. See the *5620 SAM Planning Guide* for more information about requirements for the following:

- firewalls and open ports
- communication bandwidth between 5620 SAM components
- communication bandwidth between the 5620 SAM and managed network

IPv6 device management

The 5620 SAM supports device management using IPv6 for devices with IPv6 capabilities. The management protocol is established when the device is discovered. When a device is configured with an IPv6 address on its management port and/or system interface and the discovery rule is configured to discover IPv6 addresses, the 5620 SAM discovers and manages the device using IPv6. To change a device management protocol between IPv4 and IPv6, you must unmanage the device, create a new discovery rule specifying the new management protocol, and then rediscover the device.

Note 1 — To manage 7750 SR, 7710 SR, 7450 ESS, or 7950 XRS devices using IPv6, the device must also be configured with an IPv4 address on the management port for out-of-band management, or an IPv4 address on the system interface for in-band management.

Note 2 — To manage the 7210 SAS-E, 7210 SAS-M, 7210 SAS-T, or 7210 SAS-X, Release 4.0 or later using IPv6 for out-of-band management, you must configure IPv6 on the management port and IPv4 on the system interface. Earlier releases of the 7210 SAS do not support IPv6 management.

The 7210 SAS-D, 7210 SAS-M, 7210 SAS-T, and 7210 SAS-X, Release 5.0 R1 or later, support in-band management using IPv6.

The 5620 SAM supports the configuration of IPv4 and IPv6 in-band and out-of-band management addresses on the same device.

Secure file transfers

The 5620 SAM supports secure and non-secure file transfers for backups, restores, software upgrades, and statistics collection. The device mediation policy determines whether FTP or SCP is used to perform file transfers to and from the managed devices. SCP requires SSH2. See chapter 10 for more information about configuring SSH2.

9.2 GNE commissioning overview

A GNE requires commissioning preconfiguration before the 5620 SAM can manage it. When the preconfiguration is complete, the 5620 SAM can discover the device, as described in chapter 10.

The 5620 SAM uses configurable profiles and CLI configuration scripts to discover and manage GNEs. You can use one GNE profile for multiple GNEs of the same type.

By default, only the 5620 SAM admin user, or a user with an assigned admin scope of command role, can manage GNE objects. To create and configure GNE objects, a non-admin user requires a scope of command role that has Create and Update/Execute permissions on packages and classes that include the following:

- genericne—to create GNE interfaces and configure profiles
- netw—to create discovery rules
- script—to manage scripts

- security.MediationPolicy and snmp.PollerManager—to create mediation policies
- trapmapper—to create alarm catalogs that map SNMP traps to 5620 SAM alarms

The 5620 SAM can discover a device as a GNE only when the following conditions are in place.

- The GNE preconfiguration is complete.
  - The System Object ID of the GNE is required for the GNE Profile, for example 1.3.6.1.4.1. When multiple GNE profiles contain possible matches for a system object ID, the profile that contains the system object ID with the longest or most specific match is chosen.
  - SNMP is configured and enabled on the device.
  - Telnet or SSH is enabled on the device.
- A 5620 SAM GNE profile for the device exists.
- A 5620 SAM mediation policy is configured with SNMP settings that match the device configuration.
- A discovery rule for the device exists.

See section 9.5 for the GNE commissioning workflow. See chapter 10 for information about mediation policies and device discovery.

Using alternate element managers

If an EMS client application for a GNE is installed on a 5620 SAM GUI client station, you can use a right-click GNE menu option in the network navigation tree to open the EMS client application. The OS-level command that opens the client must be specified in the associated GNE profile, or in the individual GNE configuration, to enable the function. A command in the configuration of a specific GNE overrides a command in the associated GNE profile.

If the command path is not included, the 5620 SAM attempts to locate the command using the paths listed in the PATH environment variable of the client station OS.

If the command that opens an EMS client accepts an NE IP address as an argument, you can specify the address using a keyword in the command entry. The 5620 SAM replaces the keyword with the target GNE IP address as it runs the command.

An alternate GNE manager is configurable using the GUI or OSS. See Procedure 9-7 for information about configuring an alternate EMS in a GNE profile. See Procedure 9-8 for information about specifying an alternate EMS in the GNE configuration.

GNE profiles

5620 SAM management of a device as a GNE requires a GNE profile, which defines how the 5620 SAM communicates with the device. A GNE profile includes the following elements:

- a unique GNE name
- the system object ID from the device MIB
- the GNE category
- the interface types that the GNE supports
- the interfaces that can be specified as the endpoints of 5620 SAM physical links

- an SNMP trap management configuration that associate trap configuration and deconfiguration scripts with the profile
- CLI profile information
- an optional alarm catalog that defines the alarms that the 5620 SAM raises in response to SNMP traps from the device

Configuring user-defined alarms for GNEs

You can map GNE SNMP traps to user-defined 5620 SAM alarms in an alarm catalog, and associate the catalog with a GNE profile. A GNE profile can have one alarm catalog that contains up to 150 trap-to-alarm mappings.

A mapping is one of the following types:

- static—A specific SNMP trap is associated with a specific alarm.
- dynamic—The mapping includes one or more transform functions that define alarm properties based on values in SNMP trap PDUs.

Each mapping in a catalog defines an alarm that the 5620 SAM raises or clears when it receives a specific SNMP trap. A mapping includes standard elements such as the trap OID, alarm type, probable cause, and severity, but can include the following optional elements:

- trap name
- self-clearing designation—specifies that the alarm clears when a specific clearing trap is received, and has the following requirements:
  - If the severity of the raising alarm is a static value, the clearing trap must have a static mapping in the same catalog as the raising trap, and can be linked to only one raising trap.
  - If the severity of the raising alarm is defined using a transform function, the transform function must include a raising value pair and a clearing value pair.
- FDN extension, which is an alarm-name extension that can include the following:
  - static text
  - scripting functions—expressions that specify the trap PDU values to include; these allow the same alarm type to be raised in response to different traps while uniquely identifying the trap origin in the alarm name.
- additional text—used to provide information of value related to the trap event, for example, troubleshooting actions; the additional text consists of the trap OID by default, but can include the following:
  - static text
  - scripting functions—expressions that specify the trap PDU values to include; these are used to generate a more precise description of the alarm condition
- System Address and/or Interface Index varbind positions for a GNE on which to raise an alarm

Note — The FDN extension of a GNE alarm is not appended to the Alarm Name field in the 5620 SAM GUI, but is included in the Additional Text field. To create a filter for GNE alarms that have FDN extensions, you must filter on the Additional Text field.

A change to an alarm catalog or to a mapping in a catalog takes effect immediately after you commit the change.

Transform functions

A transform function is an optional catalog component that associates one or more values in an SNMP trap PDU with an alarm property such as the alarm name, probable cause, or severity. For example, you can create a transform function that assigns an alarm severity of Critical when the value in a specific varbind is 1, Major when the value is 2, and Minor when the value is 3.

When an alarm mapping includes one or more transform functions, the 5620 SAM can raise multiple alarms in response to the same SNMP trap. A trap value and the associated alarm property value are specified as a value pair in a transform function. You can also specify a default alarm property value that the 5620 SAM assigns to an alarm when a received value is not defined in a value pair.

A transform function defines the input value type, such as integer, and the output alarm property type, such as severity. You can modify these parameters only when the transform function does not contain a value pair and is not used by a mapping.

A transform function returns an empty string when a received value is not defined in a value pair and no default alarm property value is assigned. When the transform function defines the alarm name, probable cause, or severity, the 5620 SAM logs an error in response and does not raise an alarm.

9.3 Workflow to commission Alcatel-Lucent devices

The following workflow describes the high-level tasks required to commission a device prior to discovery by the 5620 SAM.

1. Enable and configure SNMP on the device.
   - **a** See Procedure 9-1 for 5620 SAM natively-managed devices.
   - **b** See Procedure 9-2 for the OmniSwitch.
2. If required, configure the source of device SNMP traps; see Procedure 9-3.
3. If required, use a CLI to enable 5620 SAM in-band management of the device by to configure a second trap destination and trap log on the device. See section 9.2 for information about in-band management. See the device documentation for configuration information.

4 If required, establish a route for in-band traffic. For example, to configure a static route or use OSPF. See chapter 22 for more information on static routes. See chapter 23 for more information about OSPF.

5 Configure the 5620 SAM to use in-band, out-of-band, or in-band and out-of-band polling for the device. A 5620 SAM mediation policy specifies the polling interval. See chapter 10 for information about mediation policies.

   a See Procedure 9-4 for 7450 ESS, 7705 SAR, 7710 SR, 7750 SR, and 7950 XRS polling configuration information.

   b See Procedure 9-5 for 7210 SAS polling configuration information.

   c See Procedure 9-6 for information about editing polling settings for multiple managed devices.

9.4 Device commissioning procedures

The following procedures describe how to commission devices that are natively-managed by the 5620 SAM except for the devices listed in Table 9-1. See section 8.1 for a list of all devices managed by the 5620 SAM. See the appropriate device documentation for information about using a device CLI.

Table 9-1 Location of device commissioning information

Device	Information location
1830 PSS	*1830 PSS-32/16 Installation and System Turn-Up Guide* *1830 PSS Engineering and Planning Tool User Guide* *1830 PSS DCN Planning and Engineering Guide (Photonic Applications)* *1830 PSS Commissioning and Power Balancing Tool User Guide*
5780 DSC	*5780 DSC User Guide*
7750 MG	*5620 SAM LTE EPC User Guide*
9471 WMM	Contact your ALU technical representative
eNodeB	Contact your ALU technical representative

Procedure 9-1 To commission a device for 5620 SAM management

Caution — Do not apply an SNMP log filter to the 5620 SAM SNMP log. The 5620 SAM cannot manage an NE that has an SNMP log filter applied to the log used by the 5620 SAM, which is typically log ID 98. In rare cases, Alcatel-Lucent may apply filters.

1 Open a console window on the device.

2 Enter the following command at the prompt to configure the system address of the device:

configure router interface "system" address *xxx.xxx.xxx.xxx/mask* ↵

where <*xxx.xxx.xxx.xxx*> is the system IP address
mask is the bit mask

3 Enter the following command at the prompt to enable Telnet:

configure system security telnet-server ↵

4 Enter the following command at the prompt to enable FTP:

configure system security ftp-server ↵

5 If required, enter the following command at the prompt to enable SSH2:

configure system security ssh version 2 ↵

6 Enter the following command at the prompt to enable console, FTP, and SNMP access for the appropriate user account on the device:

configure system security user *user_account* access console ftp snmp ↵

where *user_account* is the appropriate user account for Telnet, FTP, and SNMP access, for example, admin

7 If required, enter the following command at the prompt to enable hash encryption for passwords and authentication keys during device configuration save or list operations:

configure system security hash-control read-version *read-version* write-version *write-version* ↵

where
read-version is the version of encryption accepted during read operations, for example, 1, 2, or all to indicate that both are accepted
write-version is the version of encryption used during write operations, for example, 1 or 2

Version 1 encryption uses a simple key algorithm that generates the same character string each time it hashes a specific password or authentication key.

Version 2 encryption uses a more complex key algorithm that generates a different character string each time it hashes a specific password or authentication key.

8 Enter the following commands in sequence at the prompt to set the time zone and time:

configure system time zone *time_zone -offset_from_UCT* ↵

admin set-time *YYYY/MM/DD hh:mm:ss* ↵

where
time_zone is the appropriate time zone, for example, EST
offset_from_UCT is the offset, in hours, from Universal Co-ordinated Time, also known as Greenwich Mean Time, for example, if you specify EST, *offset_from_UCT* is -5, as EST lags UCT by five hours
YYYY/MM/DD hh:mm:ss is the current local time

9 If required, perform one of the following to enable a time protocol.

a Enter the following command at the prompt to enable NTP:

configure system time ntp server-address *server_IP_address* ↵

where
server_IP_address is the IP address of the SNTP server

b Enter the following command at the prompt to enable SNTP:

configure system time sntp server-address *server_IP_address* ↵

where
server_IP_address is the IP address of the SNTP server

10 Enter the following in sequence to enable the SNMPv2 engine and to configure an SNMP community:

configure system snmp no shutdown ↵

configure system snmp packet-size 9216 ↵

configure system security snmp community *community_name* rwa version both ↵

where *community_name* is the SNMPv2 community name

Note 1 — The command is used for the 5620 SAM write mediation policy. If you are using SNMPv2, you must use this mediation policy for read as well, or create another mediation policy that is also configured for rwa.

Note 2 — The SNMPv2 community string name rwa attributes must be enabled for the 5620 SAM to properly manage a device, even if the 5620 SAM is only used to monitor a network.

11 Enter the following commands in sequence at the prompt to ensure that the device uses persistent SNMP indexes:

bof persist on ↵

bof save ↵

12 Enter the following commands in sequence at the prompt to save the configuration changes and reboot the device:

```
admin save ↵

admin synchronize boot-env ↵

admin reboot now ↵
```

The device initializes with SNMP communication enabled.

13 Enter the following to clear the log ID and trap group ID:

```
configure log ↵

log-id 98 ↵

shutdown ↵

exit ↵

no log-id 98 ↵

no snmp-trap-group 98 ↵

exit all ↵
```

14 Use a 5620 SAM client to discover the device and to verify that the device configuration allows management of the device. See chapter 10 for information about device discovery. See "Network management configuration procedures" in the *5620 SAM System Administrator Guide* for information about performing device configuration backups.

15 Enter the following in sequence to verify the SNMP configuration:

```
configure log ↵

info ↵
```

The output is similar to the following:

```
snmp-trap-group 98

    description "5620sam"

    trap-target "xxx.xxx.xxx.xxx:mmm" address xxx.xxx.xxx.xxx
snmpv2c notify-community "privatetrap98"

    trap-target "yyy.yyy.yyy.yyy:nnn" address yyy.yyy.yyy.yyy
snmpv2c notify-community "privatetrap98"

exit

log-id 98

    from main security change

    to snmp 1024
```

```
exit
```

where

xxx.xxx.xxx.xxx is the IP address of the main server in a standalone 5620 SAM deployment, or one of the main servers in a redundant deployment

mmm is the SNMP port number

yyy.yyy.yyy.yyy is the IP address of the peer main server, if the 5620 SAM is deployed in a redundant configuration

nnn is the SNMP port number

Procedure 9-2 To commission an OmniSwitch for 5620 SAM management

See the appropriate OmniSwitch documentation for more information about the CLI command syntax and SNMP.

Note 1 — The 5620 SAM cannot discover an OmniSwitch that is configured with the factory default settings.

Note 2 — You must use a direct console port connection to access an OmniSwitch for the first time. All other management methods such as SNMP, Telnet, FTP, and HTTP, are disabled until you enable them.

1 Open a console window using a direct console port connection to the OmniSwitch.

2 Create a Loopback0 interface and assign an IP address to the interface by entering the following at the prompt:

`ip interface Loopback0 address` ***`xxx.xxx.xxx.xxx`*** ↵

where

xxx.xxx.xxx.xxx is the IP address of the interface

Note 1 — Loopback0 is the name assigned to an IP interface to identify an address that is used for network management purposes. The Loopback0 interface is not bound to any VLAN, therefore it always remains operationally active.

Note 2 — The Loopback0 interface name is case-sensitive. Ensure that you enter the name exactly as shown.

3 Enable SNMP sessions on the switch by entering the following at the prompt:

`aaa authentication snmp local` ↵

4 Enable FTP, Telnet, HTTP, or SSH sessions, if required, by entering the following at the prompt:

```
aaa authentication ftp local ↵

aaa authentication telnet local ↵

aaa authentication http local ↵

aaa authentication ssh local ↵
```

5 Perform one of the following to configure the required version of SNMP on the switch and the 5620 SAM:

The OmniSwitch default user, admin, does not have SNMP access. Before the 5620 SAM can discover an OmniSwitch, you must create at least one user on the switch with SNMP access.

a For SNMP v2c:

i Configure an SNMP v2 user by entering the following at the prompt:

```
user user_name password password no auth ↵
```

where
user_name is a username that corresponds to an SNMP v2 user who the 5620 SAM can identify; Alcatel-Lucent recommends that you use the name sam, which is the 5620 SAM default name
password is a password associated with the username; the password is between 8 and 47 characters

Note — If you need to use a different SNMPv2 default user name, create an SNMPv2 default user name on the 5620 SAM. See "To create a default SNMPv2 OmniSwitch user on a 5620 SAM system" in the *5620 SAM System Administrator Guide* for information about creating an SNMPv2 default user name.

ii Configure SNMP v2 trap forwarding to the 5620 SAM by entering the following at the prompt:

```
snmp station xxx.xxx.xxx.xxx v2 user_name ↵
```

where
xxx.xxx.xxx.xxx is the IP address of the 5620 SAM main server
user_name is the username that you created in step i

Trap forwarding configuration occurs automatically when the 5620 SAM discovers a switch and uses the default SNMP v2 user name sam or the user name configured, if any.

iii Configure an SNMP security level that allows the switch to accept all SNMP queries by entering the following at the prompt:

```
snmp security no security ↵
```

iv Configure an SNMP v2 community string by entering the following at the prompt:

snmp community map *community_string* user *user_name* ↵

where
community_string is the name of an SNMP v2 community string that the 5620 SAM can identify
user_name is the SNMP v2 username created in step i

v Create a mediation security policy on the 5620 SAM that uses a community string that matches the string created in step iv. See Procedure 10-4 for information about creating a mediation security policy.

vi Create a discovery rule on the 5620 SAM to discover the switch and reference the policy created in step v. See Procedure 10-7 for information about creating a discovery rule.

b For SNMP v3:

If you need to discover an OmniSwitch using SNMP v3 you must create an SNMP v3 user on the switch that matches an SNMP v3 user defined on the 5620 SAM.

i Configure an SNMP v3 user on the switch by entering the following at the prompt:

user *user_name* password *password security_level* ↵

where
user_name is a username that matches an SNMP v3 USM username configured on the 5620 SAM
password is a password associated with the username; the password is between 8 and 47 characters. The password is the plain text ASCII MD5/SHA authentication key and DES privacy key.
security_level is MD5, MD5 + DES, SHA, or SHA + DES

ii Configure SNMP v3 trap forwarding to the 5620 SAM by entering the following at the prompt:

snmp station *xxx.xxx.xxx.xxx* v3 *user_name* ↵

where
xxx.xxx.xxx.xxx is the IP address of the 5620 SAM main server
user_name is the username created in step i

Trap forwarding occurs automatically when the 5620 SAM discovers a device with a username that matches the SNMP v3 USM username specified in the 5620 SAM mediation policy.

iii Configure the SNMP v3 switch security option that you need by entering the following at the prompt:

snmp security *security_option* ↵

where *security_option* is one of the security options described in Table 9-2

Table 9-2 SNMP security options

Option	Description
no security	All SNMP queries are accepted.
authentication set	Includes: • SNPM v1 and v2 Gets • Non-authenticated v3 Gets and Get-Nexts • Authenticated v3 Sets, Gets, and Get-Nexts • Encrypted v3 Sets, Gets, and Get-Nexts
authentication all	Includes: • Authenticated v3 Sets, Gets, and Get-Nexts • Encrypted v3 Sets, Gets, and Get-Nexts
privacy set	Includes: • Authenticated v3 Gets and Get-Nexts • Encrypted v3 Sets, Gets, and Get-Nexts
privacy all (default)	Includes: • Encrypted v3 Sets, Gets, and Get-Nexts
traps only	Includes: • All SNMP requests are rejected

iv Create an SNMP v3 user on the 5620 SAM using the NE User Configuration manager. See "NE user and device security" in the *5620 SAM System Administrator Guide* for information about NE user configuration.

- Enable SNMP to give the SNMP v3 user SNMP access.
- Choose a username that matches the name created on the switch in step i.
- Choose the same SNMP v3 authentication protocol, privacy protocol, and password that is configured on the switch.

v Create an SNMP v3 mediation security policy. See Procedure 10-4 for information about configuring a mediation security policy.

- Choose the SNMP v3 (USM) security model option.
- Choose a username that matches the name created on the switch in step i.

vi Create a discovery rule that uses the mediation security policy created in step v. See Procedure 10-7 for information about creating discovery rules.

6 Use a 5620 SAM client to discover the switch and to verify that the switch configuration allows you to manage the switch.

Procedure 9-3 To configure the 5620 SAM SNMP trap sources

Perform this procedure to configure the sources of SNMP traps associated with log ID 98. If no SNMP log ID on a device matches the log ID in the 5620 SAM configuration, the 5620 SAM recreates the log ID and SNMP trap group on the device, which results in a single log file that receives traps from the following sources:

- main
- security—always included as an SNMP source
- change—supported by the 5620 SAM for the 7950 XRS and for the 7750 SR, Release 9.0 and later

Caution — This procedure requires a restart of each 5620 SAM main server, which is service-affecting. Perform this procedure only during a scheduled maintenance window.

1 If the 5620 SAM is deployed in a standalone configuration, go to step 6.

2 Perform the following steps to stop the standby main server.

i Log in to the standby main server station as the samadmin user.

ii Open a console window.

iii Enter the following to change to the server binary directory:

```
bash$ cd path/nms/bin ↵
```

where *path* is the main server installation location, typically /opt/5620sam/server

iv Enter the following to stop the main server application:

```
bash$ ./nmsserver.bash stop ↵
```

v Enter the following to display the main server status:

```
bash$ ./nmsserver.bash appserver_status ↵
```

The command displays a status message.

vi The main server is stopped when the command displays the following status message:

```
Application Server is stopped
```

If the command displays a different message, wait 5m and repeat step 2 v. Do not proceed to the next step until the server is stopped.

3 Perform steps 6 to 13 on the primary main server station.

4 Perform steps 6 to 13 on the standby main server station.

5 Go to step 14.

6 Log in to the main server station as the samadmin user.

7 Open the *path*/nms/config/nms-server.xml file using a plain-text editor

where *path* is the 5620 SAM server installation location, typically /opt/5620sam/server

Caution — Contact your Alcatel-Lucent technical support representative before you attempt to modify the nms-server.xml file. Modifying the nms-server.xml file can have serious consequences that can include service disruption.

8 Locate the following text section:

```
<snmp

ip="samserverIP"

port="nnn"

trapLogId="98"
```

where
samserverIP is the IP address of the 5620 SAM main server
nnn is the SNMP port number

This default configuration applies to traps from main, security, and change, if available.

9 Perform one of the following.

a To restrict the trap source to main only, add the following line:

```
logIdSourceBits="80"
```

b To restrict the trap source to main and change, add the following line:

```
logIdSourceBits="A0"
```

10 Save and close the nms-server.xml file.

11 Open a console window.

12 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

13 Enter the following to restart the main server:

```
bash$ ./nmsserver.bash force_restart ↵
```

The main server restarts, and the configuration change takes effect.

14 Close the console windows, as required.

Procedure 9-4 To configure polling for a 7450 ESS, 7705 SAR, 7710 SR, 7750 SR, or 7950 XRS

1 Choose Equipment or Routing from the navigation tree view selector. The managed devices are displayed.

2 Right-click on an icon that represents a 7750 SR, 7450 ESS, 7710 SR, 7705 SAR, or 7950 XRS and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Record the system IP address and the management IP address. Configure the Location and Current OLC State parameters, if required.

4 Click on the Polling tab.

5 Click on the General tab.

6 Specify whether scheduled polling is enabled or disabled using the Scheduled Polling parameter. Scheduled polling is configured using the Mediation configuration form. See Procedure 10-4 for more information.

7 Configure the Redundant Synchronization Mode parameter.

8 Verify that the Persistent SNMP Indices parameter is set to true to ensure persistent SNMP indices are used.

9 Configure the parameters:

- Primary DNS
- Secondary DNS
- Tertiary DNS
- DNS Domain
- Separate LI Administration
- LI Local Save Allowed

Note 1 — To configure LI parameters, you require LI user privileges.

Note 2 — To view LI configuration information, you need LI privileges. Right-click on a discovered device in the navigation tree and choose Properties from the contextual menu, and click on the LI Configuration Status tab.

10 View the read-only parameters to determine the current polling status:

- Resync Status indicates whether the last poll was successfully completed.
- Last Resync Start Time and Last Resync End Time indicate the start and finish of the last poll.
- Scheduled Resync Status indicates whether the last scheduled poll was successfully completed.
- Last Scheduled Resync Start Time and Last Scheduled Resync End Time indicate the start and finish of the last scheduled poll.

11 Click on the Management tab.

12 Configure the following parameters to specify an L3 management interface for in-band management, if required:

- L3 Management Interface
- Enable L3 Management Interface

13 Configure the following parameters:

- Active Management IP
- Auto Revert to Preferred
- Management IP Selection
- Primary Route Preference
- Secondary Route Preference

Note 1 — The Auto Revert to Preferred parameter is configurable when the Management IP Selection parameter is set to Out Of Band Preferred or In Band Preferred.

Note 2 — To avoid a communications outage between the 5620 SAM and managed NEs, the parameter settings in the Management Preference panel must match the parameter settings in the Notifications Preferred Management panel. See the Management IP Selection parameter description for more information.

Note 3 — If you want to transmit on in-band management on the 7705 SAR when both in-band and out-of-band management are both used, configure the Active Management IP, Auto Revert to Preferred, and Management IP Selection parameters as described in "7705 SAR management bandwidth".

14 Click on the OK button. A dialog box appears.

15 Click on the Yes button. The Network Element (Edit) form closes.

Procedure 9-5 To configure polling for a 7210 SAS

1 Choose Equipment or Routing from the navigation tree view selector. The managed devices are displayed.

2 Right-click on a device icon and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Record the system IP address and the management IP address. Configure the Location and Current OLC State parameters, if required.

4 Click on the Polling tab.

5 Specify whether scheduled polling is enabled or disabled using the Scheduled Polling parameter. Scheduled polling is configured using the Mediation configuration form. See Procedure 10-4 for more information.

6 Verify that the Persistent SNMP Indices parameter is set to true to ensure that persistent SNMP indices are used.

7 Configure the parameters in the Bof Configuration panel, if required:

- Primary DNS
- Secondary DNS
- Tertiary DNS
- DNS Domain

8 View the read-only parameters to determine the current polling status:

- Resync Status indicates whether the last poll was successfully completed.
- Last Resync Start Time and Last Resync End Time indicate the start and finish of the last poll.
- Scheduled Resync Status indicates whether the last scheduled poll was successfully completed.
- Last Scheduled Resync Start Time and Last Scheduled Resync End Time indicate the start and finish of the last scheduled poll.

9 Click on the Management tab.

10 On the In Band panel, configure the parameters:

- L3 Management Interface
- Enable L3 Management Interface

11 On the Management Preference panel, configure the parameters:

- Active Management IP
- Auto Revert to Preferred
- Management IP Selection

Note 1 — The Active Management IP, Auto Revert to Preferred, and Management IP Selection parameters are configurable only on the 7210 SAS-D 6F 4T and 7210 SAS-D 6F 4T ETR (Release 3.0 or later), the 7210 SAS-E, and the 7210 SAS-M. The 7210 SAS-X Release 3.0R2 or later supports a Management IP Selection value of Out of Band Preferred.

Note 2 — The Auto Revert to Preferred parameter is configurable when the Management IP Selection parameter is set to Out Of Band Preferred, In Band Preferred, or In Band Only.

12 On the Notifications Preferred panel, configure the following parameters:

- Primary Route Preference
- Secondary Route Preference

13 You can configure two uplinks in the BOF for port redundancy. If the image path and configuration file path are local, you do not need to configure the IP address and routing information for uplink A and uplink B. You can optionally obtain IP parameters using DHCP when you configure a value of 0 for the uplink port IP address. The DHCP server should be configured to provide the IP address and the default gateway information that is used to reach the server where the image and configuration files are stored.

14 Click on the 7210 BOF tab and on the Select button in the Uplink A panel to choose an uplink port. The Select Port - Uplink Bof Configuration search form opens.

15 Choose a port from the list and click on the OK button. The Select Port - Uplink Bof Configuration search form closes and the port name appears in the Uplink A panel.

16 Configure the following parameters in the Uplink A panel:

- IP Address
- Mask
- VLAN ID

17 Click on the Select button in the Uplink B panel to choose an uplink port. The Select Port - Uplink Bof Configuration search form opens.

18 Choose a port from the list and click on the OK button. The Select Port - Uplink Bof Configuration search form closes and the port name appears in the Uplink B panel.

19 Configure the following parameters in the Uplink B panel:

- IP Address
- Mask
- VLAN ID

20 Click on the Uplink Routes tab and on the Create button. The Uplink Route Configuration (Create) form opens.

21 Configure the following parameters:

- Uplink
- Route Destination
- Mask
- Next Hop

22 Click on the Apply button if you need to add more than one uplink route or the OK button if you only need to add one route. A dialog box appears.

23 Click on OK to save your configuration.

24 Repeat steps 21 to 23 to add another uplink route. You can add up to ten routes for each uplink.

25 Click on the OK button. A dialog box appears.

26 Click on the Yes button to confirm the action. The Network Element (Edit) form closes.

Procedure 9-6 To edit polling settings for multiple devices

You can use the list of managed devices from the Discovery Manager Resync Status tab to modify polling settings for a device or devices; for example, when you want to enable or disable polling on numerous managed devices.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager (Edit) form opens.

2 Click on the Resync Status tab.

3 Select a device or devices from the list.

4 Click on the Properties button. When you choose multiple devices, the Network Element (Multiple Instances) (Edit) form opens.

You can only configure those parameters that are common to all devices selected from the list.

5 Click on the Polling tab.

6 Enable or disable polling using the Scheduled Polling parameter.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button to confirm the action. The Network Element (Edit) form closes.

9.5 Workflow to commission GNEs

The following workflow describes the sequence of high-level tasks required to commission a GNE prior to discovery by the 5620 SAM.

1 Create a CLI script to enable trap forwarding to each main server in the 5620 SAM system. See the device documentation for information about configuring SNMP trap targets. See "CLI scripts" in the *5620 SAM Scripts and Templates Developer Guide* for information about using the 5620 SAM to create CLI scripts.

2 Create a CLI script to disable trap forwarding to each main server in the 5620 SAM system. See the device documentation for information about configuring SNMP trap targets.

3 Prepare the device for 5620 SAM discovery and management using a GNE profile. See Procedure 9-7 to prepare a device other than a 400 AWY or 9500 MSS-1c, and Procedure 9-9 to prepare a 400 AWY or 9500 MSS-1c.

4 If required, configure or modify a GNE alarm catalog for use with a GNE profile.

- Create a GNE alarm catalog; see Procedure 9-12.
- Create a transform function for the alarm catalog; see Procedure 9-13.
- Add an alarm mapping to the alarm catalog; see Procedure 9-14.

5 If required, enable the cross launch of a 9400 AWY or 9500 MSS-1c J-USM manager; see Procedure 9-17.

9.6 GNE commissioning procedures

The following procedures describe how to prepare a GNE for 5620 SAM management, and how to modify a GNE configuration after device discovery.

Procedure 9-7 To prepare a GNE for 5620 SAM management

Perform this procedure to prepare a GNE, which is typically a non-Alcatel-Lucent device, for 5620 SAM discovery and management.

Note 1 — To prepare a 9400 AWY or 9500 MSS-1c for 5620 SAM management, see Procedure 9-9.

Note 2 — See the *5620 SAM Management of OEM WT Products* application note on OLCS to obtain specific configuration information for the following GNEs:

- 9500 MPT-GC
- Radwin 2000
- Radwin 5000
- SUB 10 v320
- Siklu EH-1200

1 Preconfigure the device using a CLI. Perform the following steps.

i Enable FTP.

ii Enable Telnet.

iii Enable SNMP.

iv Configure at least one SNMPv1, SNMPv2c, or SNMPv3 community.

v Set the SNMP PDU size to 9216.

vi Enable persistent SNMP indexes.

2 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

3 Click on the Create button and choose Create Generic NE Profile. The Generic NE Profile (Create) form opens.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Generic NE Type
- Generic NE Category
- Sys Object ID
- Description
- Default Element Manager URL
- Alternate Element Manager
- Chassis MAC Object ID
- CLI Supported

Note 1 — The Sys Object ID parameter must begin with the following, which identifies the SMI enterprises subtree defined in RFC 1213:

.1.3.6.1.4.1

Note 2 — Do not enclose the Alternate Element Manager value in quotation marks; the 5620 SAM automatically encloses the value in quotation marks at run time.

Note 3 — To specify the target GNE IP address in the Default Element Manager URL or as a Default Alternate Element Manager command argument, use the %IP% keyword.

Note 4 — You cannot modify the Generic NE Type parameter after the GNE profile is created; you must delete the GNE profile and create a profile using the new Generic NE Type parameter value.

5 Click on the CLI Profile tab and configure the parameters:

- Command Prompt
- Max Number Of Sessions
- Telnet Port
- Pre Login Prompt
- Write Login Prompt
- Write Password Prompt
- Read Login Prompt
- Read Password Prompt
- Error Indicator
- Disable Paging Command
- Reset Command
- Login Timeout (seconds)
- Negotiation Delay (milliseconds)
- Execution Command Timeout (seconds)
- Login Prompt Optional
- Idle Session Warning Message
- Add CR to LF
- Drop Character After Invalid CR

6 Configure the following parameters if a login confirmation prompt appears:

- Enable Confirm Prompt
- Prompt
- Answer

The Prompt and Answer parameters are configurable when the Enable Confirm Prompt parameter is selected.

7 Configure the following parameters for a second level of login security, if required:

- Enable Second Login
- Enable Login Command
- Enable Login Prompt

The Enable Login Command and Enable Login Prompt parameters are configurable when the Enable Second Login parameter is selected.

8 To configure an interface for the GNE, perform the following steps.

i Click on the Interface Types tab.

ii Click on the Add button and use the Select Generic NE Interface Type form that opens to choose an interface type.

9 To associate one or more routing MIBs with the GNE profile, perform the following steps.

Note 1 — After you discover the device using the GNE profile, you can use the Routing view in the network navigation tree to view the discovered routing objects.

Note 2 — You must configure the GNE interface types before you associate a routing MIB with a GNE profile. Otherwise, you must perform a customized NE resync of all MIBs and select the Ignore Timestamps parameter.

i Click on the Routing MIBs tab.

Note — The Routing MIBs tab is dimmed if you do not have a valid 5650 CPAM license that has a third-party router quantity greater than zero. See "5650 CPAM routine system maintenance" in the *5650 CPAM User Guide* for information about 5650 CPAM licenses.

ii Click on the Add button. The Select Generic NE Routing MIB form is displayed.

iii Configure the filter and click on the Search button. The supported routing MIBs are listed.

iv Select one or more MIBs and click on the OK button. The MIBs are listed on the Generic NE Profile (Create) form.

10 Click on the Apply button. A dialog box appears.

11 Click on the Yes button. The form name changes to Generic NE Profile (Edit) and the Trap Configuration tab is enabled.

12 Click on the Trap Configuration tab.

13 Click on the Select button in the Trap Configuration Script panel and use the form that opens to choose a script. During device discovery, the 5620 SAM runs the script on the GNE to enable trap forwarding to the 5620 SAM.

14 Click on the Select button in the Trap De-Configuration Script panel and use the form that opens to choose a script. During device discovery, the 5620 SAM runs the script on the GNE to enable trap forwarding to the 5620 SAM.

15 Click on the Select button in the Alarm Catalogue panel and use the form that opens to choose an alarm catalog.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The Generic NE Profile (Edit) form closes.

18 Close the Generic NE Manager form.

Procedure 9-8 To configure an alternate EMS for a specific GNE

Perform this procedure to specify an alternate EMS client application for a specific NE.

Note — The EMS that you specify overrides an EMS specified in the associated GNE profile.

1 Right-click on a GNE object in the network navigation tree and choose Properties from the contextual menu. The GNE properties form opens.

2 Configure the Alternate Element Manager parameter.

Note 1 — Do not enclose the Alternate Element Manager value in quotation marks; the 5620 SAM automatically encloses the value in quotation marks at run time.

Note 2 — To specify the target GNE IP address as an Alternate Element Manager command argument, use the %IP% keyword.

3 Click on the OK button. A dialog box appears.

4 Click on the Yes button. The GNE properties form closes.

Procedure 9-9 To prepare a 9400 AWY or 9500 MSS-1c for 5620 SAM management

5620 SAM management of a 9400 AWY or 9500 MSS-1c requires a GNE profile. Perform this procedure to prepare a 9400 AWY or 9500 MSS-1c for 5620 SAM discovery and management using a GNE profile.

Note — After you perform the procedure, each new profile is the default GNE profile for the device type.

1 Choose Administration→Mediation from the 5620 SAM main menu. The Mediation (Edit) form opens with the General tab displayed.

2 Record the Trap Destination Port value in the SNMP Trap panel.

3 Close the Mediation (Edit) form.

4 Register the 5620 SAM SNMP IP address with the 9400 AWY or 9500 MSS-1c. Perform the following steps.

- **i** Open the MCT or Multi-version NEtO.
- **ii** Open the required 9400 AWY or 9500 MSS-1c.
- **iii** Use the Trusted SNMP Manager option in the navigation tree to register the 5620 SAM IP address.
- **iv** Configure the Traps UDP Port for the 9400 AWY or 9500 MSS-1c using the Trap Destination Port value recorded in step 2.
- **v** Enter Network Manager Layer as the Type.
- **vi** Close the MCT or Multi-version NEtO.

5 Perform the following steps on each 5620 SAM main server station.

- **i** Log in to the main server station as the samadmin user.
- **ii** Open the *path*/nms/config/nms-server.xml file using a plain-text editor

  where *path* is the 5620 SAM server installation location, typically /opt/5620sam/server

Caution — Contact Alcatel-Lucent technical support before you attempt to modify the nms-server.xml file. Modifying the nms-server.xml file can have serious consequences that can include service disruption.

- **iii** Locate the line that begins with the following:

  ```
  systemGNEProfileNames=
  ```

iv Edit the line to read as one of the following, depending on the NE types that you want to manage:

- systemGNEProfileNames="MSS1c"
- systemGNEProfileNames="9400AWY"
- systemGNEProfileNames="MSS1c, 9400AWY"

v Save and close the nms-server.xml file.

6 If the 5620 SAM system is deployed in a redundant configuration, perform the following steps on the standby main server.

i Log in to the main server station as the samadmin user.

ii Open a console window.

iii Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

iv Enter the following to restart the main server:

```
bash$ ./nmsserver.bash force_restart ↵
```

The main server restarts and reads the updated configuration.

v Close the console window.

7 Perform the following steps on one of the following:

- the main server in a standalone deployment
- the primary main server in a redundant deployment

i Log in to the main server station as the samadmin user.

ii Open a console window.

iii Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

iv Enter the following:

```
bash$ ./nmsserver.bash read_config ↵
```

The main server reads the updated configuration and creates the GNE profiles.

v Close the console window.

8 Configure Discovery Manager for the required 9400 AWY or 9500 MSS-1c devices using the following:

- default SNMPv2 read-write access policy settings
- “SNMP-trap” as the SNMP community string

9 Ensure that a new group is created in the Equipment view of the network navigation tree, and that the group contains the required NEs.

10 To auto-populate the alarms catalog, perform the following steps.

Note — After you auto-populate an alarm catalog, the 5620 SAM processes the traps that are received from a GNE and raises alarms, as required; however, the 5620 SAM does not process the existing traps on a GNE.

i Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

ii Click on the Search button. A list of GNE profiles is displayed.

iii Select the new GNE profile and click on the Properties button. The Generic NE Profile (Edit) form opens with the General tab displayed.

iv Click on the Populate Alarm Catalogue button. If the Populate Alarm Catalogue button is not present, click on the More Actions button and choose Populate Alarm Catalogue from the drop-down list. The 5620 SAM creates the alarm catalog.

v Click on the Trap Configuration tab.

vi Click on the Select button in the Alarm Catalogue panel and use the form that opens to specify an alarm catalog.

vii Click on the Interface tab.

viii Add each interface that is to send traps.

ix Generate new traps from the 9400 AWY or 9500 MSS-1c. The 5620 SAM alarm window displays the alarms.

Procedure 9-10 To modify a GNE profile

Perform this procedure to change a GNE profile configuration.

1 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

2 Choose Generic NE Profile (Generic NE) in the object drop-down list and click on the Search button. A list of GNE profiles is displayed.

3 Select a GNE profile in the list and click on the Properties button. The Generic NE Profile (Edit) form opens with the General tab displayed.

The following tabs contain configurable parameters:

- General—contains parameters that identify the GNE type
- CLI Profile—contains parameters that define the console window prompts and commands
- Trap Configuration—contains parameters that define the SNMP trap management configuration
- Interface Types—allows the association of multiple types of interfaces with the GNE profile

Caution — If you modify the list of interfaces on the Interface Types tab, you must resynchronize the entire GNE, as described in step 8.

4 Modify the parameters for the GNE profile, as required.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Generic NE Profile (Edit) form closes.

7 Close the Generic NE Manager form.

8 If you modify the list of interfaces on the Interface Types tab, perform the following steps.

i Right-click on the GNE in the 5620 SAM topology map and choose Resync→Customized Resync from the contextual menu. The Resync Site(s) form opens with the Resync Options panel displayed.

ii Click on the Next button. The Force Resync panel is displayed.

iii Select the Ignore Timestamps parameter.

iv Click on the Finish button. The 5620 SAM resynchronizes the GNE.

v Close the Resync Site(s) form.

Procedure 9-11 To delete a GNE profile

Note 1 — You cannot delete a GNE profile that is associated with a managed GNE. You must unmanage the GNEs associated with a GNE profile before you can delete the profile.

Note 2 — You cannot delete a GNE profile when a GNE associated with the profile is a target of a CLI script. See “Script management” in the *5620 SAM Scripts and Templates Developer Guide* for more information about CLI script management.

1 Unmanage and delete the GNEs that are managed using the GNE profile. See chapter 10 for more information.

2 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

3 Choose Generic NE Profile (Generic NE) in the object drop-down list and click on the Search button. A list of GNE profiles is displayed.

4 Select a profile in the list and click on the Delete button. A dialog box appears.

5 Click on the Yes button. The 5620 SAM deletes the GNE profile.

6 Close the Generic NE Manager form.

Procedure 9-12 To create a GNE alarm catalog

Perform this procedure to create an alarm catalog for use with a GNE profile.

1 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

2 Click on the Create button and choose Create Generic NE Alarm Catalogue. The Generic NE Alarm Catalogue (Create) form opens.

3 Configure the parameters:

- Catalogue Name
- Description
- Version

4 Perform steps 3 to 18 of Procedure 9-13 to create a transform function for the catalog, if required.

5 Click on the Mappings tab.

6 Click on the Create button to create a raising alarm mapping. The Generic NE Alarm Mapping (Create) form opens.

7 Configure the following parameters:

- Trap OID
- Trap Name
- Administrative State
- FDN Extension
- Additional Text
- Use Default Additional Text

8 Perform one of the following using the parameters in the Alarm Name panel.

a Specify a static alarm name by configuring the Alarm Name parameter.

b Specify a dynamic alarm name. Perform the following steps.

i Select the Specify Transform Function parameter.

ii Click on the Select button beside the Varbind Transform Function parameter. The Select Transform Function form opens.

iii Select a transform function in the list and click on the OK button. The Select Transform Function form closes, and the transform function name is displayed on the Generic NE Alarm Mapping (Create) form.

iv Configure the Varbind Position parameter.

9 Perform one of the following using the parameters in the Probable Cause panel.

a Specify a static probable cause. Perform the following steps.

i Click on the Select button beside the Probable Cause parameter. The Select Property form opens with a list of probable causes displayed.

ii Select a probable cause in the list and click on the OK button. The probable cause is displayed on the Generic NE Alarm Mapping (Create) form.

b Specify a dynamic probable cause. Perform the following steps.

i Select the Specify Transform Function parameter.

ii Click on the Select button beside the Varbind Transform Function parameter. The Select Transform Function form opens.

iii Select a transform function in the list and click on the OK button. The Select Transform Function form closes, and the transform function name is displayed on the Generic NE Alarm Mapping (Create) form.

iv Configure the Varbind Position parameter.

10 Perform one of the following using the parameters in the Severity panel.

a Specify a static severity by configuring the Severity parameter.

b Specify a dynamic severity. Perform the following steps.

Note — When you specify the use of a transform function for the alarm severity, the Mapping Type changes to Raising/Clearing. You cannot create a clearing mapping for this type of mapping; you must use a transform function to clear an alarm when the alarm severity is defined using a transform function.

i Select the Specify Transform Function parameter.

ii Click on the Select button beside the Varbind Transform Function parameter. The Select Transform Function form opens.

iii Select a transform function in the list and click on the OK button. The Select Transform Function form closes, and the transform function name is displayed on the Generic NE Alarm Mapping (Create) form.

iv Configure the Varbind Position parameter.

11 Configure the varbind positions for specific objects on a GNE in the Alarmed Object panel:

- System Address Varbind Position
- Interface Index Varbind Position

Note — In order to configure the System Address Varbind Position and Interface Index Varbind Position parameters, you must set the Alarm Name parameter to GNE MTIE Alarm.

12 Click on the OK button. A dialog box appears.

13 Click on the OK button. The Generic NE Alarm Mapping (Create) form closes, and the new alarm mapping is listed on the Generic NE Alarm Catalogue (Create) form.

14 Repeat steps 6 to 13 to create an additional raising alarm mapping, if required.

15 If you do not need to create a clearing alarm mapping, go to step 25.

16 To create a clearing alarm mapping, select a raising alarm mapping in the list and click on the Create Clearing button. The Generic NE Alarm Mapping (Create) form opens.

Note 1 — A raising alarm mapping is indicated by the word Raising in the Mapping Type list column.

Note 2 — You can create a clearing alarm mapping only when the corresponding raising alarm is in the same alarm catalog.

Note 3 — You can associate a clearing alarm mapping with only one raising alarm mapping.

Note 4 — You cannot create a clearing mapping for a mapping that uses a transform function to define the alarm severity; you must use a transform function to clear an alarm when the alarm severity is defined using a transform function.

17 Configure the parameters:

- Trap OID
- Trap Name
- Administrative State
- FDN Extension
- Additional Text
- Use Default Additional Text

Note 1 — A static clearing alarm mapping inherits the following values from the associated raising alarm:

- Alarm Name—must match raising alarm Alarm Name
- Probable Cause—must match raising alarm Probable Cause
- FDN Extension—resulting text string must match text string generated by raising alarm mapping
- Additional Text—resulting text string must match text string generated by raising alarm mapping

See Procedure 9-15 for information about modifying the Alarm Name or Probable Cause value.

Note 2 — The explicit FDN Extension and Additional Text values can differ from the values in the raising mapping, but the generated text strings must match. For example, if the object name is in varbind 2 of the raising trap and in varbind 3 of the clearing trap, the parameter values name different varbinds but the script output is identical.

Note 3 — The alarm severity in a clearing alarm mapping is set to Cleared and cannot be changed.

18 Perform the following steps to specify a dynamic alarm name, if required, using the parameters in the Alarm Name panel.

i Select the Specify Transform Function parameter.

ii Click on the Select button beside the Varbind Transform Function parameter. The Select Transform Function form opens.

iii Select a transform function in the list and click on the OK button. The Select Transform Function form closes, and the transform function name is displayed on the Generic NE Alarm Mapping (Create) form.

iv Configure the Varbind Position parameter.

19 Perform the following steps to specify a dynamic probable cause, if required, using the parameters in the Probable Cause panel.

i Select the Specify Transform Function parameter.

ii Click on the Select button beside the Varbind Transform Function parameter. The Select Transform Function form opens.

iii Select a transform function in the list and click on the OK button. The Select Transform Function form closes, and the transform function name is displayed on the Generic NE Alarm Mapping (Create) form.

iv Configure the Varbind Position parameter.

20 Click on the OK button. A dialog box appears.

21 Click on the OK button. The Generic NE Alarm Mapping (Create) form closes, and the new alarm mapping is listed on the Generic NE Alarm Catalogue (Create) form.

22 Repeat steps 16 to 21 to create and additional clearing alarm mapping, if required.

23 Click on the OK button. A dialog box appears.

24 Click on the OK button. The Generic NE Alarm Mapping (Edit) form closes.

25 Click on the OK button. A dialog box appears.

26 Click on the Yes button. The Generic NE Alarm Catalogue (Edit) form closes.

27 Close the Generic NE Manager form.

Procedure 9-13 To create a transform function for a GNE alarm catalog

1 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

2 Click on the Create button and choose Create Generic NE Alarm Catalogue. The Generic NE Alarm Catalogue (Create) form opens.

3 Click on the Transform Functions tab.

4 Click on the Create button. The Generic NE Alarm Transform Function (Create) form opens.

5 Configure the parameters:

- Transform Function Name
- Out Value Type
- Specify Default Out Value

6 If you enable the Specify Default Out Value parameter, click on the Select button beside the Default Out Value parameter. The Select Property form opens. Otherwise, go to step 8.

7 Select a value in the list and click on the OK button. The Select Property form closes, and the value is displayed on the Generic NE Alarm Transform Function (Create) form.

8 Click on the Pairs tab.

9 Click on the Create button. The Pair (Create) form opens.

10 Configure the In Value parameter.

11 Click on the Select button beside the Out Value parameter. The Select Property form opens.

12 Select a value in the list and click on the OK button. The value is displayed on the Pair (Create) form.

13 Click on the OK button. A dialog box appears.

14 Click on the OK button. The Pair (Create) form closes, and the value pair is listed on the Generic NE Alarm Transform Function (Create) form.

15 Repeat steps 9 to 14 to add another value pair, if required.

16 Click on the OK button. A dialog box appears.

17 Click on the OK button. The Generic NE Alarm Transform Function (Create) form closes, and the transform function is listed on the Generic NE Alarm Catalogue (Edit) form.

18 Repeat steps 4 to 17 to create another transform function, if required.

19 Click on the OK button. A dialog box appears.

20 Click on the Yes button. The Generic NE Alarm Catalogue (Edit) form closes.

21 Close the Generic NE Manager form.

Procedure 9-14 To add an alarm mapping to a GNE alarm catalog

Note — A modification to a GNE alarm catalog takes effect immediately after you commit the change.

1 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

2 Choose Generic NE Alarm Catalogue (Trap to Alarm Mapper) in the object drop-down list and click on the Search button. A list of GNE alarm catalogs is displayed.

3 Select an alarm catalog in the list and click on the Properties button. The Generic NE Alarm Catalogue (Edit) form opens with the General tab displayed.

4 Configure the Description and Version parameters, if required.

5 Perform steps 5 to 27 in Procedure 9-12.

Procedure 9-15 To modify or delete a GNE alarm mapping

1 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

2 Choose Generic NE Alarm Catalogue (Trap to Alarm Mapper) in the object drop-down list and click on the Search button. A list of GNE alarm catalogs is displayed.

3 Select an alarm catalog in the list and click on the Properties button. The Generic NE Alarm Catalogue (Edit) form opens with the General tab displayed.

4 Click on the Mappings tab.

5 Perform one of the following.

a Modify the mapping. Perform the following steps.

Note — A modification to a GNE alarm mapping takes effect immediately after you commit the change.

i Select a mapping in the list and click on the Properties button.The Generic NE Alarm Mapping (Edit) form opens.

Note — To change the Alarm Name value in a raising alarm mapping and in the associated clearing alarm mapping, you must do one of the following:

- Configure the parameter in each mapping simultaneously by selecting both mappings before you click on the Properties button.
- Configure the parameter in one mapping at a time and commit the changes to the catalog only after both mappings are modified.

ii Configure the following parameters:

- Trap Name
- Administrative State
- Alarm Name
- Severity
- FDN Extension
- Additional Text
- Use Default Additional Text

iii Click on the Select button beside the Probable Cause parameter. The Select Property - Generic NE Alarm Mapping form opens with a list of probable causes displayed.

iv Select a probable cause in the list and click on the OK button. The probable cause is displayed on the Generic NE Alarm Mapping form.

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The Generic NE Alarm Mapping (Create) form closes.

b Delete the mapping. Perform the following steps.

Note — When you delete a GNE raising alarm mapping, the associated clearing mapping is also deleted.

i Select a mapping in the list and click on the Delete button. A dialog box appears.

ii Click on the OK button. The 5620 SAM deletes the GNE alarm mapping.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Generic NE Alarm Catalogue (Edit) form closes, and the Generic NE Manager form reappears.

8 Close the Generic NE Manager form.

Procedure 9-16 To delete a GNE alarm catalog

Note 1 — You cannot delete an alarm catalog that is associated with a GNE profile. You must remove the alarm catalog from each associated GNE profile before you can delete the catalog.

Note 2 — When you delete a GNE alarm catalog, you delete the alarm mappings that the catalog contains.

1 Choose Administration→Generic NE Manager from the 5620 SAM main menu. The Generic NE Manager form opens.

2 Choose Generic NE Alarm Catalogue (Trap to Alarm Mapper) in the object drop-down list and click on the Search button. A list of GNE alarm catalogs is displayed.

3 Select an alarm catalog in the list and click on the Properties button. The Generic NE Alarm Catalogue (Edit) form opens with the General tab displayed.

4 Click on the Generic NE Profiles tab. The tab lists the GNE profiles to which the alarm catalog is assigned.

5 If no profiles are listed, go to step 8.

6 Perform the following steps to remove a profile association.

i Select a profile in the list and click on the Properties button. The Generic NE Profile (Edit) form opens with the General tab displayed.

ii Click on the Trap Configuration tab.

iii Click on the Clear button in the Alarm Catalogue panel. The Catalogue Name value is removed from the form.

iv Click on the OK button. A dialog box appears.

v Click on the Yes button. The Generic NE Profile (Edit) form closes, and the Generic NE Alarm Catalogue (Edit) form reappears.

7 Repeat step 6 for each listed profile.

8 Close the Generic NE Alarm Catalogue (Edit) form. The Generic NE Manager form reappears.

9 Select the alarm catalog in the list and click on the Delete button. A dialog box appears.

10 Click on the Yes button. The 5620 SAM deletes the GNE alarm catalog.

11 Close the Generic NE Manager form.

Procedure 9-17 To cross launch the 9400 AWY or 9500 MSS-1c J-USM manager

Perform this procedure to enable the cross launch of a Java-based EMS/craft terminal.

1 Perform Procedure 9-7 to discover the 9400 AWY or 9500 MSS-1c GNE.

2 Perform one of the following to specify the NEtO directory path:

Note — Option B is the preferred method.

a Configure the NEtO directory path on each NE. Perform the following steps.

i Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

ii Right-click on the 9400 AWY or MSS-1c GNE and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

iii Specify the directory name in the External EMS field.

b Configure and use the same NEtO directory path for all devices that are discovered using a discovery rule. Perform the following steps.

i Open the Discovery Manager form and choose the Discovery Rules tab.

ii Select the discovery rule for the NEs and click on the Properties button. The Topology Discovery Rule (Edit) form opens with the General tab displayed.

iii Specify the NEtO directory name in the Default External EMS field

Note — To cross launch a 9400 AWY NE, retain the NEtO software directory in your 5620 SAM client and remove any spaces in the NEtO directory path.

3 Click on the OK button. A dialog box appears.

4 Click on the Yes button. The Network Element (Edit) form closes.

5 Right-click on the GNE and choose External Element Manager from the contextual menu. The MCT/NEtO is launched.

10 — Device discovery

10.1 Device discovery overview *10-2*

10.2 Resynchronization of NEs *10-8*

10.3 Mediation and SNMP MIBs *10-9*

10.4 SSH security *10-9*

10.5 Server resource management *10-11*

10.6 SNMP event notification policies *10-11*

10.7 Workflow to discover network devices *10-12*

10.8 Device discovery procedures *10-14*

10.1 Device discovery overview

The 5620 SAM discovers devices using SNMP and stores the device properties in the 5620 SAM database. To discover one or more devices, you use the 5620 SAM Discovery Manager to create a discovery rule, and then scan the network for devices according to the IP addresses or address ranges specified in the rules.

A discovery rule contains one or more rule elements that specify which devices or subnets are to be included in, or excluded from, the discovery process. For example, you can configure one rule element to discover a subnet and another to exclude specific IP addresses from the subnet.

Note — The 5620 SAM does not attempt to discover tests or test suites that are configured locally on a device, for example, using a CLI.

When the system IP address, also called the system ID, is used to discover a device, the management is in-band. When the management IP address is used to discover a device, the management is out-of-band. See chapter 9 for information about in-band and out-of-band management.

Note — If you need to change the system name of a device, you must unmanage and delete the device from the 5620 SAM before you change the name, and then rediscover the device, See Procedures 10-16 and 10-18 for information about unmanaging and deleting devices.

A device can be in one of the following management states:

- managed—the 5620 SAM manages the device
- not managed—an operator has unmanaged the formerly managed device; the management information is removed from the 5620 SAM database
- suspended—an operator has suspended management of the device; see "Suspending device management" in this section for more information

Suspending device management

When you need to exclude a device from 5620 SAM management but do not want to lose the 5620 SAM information about the device, for example, during a maintenance period that may generate an exceptional number of SNMP traps, you can use a GUI or OSS client to suspend the management of the device.

Caution — When you suspend the management of a device, the 5620 SAM raises a critical alarm against the device.

When you suspend management of a device, the 5620 SAM removes the 5620 SAM trap target entries from the device configuration, and the following operations are subsequently blocked:

- SNMP deployment and trap handling; all traps from the device are dropped
- NETCONF deployments and event subscriptions

- statistics collection
- automated FTP and other file transfers
- GUI or OSS client configuration of device parameters; a configuration attempt results in a failed deployment
- scheduled and periodic operations that the 5620 SAM initiates, such as the following:
  - connectivity checks
  - resynchronizations
  - device configuration backups
  - device software upgrades
  - OAM test and test suite execution

Note 1 — You cannot suspend the management of a device while a software upgrade or configuration backup is in progress on the device.

Note 2 — If you attempt to modify an OAM test or test suite that is deployed to a suspended NE, the 5620 SAM raises an alarm. The alarm does not automatically clear when the NE is remanaged.

You can use the 5620 SAM to perform the following on a suspended device:

- open a Telnet or SSH CLI session
- execute CLI scripts
- open an FTP session
- configure 5620 SAM parameters that affect the device management but are not deployed, such as the in-band or out-of-band management preferences

As shown in Figure 10-1, when a device is suspended, the device icons in the network navigation tree and physical topology map are colored purple. The following icons are also colored purple to indicate that at least one device is suspended:

- parent group icon in the network navigation tree Equipment and Routing views
- parent group icon in the physical topology map

Note — The group icon colors are prioritized; when a group contains one or more unreachable NEs and one or more suspended NEs, the group icon is colored red.

Figure 10-1 GUI representation of suspended device

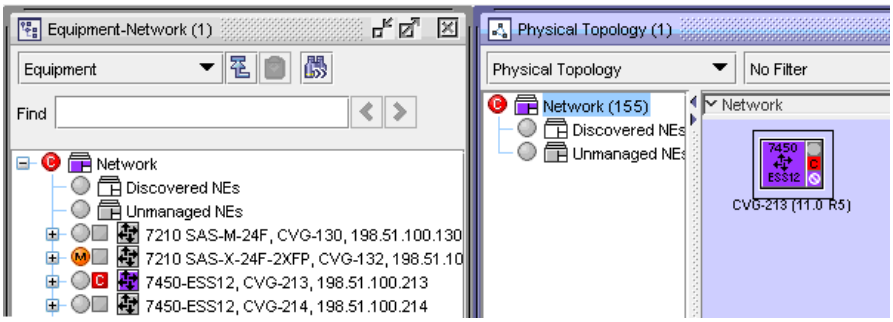


Figure 10-1 shows The Network equipment group. When a suspended device is in a group other than the Network group, only the lower right corner of the Network group icon is colored purple.

When you return a suspended device to the managed state, the 5620 SAM rediscovers the device to capture events such as device reboots or software release changes, and initiates a full device resynchronization based on the response to a trap sequence ID check.

Note — The 5620 SAM also checks the device management parameters to adapt to a switch from one type of management to another, for example, from in-band to out-of-band.

Unmanaging and deleting devices

Using the 5620 SAM to unmanage a device excludes the device from the managed network, but a reference to the device remains in the 5620 SAM discovery system. The unmanage function may be used for unusual conditions such as when the 5620 SAM requires a complete refresh of device data because of data corruption. Unmanaging a device results in a loss of management data for the selected device, which includes, but is not limited to, the following:

- object names and descriptions
- statistics
- alarms
- physical links
- policies
- script results
- scheduled activities
- device configuration backups

Deleting a device results in the complete loss of management data for the device and completely removes the device from the managed network.

Caution — Unmanaging or deleting a device results in the loss of all historical 5670 RAM AA statistics for the device.

Post-discovery actions

In a discovery rule, you can create and specify a post-discovery action to perform on the successfully discovered NEs included in the rule. The 5620 SAM performs the post-discovery action automatically at the end of rule execution.

A post-discovery action requires a 5620 SAM control script that manages the auto-configuration actions performed on discovered NEs.

For example, an operator specifies a control script as a post-discovery action in a discovery rule for a subnet. The control script co-ordinates the execution of device-specific child control scripts. The child control scripts call XML API scripts that each configure a group of discovered NEs, such as aggregation ring or IP backhaul NEs. After the 5620 SAM executes the discovery rule, it invokes the control script to auto-configure the successfully discovered NEs in the subnet.

Note — Because a post-discovery action is intended to be autonomous, the 5620 SAM displays an error message and halts a post-discovery action that requires user interaction.

See "Script management" in the *5620 SAM Scripts and Templates Developer Guide* for information about creating control scripts, and for information about viewing example scripts.

From the Managed State tab of the Discovery Manager form, you can do the following:

- List the post-discovery action associated with each managed NE.
- View the status of the script execution as it occurs.
- View the script run result.

The Node Discovery Control form of an NE displays additional information and allows post-discovery action management. See Procedure 10-9 for more information.

The following conditions apply to post-discovery actions.

- The 5620 SAM performs no logic validation of the associated scripts.
- Deletion of the associated control script is blocked.
- After a discovery rule runs, the action is not automatically executed on new NEs that are added to the rule. To execute the action on the new NEs, you must rescan the network using the rule.
- An action is performed on an NE only when the Full Resync Status of the NE is Full Resync Done.
- If a device fails discovery, the action is not performed, and the script execution status is Not Executed. Resynchronization of the NE does not invoke the script or change the execution status.
- If the control script execution fails, an alarm is raised.
- After a post-discovery action is performed on an NE:
  - Unmanaging and remanaging the NE has no effect.
  - Deleting and rediscovering the NE causes the action to be performed on the NE.

SNMP management

Simple Network Management Protocol, or SNMP, is an application-layer protocol that provides a message format to facilitate communication between SNMP managers and agents. SNMP provides a standard framework for NE monitoring and management from a central location.

An SNMP manager controls and monitors the activities of network hosts that use SNMP. An SNMP manager uses a get operation to obtain a value from an SNMP agent, and uses a set operation to store a value in the agent. The manager uses definitions from a management information base, or MIB, to perform operations on the managed device, for example, retrieving data values, replying to requests, and processing SNMP notifications called traps.

SNMPv1 and SNMPv2c provide no security, authentication, or encryption. Without authentication, an unauthorized user is able to perform SNMP network management functions and eavesdrop on management information as it passes from one system to another.

SNMPv3 requires that an authentication and encryption method such as SSH is assigned to each user for validation by the NE. SNMPv3 authentication and encryption enable an NE to validate the system that issues an SNMP message and to determine whether another system has tampered with the message.

For information about device-specific SNMP support, see the SNMP chapter of the appropriate *System Management Guide* for the device. For information about SSH security, see section 10.4.

IPv6 discovery

The 5620 SAM supports the discovery of devices that use IPv6 in-band or out-of-band management IP addresses. In order for the 5620 SAM to discover and manage a device that uses IPv6, the device must have an IPv6 address on the management port, system interface, or both. The 5620 SAM main server must also be given an IPv6 address during installation.

Note — To manage 7750 SR, 7710 SR, 7450 ESS, 7950 XRS devices using IPv6, the device must also be configured with an IPv4 address on the management port for out-of-band management, or an IPv4 address on the system interface for in-band management.

The IP version that the 5620 SAM uses to discover a device is specified in each discovery rule. If the 5620 SAM discovers both IPv4 and IPv6 addresses on the system interface of a device, it discovers the device using the address that corresponds to the IP version specified in the discovery rule.

Discovery and SNMP packet size

The network infrastructure carrying traffic between the 5620 SAM Servers/Auxiliaries and the managed NEs must support fragmentation and reassembly of the UDP packets for NEs that have an SNMP PDU size greater than the MTU configured for the network path between the NE and 5620 SAM. The 7210 SAS, 7450 ESS, 7705 SAR, 7710 SR, 7750 MG, 7750 SR, and 7950 XRS require an SNMP PDU size of 9216 bytes to be configured and fragmentation support is required in the network path between the 5620 SAM and the NE.

Consider the following:

- When an intermediate network device receives SNMP traffic, it must be able to process fragmentation of packets. If the SNMP packet exceeds the MTU size of the intermediate device, and the device does not support fragmentation of packets, the packets may be dropped and device discovery may fail.
- Verify that data payloads of the SNMP PDU size can travel from the managed devices to the 5620 SAM by using a CLI to ping the IP address of the 5620 SAM main server, using a packet size of the configured SNMP PDU. See "Packet size and fragmentation issues" in the *5620 SAM Troubleshooting Guide* for information about using traceroute and ping to verify packet transport.

9500 MPR radio link discovery and management

The 5620 SAM supports N x (1+x) radio [x = 0, 1] link discovery. To enable 9500 MPR radio link discovery and management, the 5620 SAM requires connectivity between the 9500 MPR NE radio ports, as shown in Figure 10-2 and described in Table 10-1.

Figure 10-2 Connectivity example for 9500 MPR radio link discovery and management

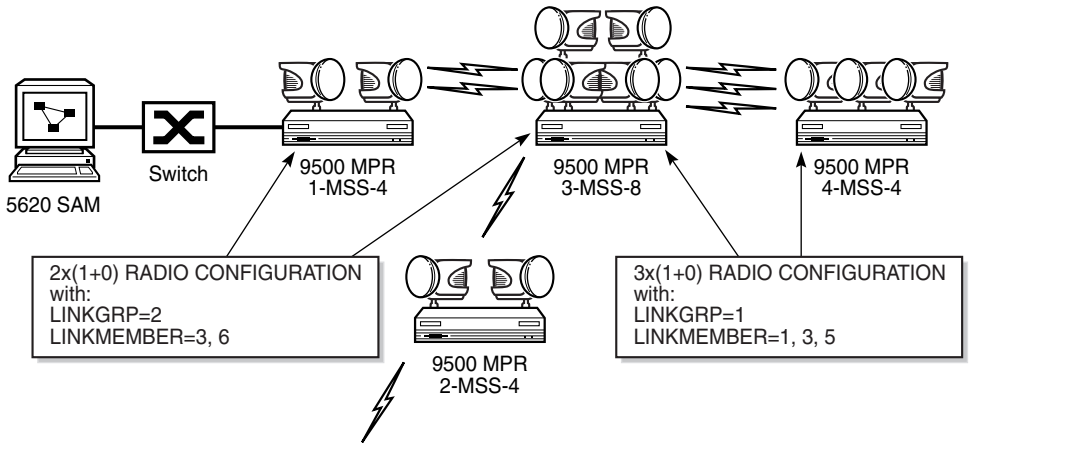

Table 10-1 Connectivity parameter details

	1-MMS-4	2-MSS-4	3-MSS-8	4-MSS-4
2-MSS-4	PPPRF Enabled LinkID (as assigned)	—	PPPRF Enabled LinkID (as assigned)	—
3-MSS-8	PPPRF Enabled LinkID (23, 23) PPPRF Disabled LinkID (26, 26)	PPPRF Enabled LinkID (as assigned)	—	PPPRF Enabled LinkID (11, 11) PPPRF Disabled LinkID (13, 13) PPPRF Disabled LinkID (15, 15)

To discover multiple radio links, you must provision the radio ports on the 9500 MPR based on the following criteria.

1 Only one radio port can have PPPRF enabled. The far endpoint on the same link must have the same configuration as the first endpoint. PPPRF should be disabled on both endpoints for the second and any subsequent radio links.

2 LinkID requirements include:

- The LinkID must be enabled for all of the port members of the configuration that have the same LINKGRP, and a different LINKMEMBER that matches the far endpoint.
- Expected and Sent values must be equal (for example, 11, 11 or 13, 13).
- For a multiple Nx(1+x) radio configurations on the same NE, the LINKGRP must be unique without overlapping (for example, 1 and 2).
- LinkID should be formatted as LINKGRP:LINKMEMBER in a hexidecimal format where LINKGRP is the first character and LINKMEMBER are the members.
- Any mismatch between the LinkID at the link level (for example, Send is not equal to Expected) mutes the radio connection (MPT case).

3 As a requirement for the first radio link to be discovered, the remote address must be configured at both endpoints. For subsequent links, alarms cannot be present on the radio port.

4 When Radio Link Aggregation is enabled for any of the radio links between two 9500 MPRs, all radio links must belong to the same LAG.

10.2 Resynchronization of NEs

The Resync contextual menu option for an object specifies that SNMP MIB and CLI information bases for the object are reread to resynchronize them with the 5620 SAM database. When you choose the Resync option at the NE level, you can choose to resynchronize all MIBs or perform a customized resynchronization. When you choose to resynchronize all MIBs, the color of the device object in the navigation tree is yellow during the resynchronization. See Procedure 10-7 for more information about performing NE resynchronizations.

The Resync Status tab of the Discovery Manager form displays the following resynchronization attributes for each managed NE; the attributes are updated after an attempted resynchronization of all MIBs, but not after a customized resynchronization attempt:

- Resync Status
- Last Resync Start Time
- Last Resync End Time
- Scheduled Resync Status
- Last Scheduled Resync Start Time
- Last Scheduled Resync End Time

The Resync Status value is one of the following:

- Full Resync Done—a resynchronization has successfully completed
- Full Resync Failed—a resynchronization attempt has failed

  Full Resync Failed does not indicate that the SNMP agent on the NE is unreachable; if the agent is unreachable, an alarm is raised against the NE and the NE icon color changes to red. When the agent is again reachable, the alarm clears and the NE icon color changes to green.
- In Progress—a resynchronization is in progress
- Not Attempted—no resynchronization has been requested
- Requested—the resynchronization request is queued for processing.

The Scheduled Resync Status value is one of the following:

- In Progress—a resynchronization is in progress
- Not Attempted—no resynchronization has been requested
- Scheduled Resync Done—a resynchronization has successfully completed
- Scheduled Resync Failed—a resynchronization attempt has failed

10.3 Mediation and SNMP MIBs

A 5620 SAM mediation policy defines the interval at which the 5620 SAM polls NEs for SNMP MIB configuration changes. You can use the Mediation and MIB Entry Policy forms to view the information in an SNMP MIB. See Procedure 10-4 for more information.

You can use the 5620 SAM client GUI to list the contents of the device MIBs that the current 5620 SAM system supports. The list includes the following information:

- the MIB name
- the MIB version; the 5620 SAM software may support multiple MIB versions
- the OID of a MIB entry
- the MIB entry name
- the 5620 SAM polling interval for a MIB or MIB entry

See Procedure 10-24 for information about listing and saving SNMP MIB information.

10.4 SSH security

SSH is a protocol that provides secure file transfer and file system access between the 5620 SAM, and managed NEs. SSH version 2, or SSH2, is enabled by default on many devices.

SSH2 supports the use of public/private encryption-key pairs to perform authentication based on public key cryptography. A public/private key pair is generated on an NE. The private key is stored locally on the NE, and the public key is specific to SSH2 clients and persists in the 5620 SAM for future communication with the SSH2 server on the NE. The public key is used to verify that the client is connecting to the correct SSH2 server.

An SSH2 server identifies itself to a client by sending a message that is signed with the private key of the server. The 5620 SAM uses the public key of the SSH2 server to authenticate the identity of the server.

SSH2 host key management

An NE sends an SSH2 host key on the first attempt of the 5620 SAM to make an SSH2 connection. The 5620 SAM automatically accepts the public key fingerprint and stores it locally. After the first connection, the local copy of the fingerprint is used for server authentication during subsequent sessions.

If a different host key is sent by the same NE in a subsequent session, the connection is rejected and the 5620 SAM raises an alarm. If the user verifies that the host key of the SSH2 NE has been changed in a legitimate manner, for example, when the SSH server is rebooted and host key persistence is not configured, the user can manually accept the key by removing the mismatched host key entry from the SSH2 known host manager of the 5620 SAM. This removes the SSH2 fingerprint from the 5620 SAM database. Connections are then accepted from the NE until the SSH server is again rebooted.

Note — By default, SSH host keys do not persist in the 7210 SAS, 7450 ESS, 7705 SAR, 7710 SR, 7750 SR, and 7950 XRS.

Alcatel-Lucent recommends that you configure the host key persistence on an SSH2 NE to retain the public key fingerprint across reboots. If public key persistence is not enabled, a 5620 SAM operator must manually accept a new key and remove an alarm each time a connection attempt is made after the NE reboots.

SSH2 and device CLI sessions

When SSH2 for CLI sessions is enabled in the mediation policy of an SSH2-capable device, SSH2 instead of Telnet is used for each CLI session.

SSH1 is used only in SSH CLI sessions on NEs that do not support SSH2.

SSH2 and script management

When SSH2 for CLI sessions is enabled in the mediation policy of an SSH2-capable device, SSH2 is used instead of Telnet for each script execution session.

SSH1 is used only in SSH CLI sessions on NEs that do not support SSH2.

SSH2 and secure file transfers

When secure file transfers are specified in the mediation policy of an SSH2-capable device, SCP is used instead of FTP for backups, restores, software upgrades, and statistics collection.

10.5 Server resource management

The 5620 SAM supports the grouping of NEs by network function for increased SNMP mediation efficiency.

Resource allocation is automatically configured during 5620 SAM installation and network discovery based on the available system resources, and the numbers and types of NEs that are to be managed. The resource group to which an NE belongs is initially determined by the device type. The following are the 5620 SAM NE resource groups and the default device assignments:

- global—for 5620 SAM tasks that are not associated with NEs
- default—for NEs that do not belong to a specific resource group
- core—for 7450 ESS, 7750 SR, and 7950 XRS devices
- middle—for 7210 SAS, 7710 SR, and 7705 SAR devices
- edge—for OmniSwitch and similar devices
- GNE—for other network devices

The 5620 SAM logs the system load of each resource group at regular intervals. An Alcatel-Lucent support representative can monitor system resource usage, determine whether the current resource allocation is appropriate, and reconfigure resource management, if required.

Caution — Only a qualified Alcatel-Lucent support representative can assess or configure 5620 SAM server resource management. Contact Alcatel-Lucent technical support for more information.

10.6 SNMP event notification policies

To reduce the 5620 SAM processing load associated with SNMP events, you can configure a policy that specifies which SNMP traps the 5620 SAM processes. An event notification policy acts as a filter that enables or disables the processing of specific SNMP traps for a specific NE type and release.

A 5620 SAM operator with an admin or operations scope of command role and write access permission to the policy package can create an event notification policy using the Mediation form. The 5620 SAM assigns a default event notification policy to an NE during initial device discovery. A 5620 SAM operator can create and apply a policy that specifies which traps to process and which to ignore. 5620 SAM processing is enabled for all supported traps in the default policy. See Procedure 10-10 for information about configuring an event notification policy.

The following conditions apply to event notification policies:

- After an NE upgrade, the 5620 SAM processes the new traps generated by the upgraded NE. A 5620 SAM administrator must ensure that the event notification policies that are in effect before an NE upgrade are correctly configured, and must modify them after the upgrade to silenced new traps, if required.
- 5620 SAM software upgrades do not affect existing event notification policies.

Caution — The 5620 SAM relies on certain SNMP notifications to verify network management activities. Before you configure an event notification policy, consult an Alcatel-Lucent support representative to ensure that you do not disable the processing of traps that are vital to 5620 SAM operation.

SNMP statistics that include the number of ignored traps for an NE are available from the Statistics tab of the NE properties form.

10.7 Workflow to discover network devices

The following workflow describes the sequence of high-level tasks required to discover network devices. The following must be true before the 5620 SAM can discover a device.

- Each Alcatel-Lucent device is commissioned; see chapter 9 for commissioning information.
- Each non-Alcatel-Lucent device has a GNE profile; see chapter 9 for information.

1 Using a CLI, ensure that each device you want to discover and manage using SNMPv3 has a unique engine ID. See Procedure 10-1 for information.

2 If required, perform the following steps to configure SSH2 security.

i Enable SSH2 on the device. See Procedure 10-2 for information.

ii Configure and start an SSH server on the device. See the appropriate device documentation for SSH configuration information.

Note — A 7705 SAR may become temporarily unreachable after you enable SSH and start the SSH server on the device.

iii If the device supports SSH2 host key persistence, use Telnet to enable the function on the device. See Procedure 10-3 for information.

3 Create a mediation policy. If you want to use SSH2 for mediation, ensure that you enable SSH2 for CLI sessions and secure file transfers. See Procedure 10-4 for information.

Note — If you specify the use of SNMPv3 in the policy, you must enable SSH2 in the policy.

4 Configure the control scripts and XML API scripts for post-discovery actions, as required. See the *5620 SAM Scripts and Templates Developer Guide* for information about control and XML API script configuration.

5 Create post-discovery actions to associate with discovery rules, as required. See Procedure 10-5.

Note — You can also create a post-discovery action during discovery rule creation.

6 Create discovery rules, as required. See Procedure 10-6.

Note — If you want to use SSH2, specify the created SSH2 mediation policy for read and write access in the discovery rule.

7 Discover devices, as required. See Procedure 10-7.

8 If the discovery rule includes a post-discovery action, perform the following, as required.

- View the script execution status for the action. See Procedure 10-8.
- For an NE with a script execution status of Failed, clear the script execution status and manually execute the script. See Procedure 10-9.

9 As required, create event notification policies. See Procedure 10-10 for information.

10 As required, assign event notification policies to NEs. See Procedure 10-11 for information.

11 As required, manage device discovery by performing one or more of the following using the procedures in this chapter.

a Edit discovery rules and rule elements. See Procedure 10-12 for information.

b Enable or disable discovery rules. See Procedure 10-13 for information.

c Delete discovery rules. See Procedure 10-14 for information.

d Rescan the network using a discovery rule. See Procedure 10-15 for information.

e Manage, unmanage, or delete managed devices. See Procedures 10-16, 10-17, and 10-18 for information.

f Synchronize NEs with the 5620 SAM database. See Procedure 10-19 for information.

g Monitor the acceptance and rejection of SSH2 host keys using the 5620 SAM SSH2 Known Host Key Manager. See Procedures 10-20 and 10-21 for information.

h Switch from non-secure to secure mediation for one or more devices. See Procedures 10-22 and 10-23 for information.

i List and save SNMP MIB information. See Procedure 10-24 for information.

10.8 Device discovery procedures

Use the following procedures to configure device discovery and mediation.

Procedure 10-1 To configure SNMPv3 on a device

Perform this procedure to enable SNMPv3 on a device. SNMPv3 provides user-based security. The access granted is restricted to the scope of the configured users and groups.

If you are configuring an NE for LI, you must create a second access group. See chapter 28 for information about creating an LI user and access group.

1 Open a CLI session on the device.

2 Enter the following commands in the order shown to create a read-write-notify group for general SNMP mediation on the managed device:

```
configure system security snmp ↵

access group "snmpv3_groupname" security-model usm security-level
privacy read "iso" write "iso" notify "iso" ↵
```

where
snmpv3_groupname is the name that is being assigned to the SNMP group

Note — For 9500 MPR SNMPv3 passwords see the 9500 MPR documentation.

3 If mediation of VPRN objects is required, enter the following command to create a read-write-notify group for this purpose on the managed device:

access group "*snmpv3_groupname*" security-model usm security-level privacy context vprn prefix read "vprn-view" write "vprn-view" notify "iso" ↵

where
snmpv3_groupname is the name that is being assigned to the SNMP group

4 Enter the following command to exit SNMP group configuration.

exit ↵

5 Enter the following command to obtain the SNMP engine ID of the device.

show system info ↵

The SNMP engine ID is displayed as SNMP Engine ID.

6 Generate an MD5 or SHA authentication key, and DES privacy keys, using the password2key utility on a 5620 SAM client or server station.

- MD5 and SHA authentication keys are used to create an encrypted authentication password for users.
- DES privacy keys are used to encrypt the entire SNMP packet, for additional security.

Note — The length of a generated key is determined by the authentication method. MD5 keys are 32-character strings. SHA keys are 40-character strings.

i Log in to the 5620 SAM client or server station.

Note 1 — If you are using the password2key utility on a RHEL or Solaris 5620 SAM main server station, you must log in as the samadmin user.

Note 2 — If you are using the password2key utility on a 5620 SAM client station, you must log in as a local administrator, or as the user who installed the client.

ii Open a console window.

iii Navigate to the *install_directory*/nms/bin directory

where *install_directory* is the 5620 SAM installation location, typically /opt/5620sam/server or /opt/5620sam/client on RHEL and Solaris, and C:\5620sam\client on Windows

iv Enter the following to create an MD5 or SHA authentication key.

nmsclient.bat password2key *method password engine_ID* ↵

where
method is the type of encryption algorithm used to generate the authentication key, either MD5 or SHA
password is the ASCII password string used to generate the authentication key for the SNMPv3 user, for example, yoga
engine_ID is the SNMP engine ID obtained in step 5

The SHA authentication key generated from this example is 60210e3d2bfa7e02682262df9c5de400b9c3322b.

v Enter the following to create an MD5 or SHA DES privacy key.

nmsclient.bat password2key *method password engine_ID* ↵

where
method is the type of encryption algorithm used to generate the DES privacy key, either MD5 or SHA
password is the ASCII password string used to generate the DES privacy key, for example, happy
engine_ID is the SNMP engine ID obtained in step 5

The DES privacy key generated from this example is 4088f4ef966b8d1ebe54b8d841a5f76806c374ec.

vi If your security model requires unique keys for each managed device, repeat steps 6iv and 6v for each set of keys to be generated.

vii Store the generated keys.

7 Using the keys generated in step 6, create an SNMPv3 user on the managed device.

i Enter the following sequence of commands at the prompt:

```
configure system security user snmpv3_username ↵

access snmp ↵

snmp ↵

authentication method authentication_key privacy des-key
DES_privacy_key ↵

group snmpv3_groupname ↵

exit all ↵
```

where
snmpv3_username is the name being assigned to the SNMPv3 user
snmpv3_groupname is the name of the new SNMP user group
method is sha or md5, depending on the authentication method used
authentication_key is the SHA or MD5 authentication key generated in step 6
DES_privacy_key is the DES privacy key generated in step 6

Note — A DES privacy key is 32 characters long. If SHA encryption, which produces a 40-character key, is used to generate the DES privacy key in step 6, you must provide only the first 32 characters of the key, as shown in the following example that uses the key values from step 6:

```
authentication sha
60210e3d2bfa7e02682262df9c5de400b9c3322b privacy des
4088f4ef966b8d1ebe54b8d841a5f768 ↵
```

ii Enter the following command at the prompt to save the configuration changes.

```
admin save ↵
```

The device is now ready to be managed using SNMPv3. To enable device management by the 5620 SAM, you must do the following:

- Create an SNMPv3 user using the 5620 SAM NE user configuration manager. See "NE user and device security" in the *5620 SAM System Administrator Guide* for information about creating and configuring NE users. You must specify the following for each user:
  - Give the user SNMP access.
  - Enter the same User Name as the user name created earlier in this procedure.
  - On the SNMPv3 tab, select SHA as the authentication protocol and DES as the privacy protocol.
  - Type the appropriate ASCII password used to generate the MD5 or SHA authentication key, and DES privacy key, in step 6; for example, yoga and happy.
- Create a new SNMPv3 mediation security policy, as described in Procedure 10-4. Specify the following:
  - the SNMPv3 USM security model
  - the SNMP user name created earlier in this procedure
- Create one or more discovery rules that use the new SNMPv3 mediation policy.

8 Close the CLI session.

Procedure 10-2 To verify that SSH2 is enabled on a device

Perform this procedure to verify that SSH2 is enabled on a device, and to enable SSH2 on the device, if required.

1 Open a CLI session on the device.

2 Run the following CLI command to see whether SSH2 is enabled:

```
show system security ssh ↵
```

3 If required, enter the following command at the prompt to enable SSH2:

```
configure system security ssh version 2 ↵
```

4 Close the CLI session.

Procedure 10-3 To enable SSH host key persistence on a device

Perform this procedure to enable the persistence of the server host key on a 7210 SAS, 7450 ESS, 7750 SR, 7705 SAR, 7710 SR, or 7950 XRS. For other devices, see the user documentation for information about configuring SSH2 host key persistence.

1 Open a CLI session on the device.

2 Enter the following at the prompt to disable the SSH server:

```
configure system security ssh server-shutdown ↵
```

3 Enter the following at the prompt to enable host key persistence:

```
configure system security ssh preserve-key ↵
```

4 Enter the following at the prompt to enable the SSH server:

```
configure system security ssh no server-shutdown ↵
```

5 Enter the following at the prompt to verify that the preserve-key function is enabled on the server:

```
show system security ssh ↵
```

6 Close the CLI session.

Procedure 10-4 To configure NE mediation

Perform this procedure to configure the 5620 SAM to poll NEs at regular intervals. To configure LI mediation, see Procedure 28-7.

1 Choose Administration→Mediation from the 5620 SAM main menu. The Mediation (Edit) form opens with the General tab displayed.

2 Configure the parameters:

- Polling Synchronization Time
- Polling Admin State
- Discovery Rule Scan Interval

Note — Polling and scanning use system resources, and can increase the amount of management traffic. Consider your network needs and network management domain capabilities before you perform this procedure.

3 Configure MIB polling intervals for different managed devices, as required.

i Click on the MIB Entry Policies tab. A list of MIBs appears, organized by the product name of the device that supports the MIB.

ii Configure the search filter, if required, and click on the Search button. A list of MIB entry policies that match the search criteria is displayed.

iii Choose one or more MIBs from the list.

iv Click on the Properties button. The MIB Entry Policy (Edit) form opens with the General tab displayed.

v Configure the parameters:

- Polling Interval
- Administrative State
- Number of Varbind per PDU
- Use GETBULK to Walk SNMP Table

Caution — Changing the Number of Varbind per PDU parameter value may affect the time required for subsequent NE resynchronizations and degrade 5620 SAM server performance. Do not configure the parameter without contacting Alcatel-Lucent technical support.

vi Click on the OK button. A dialog box appears.

vii Click on the Yes button. The MIB Entry Policy (Edit) form closes and the Mediation (Edit) form reappears.

4 Click on the Ping tab to define how the management IP addresses of devices are checked using a ping. Each managed device may provide one or more of the following three IP addresses, each of which can be scheduled to be pinged, as configured during discovery rule creation:

- the system IP address, called an in-band management interface
- the management IP address on the management port, called an out-of-band management interface
- the IP address of the standby Control card, also called a CPM

Note — When the device does not have one or two of the IP addresses, for example, there is no CPM IP address, ensure that you create a ping policy that does not have its schedule enabled. This allows the assignment of an inactive ping policy during discovery configuration. See Procedure 10-7 for information.

i Click on the Ping tab.

ii Click on the Create button to create a new ping policy, or click on the Properties button to change an existing ping policy.

The Management Ping Policy (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Auto-Assign ID
- Policy ID
- Displayed Name
- Ping Command Timeout (seconds)
- Schedule Enabled
- Ping Interval (minutes)
- Ping Interval (seconds)

You must enable scheduling for the default ping policy to be performed. When scheduling is not enabled, and a managed device is not reachable, management connection alarms may not be raised.

The destination interface of the ping is determined during the creation of discovery rules for devices. You can also perform an unscheduled ping from the Managed State tab of the Discovery Manager configuration form. See Procedure 10-7 for more information.

iv Click on the OK button to save the changes. A warning dialog box appears.

You can view management connection alarms from the NE properties form of the managed device that was pinged. For example, from the Discovery Manager form, click on the Resync Status tab. Choose a device from the list and click on the Properties button. From the NE properties form, click on the Faults tab to view the alarms.

v Click on the OK button.

5 Create or modify a statistics MIB policy to determine how often the 5620 SAM polls the managed device MIBs for statistics. See "Performance statistics collection" in the *5620 SAM Statistics Management Guide* for information about statistics collection.

6 Click on the Mediation Security tab.

i Click on the Create button to create a new SNMP mediation security policy, or choose an existing policy and click on the Properties button to modify the policy. The Mediation Policy form opens with the General tab displayed.

Note — To configure SNMPv3 security, you must preconfigure the 5620 SAM server and the managed devices. See Procedure 10-1 for information.

ii Configure the general mediation parameters:

- Policy ID
- Auto-Assign ID
- Displayed Name
- Security Model
- Timeout (milliseconds)
- Retry
- Port
- Community String

Note 1 — The recommended value for Timeout (milliseconds) parameter specifying the SNMP timeout value for polling or deployment requests between the 5620 SAM and the 1830 PSS device is 60000.

Note 2 — The recommended value for Retry parameter specifying the number of retries for SNMP polling or deployment requests between the 5620 SAM and the 1830 PSS device is 2.

Note 3 — The Community String value must match the community string value on the managed device.

Note 4 — The default Community String for the trap access mediation policy on the 9500 MPR and 9500 MPRe is SNMP-trap.

Note 5 — The Community String for the 1830 PSS device access mediation policy should be set to nms_snmp.

iii Configure the parameters in the CLI and File Transfer panels:

- Communication Protocol
- User Name
- User Password

  You must also enter the User Password parameter value in the Confirm Password parameter field.
- File Transfer Type

Note 1 — If you choose Secure as the File Transfer Type parameter value, you must set the Communication Protocol parameter to SSH2.

Note 2 — To configure SSH2 you must enable SSH2 and host key persistence on the SSH server of the device. See section 10.4 for information about configuring SSH2.

Note 3 — If you choose SSH2 as the Communication Protocol, the User Name and User Password parameters must be the user name and password for the SSH server.

Note 4 — The default User Name and User Password for FTP access on the 9500 MPR and 9500 MPRe, is ftp.

7 If you choose SSH2 as the Communication Protocol value in step 6 iii, configure the SSH2 Server Port parameter.

8 Perform one of the following.

a If you choose FTP as the File Transfer Type value in step 6 iii, configure the parameters in the FTP panel:

- User Name
- User Password
  You must also enter the User Password parameter value in the Confirm Password parameter field.
- Connect Timeout (sec)
- Read Timeout (sec)

Note — The default ftp User Name and Password is “ftp” for the 9500 MPR read/write access Mediation policy.

b If you choose Secure as the File Transfer Type value in step 6 iii, configure the parameters in the Secure FTP panel:

- Connect Timeout (sec)
- Read Timeout (sec)

See chapter 9 for information about enabling FTP access for a device user account.

9 If you set the Security Model parameter to SNMPv3 (USM), assign a user profile that is configured with the SNMPv3 authentication and privacy parameters, as described in Procedure 10-1.

i Click on the Select button to view a list of configured users. The Select Site User For SNMP Access form opens.

ii Select a user from the list and click on the OK button. The user name is displayed on the Mediation Security form.

iii Click on the Properties button to open the configuration form for the user and view or modify the SNMPv3 security settings, if required.

10 See the *5620 SAM LTE EPC User Guide* and *5620 SAM LTE RAN User Guide* for information about how to configure the NETCONF parameters for the eNodeB and the 9471 WMM.

11 Click on the OK button. A dialog box appears.

12 Click on the OK button. The Mediation Policy form closes and the Mediation (Edit) form reappears.

13 Close the Mediation (Edit) form.

Procedure 10-5 To configure a post-discovery action

Perform this procedure to create a post-discovery action that you can associate with one or more discovery rules.

Note — You can also create a post-discovery action during discovery rule creation.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens with the Discovery Rules tab displayed.

2 Click on the Post Discovery Actions tab.

3 Click on the Create button. The Post Discovery Action (Create) form opens.

4 Configure the parameters:

- Name
- Description

5 Click on the Select button beside the Control Script Name parameter and use the list form that opens to choose a control script.

6 Click on the Select button beside the Control Script Instance Name parameter and use the list form that opens to choose a control script instance.

7 Click on the OK button. A dialog box appears.

8 Click on the OK button. The Post Discovery Action (Create) form closes, and the post-discovery action is listed on the Discovery Manager form.

9 Click on the OK button. A dialog box appears.

10 Click on the Yes button. The Discovery Manager form closes.

Procedure 10-6 To configure a discovery rule

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens with the Discovery Rules tab displayed.

2 Click on the Create button to create a new discovery rule. The Create Discovery Rule - Specify General Attributes step form opens.

3 Configure the parameters:

- ID
- Auto-Assign ID
- Description
- Administrative State
- OLC State
- Revert OLC State when discovery completes
- Management Protocol
- Default External EMS

Note — When you close the Discovery Manager form, the 5620 SAM scans the network using the discovery rule, if the Administrative State parameter of the discovery rule is set to Up.

4 Click on the Select button beside the Group Name parameter. The Select Discovery Group - Topology Discovery Rule form opens with a list of topology groups displayed.

5 Select a topology group from the list and click on the OK button. The topology group name is displayed on the Create Discovery Rule step form.

Note 1 — If the selected topology group reaches the maximum element limit, any additional discovered NEs are automatically added to the Discovered NEs group.

Note 2 — The Discovered NEs Group Name cannot be chosen when configuring a Discovery Rule for an EM system. See Procedure 6-28 for information about creating unique topology groups.

6 Click the Next button. The Create Discovery Rule - Add Rule Elements form opens.

7 Click on the Create button to add a new rule element. The Topology Discovery Rule Element (Create) form opens.

8 Configure the parameters:

- IP Address
- Mask Bits
- Usage

9 Click on the OK button. The Topology Discovery Rule Element (Create) form closes and a dialog box appears.

10 Click on the OK button.

11 Repeat steps 7 to 10 to create an additional rule element, if required.

12 Click on the Next button. The Add Auto Discovery Rule Elements ACL form opens.

13 Click on the Create button. The Auto Discovery Rule Element ACL (Create) form opens.

14 Configure the parameters:

- System ID
- Action

15 Click on the OK button. The Auto Discovery Rule Element ACL (Create) form closes.

16 Repeat steps 13 to 15 to create an additional automatic discovery rule element, if required.

17 Click on the Next button. The Create Discovery Rule - Configure Mediation Security form opens.

18 Click on the Select button in each of the following panels, as required, and use the Configure Mediation Security form to specify the mediation security policies for the discovery rule.

- Read Access Mediation Policy
- Write Access Mediation Policy
- Trap Access Mediation Policy

Note 1 — If you do not specify a policy, the default policy is applied.

Note 2 — A 9400 AWY or 9500 MSS-1c discovery rule requires the default SNMPv2 read and write access policies.

19 Click on the Next button. The Create Discovery Rule - Configure Management Ping Policy form opens.

20 Click on the Select button in each of the following panels, as required, and use the Configure Management Ping Policy form to specify the ping policies for the discovery rule.

- Out Of Band Management Interface Ping
- In Band Management Interface Ping
- Standby CPM Ping

Note 1 — If you do not specify a policy, the default policy is applied.

Note 2 — Management ping policies are created using the Mediation configuration form. These are the policies applied during discovery rule creation. You must apply a ping policy even to interfaces that do not exist. When there is no interface, you must choose a ping policy that has its Schedule Enabled parameter set to disabled.

For example, if there is no standby CPM or out-of-band management IP address, specify a ping policy that has the Schedule Enabled parameter set to disabled for the nonexistent management and standby CPM interfaces. In this example, a ping policy with the Schedule Enabled parameter enabled is required for the in-band interface that does exist. See Procedure 10-4 for information about creating ping policies.

21 Click on the Next button. The Create Discovery Rule - Configure MIB Statistics Policy form opens with the default MIB statistics policy displayed.

22 Click on the Select button to choose a different MIB statistics policy, if required. The Configure MIB Statistics Policy form opens. Select a MIB statistics policy in the list and click on the OK button.

23 Click on the Next button. The Create Discovery Rule - Add Discovered Routers to Span(s) form opens.

24 Click on the Add button to specify a span of control for the new NE contained in the discovery rule. If you do not specify a span, the default span is applied.

Note — New devices added to a span from a discovery rule are added explicitly to the span.

When a discovered NE group is part of a user-defined span, new devices that are discovered using the discovery rule are automatically added to the span.

25 Click on the Next button. The Create Discovery Rule - Configure Backup Policy form opens with the default backup policy displayed.

26 If required, click on the Select button and use the Select Backup Policy form to choose a different backup policy.

27 Click on the Next button. The Create Discovery Rule - Add NE Self Config Policies form opens.

Note — This form requires configuration only for eNodeB discovery. See "Self-configuration and discovery" in the *5620 SAM LTE RAN User Guide* for information about eNodeB discovery.

28 Click on the Next button. The Create Discovery Rule - Add EM Systems form opens.

29 Click on the Create button. The EM System (Create) form opens with the General tab displayed.

30 Configure the parameters:

- ID
- Auto-Assign ID
- Element Manager System Name
- Description
- Administrative State

31 Click on the Element Managers tab.

32 Click on the Create button. The Element Manager (Create) form opens.

Note 1 — If the EM system being discovered is an OMC-RAN, only space and underscore are supported characters for NE names. Any other special characters will be replaced by an underscore.

Note 2 — After discovering an EM system, the system should be opened and its administrative state set to Up in order to enable the connection to the 5620 SAM. A maximum of four EM Systems may have their administrative state set to Up at any time within the 5620 SAM.

Note 3 — A manual resync must be performed in order for alarms from an EM system to display in the 5620 SAM or Supervision web portal. This does not apply to the EM system (NEtO) for 9500 MPR devices; alarms are aggregated automatically provided the Trap Access Mediation policy in the Discovery step form is configured.

Note 4 — The 5620 SAM is able to manage 10 000 alarms per EM system. When this limit is reached, a critical alarm is raised and new incoming alarms are deleted. When the alarm counter for the EM System drops to 9000, the critical alarm is cleared and the 5620 SAM performs an alarm resynchronization on the EM system.

33 Configure the parameters:

- Host Name
- Server IP Address
- Server Port Number
- User Name
- Password
- Confirm Password

34 Click on the OK button. The Element Manager (Create) form closes and the EM System (Create) form reappears.

35 Click on the OK button. The EM System (Create) form closes and the Create Discovery Rule - Add EM Systems form reappears.

36 Click on the Next button. The Create Discovery Rule - Add Post Discovery Action form opens.

37 To specify a post-discovery action, perform one of the following.

a Click on the Select button and use the list form that opens to associate an existing post-discovery action with the discovery rule.

b Create a post-discovery action to associate with the discovery rule. Perform the following steps.

i Click on the Select button. The Select Post Discovery Action form opens.

ii Click on the Create button. The Post Discovery Action (Create) form opens.

iii Configure the parameters:

- Name
- Description

iv Click on the Select button beside the Control Script Name parameter and use the list form that opens to choose a control script.

v Click on the Select button beside the Control Script Instance Name parameter and use the list form that opens to choose a control script instance.

vi Click on the OK button. The Post Discovery Action (Create) form closes, and the post-discovery action is listed on the Select Post Discovery Action form.

vii Select the new post-discovery action and click on the OK button. The new post-discovery action is associated with the discovery rule.

38 Click on the Finish button. The Create Discovery Rule step form closes and a dialog box appears.

39 Click on the OK button. The Discovery Manager form reappears.

Note — When you close the Discovery Manager form, the 5620 SAM scans the network using the discovery rule, if the Administrative State parameter of the discovery rule is set to Up.

40 Click on the OK button. A dialog box appears.

41 Click on the Yes button. The Discovery Manager form closes.

Procedure 10-7 To discover devices

Perform this procedure to complete the following tasks:

- Ping the managed devices to test connectivity
- Locate managed devices on a topology map
- Discover devices by scanning the network according to discovery rules
- Resynchronize NEs and the 5620 SAM database
- Check the discovery, management, and synchronization status of a device

Note 1 — SNMP parameters must be correctly specified using CLI on the managed devices. Contact your Alcatel-Lucent support representative or see chapter 9 for information about using CLI to commission devices before managing them.

Note 2 — Ensure that in-band and out-of-band management are correctly configured to discover devices, as described in chapter 9.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens with the Discovery Rules tab displayed.

2 Click on the Apply button to discover devices by scanning the network as specified by a discovery rule.

New or modified discovery rules are saved. The 5620 SAM discovers devices by scanning the network as specified by the discovery rules. After a device is discovered, the 5620 SAM server sets the device in a managed state and adds the device elements to the 5620 SAM database.

Discovery rules that are disabled or shut down are not applied.

3 Verify that the device is discovered and is managed by the 5620 SAM by clicking on the Managed State tab on the Discovery Manager form. A list of managed devices opens.

The management state of the device is displayed in the Site State column. Managed is the default state. If the device is unmanaged, select the device from the list and click on the Manage button.

4 From the Managed State tab, you can also perform management IP address pings to ensure connectivity to all managed devices. Do not ping devices without an interface.

5 From the Managed State tab, you can locate the device in a topology map.

i Click on one or multiple managed devices in the list.

ii Click on the Navigate button. A drop-down menu opens that lists the map view options.

iii Select an option. The *topology_view* (Navigate) form appears showing the selected network objects.

Note — Only managed devices that are not in the Discovered NEs group can be located. If the selected managed devices do not all belong to the same group on the map, then only the managed devices of one of the groups is located. Unmanaged devices cannot be located.

6 Verify that the device configuration has been reconciled with the 5620 SAM database contents, by clicking on the Resync Status tab. The Resync Status tab displays the operation status of the last full resync. See section 10.2 for more information.

To initiate manual device reconciliation, select one or more devices in the list and click on the Resync button.

If the reconciliation fails:

- View faults that are associated with a device by double-clicking on the device in the Discovery Manager form and clicking on the Faults tab in the form that opens.
- Check the SNMP security parameters on a device using the CLI.
- Check the 5620 SAM mediation settings.

Successfully discovered NEs appear in the 5620 SAM navigation tree.

7 From the Resync Status tab, you can locate the device in a topology map.

i Click on one or more resynchronized devices in the list.

ii Click on the Navigate button. A drop-down menu opens that lists the map view options.

iii Select an option. The *topology_view* (Navigate) form appears showing the selected network objects.

Note — Only devices located outside the discovery group can be located. If the selected devices do not all belong to the same group on the map, then only the devices of one of the groups is located.

8 Close the Discovery Manager form.

Procedure 10-8 To view the post-discovery action execution status

Perform this procedure to view the script execution status of a post-discovery action associated with a discovery rule.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens with the Discovery Rules tab displayed.

2 Click on the Managed State tab.

3 View the entries in the Script Execution Status column. The possible values are:

- unspecified—post-discovery action not specified in discovery rule
- Pending—post-discovery action execution awaits discovery completion
- Not Executed—control script not executed
- In Progress—control script execution in progress
- Successful—control script execution completed without failure indication
- Failed—control script execution unsuccessful
- Cleared—Failed state manually cleared

4 For each NE that has a Failed entry, perform the following steps to view the script execution result.

i Click on the Show Results button. The Results form for the NE opens.

ii Click on the Search button. A list of script results is displayed.

iii Select a result in the list and click on the Properties button. The View Result form opens. The form displays information such as the script name, version, run time, and execution status.

iv View the information to determine the required corrective action.

v If required, perform the following steps to export the result information to a file.

- Choose File→Export from the View Result form main menu, or click on the Export icon. The Export form opens.
- Navigate to the location in which you want to save the file, and enter a filename in the File Name field.
- Click on the Export button. The result text is saved in the specified file.

Note — You can also export a script result to a file using the Export button on the Results form for the NE.

5 Close the View Result form.

6 To delete a result, perform the following steps.

i Select the result on the Results form and click on the Delete button. A dialog box appears.

ii Click on the Yes button. The result is deleted.

7 Close the Results form.

8 Close the Discovery Manager form.

Procedure 10-9 To manage a post-discovery action failure on an NE

Perform this procedure to do the following:

- reset the script execution status for an NE
- manually run the post-discovery action script against the NE

This action may be required after the script associated with a post-discovery action fails and the cause of the failure is corrected.

Note — Clearing the status also clears the associated alarm that is raised when post-discovery script execution fails.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens with the Discovery Rules tab displayed.

2 Click on the Managed State tab.

3 Click on the Search button. A list of NEs is displayed.

4 Select an NE with an Execution Status of Failed and click on the Properties button. The Node Discovery Control (Edit) form opens.

5 Click on the Post Discovery tab.

6 Click on the Clear button. The Script Execution Status changes from Failed to unspecified.

7 To execute the script, perform the following steps.

- **i** Click on the Execute Script button. The Execute script form opens.
- **ii** Click on the Execute button. The script executes, and a script object is displayed in the navigation tree of the form.
- **iii** Select the script object in the navigation tree.
- **iv** Expand the Status and Script Results panels on the right side of the form to reveal the script execution information.
- **v** Click on the Save Result button to save the result in the 5620 SAM database. A dialog box appears.
- **vi** Click on the OK button.
- **vii** Click on the Close button. The Execute script form closes.

8 Click on the OK button.

9 Close the Node Discovery Control form.

10 Close the Discovery Manager form.

Procedure 10-10 To configure an event notification policy

Perform this procedure to configure how the 5620 SAM processes specific SNMP traps from specific NE types and releases.

Caution — The 5620 SAM relies on certain SNMP notifications to verify network management activities. Before you configure an event notification policy, consult an Alcatel-Lucent support representative to ensure that you do not disable the processing of traps that are vital to 5620 SAM operation.

1 Choose Administration→Mediation from the 5620 SAM main menu. The Mediation (Edit) form opens.

2 Click on the Event Notification Policies tab.

3 Perform one of the following.

a Create a policy.

i Click on the Create button. The Event Notification Policy (Create) form opens.

ii Configure the parameters:

- Auto-Assign ID
- Policy ID
- Displayed Name
- Description
- Network Element Type

After the Network Element Type parameter is configured, the form expands to display the Product and Version panels.

iii Click on the Select button in the Version panel to choose the release of NE to which the policy is to apply. The Select Version - Event Notification Policy form opens with a list of available releases displayed.

iv Select a release and click on the OK button. The Select Version - Event Notification Policy form closes and the release information is displayed on the Event Notification Policy (Create) form.

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The Mediation (Edit) form reappears with the new policy in the list.

vii Click on the Apply button. A dialog box appears.

viii Click on the Yes button.

ix Select the new policy in the list and click on the Properties button. The Event Notification Policy (Edit) form opens.

b Modify a policy.

i Click on the Displayed Name column heading to sort the existing policies by device type and release.

ii Drag the Displayed Name column boundary to display the device type and release information.

iii Scroll through the list to locate the policy for the required device type and release using the information in the Displayed Name column.

iv Select the required policy and click on the Properties button. The Event Notification Policy (Edit) form opens.

v Configure the parameters:

- Displayed Name
- Description

4 Click on the Notification Policies tab. A list of SNMP traps is displayed.

5 Click on a column header, for example, MIB Name or MIB Entry Name, to sort the list alphabetically.

6 Select an SNMP trap entry in the list and click on the Properties button. The MIB Entry Policy - trappolicy (Edit) form opens.

7 Configure the Administrative State parameter.

Note — You cannot configure the Administrative State parameter in a default event notification policy. A default policy is indicated by a check mark beside the Default Policy indicator on the General tab of the Event Notification Policy (Edit) form.

8 Click on the OK button. A dialog box appears.

9 Click on the Yes button. The MIB Entry Policy - trappolicy (Edit) form closes.

10 Repeat steps 6 to 9 to configure the processing of an additional SNMP trap by the 5620 SAM.

11 Close the Event Notification Policy (Edit) form.

12 Close the Mediation (Edit) form.

Procedure 10-11 To assign an event notification policy to an NE

Caution — The 5620 SAM relies on certain SNMP notifications to verify network management activities. Before you assign an event notification policy to an NE, consult an Alcatel-Lucent support representative to ensure that you do not disable the processing of traps that are vital to 5620 SAM operation.

1 Right-click on an NE icon in the navigation tree and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

2 Click on the Polling tab.

3 Click on the Clear button in the Assigned Event Notification Policy panel. The Select button in the panel is enabled.

4 Click on the Select button in the Assigned Event Notification Policy panel to choose an event notification policy. The Select Event Notification Policy - Network Element form opens with a list of appropriate event notification policies for the device displayed.

5 Select a policy in the list and click on the OK button. The Select Event Notification Policy - Network Element form closes and the new policy identifier is displayed on the Network Element (Edit) form.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Network Element (Edit) form closes and the policy is applied.

Procedure 10-12 To edit a discovery rule

Edit discovery rules when new devices are added to the network.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens.

2 Select a discovery rule from the list.

3 Click on the Properties button. The Topology Discovery Rule (Edit) form opens with the General tab displayed.

4 Configure the parameters, as required. For example, to remove a rule element:

- **i** Click on the Rule Elements tab.
- **ii** Select the rule from the list.
- **iii** Click on the Delete button.
- **iv** Confirm the action.

5 Click on the OK button to close the Topology Discovery Rule (Edit) form.

6 Perform steps 2 to 6 in Procedure 10-7.

7 Close the Discovery Manager form.

Procedure 10-13 To enable or disable a discovery rule

When a discovery rule is enabled, the network is scanned according to the discovery rule when the discovery rule is saved or rescanned. The network is also scanned according to the discovery rule as specified by the Discovery Rule Scan Interval parameter in the Mediation form. If your discovery rule is disabled, the network is not scanned as specified by these conditions.

1 Choose Administration→Discovery Manager from the main menu. The Discovery Manager form opens.

2 Select a discovery rule from the list.

3 Enable or disable the discovery rule.

   a Click on the Turn Up button to enable the discovery rule.

   b Click on the Shut Down button to disable the discovery rule.

Procedure 10-14 To delete a discovery rule

When you delete a discovery rule, only the rule is removed. The NEs discovered using the rule are not removed from the 5620 SAM, but the Discovery Rule ID for each of the NEs set to 0.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens.

2 Select a discovery rule in the list.

3 Click on the Delete button. A dialog box appears.

4 Click on the OK button.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Discovery Manager form closes.

Procedure 10-15 To rescan the network according to a discovery rule

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens.

2 Select one or more discovery rules from the list.

3 Click on the Rescan button.

4 Click Yes to confirm the action.

The 5620 SAM scans the network as specified by the discovery rules and discovers devices. After a device is discovered, the 5620 SAM server sets the device in a managed state and adds the NE properties to the 5620 SAM database.

5 Perform steps 3 and 6 in Procedure 10-7 to verify that the device has been successfully discovered.

Procedure 10-16 To manage, suspend, or unmanage a device

Perform this procedure to change the management state of a device.

Note — Managing and unmanaging a HIP device is not supported. To unmanage or delete a HIP device, you must set the EM system administrative state to Down, and then delete the EM system.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens.

2 Click on the Managed State tab.

3 Select a device in the list.

4 Perform one of the following.

a Click on the Manage button to return an unmanaged or suspended device to the managed state.

b Click on the Suspend button to suspend the management of the device.

Warning — Suspending the management of a device results in a loss of communication with the device.

Caution — When you suspend the management of a device, the 5620 SAM raises a critical alarm against the device.

c Click on the Unmanage button to stop the management of the device.

Warning 1 — Unmanaging a device results in a loss of management data for the device. See "Unmanaging and deleting devices" in section 10.1 for more information.

Warning 2 — Unmanaging a device results in the loss of all historical 5670 RAM AA statistics for the device.

A dialog box appears.

5 Click on the Yes button. The Managed State of the device changes to one of the following:

- managed, if you are remanaging the device
- suspended, if you are suspending management of the device
- not managed, if you are unmanaging the device

Procedure 10-17 To specify which management address the 5620 SAM uses to remanage a device

Perform this procedure to specify which management IP address is saved for a device when the device is set to an unmanaged state. You can configure the 5620 SAM to save the original management IP address or the most recently used management IP address for a device.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens.

2 Click on the Managed State tab.

3 Choose a device from the list.

4 Click on the Properties button. The Node Discovery Control (Edit) form opens with the General tab displayed.

5 Configure the Use Original Management IP parameter.

6 Click on the OK button. A dialog box appears.

7 Click Yes to confirm the action.

Procedure 10-18 To delete a device

Warning — Deleting a device results in a loss of management data and completely removes the device from the managed network. See section 10.1 for more information.

If you use the 5670 RAM to process 5620 SAM statistics, deleting an NE results in the loss of all historical 5670 RAM AA statistics for the device.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager form opens.

2 Click on the Managed State tab.

3 Select a device in the list.

4 If the device is managed, click on the Unmanage button and wait for the state to change to Unmanaged. Otherwise, go to step 5.

5 Click on the Delete button. A dialog box appears.

6 Click on the Yes button. The device is deleted from the 5620 SAM database.

Procedure 10-19 To partially or fully resynchronize NEs with the 5620 SAM database

1 Perform one of the following.

a Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

b Open a physical or service tunnel topology map that displays the required NEs. See Chapter 6 for information about using topology maps.

2 Select one or more NEs, as required.

3 Choose a resynchonization option.

a Right-click on one of the selected devices you want to resynchronize with the 5620 SAM database and choose Resync→Resync All MIBs from the contextual menu.

Note — Choosing Resync All MIBs will fully resynchronize all MIBs for the devices, ignoring timestamps.

b Perform a partial resynchronization.

i Right-click on one of the selected devices you want to resynchronize with the 5620 SAM database and choose Resync→Customized Resync from the contextual menu. The Resync Site(s) form opens.

ii Select Choose MIB Entries.

iii Click on the Next button.

iv Select one or more MIB entries from the list.

v Click on the Next button.

vi Configure the Ignore Timestamps parameter.

vii Click on the Finish button and close the Resync Site(s) form.

4 Choose Administration→Discovery Manager from the 5620 SAM main menu.

5 Perform step 6 in Procedure 10-7 to verify that a particular device's properties have been added to the 5620 SAM database.

6 Close the Discovery Manager form.

Procedure 10-20 To list the active and mismatched SSH host keys

Perform this procedure to view the SSH2 host keys in order to identify the active and mismatched keys.

1 Open the SSH2 known host key manager by performing one of the following.

   a Choose Administration→Security→SSH2 Known Host Key from the 5620 SAM main menu.

   b Perform the following steps.

      i Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager (Edit) form appears.

      ii Click on the Managed State tab. A list of managed devices appears.

      iii Select a device in the list and click on the Properties button. The Node Discovery Control (Edit) form opens.

      iv Click on the Mediation Security tab.

      v Click on the SSH2 Known Host Key button. The SSH2 Known Host Key Manager form opens.

2 Configure the filter criteria and click on the Search button. A list of active and mismatched host keys appears.

3 Close the open forms, as required.

Procedure 10-21 To manually accept a mismatched SSH host key

Perform this procedure to manually accept a rejected SSH host key in order to establish a connection to the SSH server on an NE.

Caution — Before you accept a mismatched host key, you must verify the validity of the SSH connection.

1 Open the SSH2 Known Host Key Manager by performing one of the following.

   a Choose Administration→Security→SSH2 Known Host Key Manager from the 5620 SAM main menu.

   b Perform the following steps.

      i Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager (Edit) form appears.

      ii Click on the Managed State tab. A list of managed devices appears.

      iii Select a device in the list and click on the Properties button. The Node Discovery Control (Edit) form opens.

      iv Click on the Mediation Security tab.

      v Click on the SSH2 Known Host Key button. The SSH2 Known Host Key Manager filter form opens.

2 Choose Mismatch SSH2 Host Key as a match criterion using the drop-down list in the SSH2 Server Key Status column header.

3 Click on the Search button. A list of mismatched host keys is displayed.

4 Select the required host key entry.

5 Verify with the device administrator that the key fingerprint is the host key of the required device.

6 Click on the Delete button to delete the mismatched host key. The mismatched host key is deleted and a connection to the SSH server can be established.

7 Close the SSH2 Known Host Key Manager form.

8 Close open forms, as required.

Procedure 10-22 To change from SNMPv2c to SNMPv3 management of a device

1 Unmanage and delete the device.

   i Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager (Edit) form appears.

   ii On the Discovery Manager (Edit) form, select the device from the list that you want to manage using SNMPv3 and then click on the Unmanage button.

   iii When the device shows a Site State of Not Managed, click on the Delete button.

   iv Click OK on the Discovery Manager (Edit) form.

2 Perform Procedure 10-1 to create SNMPv3 groups and users on the device, and to create a discovery rule with an SNMPv3 mediation security policy.

Note — You can modify the existing discovery rule with an SNMPv3 mediation security policy. However, you must create a new discovery rule for the deleted device if not all devices discovered by the same rule are changed to SNMPv3 management.

3 Rediscover the device.

   i Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager (Edit) form appears.

   ii Click on the Discovery Rules tab.

   iii Select the discovery rule that was created in step 2 to discover the deleted device.

   iv Click on the Rescan button.

   v Click OK on the Discovery Manager (Edit) form.

Procedure 10-23 To switch from non-secure to secure mediation

1 Choose Administration→Mediation from the 5620 SAM main menu. The Mediation (Edit) form opens with the General tab displayed.

2 Click on the Mediation Security tab. You can create a mediation policy as described in Procedure 10-4, or modify the default mediation policy to use SSH2. Perform one of the following.

   a Click on the Create button to create a new mediation policy. The Mediation Policy (Create) form opens with the General tab displayed.

   b Choose the default policy from the list, and click on Edit. The Mediation Policy (Edit) form opens with the General tab displayed.

3 Configure the following parameters using the prescribed values:

- SSH2 as the Communication Protocol
- The SSH2 server user name and password as the User Name and User Password
- Secure as the File Transfer Type

Note — When the File Transfer Type is set to Secure, the Communication Protocol, User Name, and User Password parameters must be configured with the SSH2 information.

- The port that the NE uses for SSH2 communication as the SSH2 Server Port

4 Configure the remaining parameters on the form.

5 Click on the OK button. A dialog box appears.

6 Click on the OK button. The Mediation Policy form closes.

7 Click on the OK button. The Mediation (Edit) form closes.

8 Create a new discovery rule that uses the new SSH2 mediation policy as the read-access mediation policy and the write-access mediation policy. See Procedure 10-7 for information about creating discovery rules.

9 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager (Edit) form opens with the Discovery Rules tab displayed.

10 Click on the Managed State tab. A list of managed devices appears.

11 Choose the device from the list that you want to use SSH2 for CLI sessions and secure file transfers.

12 Click on the Properties button.

13 Click on the Mediation Security tab.

14 Choose the newly created SSH2 mediation policy as the read access mediation policy.

Note — You can also change the mediation policy for a discovery rule by performing step 14 and choosing a discovery rule from the Discovery Rules tab.

15 Click on the OK button. A dialog box appears.

16 Click on the Yes button. The Discovery Manager (Edit) form closes.

Procedure 10-24 To list and save SNMP MIB information

Perform this procedure to list and save SNMP MIB information, which may be of use for purposes such as the following:

- to maintain a record of the SNMP MIBs that the 5620 SAM supports
- to compare SNMP MIB support between 5620 SAM releases
- to identify the polling interval for a MIB entry

1 Choose Administration→Mediation from the 5620 SAM main menu. The Mediation (Edit) form opens with the General tab displayed.

2 Click on the MIB Entry Policies tab.

3 Configure the search filter and click on the OK button. The Mediation (Edit) form displays the MIB entry policies that match the search criteria.

4 To view the polling interval for a MIB entry, perform the following steps.

   i select the MIB entry and click on the Properties button. The MIB Entry Policy (Edit) form opens with the General tab displayed.

   ii View the polling interval setting in the Configuration panel.

   iii Close the MIB Entry Policy (Edit) form.

5 If required, sort the list according to the contents of a column by clicking on the column header.

6 If required, perform the following steps to save the listed information to a file.

   i Right-click on a column header and choose Save to File. the Save As form opens.

   ii Use the form to specify the file that is to contain the saved information.

   iii Click on the Save button. The information is saved to the specified file.

7 Close the Mediation (Edit) form.

11 — Device CLI sessions

11.1 Device CLI sessions overview *11-2*

11.2 Workflow to use a 5620 SAM CLI *11-3*

11.3 CLI procedures *11-3*

11.1 Device CLI sessions overview

You can perform most NE management functions using the 5620 SAM client GUI. Functions such as the following, however, require CLI access to a managed NE:

- validating GUI configuration actions
- configuring items that the GUI cannot, such as LI user access
- troubleshooting using device debug files

The 5620 SAM client GUI provides CLI access to the managed NEs from the main menu and from NE contextual menus in topology maps and navigation trees.

Note — When you use a CLI to change security parameters on an NE, the changes may not be synchronized with the 5620 SAM and subsequently not displayed in the GUI. For security reasons, the 5620 SAM cannot retrieve parameters such as passwords from an NE. To ensure that the security parameters are synchronized, you must use the client GUI to change the values.

Scope of command roles and user permissions on the cli package control CLI command access on an NE. The user permissions are set when security is configured on the NE locally or by using 5620 SAM configuration forms. See "NE user and device security" in the *5620 SAM System Administrator Guide* for information about setting NE access privileges.

vi editor support

On a 7450 ESS, 7710 SR, 7750 SR, or 7950 XRS, you can use the vi editor to modify local files. For example, after you use the 5620 SAM Scripts tool to create a CLI script, you can use a 5620 SAM CLI session to monitor the script execution on an NE, and then use the vi editor to modify the script. The vi editor is available in 5620 SAM Telnet and SSH sessions. The vi editor supports the standard vi navigation keys as well as the cursor keys (which are often called the arrow keys). See the appropriate device documentation for information about the supported vi commands and functions for a specific device.

See the appropriate device documentation for information about the device CLI command structure and usage. See "Script management" in the *5620 SAM Scripts and Templates Developer Guide* for more information about using the 5620 SAM Scripts tool to create CLI scripts.

11.2 Workflow to use a 5620 SAM CLI

The following workflow describes the sequence of high-level tasks required to open and use a device CLI from the 5620 SAM client GUI. The following must be true before you can use the 5620 SAM to open a device CLI using the GUI.

- The 5620 SAM user account has console access privileges on the managed devices. See "NE user and device security" in the *5620 SAM System Administrator Guide* for more information about user account privileges.
- The Telnet server on the managed devices is started.
- If required, SSH2 is properly configured on the managed devices; see chapter 10 for more information.

1 Configure the 5620 SAM CLI preferences. See Procedure 11-1 for more information.

2 Open a CLI session and log in to a managed device. See Procedure 11-2 for more information.

3 Configure the device, view device information, and modify files, as required.

4 Close the CLI session. See Procedure 11-1 for more information.

11.3 CLI procedures

The following procedures describe how to open CLI sessions using the 5620 SAM and configure the CLI console preferences.

Procedure 11-1 To configure the 5620 SAM CLI console preferences

Perform this procedure to customize the 5620 SAM CLI window settings. You can specify the following:

- the console text style and appearance
- the size of the scrolling buffer
- whether to save the session output to a file

1 Open a CLI session, as described in Procedure 11-2.

2 Right-click in the CLI window and choose Configure from the contextual menu. The Terminal Configuration form opens.

3 Configure the parameters:

- Minimum number of scrolling lines
- Font Name
- Font Size
- Bold
- Italic
- Foreground color
- Background color
- Send Console To a File
- Append to file
- Log File Location

Note — When the Send Console To a File parameter is enabled and the Append to file parameter is disabled, the log file is overwritten each time a new CLI session starts.

4 Click on the OK button. The Terminal Configuration form closes. The current and subsequent CLI sessions use the new settings.

Procedure 11-2 To open and close a 5620 SAM device CLI session

Perform this procedure to open a Telnet or SSH session on a managed device using the 5620 SAM client GUI.

1 Perform one of the following.

a Use the 5620 SAM navigation tree; perform the following steps.

i Choose Equipment from the view selector.

ii Right-click on a device icon.

iii Choose NE Sessions→*option* from the contextual menu

where *option* is Telnet Session or SSH Session

The Telnet Session or SSH Session window opens.

Note 1 — The managed device must be configured for Telnet access. See the appropriate device documentation for information about configuring Telnet access to the device.

Note 2 — SSH sessions use SSH2 by default on the 7210 SAS, 7450 ESS, 7750 SR, 7950 XRS, and GNEs. Ensure that SSH2 is properly configured on the device and that an SSH2 mediation policy is specified in the device discovery rule. See chapter 10 for more information about configuring SSH2 security.

b Use the 5620 SAM main menu; perform the following steps.

i Choose one of the following main menu options:

- Tools→Network Elements→NE Sessions→Telnet Session
- Tools→Network Elements→NE Sessions→SSH Session

The Telnet Session or SSH Session window opens.

ii Perform one of the following to specify an NE as the CLI session target.

- Type the management IP address of the NE beside the dimmed Connect button.
- Select an IP address from the drop-down menu.
- Click on the Select button to search for the NE.

The Connect button is enabled.

iii Click on the Connect button.

c Use the Manage Equipment form; perform the following steps.

i Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

ii Configure the filter criteria and click on the Search button.

iii Select an NE in the list.

iv Click on the NE Sessions button and choose Telnet Session or SSH Session. The Telnet Session or SSH Session window opens.

d Use a service topology map; perform the following steps.

i Choose one of the following from the 5620 SAM main menu:

- Manage→Service→Services
- Manage→Service→Composite Services
- Manage→Service→Mirror Services

The appropriate management list form opens.

ii Configure the filter criteria and click on the Search button.

iii Select a service in the list.

iv Click on the Topology View button. A dialog box appears.

v Click on the Yes button. A service topology map opens.

vi Right-click on an NE in the map and choose NE Sessions→Telnet Session or NE Sessions→SSH Session. The Telnet Session or SSH Session window opens.

e Use the Physical Topology map; perform the following steps.

i If the Physical Topology map is not open, choose Application→Physical Topology from the 5620 SAM main menu. The Physical Topology map opens.

ii Right-click on an NE in the map and choose NE Sessions→Telnet Session or NE Sessions→SSH Session. The Telnet Session or SSH Session window opens.

2 Enter the login credentials. You can use the CLI as specified by your user account permissions.

3 Perform NE management tasks, as required.

4 Click on the Disconnect button to close the CLI session.

Note — When you disconnect from a CLI session, the session window remains open to facilitate the opening of a subsequent CLI session.

5 Perform one of the following.

a Open a new CLI session; perform the following steps.

i Perform one of the following to specify an NE as the CLI session target.

- Type the management IP address of an NE beside the dimmed Connect button.
- Select an IP address from the drop-down menu.
- Click on the Select button to search for an NE.

The Connect button is enabled.

ii Click on the Connect button.

b Close the Telnet Session or SSH Session window.

12 — Working with network objects

12.1 Working with network objects overview *12-2*

12.2 Working with topology group objects *12-3*

12.3 Working with physical links *12-4*

12.4 Workflow to manage network objects *12-5*

12.5 Working with network objects procedures *12-5*

12.1 Working with network objects overview

The 5620 SAM is used to create, configure, and manage a device with the various children objects required to be part of a network. Equipment such as the routers, which are at the top of the hierarchy, have properties that are configured using the CLI and discovered when the 5620 SAM discovery process is run. After the device is discovered, it is displayed as an object in the navigation tree. See chapter 5 for more information about the navigation tree.

Objects in the 5620 SAM are considered to have parent/child relationships that are contained within a hierarchy. For example, a card in a card slot is the parent object of a daughter card. The behavior of each object is defined using parameters that are specific to the function required. Those parameters can be managed to suit the needs of the service required. Objects are created and managed using the properties forms found in the contextual menus of the equipment view.

The network is the top object in the navigation tree. The network icon in the navigation tree is the parent object of all managed devices. When you expand the network icon, all managed devices are shown as children of the network parent.

The device object is the discovered device at the top of the hierarchy in the navigation tree, directly below the network icon. The following children objects of the router are created automatically in the navigation tree after the device is discovered.

- CCAG
- ISA-Tunnel Group
- ISA-AA Group
- ISA-LNS Group
- ISA-NAT Group
- ISA-Video Group
- LAG
- IGH
- Shelf
- Card Slot
- Card Slot A for the CPM and switch fabric
- Card Slot B for the redundant CPM and switch fabric
- Fans
- Power Supplies
- CCM
- SFM Slot

The following objects must be created using property forms or create forms from the contextual menus of the equipment view or the ring group view.

- topology groups
- individual CCAGs with VSM-CCA members
- individual ISA-Tunnel Groups with ISA IPsec MDA members
- individual ISA-AA Groups with ISA-AA MDA members and ISA-AA partitions
- individual ISA-LNS Groups with ISA broadband applications MDA members
- individual ISA-NAT Groups with ISA broadband applications MDA members
- individual ISA-Video Groups with ISA-Video MDA members
- individual LAGs with subgroups of LAG member ports
- IGH members
- cards
- ring groups

- daughter cards
  Ports are automatically created when the daughter card is created.
- channels

Configuring an object is accomplished in two steps. First the object must exist or be created, second, the object parameters are modified. See Procedure 13-1 to create objects using the navigation tree.

Object deployment status

When you configure an object using the 5620 SAM GUI or the 5620 SAM OSS, the 5620 SAM saves the configuration and attempts to deploy the changes to the network. Although the value is changed on the configuration forms, the configuration change may not be fully deployed to the NE.

The 5620 SAM allows you to monitor the deployment state for objects. The Deployment tab on all object properties forms notifies you of configuration changes that are not fully deployed to the NE. The parameter that was unsuccessfully deployed is listed, along with the old value and the new value. A deployment icon or warning indicator appears in the following locations when you change the configuration of an object:

- beside all of the parameters on an object properties form for which a deployment is in progress (yellow icon) or has failed (red icon)
- beside the object in the navigation tree (blue icon, regardless of state)
- in info tables in map views (blue icon, regardless of state)
- in the Deployment column on object list forms (blue icon, regardless of state)
- on the Deployment tab (warning indicator)

See “NE maintenance” in the *5620 SAM System Administrator Guide* for information about how to configure a deployment policy, manage deployments, and troubleshoot failed deployments. See Procedure 12-1 for information about how to monitor the deployment of an object configuration change.

12.2 Working with topology group objects

The topology group icons in the navigation tree represent logical topology groups. Initially, a topology group object is created by choosing Create→Equipment→Group from the 5620 SAM main menu. A Group (Create) form opens. Additional topology groups can be created using the Copy button on the topology group properties form.

The Discovered NEs and the Unmanaged NEs topology groups are created by default. The Discovered NEs topology group contains the discovered devices. The Unmanaged NEs topology group contains unmanaged NEs that have been added to the network. You can create new topology groups and move devices to them using the topology maps.

Note — For existing topologies, the unmanaged NE will not be automatically moved to the Unmanaged NEs topology group in the following situations:

- existing unmanaged NEs
- managed NEs that are unmanaged

Although there is no limit to the number of topology groups, Alcatel-Lucent recommends a maximum of 10 000 topology groups per system for optimal performance. Each topology group can contain a maximum of 500 objects. Network elements and immediate child groups are considered objects in a topology group. A bracketed number is displayed beside the name of each topology group in the navigation tree. This number indicates the current number of objects in the group.

See chapter 6 for information about configuring topology group objects and managing topology groups using maps.

12.3 Working with physical links

The 5620 SAM allows you to create and manage links at the Layer 1 level. The physical links represent the actual physical configuration of network connections between ports. You can view and manage physical links from the physical topology map and the Manage Equipment list form.

Although there is no limit to the number of physical links you can have in a system, Alcatel-Lucent recommends a maximum of 10 000 physical links for optimal system performance.

Radio links between 9500 MPRs are shown as physical links by the 5620 SAM, with ports as the endpoint type.

See chapter 6 for information about configuring physical links and managing physical links using maps.

12.4 Workflow to manage network objects

The following workflow describes the sequence of high-level tasks required to manage and configure network objects. This workflow assumes that the physical devices have been installed, commissioned, and discovered. See chapter 9 for more information about device commissioning. See chapter 10 for more information about device discovery.

Note — Network objects can be accessed using the equipment navigation tree. See chapter 5 for more information.

1. As required, create network topology groups. See chapter 6 for more information.
2. As required, configure device objects. See chapter 13 for more information.
3. As required, configure logical group objects. See chapter 14 for more information.
4. As required, configure shelf, card, and daughter card objects. See chapter 15 for more information.
5. As required, configure port and channel objects. See chapter 16 for more information.
6. As required, create physical links. See chapter 6 for more information.
7. Monitor the deployment status of network objects. See Procedure 12-1 for information about how to monitor the deployment status of an object.

12.5 Working with network objects procedures

Use the following procedures to work with network objects.

Procedure 12-1 To monitor the deployment status of a network object

Perform the following procedure to monitor the deployment status of a configuration change to a network object. In addition, you can click on the Deployment tab if a warning indicator appears when you open a properties form

1. Open the properties form for the network object.
2. Configure the parameters, as required.
3. Click on the Apply button. An icon appears beside the modified parameter:
   - yellow icon—deployment in progress. The icon disappears when the deployment is successful.
   - red icon—failed deployment

   In addition, a blue deployment icon appears beside the NE object in the navigation tree, in list forms, and in configured info tables in map views.

A warning indicator appears on the Deployment tab.

4 Click on the Deployment tab.

5 Click on the Search button, if required.

6 In the Name column, verify the name of the parameter for which the deployment was unsuccessful. You can also verify the old value of the parameter before the change was applied, the new parameter value, and the deployer ID.

7 Navigate to the parameter on the configuration form that failed to deploy, if necessary, by selecting an entry in the Attributes list and clicking on the Show Attribute button. The attribute is higlighted for a few seconds on the configuration form.

Note — If you choose an entry in the Attributes list that is located on a hidden tab and click on the Show Attribute button, the hidden tab will temporarily be displayed. See Procedure 3-20 on how to configure hidden tabs.

8 Troubleshoot the cause of the failed deployment. See “To troubleshoot a failed configuration deployment” in the *5620 SAM System Administrator Guide* for more information. After you clear the deployer, all deployment icons disappear.

13 — Device object configuration

13.1 Device object configuration overview *13-2*

13.2 Working with device objects *13-2*

13.3 Working with ring group objects *13-2*

13.4 Workflow to manage device objects *13-3*

13.5 General device configuration procedures *13-5*

13.6 Ring group configuration procedures *13-24*

13.1 Device object configuration overview

The device object is the discovered device at the top of the hierarchy in the navigation tree, directly below the network icon.

This chapter contains the procedures to configure device objects using the navigation tree. Device object properties forms, which are used to configure specific parameters for discovered devices, are accessed using objects on the 5620 SAM navigation tree. See chapter 5 for more information about using the navigation tree.

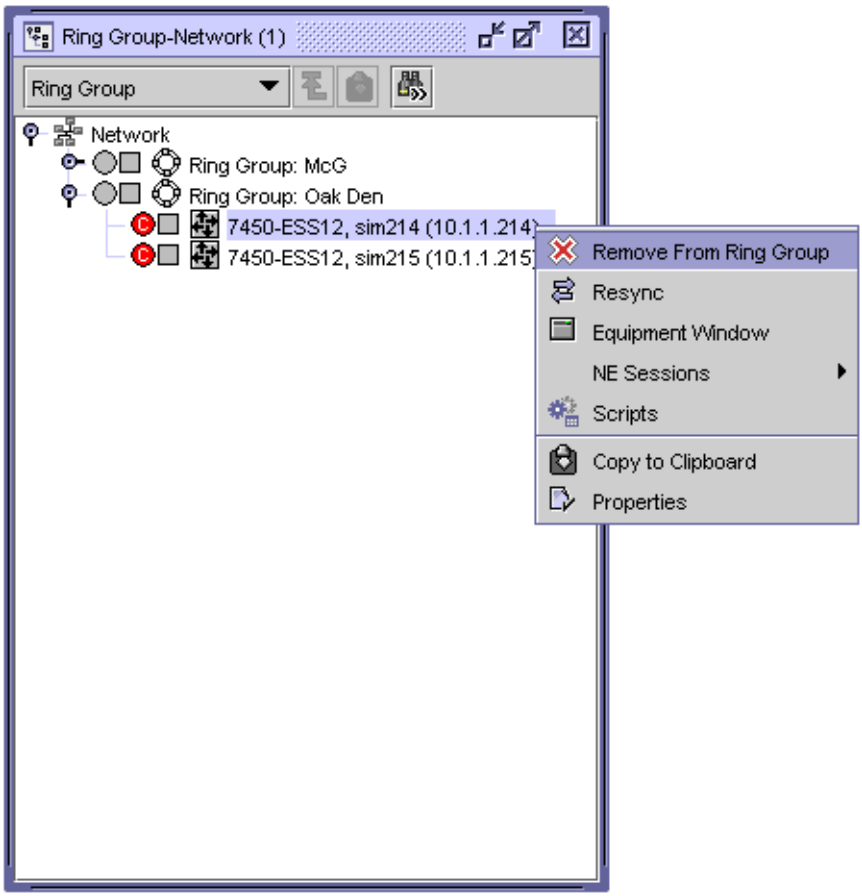
13.2 Working with device objects

The device icons in the navigation tree represent device objects. Most of the configured properties for this object are inherited from the device. The Properties contextual menu option from the navigation tree allows you to configure or modify parameters for the object. These parameters are found on the respective tabs of the properties form and include the following:

- General
- Polling
- Protocols
- Load Balancing
- PAE Site
- Groups
- SAS Agent
- Faults

See chapter 9 for in-band and out-of-band management using parameters on the Polling tab. See chapter 8 for more information about the supported device types.

13.3 Working with ring group objects



The 5620 SAM allows you to create and manage ring groups in the ring group view of the navigation tree. Ring groups are used to group devices logically to represent a typical network topology.

Note — The 5620 SAM uses VLAN groups instead of ring groups to group OmniSwitch NEs. See chapter 67 for more information about VLAN groups.

In the ring group view of the navigation tree, the network icon provides the contextual menu option Create Ring Group to create ring group icons. Using the properties form of a ring group, you can group devices logically in the ring group. Figure 13-1 shows a sample navigation tree ring group view.

Figure 13-1 Sample navigation tree ring group view

13.4 Workflow to manage device objects

The following workflow describes the sequence of high-level tasks required to manage and configure device objects. This workflow assumes that the physical devices have been installed, commissioned, and discovered. See chapter 9 for more information about device commissioning. See chapter 10 for more information about device discovery.

Note — Device objects can be accessed using the equipment navigation tree. See chapter 5 for more information about using the equipment navigation tree.

1 As required, configure the following general NE capabilities:

- **a** Create an object. See Procedure 13-1 for more information.
- **b** Modify an NE configuration. See Procedure 13-2 for more information.
- **c** Customize the NE property labels and values in the System preferences form, for example, to specify the location and site name that differs from the actual NE site name.

d Customize the NE property values in the NE form, see Procedure 13-3.

e Create an operational group. See Procedure 13-4 for more information.

f Enable and configure global cflowd on an NE, and create cflowd collectors. See Procedure 13-5 for more information.

g Associate a span of control with an NE. See Procedure 13-6 for more information.

h Configure 802.1x authentication on an NE. See Procedure 13-8 for more information.

i Configure active card alarms on an NE. See Procedure 13-10 for more information.

j Configure a TWAMP server. See Procedure 13-11 for more information.

k Enable LLDP on a router. See Procedure 13-12 for more information.

l Configure BFD flap detection on an NE. See Procedure 13-13 for more information.

m Create a chassis-level PBB configuration. See Procedure 13-15 for more information.

n Configure serving network information. See Procedure 13-16 for more information.

o Configure the RADIUS CoA port on an NE. See Procedure 13-17 for more information.

p Enable frame-based accounting on a 7210 SAS. See Procedure 13-19 for more information.

q Configure the system resource profile on a 7210 SAS. See Procedure 13-20 for more information.

r Configure the use of vendor-specific ICMP extensions on a 7705 SAR. See Procedure 13-21 for more information.

s Configure subscriber data persistence on the NE. See Procedure 13-22 for more information.

t Configure the QoS ingress aggregate rates on a 7705 SAR-M. See Procedure 13-23 for more information.

u Launch an MCT from a 9500 MPR NE connected to a 7705 SAR. See Procedure 13-24 for more information.

v Start and stop a Webview or Secure Webview session on an OmniSwitch. See Procedure 13-25 for more information.

w Configure the dying gasp alarm on an OS 6250 (Metro), OS 6850E, or OS 6855 NE. See Procedure 13-26 for more information.

2 As required, configure ring group objects. See Procedures 13-27 and 13-28 for more information.

13.5 General device configuration procedures

Use the following procedures to configure devices using the navigation tree.

Procedure 13-1 To create an object

1 Right-click on an empty object in the navigation tree to open the contextual menu.

2 Choose Properties or, when available, Create <*objectname*>.

The properties form or the create form, as applicable, opens.

3 Configure the parameters as required.

Certain object parameters are available for configuration. Configuring these parameters creates the object, however, after the object is created you may need to edit it using properties forms.

Procedure 13-2 To modify NE properties

1 Right-click on a discovered NE in the navigation tree and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

2 Use the form to view or modify the NE parameters, as required.

3 Click on the OK button to save the changes. A dialog box appears.

4 Click on the Yes button. The Network Element (Edit) form closes.

Procedure 13-3 To configure custom NE property values in the NE form

1 Choose Equipment or Routing from the navigation tree view selector. The navigation tree displays the Equipment or Routing view.

2 Right-click on the NE where you need to configure the values for the Custom NE Properties. The Network Element (Edit) properties form opens with the General tab displayed.

3 In the Custom Properties panel, configure the user-defined values.

4 Click on the OK button. A dialog box appears.

5 Click on the Yes button. The Network Element (Edit) properties form closes.

Note 1 — The NE custom properties support the extended character set including multi-byte characters.

Note 2 — The configured labels and values are displayed in the following locations. You can configure the labels and values, if required.

- NE list form: Choose Manage→Equipment→Equipment→Network Element (from the object drop-down menu). The appropriate columns display the values and labels.
- Tree labels: See Procedure 4-3.
- Topology labels: See Procedure 4-4.
- Info Table: See Procedure 6-14.
- Alarms: See Procedure 31-13.

Note 3 — You can also configure Custom NE property values using the 5620 SAM-O. See the *5620 SAM-O XML Reference*.

Note 4 — The 5620 SAM GUI supports localized language display. See chapter 3 for more information.

Procedure 13-4 To create an operational group

Multiple objects can be bundled in operational groups. If you change the status of the operational group, the status of every object in the group is changed.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on an *NE* icon and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab.

4 Click on the Service tab.

5 Click on the Operational Group tab.

6 Click on the Create... button. The Operational Group (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Group Name
- Hold Down Time
- Hold Up Time

8 Click on the OK button. A dialog box appears.

9 Click on the OK button. The Operational Group (Create) form closes and the Network Element form reappears with the new operational group in the list.

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The Network Element form closes.

Procedure 13-5 To enable and configure global cflowd on an NE

Perform this procedure to enable global cflowd and configure cflowd parameters on an NE. You can also configure cflowd sampling for AA flows. See chapter 76 for information about configuring cflowd collectors for AA application groups.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on an NE and select Properties from the contextual menu. The NE properties form opens.

3 Click on the CFLOWD tab. The General tab is displayed.

4 Set the CFLOWD State parameter to Enabled. The form displays additional parameters.

5 Configure the remaining parameters:

- Active Time-out (minutes)
- In-Active Time-out (seconds)
- Cache Size
- Sample Rate
- Over Flow (percent)
- Administrative State
- Template Re-transmit (seconds)

6 Click on the Collector tab.

7 Perform the following steps to add a collector.

i Click on the Create button. The Cflowd Collector Configuration (Create) form opens.

ii Configure the parameters:

- Host Address
- Port Number
- Description
- Version
- Aggregation Type
- Autonomous System
- Template Type

The Aggregation Type parameter is configurable when the Version parameter is set to version-8.

The Autonomous System parameter is configurable when the Version parameter is set to version-5 or version-8.

The Template Type parameter is configurable when the Version parameter is set to version-9.

iii Click on the OK button. The Cflowd Collector Configuration (Create) form closes and a dialog box appears.

iv Click on the OK button. The collector is listed on the NE properties form.

8 Repeat step 7 to add another collector, if required.

Note — A global NE cflowd configuration can contain up to five collectors.

9 Click on the OK button. A dialog box appears.

10 Click on the Yes button. The NE properties form closes.

Procedure 13-6 To add a span of control to an NE

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on a discovered NE and choose Properties. The properties form for the NE opens.

3 Click on the Spans tab.

4 Click on the Add button. The Select Span(s) - Network Element form opens with a list of available spans.

5 Choose one or more spans to apply to the NE.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Select Span(s) - Network Element form closes.

Procedure 13-7 To configure load balancing

1 Right-click on the managed NE for which you want to configure load balancing and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

2 Click on the Globals tab. The Load Balancing tab is displayed.

3 Configure the parameters:

- L4 Load Balancing
- LSR IP Load Balancing
- IP Load Balancing
- Multicast Enhanced Load Balancing
- Service ID Lag Hashing

To enable system-wide enhanced multicast load balancing to send multicast traffic over a LAG, set the Multicast Enhanced Load Balancing to true.

To improve the LAG spraying of VLL service packets when ECMP and LAG hashing are performed by the same NE, set the Service ID Lag Hashing parameter to true.

4 Click on the OK button. The Network Element (Edit) form closes.

Procedure 13-8 To enable or disable 802.1X

Note — Before you can create an 802.1X policy, 802.1X must be enabled on the NE. Before you can configure 802.1X on an Ethernet access port, 802.1X must be enabled on the NE and an 802.1X policy must be created and distributed to the NE.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the managed NE for which you want to enable or disable 802.1X and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab. The Load Balancing tab is displayed.

4 Click on the PAE tab.

5 Set the Administrative State parameter to Up.

6 Click on the OK button. The Network Element (Edit) form closes.

7 Repeat steps 2 to 6 for each NE for which you want to enable 802.1X.

To create and distribute 802.1X policies to the NEs that use 802.1X, see chapter 50.

To configure 802.1X on Ethernet access ports, see Procedure 16-1 in chapter 16.

8 To disable 802.1X on a managed NE, repeat steps 2 to 6 and set the Administrative State to Down.

Procedure 13-9 To configure exclusive policy editing on an NE

You can enable or disable an exclusive policy editing restriction on one or more NEs.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the managed NE for which you want to configure exclusive policy editing and select Properties.

Note — You can perform this procedure on multiple NEs if needed. Select the required NEs from the navigation tree, right-click on any one of them, and then select Properties.

The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab. The Load Balancing tab is displayed.

4 Click on the Exclusive Edit tab.

5 Perform one of the following:

a Configure the parameters:

- Timeout (Seconds)
- Use Exclusive Edit

Setting the Use Exclusive Edit for the selected NEs prevents their local policy definitions from being changed by global updates.

b Click on the Reset Exclusive Edit button. A confirmation message is displayed. Click on Yes.

This action is only available to admin and policy users and removes any exclusive edit locks that were previously set for the selected NE(s).

Note — The Reset Exclusive Edit option is also available in global routing policies under the Local Definitions tab.

6 Close the Network Element (Edit) form.

Procedure 13-10 To configure active card alarms on an NE

Use this procedure to configure a 7950 XRS, 7450 ESS, 7710 SR, or 7750 SR to view NE alarms through the CLI.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the NE where you want to configure active card alarms and select Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab. The Load Balancing tab is displayed.

4 Click on the Alarm Management tab and configure the parameters:

- Alarm Management
- Maximum Cleared Alarms

5 Click on the OK button. The Network Element (Edit) form closes.

Procedure 13-11 To configure a TWAMP server

You can enable or disable Two-Way Active Measurement Protocol on a server and view session and connection statistics.

Note — You cannot configure a TWAMP server after an NE upgrade until the NE is fully resynchronized.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the managed NE for which you want to configure a TWAMP server and select Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab. The Load Balancing tab is displayed.

4 Click on the OAM tab.

5 Scroll to the OAM TWAMP panel. The General tab is displayed.

6 Configure the Administrative Status parameter.

Note — To make changes to the following TWAMP server parameters, the Administrative Status parameter must be set to Disabled.

7 Expand the Server Configuration panel.

8 Configure the parameters:

- Inactivity Timeout (Seconds)
- Maximum Connections
- Maximum Sessions

9 If you are configuring a 7705 SAR, Release 6.0 R1 or later, the Reflector Configuration panel is displayed.

Expand the Reflector Configuration panel and configure the Reflector Test Session Timeout (Seconds) parameter.

10 Click on the Prefix tab.

Note — The objects listed in the table control the behavior of the TWAMP connections that match the defined IP prefix.

11 Perform one of the following:

a Click on the Create button to add a new prefix. The Prefix TWAMP Server (Create) form opens, with the General tab displayed.

Note — The 5620 SAM allows you to create an unlimited number of prefixes. However, an NE can only accept a maximum of 100 prefixes. If more than 100 prefixes are created in the 5620 SAM, the affected NE will issue a deployment error.

b Click on the Search button to display a list of existing prefixes. Select the required item from the list and click the Properties button. The Prefix TWAMP Server (Edit) form opens, with the General tab displayed.

12 Configure the parameters:

- Prefix Address
- Prefix Length
- Description
- Maximum # Connections
- Maximum # Sessions

13 Click on the Statistics tab.

14 Select either SrvConnStats (Assurance) or PrefixSrvStats (Assurance), as required, from the Select Object Type drop-down menu.

15 Select either Past 4 Hour(s) or No Filter, as required, from the filter selector.

16 Click on the Statistics Policies button and select Statistics Policy from the menu. The Statistics Policy form opens, with the General tab displayed.

17 Configure the parameters:

- Retention Time (hours)
- Administrative State
- Threshold Reporting State

18 Click on the Thresholds tab.

19 Perform one of the following, depending on your selection in step 14.

a Configure the PrefixSrvStats (Assurance) threshold parameters:

- Srv Pfx Conn Count Periodic Threshold
- Srv Pfx Conns Rejected Periodic Threshold
- Srv Pfx Session Count Periodic Threshold
- Srv Pfx Test Packets Rx Periodic Threshold
- Srv Pfx Test Packets Tx Periodic Threshold
- Srv Pfx Test Sess Abort Periodic Threshold
- Srv Pfx Test Sess Completed Periodic Threshold
- Srv Pfx Test Sess Rejected Periodic Threshold

b Configure the SrvConnStats (Assurance) threshold parameters:

- Conn Idle Time Periodic Threshold (seconds)
- Conn Session Count Periodic Threshold
- Conn Test Packets Rx Periodic Threshold
- Conn Test Packets Tx Periodic Threshold
- Conn Test Sess Completed Periodic Threshold
- Conn Test Sess Rejected Periodic Threshold

20 Click on the OK button. A dialog box is displayed.

21 Click on the Yes button. The Statistics Policy form closes.

22 Click on the OK button. The Prefix TWAMP Server (Create) form closes.

23 To view TWAMP statistics on a server:

i Perform steps 1 to 4 of this procedure.

ii Click on the Prefix tab.

iii Click on the Search button to display a list of existing prefixes. Select the required item from the list and click the Properties button. The Prefix TWAMP Server (Edit) form opens, with the General tab displayed.

iv Select either SrvConnStats (Assurance) or PrefixSrvStats (Assurance), as required, from the Select Object Type drop-down menu.

v Select either Past 4 Hour(s) or No Filter, as required, from the filter selector.

vi Click on the Collect or Collect All button. The system compiles the statistics and displays the available records in the table.

vii Select the required record from the table and click the Properties button. The Statistics Record is displayed.

viii Close the Statistics record form when your are finished.

ix Click on the OK button. The Prefix TWAMP Server (Create) form closes.

24 Close the Network Element (Edit) form.

Procedure 13-12 To enable LLDP on an NE

LLDP is a neighbor-discovery protocol that allows an NE to advertise its identity and capabilities to other NEs attached to the same physical IEEE 801 LAN. LLDP is a global NE function that you can configure from the 5620 SAM equipment navigation tree on NEs that use Ethernet connectivity. See section 22.1 for more information.

1 Choose Routing from the navigation tree view selector. The navigation tree displays the Routing view.

2 Navigate to the router object. The path is Network→*NE*.

3 Right-click the NE icon and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

4 Enable LLDP by performing the following steps.

i Click on the Globals tab.

ii Click on the LLDP tab.

iii Configure the parameters:

- Administrative Status
- Transmission Interval (Seconds)
- Transmission Multiplier
- Re-Init Delay (Seconds)
- Maximum Consecutive Transmissions
- Fast Transmission Interval (Seconds)
- PDUs in Fast Transmission
- Notification Interval (Seconds)
- Transmission Delay (Seconds)
- Fast Start Repeat Count

The Administrative Status, Maximum Consecutive Transmissions, Fast Transmission Interval (Seconds), and PDUs in Fast Transmission parameters do not apply to the OmniSwitch.

The Transmission Delay (Seconds) and Fast Start Repeat Count parameters only apply to the OmniSwitch.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Network Element (Edit) form closes.

7 Enable LLDP on one or more ports, as required. See chapter 16 for information about configuring port objects.

Procedure 13-13 To configure the BFD flap detection interval on an NE

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on an NE and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab.

4 Click on the BFD tab.

5 Configure the Operational State Transition Interval parameter.

6 Click on the OK button. A dialog box opens.

7 Click on the Yes button. The Network Element (Edit) form closes.

Procedure 13-14 To configure an IP next hop limit on an NE

Complete this procedure to specify a global IP next hop limit for hosts' managed routes.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on an NE and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab.

4 Click on the Subscriber Management tab.

5 Configure the IP Next Hop Limit parameter.

6 Click on the OK button. A dialog box opens.

7 Click on the Yes button. The Network Element (Edit) form closes.

Procedure 13-15 To create a chassis-level PBB configuration

Perform this procedure to provide the PBB MAC name configuration at the NE level.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on an NE and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab.

4 Click on the Service tab and configure the parameters:

- PBB Source Backbone MAC Address
- MAC Notification Interval (seconds)
- MAC Notification Count

5 Click on the MAC Name tab and click on the Create button. The PBB MAC Name (Create) form opens with the General tab displayed. Configure the parameters:

- MAC Name
- MAC Address

6 Click on the OK button.

Procedure 13-16 To configure serving network information on an NE

Perform this procedure to configure serving network information on an NE.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on an NE and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab.

4 Click on the Serving Network tab and configure the parameters:

- Mobile Country Code
- Mobile Network Code

5 Click on the OK button.

Procedure 13-17 To configure the RADIUS CoA port on an NE

Perform this procedure to configure the RADIUS change of authorization port on an NE.

Note — You cannot configure the RADIUS CoA port on the 7950 XRS, Release 11.0 R1 or later.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on an NE and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab.

4 Click on the RADIUS tab.

5 Configure the RADIUS CoA Port parameter.

Note — If the routing instance is bound to a RADIUS proxy server and the RADIUS CoA port is set to 1812, all CoA messages are received by the RADIUS proxy server and dropped by port 1812.

6 Click on the OK button.

Procedure 13-18 To configure two WRED slopes on a 7210 SAS

The 7210 SAS-D and 7210 SAS-M support three WRED slopes per queue.

- High priority/in-profile TCP
- Low priority/out-of-profile TCP
- Non-TCP

Perform this procedure to specify whether only the high priority and low priority slopes are used, and non-TCP slopes are ignored. This configuration is supported on the 7210 SAS-D and 7210 SAS-M, Release 6.0 R1 or later.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7210 SAS NE for which you need to configure two WRED slopes and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the QoS tab.

4 Configure the Use WRED Slopes parameter.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Network Element (Edit) form closes.

Procedure 13-19 To enable frame-based accounting for QoS policies

Perform this procedure to enable frame-based accounting for QoS policies on 7210 SAS NEs.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7210 SAS NE for which you want to configure frame-based accounting and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Frame Based Accounting tab.

4 Configure the parameters:

- Egress
- Ingress

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Network Element (Edit) form closes.

Procedure 13-20 To configure the system resource profile on a 7210 SAS

Perform this procedure to allocate the system resources on a 7210 SAS. The functional areas for which you can allocate resources depend on the chassis type. Not all panels display for all devices. See "System resource profile" in section 8.5 and the NE documentation for more information about system resource allocation.

Note — System hardware resources are shared. Do not assign more than the available resources. Functions are disabled if you assign more than the amount of available resources.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the required 7210 SAS network element and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab.

4 Click on the System Resource Profile tab.

5 Configure the system resources in the Ingress Internal CAM Resources panel.

i Configure the G8032 Fast Flood (Configured) parameter.

Note — Configuration changes for the G8032 Fast Flood (Configured) parameter do not take effect until the NE is rebooted. The current state of the parameter is displayed in the G8032 Fast Flood (Active) field.

ii On the SAP Ingress Internal ACL panel, configure the parameters:

- Total ACL Resource
- MAC Resource
- IPv4 Resource
- 64-bit IPv4/v6 Resource
- 128-bit IPv4/v6 Resource
- 64-bit IPv6 Resource

Note 1 — The sum of the values for the MAC Resource, IPv4 Resource, 64-bit IPv4/v6 Resource, 128-bit IPv4/v6 Resource, and 64-bit IPv6 Resource parameters must not be greater than the value specified for the Total ACL Resource parameter.

Note 2 — 128-bit addresses consume two entries each of the available entry resources.

iii On the SAP Egress Internal ACL panel, configure the parameters:

- Total ACL Resource
- MAC Resource
- IPv4 Resource
- 128-bit IPv4/v6 Resource
- 64-bit IPv6 Resource

Note 1 — The sum of the values for the MAC Resource, IPv4 Resource, 128-bit IPv4/v6 Resource, and 64-bit IPv6 Resource parameters must not be greater than the value specified for the Total ACL Resource parameter.

Note 2 — 128-bit addresses consume two entries each of the available entry resources.

iv On the SAP Ingress QoS Resources panel, configure the parameters:

- Total QoS Resource
- MAC Resource
- IPv4 Resource
- IPv4/v6 Resource

Note — The sum of the values for the MAC Resource, IPv4 Resource, and IPv4/v6 Resource parameters must not be greater than the value specified for the Total QoS Resource parameter.

v On the Queues panel, configure the SAP Ingress Queues (Configured) parameter.

Note — Configuration changes for the SAP Ingress Queues (Configured) parameter do not take effect until the NE is rebooted. The current state of the parameter is displayed in the SAP Ingress Queues (Active) field.

vi On the Router panel, configure the Max ECMP Route Destinations (Configured) parameter.

Note — Configuration changes for the Max ECMP Route Destinations (Configured) parameter do not take effect until the NE is rebooted. The current state of the parameter is displayed in the Max ECMP Route Destinations (Active) field.

vii On the Ethernet CFM panel, configure the parameters:

- Total CFM Resource
- Up MEP Resource

Note — The value for the Up MEP Resource parameter must not be greater than the value for the Total CFM Resource parameter.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Network Element (Edit) form closes.

Procedure 13-21 To enable or disable ICMP extensions

Use this procedure to configure the use of vendor-specific ICMP extensions on the 7950 XRS, 7450 ESS, 7705 SAR, 7710 SR, and 7750 SR NE types.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the NE where you want to configure ICMP extensions and select Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the ICMP tab.

4 Configure the Vendor-Specific ICMP Extensions parameter.

5 Click on the OK button. The Network Element (Edit) form closes.

Procedure 13-22 To configure subscriber data persistence

Use this procedure to configure data persistence on an NE. The Node Persistence feature allows an NE to store dynamic object information in a file on the NE.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the NE where you want to configure data persistence and select Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Node Persistence tab.

4 Configure the File Location and Description parameters on each of the following panels:

- ANCP
- Application Assurance
- DHCP Server
- NAT Port Forwarding
- Subscriber Management

Note — Configuring the File Location parameter for any of the above applications enables data persistency for that application. Ensure that the specified location has sufficient disk space to handle the volume of dynamic objects that will persisted on it.

5 Click on the OK button. The Network Element (Edit) form closes.

Procedure 13-23 To configure QoS ingress aggregate rates on the 7705 SAR-M/ME

Perform the following procedure to configure QoS access ingress and network ingress aggregate rates on the 7705 SAR-M/ME.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7705 SAR-M/ME on which you need to configure QoS ingress aggregate rates and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the QoS tab.

4 Configure the Aggregate Rate parameter in the Access Ingress panel and in the Network Ingress panel.

5 Click on the OK button. The Network Element (Edit) form closes.

Procedure 13-24 To launch an MCT on a 9500 MPRe NE connected to a 7705 SAR

The 5620 SAM supports an integrated MCT from the port or NE level on the 7705 SAR-8 and the 7705 SAR-18. The MCT is distributed with a NEtO client in the 5620 SAM. The MCT can be launched from the port that is associated with the MW link in the navigation tree or from the MW Link Member (Edit) form. You can configure radio parameters using the MCT.

Consider the following before you launch the MCT:

- Java version 1.6 is required to launch the MCT.
- The MCT is only supported on a Windows client; however, it is not supported on Windows 7.
- Only one MCT session can be open at a time.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on a discovered 7705 SAR-8 or 7705 SAR-18 NE and choose External Element Manager.

3 Choose the corresponding MW member from the list and click on the Launch MCT button.

4 Enter your login credentials and click on the OK button. A dialog box appears.

Note — If the client system does not have the required MCT packages, the packages are downloaded from the 5620 SAM and saved in a third-party folder.

5 Click on the Accept button. The MCT initialization starts, and the MCT main view screen appears.

Note — If the MCT is not installed on the client system, the MCT installer window opens. After the MCT is installed, the MCT main view screen appears for all subsequent launches, with the MCT version adjusted to the NE version from which the MCT launched.

Procedure 13-25 To start and stop a Webview or Secure Webview session on an OmniSwitch

Perform the following procedure to start and stop a Webview or Secure Webview session on an OmniSwitch.

1 To start a Webview or Secure Webview session:

- **i** Choose Equipment from the view selector in the navigation tree. The navigation tree displays the Equipment view.
- **ii** Right-click on a discovered OmniSwitch and choose Launch Webview or Launch Secure Webview. A web browser starts and the Webview or Secure Webview login screen appears.

Note — An alternative method of launching a Webview or Secure Webview session is to right-click on a discovered OmniSwitch in the Equipment view. Select Equipment Window from the contextual menu. The Equipment Window form opens. Select the Launch Webview or Launch Secure Webview button on the form.

- **iii** Enter your user name and password. After a successful login, the Chassis Management Home Page appears.

2 To stop a Webview or Secure Webview session:

- **i** Click on the Log Out text at the top of the Webview or Secure Webview window. A Confirm Log Out dialog box appears.
- **ii** Click on the Log Out button to end the Webview or Secure Webview session.

See the appropriate OmniSwitch *Switch Management Guide* for information about configuring and using Webview or Secure Webview.

Procedure 13-26 To configure the dying gasp alarm on an OS 6250M NE

Perform this procedure if you need to configure the dying gasp alarm on an OS 6250M, Release 6.6.3 or later. The dying gasp alarm is also applicable to the following NEs without any additional configuration:

- OS 6250SME (Metro), Release 6.6.3 or later
- OS 6450 (Metro), Release 6.6.3 or later
- OS 6850E, Release 6.4.5 or later
- OS 6855, Release 6.4.5 or later

Note — To view the dying gasp alarm on the 5620 SAM, the OS 6250M must be managed using SNMP v2 with the community string set to public.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on a OS 6250M icon and choose NE Sessions→Telnet Session. The Telnet Session window opens.

3 See step 5 of Procedure 9-2 to configure the NE to be managed using SNMP v2 with a community string configured to public.

Note 1 — If the Backup/Primary power supply fails, a major alarm will be raised. This alarm will be sent only to the first two SNMP stations configured on the NE. “Show snmp station” lists the management station address. SAM ip should be first or second.

Note 2 — The "Loopback 0" address should not be used for the source IP address field on the NE.

13.6 Ring group configuration procedures

Use the following procedures to manage ring groups using the navigation tree.

Procedure 13-27 To create a ring group

You can use the ring group creation function to:

- indicate a VLAN ring topology
- indicate a VPLS ring topology
- configure the properties of the ring group to provide VLAN Internet, BTV (MVR), and L2 VPN (TLS) services
- group devices by geographic region

Consider the following before you create a ring group.

- Ensure that the devices are commissioned, as described in chapter 9.
- Ensure that mediation policies are configured to allow CLI access to the managed devices, as described in chapter 10.
- If you want specific access interfaces to be part of a VLAN service, ensure that the parent device of the interface is a member of the ring group.

1 Choose Ring Group from the navigation tree view selector. The navigation tree displays the Ring Group view.

2 Right-click on the Network object and choose Create Ring Group. The Ring Group (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Group Name
- Description
- Ring Group Type

4 Click on the Apply button.

5 If you set the Ring Group Type parameter to VPLS in step 3, go to step 8.

6 Click on the TLS tab to configure L2 VPN parameters.

7 Configure the TLS parameters:

- Enabled
- Ethertype
- Jumbo Frame

The Ethertype and Jumbo Frame parameters are configurable when the Enabled parameter is selected.

8 Perform one of the following to add a device to the ring group.

a Perform the following steps to use the current properties form.

i Click on the Group Members tab.

ii Click on the Create button. The Select Network Elements form opens.

iii Choose one or more NEs and click on the OK button. A dialog box appears.

iv Click on the OK button. The Select Network Elements form closes and the selected devices are listed on the Ring Group (Create) form.

v Click on the OK button. A dialog box appears.

vi Click on the Yes button. The Ring Group (Edit) form closes and the device objects are listed in the navigation tree under the new ring group object.

b Perform the following steps to use the navigation tree.

i Right-click on the device object in the Equipment view of the navigation tree and choose Add To Ring Group from the contextual menu. The Select Group form opens to display a list of ring groups.

ii Choose the new ring group and click on the OK button. The Select Group form closes and the device object is listed under the ring group in the Ring Group view of the navigation tree.

Note — All device types can be added as members of a VLAN ring group. Only devices that support VPLS can be added to a VPLS ring group.

9 To apply a span of control to a ring group, click on the Spans tab.

i Click on the Add button. The Select Span(s) - Ring Groups form opens with a list of available spans.

ii Choose one or more spans of control to apply to the ring group.

iii Click on the OK button. The Select Span(s)-Ring Group form closes and a dialog box appears.

iv Click on the OK button.

10 Provision VLAN services, as described in chapter 66.

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The Ring Group (Create) form closes.

Procedure 13-28 To remove a ring group or ring group device

1 Choose Ring Group from the view selector in the navigation tree. The navigation tree displays the Ring Group view.

2 Navigate to the required ring group object. The path is Network→Ring Group.

3 To remove a device from the ring group, right-click on the device object under the ring group and choose Remove From Ring Group from the contextual menu. The device is removed from the ring group.

4 To remove a ring group:

i Perform step 3 for each device in the ring group to remove all devices from the ring group.

ii Right-click on the Ring Group object and choose Remove Ring Group from the contextual menu. A dialog box appears.

iii Click on the Yes button. The ring group is removed.

Caution — Removing a ring group deletes the VLAN services that are associated with the ring group.

14 — Logical group object configuration

14.1 Logical group object configuration overview *14-2*

14.2 Working with CCAG objects *14-2*

14.3 Working with ISA-AA groups *14-2*

14.4 Working with ISA-Tunnel groups *14-3*

14.5 Working with ISA-LNS groups *14-4*

14.6 Working with ISA-NAT groups *14-4*

14.7 Working with ISA-Video groups *14-4*

14.8 Working with ISA-WLAN GW groups *14-5*

14.9 Working with IGH objects *14-6*

14.10 Working with LAG objects *14-6*

14.11 Workflow to manage logical group objects *14-8*

14.12 Logical group object configuration procedures *14-9*

14.13 LAG configuration procedures *14-27*

14.1 Logical group object configuration overview

Logical group objects are children of the device object. They appear below the device object in the navigation tree. The following logical group objects are created automatically in the navigation tree after the device is discovered.

- CCAG
- ISA-AA Group
- ISA-Tunnel Group
- ISA-LNS Group
- ISA-NAT Group
- ISA-Video Group
- LAG
- IGH

Properties forms for logical group objects are accessed using the 5620 SAM navigation tree.

This chapter contains the procedures to configure logical group objects using the navigation tree. See chapter 5 for more information about using the navigation tree.

14.2 Working with CCAG objects

CCAGs are navigation tree objects located below device icons. CCAGs are configured manually using the CCAG object navigation tree menu and subsequent forms. For proper CCAG configuration, a VSM-CCA card must be present in the NE. In the navigation tree, a VSM-CCA card can be opened to show its ports. The ports are indicated by VSM Port x/y/z, which shows port type and the ID of the port.

You must configure the following in the CCAG configuration forms:

- General properties such as CCAG ID, Description, CCA Rate Enabled, CCA Rate, Access Adapt QoS, and Administrative State
- CCAG MDA Members which are compatible ports that can belong to a CCAG.

When you create a CCAG, the 5620 SAM creates virtual paths to be used as interconnections to bind services together. Two unidirectional paths are created: Alpha and Beta. For each path, three virtual ports are created: one for SAP-SAP connections, one for SAP-NET connections, and one for NET-SAP connections. The last two virtual ports are used to bind a service and a network interface together.

A maximum of eight cards can be added to a CCAG, with a maximum of eight CCAGs per NE.

14.3 Working with ISA-AA groups

ISA-AA groups provide AA load balancing, scaling, and redundancy on NEs that contain multiple ISA-AA MDAs. ISA-AA redundancy protects against card failure and minimizes service disruption during maintenance or protocol signature upgrades.

The 5620 SAM supports AA group configuration on the 7450 ESS, 7750 MG, and 7750 SR. An NE can have up to seven ISA-AA groups.

Note — A single-slot chassis does not support AA configuration.

ISA-AA group configuration requires the following:

- group number, which can be set only during group creation
- up to seven primary group members and one optional backup member
- one or more forwarding classes to divert to the AA group

You can use multiple ISA-AA groups to scale the application of AA policies, and can divide an AA group into partitions that are customized for specific VPN services. Each partition has an AA policy, and supports the configuration of custom protocols, applications, and application groups. Within a partition, you can use application service options, or ASOs, to create multiple application QoS policies, or AQPs. AA partitions support statistics collection and data reporting to the 5670 RAM.

Note — When you create an ISA-AA group or partition, a default AA policy is automatically created for the group or partition. When you delete a group or partition, the default policy is also deleted.

See chapter 76 for more information about AA groups, partitions, and policies. See Procedure 14-2 for information about creating ISA-AA groups and partitions. See Procedures 14-3 and 14-4 for information about configuring additional ISA-AA group and partition functions.

14.4 Working with ISA-Tunnel groups

ISA-tunnel groups provide redundancy for IPsec tunneling and encryption functions when multiple ISA-IPSEC MDAs are installed on an NE. ISA-IPSEC redundancy protects against card failure and minimizes service interruption during maintenance or protocol signature upgrades. You can configure up to four ISA-Tunnel groups on one NE.

An ISA-tunnel group can operate in one of the following modes:

- primary/backup active MDA
- multiple active MDAs

The primary/backup configuration provides fault tolerance in the event of an MDA failure. An ISA-tunnel group in a primary/backup configuration can contain a maximum of two MDAs.

Using multiple active MDAs provides load balancing in addition to fault tolerance. This mode of operation is supported on a 10.0 R4 or later 7750 SR in chassis mode D or higher, and on a 11.0 R1 or later 7450 ESS in mixed mode. You can include up to 16 MDAs in an ISA-tunnel group when the use of multiple active MDAs is enabled.

You can configure an ISA-tunnel group on a 7750 SR or 7450 ESS in mixed mode to act only as an IKEv2 responder during a MC IPsec switchover. This is the automatic behavior for dynamic tunnels, but not for static tunnels. See chapter 29 for more information about MC IPsec.

14.5 Working with ISA-LNS groups

The 5620 SAM supports the creation and configuration of ISA-LNS groups. ISA-LNS groups provide LNS PPP session termination on 7750 SR NEs. You can assign an ISA-LNS group to a tunnel group profile or a tunnel profile. When an operational L2TP tunnel is established, peers that are associated with the ISA-LNS group are automatically created. Session traffic is automatically balanced across the available active ISA broadband application MDAs in the group. You can add ISA broadband application MDAs to an ISA-LNS group, and up to four ISA-LNS groups on each NE. See Procedure 14-6 for information about how to create and configure an ISA-LNS group.

You must configure the following on the ISA-LNS groups configuration form:

- General properties, such as Group Number, Description, and Administrative State
- ISA-LNS Group members

Note — You can configure an ISA broadband application MDA only on an IOM3-XP module in a 7750 SR -7 or 7750 SR-12.

14.6 Working with ISA-NAT groups

An ISA-NAT group provides a redundant NAT function for routing instances using ISA Broadband Applications MDAs. See chapter 24 for information about ISA-NAT group configuration.

14.7 Working with ISA-Video groups

ISA-Video groups are created to provide packet buffering and packet processing in support of the IPTV video features.

When configured in the router, video ISAs are logically grouped into video groups. An ISA-Video group allows more than one video ISA to be treated as a single logical entity for a specific application, where the system performs a load-balancing function when it assigns tasks to a member of the group.

ISA-Video groups provide a redundancy mechanism to guard against hardware failure within a group. ISA-Video groups pool the processing capacity of all the group members and increase the application throughput because of the increased packet processing capability of the group.

You must configure the following on the ISA-Video groups configuration form:

- General parameters
- ISA-Video Group members

You can add up to four MDAs to an ISA-Video group, and up to four ISA-Video groups on each NE. All members of an ISA-Video group are primary members.

Note — If the parameter ad Insert server is enabled, only one MDA can be added to an ISA-Video group.

14.8 Working with ISA-WLAN GW groups

An ISA-WLAN GW group is used to represent multiple hardware adapters as a single entity, allowing for warm redundancy between multiple WLAN GW ISAs. Only one ISA-WLAN GW group can be created per NE. This group can be numbered 1 to 4, but this number must be exclusive and cannot be in use by an ISA-NAT group.

The ISA-IOM is the child of the ISA-WLAN GW group. Only an IOM3 with both ISA BB MDAs populated is valid for addition. A maximum of six IOMs can be added to an ISA-WLAN GW group, with a maximum active IOM limit of five per group. The required ISA-IOMs should be added before the ISA-WLAN GW group is turned administratively up.

ISA-WLAN GW members are created automatically by the NE when the ISA-WLAN GW group is administratively up, and deleted automatically when the administrative state is down. The number of members is equal to the active IOM limit.

You can globally list ISA-WLAN GW groups from the Manage→ ISA Functions→ ISA-WLAN main menu. ISA-WLAN GW groups can also be listed from Manage→ Equipment.

Soft GRE tunnels

Soft GRE tunnels are created dynamically by the NE when the first UE attempts to connect. The tunnel is used to backhaul traffic from the access point or residential gateway to the WLAN GW. The NE creates tunnels on a per-access point or per-residential gateway basis. Soft GRE tunnels terminate on the WLAN-GW ISA.

Soft GRE tunnels are viewable on the configuration form for base routing instances, VPRN routing instances, group interfaces, and ISA-WLAN GW groups. The Soft GRE Tunnels tab lists the soft GRE tunnels belonging to a given routing instance. User equipment information is viewable from the properties form for individual soft GRE tunnels. GTP session information (including bearer information) is viewable from the properties form for individual user equipment items. You can globally list Soft GRE tunnels from the Manage→ ISA Functions→ ISA-WLAN main menu.

14.9 Working with IGH objects

IGHs are navigation tree objects located below the device icon. IGHs are configured manually using the configuration forms available when you choose Create IGH from the IGH object navigation tree contextual menu.

You create an IGH to group together IP links and POS links so that if a configured number of links go out of service for any reason, the remaining links in the IGH go out of service too. This causes the routing protocols to re-converge to switch from the primary path to an alternate path.

The following requirements and restrictions apply to IGHs.

- IGHs are supported only on network links.
- IGHs are supported only on SONET/TDM interfaces with PPP auto encapsulation.
- A port or channel needs to be bound to a router interface after the member is added to an IGH.
- You can assign a port to only one IGH.

14.10 Working with LAG objects

LAGs are navigation tree objects located below a device icon which aggregate multiple network connections in parallel to increase throughput beyond what a single connection can sustain, and to provide redundancy in case one of the links fails.

LAGs are configured manually using the configuration forms available when you choose Create LAG from the LAG object navigation tree contextual menu.

The following minimum configuration is required to enable LACP.

- Enable LACP at either end of the LAG group.
- Set one end of the LAG group as LACP active.

You must configure the following in the LAG configuration forms:

- General properties, such as LAG description, configured address, encapsulation type, and administrative state
- Link aggregation group parameters, such as port threshold, port threshold action, and dynamic cost
- LACP parameters, such as LACP mode, LACP transmit interval, actor administration key, LACP transmission standby, and LACP selection criteria
- LAG members, which are the compatible ports that can belong to a LAG

Because all ports can have their own MAC address, when ports are part of a LAG, the LAG must have an MAC address.

The port configuration of the first port added to the LAG is used to compare with subsequently added ports. If a discrepancy is found with a newly added port, that port is not added to the LAG.

Up to 32 ports can be added to or removed from a LAG on XCM cards or IOM 3 and IMM cards in chassis mode D. Otherwise, up to only eight ports can be added to or removed from a LAG. All ports added to a LAG must have the same parameter settings.

Only ports belonging to one LAG subgroup are considered eligible members of a LAG and can be selected as active links.

See section 8.21 for OmniSwitch-specific LAG information.

See the *5620 SAM MPR User Guide* for 9500 MPR-specific LAG information.

LAG link mapping profiles

You can use a LAG link mapping profile to assign a specific LAG egress port to a SAP or interface, and control how egress traffic is handled if the specified port fails. You can then configure the specified port to perform admission control and QoS contract with the knowledge that all traffic for the SAP or interface will egress on that port. You can also specify a secondary port to handle traffic in the event that the primary port fails. See Procedure 14-14 for more information about creating LAG link mapping profiles.

LAG utilization TCAs

You can enable TCA on a LAG object and determine whether the LAG utilization value exceeds a TCA policy threshold. The following nodes support enabling TCA on LAG objects:

- 7710 SR
- 7450 ESS
- 7750 SR
- 7950 XRS
- 9500 MPR

You can associate a TCA policy with a LAG object from the TCA policy configuration form. See procedure 19-3 for information about applying an existing TCA policy to an object from the object properties form. The 5620 SAM compares the utilization value at each statistics collection to the threshold value in the TCA policy and raises an alarm when the LAG utilization value crosses the specified limit. You need to enable performance statistics collection on the LAG object to configure a TCA policy. See chapter 19 for more information about TCA.

L1 LAGs support collection of scheduled and on-demand statistics, and plotting of real-time and historical statistics. L2 and Ethernet LAGs support collection of scheduled statistics and plotting of historical statistics.

BFD on Ethernet LAGs

You can configure an Ethernet LAG to use BFD to speed up the detection of link failures. When BFD is enabled on a LAG, micro-BFD sessions are automatically created for each link in the group. The following nodes support enabling BFD on a LAG:

- 7450 ESS
- 7750 SR
- 7950 XRS

For information about configuring BFD on a LAG, see Procedure 14-15. For information about viewing micro-BFD sessions on a LAG, see Procedure 14-16.

14.11 Workflow to manage logical group objects

The following workflow describes the sequence of high-level tasks required to manage and configure logical group objects. This workflow assumes that the physical devices have been installed, commissioned, and discovered. See chapter 9 for more information about device commissioning. See chapter 10 for more information about device discovery.

Note — Logical group objects can be accessed using the equipment navigation tree. See chapter 5 for more information about using the equipment navigation tree.

1 As required, configure CCAG objects. See Procedure 14-1 for more information.

2 As required, create and configure ISA-AA groups and ISA-AA partitions. See Procedure 14-2 for more information. Additionally, perform the following, as required:

   a Add a subscriber policy override to an ISA-AA group or ISA-AA partition. See Procedure 14-3 for more information.

   b Enable and configure cflowd on an ISA-AA group or ISA-AA partition. See Procedure 14-4 for more information.

3 As required, configure ISA-Tunnel groups. See Procedure 14-5 for more information.

4 As required, configure ISA-LNS groups. See Procedure 14-6 for more information.

5 As required, create and configure ISA-NAT groups. See Procedure 24-1 for more information. Additionally, perform the following, as required:

   a Configure statistics on an ISA-NAT group. See Procedure 24-8 for more information.

   b Start or stop a NAT address-pool drain operation. See Procedure 24-10 for more information.

6 As required, configure ISA-Video groups. See Procedure 14-7 for more information.

7 As required, configure ISA-WLAN GW groups. See Procedure 14-8 for more information.

8 As required, configure IGH objects. See Procedure 14-9 for more information.

9 As required, configure LAG objects:

a Create and configure a LAG. See Procedures 14-10 and 14-11 for more information.

b Create and configure a LAG on an OmniSwitch. See Procedure 14-12 for more information.

c Create and configure a dynamic LAG member on an OmniSwitch. See Procedure 14-13 for more information.

d Create a LAG Link Mapping Profile. See Procedure 14-14 for more information.

e Configure BFD on a LAG. See Procedure 14-15 for more information.

14.12 Logical group object configuration procedures

Use the following procedures to configure NE logical groups using the navigation tree.

Procedure 14-1 To configure a CCAG

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the NE object in the equipment navigation tree.

3 Expand the Logical Groups objects in the equipment navigation tree.

4 Perform one of the following:

a To create a CCAG, right-click on the CCAGs object and choose Create CCAG. The CCAG (Create) form opens with the General tab displayed. Configure the CCAG ID parameter.

b To configure a CCAG, expand the CCAG object, right-click on the CCAG that you want to configure and choose Properties from the contextual menu. The CCAG (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- CCA Rate Enabled
- CCA Rate (kbps)
- Access Adapt QoS
- Administrative State

6 Click on the CCAG MDA Members tab to view and add CCAG MDA members associated with this CCAG.

7 Click on the Create button. The CCAG MDA Member (Create) form opens.

8 Click on the Select button. The Select Member MDA - CCAG MDA Member form opens with a list of available VSM-CCA cards.

9 Choose the MDA to add to this CCAG and click the OK button. The Select Member MDA - CCAG MDA Member form closes and the CCAG MDA Member (Create) form reappears.

10 Click on the OK button. The CCAG MDA Member (Create) form closes.

11 Click on the CCAG Paths tab. The Alpha and Beta paths are displayed. To modify a path, go to step 12. Otherwise, go to step 25.

12 Choose a path and click on the Properties button. The CCAG Internal Path (Edit) form opens with the General tab displayed.

13 Configure the parameters:

- Path Rate Enabled
- Path Rate (Kb/s)
- Path Rate Option
- Path Weight (%)

14 Click on the Path Cross Connects tab. This tab displays the cross- connects associated with the path.

15 Choose a cross-connect to be configured and click Edit. The Cross Connect (Edit) form opens with the General tab displayed.

16 Configure the parameters:

- Description
- Configured MAC
- MTU (octets)

17 Click on the States tab.

18 Configure the Administrative State.

19 Click on the Policies tab.

20 To specify an egress slope policy other than the default, perform the following steps.

i Click on the Clear button in the Egress Slope Policy panel.

ii Click on the Select button in the Egress Slope Policy panel. The Select Egress Slope Policy form opens.

iii Choose a policy and click on the OK button. The Select Egress Slope Policy form closes and the policy name is displayed on the Cross Connect (Edit) form.

21 Configure the parameters:

- Committed Burst Size (%)
- Committed Burst Size (%)

22 To specify an ingress slope policy other than the default, perform the following steps.

i Click on the Clear button in the Ingress Slope Policy panel.

ii Click on the Select button in the Ingress Slope Policy panel. The Select Ingress Slope Policy form opens.

iii Choose a policy and click on the OK button. The Select Ingress Slope Policy form closes and the policy name is displayed on the Cross Connect (Edit) form.

23 Click on the OK button. The Cross Connect (Edit) form closes and the CCAG Internal Path (Edit) form reappears.

24 Click on the OK button. The CCAG Internal Path (Edit) form closes and the CCAG (Edit) form reappears.

25 Click on the OK button. The CCAG (Edit) form closes.

Procedure 14-2 To configure an ISA-AA group and ISA-AA partitions

Perform this procedure to create an ISA-AA group that contains one or more partitions. ISA-AA partitions provide ISA-AA group functions that are limited to the partition scope.

Note — When you create an ISA-AA group or partition, a default AA policy is automatically created for the group or partition. When you delete a group or partition, the default policy is also deleted.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the ISA-AA Groups object on an NE. The path is Network→NE→Logical Groups→ISA-AA Groups.

Note — You can also create or configure an ISA-AA group or partition by choosing Manage→ISA Functions→ISA-AA, and then using the list form that opens.

3 Perform one of the following.

a Create an ISA-AA group. Perform the following steps.

i Right-click on the ISA-AA Groups object and choose Create ISA-AA Group from the contextual menu. The ISA-AA Group (Create) form opens with the General tab displayed.

ii Configure the Group Number parameter.

iii Click on the Apply button. The form displays additional tabs and parameters, and the form name changes to ISA-AA Group (Edit).

b Configure an existing ISA-AA group. Perform the following steps.

i Expand the ISA-AA Groups object.

ii Right-click on the ISA-AA group that you want to configure and choose Properties from the contextual menu. The ISA-AA Group (Edit) form opens with the General tab displayed.

4 Configure the parameters:

Note — If you are configuring an existing AA group and the associated AA group policy has SAP dependencies, you cannot modify the Partitions parameter until you remove the SAP dependencies on the group policy.

- Description
- Operation Upon Failure
- Administrative State
- Partitions
- Subscriber Scale
- Overload Cut-Through
- Number of IPv4 Transit Prefix Entries
- Number of IPv6 Transit Prefix Entries
- Number of Remote IPv6 Transit Prefix Entries
- Maximum HTTP Enriched Packet Size (octets)
- Match All HTTP Requests
- HTTP X-Online-Host
- AA Subscriber Remote
- Tethering Detection Administrative State
- Capacity Cost High Threshold
- Capacity Cost Low Threshold
- Current OLC State
- Revert OLC State

The Maximum HTTP Enriched Packet Size (octets) parameter is configurable only on a 7750 MG:

The Tethering Detection Administrative State parameter is configurable only on a Release 5.0 or later 7750 MG.

The following parameters are configurable only on a 7750 SR:

- AA Subscriber Remote
- Number of IPv6 Transit Prefix Entries
- Number of Remote IPv6 Transit Prefix Entries

5 Perform the following steps to specify one or more ISA-AA MDAs for the ISA-AA group.

i Click on the ISA-AA Group Members tab.

ii Click on the Create button. The ISA-AA Group Member (Create) form opens.

iii Configure the ISA-AA MDA Role parameter.

iv Click on the Select button and choose an MDA from the Select Member MDA - ISA-AA Group Member form. The MDA slot number is listed on the ISA-AA Group Member (Create) form.

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The ISA-AA Group Member (Create) form closes and the MDA is listed on the ISA-AA Group Member (Create) form.

Note — After an NE reboot, the NE performs a rebalancing of the AA load. Because of this, the MDA slot number assigned to an AA subscriber or AA SAP on the AA Subscriber or AA SAP Summary form is displayed as Unassigned if the AA subscribers in the configuration file cannot be accommodated.

vii Perform steps 5 ii to vi to add another MDA, if required.

6 Perform the following steps to specify one or more traffic forwarding classes to divert to the ISA-AA group.

i Click on the ISA-AA Group Diverted FCs tab.

ii Click on the Create button. The ISA-AA Group Diverted FC (Create) form opens.

iii Configure the Forwarding Class Name parameter.

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The ISA-AA Group Diverted FC (Create) form closes.

vi Perform steps 6 ii to v to add another forwarding class, if required.

7 Perform the following steps to configure QoS for the group.

i Click on the QoS tab.

ii Click on the Egress From-Subscriber tab.

iii Configure the following parameters:

Note 1 — You must deselect the Default check box before you can use a slider to specify a Reserved CBS (%) or Buffer Utilization High Water Mark value.

Note 2 — The value of the Buffer Utilization High Water Mark parameter must be higher than the value of the Buffer Utilization Low Water Mark parameter.

- Reserved CBS (%)
- Buffer Utilization High Water Mark
- Buffer Utilization Low Water Mark

iv To specify a slope policy, click on the Select button in the Slope Policy panel and choose a slope policy from the Select Slope Policy form.

v To specify a network queue policy, click on the Select button in the Network Queue Policy panel and choose a policy from the Select Network Queue Policy form.

vi To specify a port scheduler policy, click on the Select button in the Port Scheduler Policy panel and choose a policy from the Select Port Scheduler Policy form.

vii Click on the Egress To-Subscriber tab.

viii Repeat steps 7 iii to vi.

8 If the Partitions parameter on the General tab is set to Enabled, perform the following steps to configure an AA partition for the group.

Note — If the Partitions parameter on the General tab is set to Enabled, the remaining procedure steps apply only to the partition; no more group configuration is required.

i Click on the ISA-AA Partitions tab.

ii To create a partition, perform the following steps.

- Click on the Create button. The ISA-AA Group Partition (Create) form opens with the General tab displayed.
- Configure the Partition ID parameter.
- Go to step 8 iv.

iii To configure an existing partition, select a partition in the list and click on the Properties button. The ISA-AA Group Partition (Edit) form opens with the General tab displayed.

iv Configure the parameters:

- Description
- Match All HTTP Requests
- HTTP X-Online-Host
- AA Subscriber Remote

9 To configure cflowd, perform Procedure 14-4.

10 To add one or more AA subscriber objects for statistics collection, perform the following steps.

i Click on the AA Subscriber Stats Objects tab.

ii Click on the Add button and choose one of the following options:

- Application
- Application Group
- Charging Group
- Custom Protocol
- System Protocol

The Select *object_type* form opens and lists the available objects of the chosen type.

iii Select an object in the list and click on the OK button. The elect *object_type* form closes and the AA Subscriber Stats Object Config form opens.

iv Configure the Export Method parameter.

Note — You can select both Export Method options only on a Release 11.0 or later 7750 SR.

v Click on the OK button. A dialog box appears.

vi Click on the OK button.

vii Repeat steps 10 ii to vi to add another statistics collection object, if required.

11 To add special-study objects to the ISA-AA group or partition, click on the AA Special Study tab. Otherwise, go to step 16.

12 To add a special-study subscriber to the group or partition, perform the following steps.

i Click on the Subscribers tab.

ii Click on the Create button. The AA Special Study Subscriber Config (Create) form opens.

iii Configure the parameters:

- AA Subscriber Name
- AA Stats Type

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The AA Special Study Subscriber (Create) form closes, and the subscriber is listed on the ISA-AA group or partition properties form.

13 To add one or more special-study SAPs to the ISA-AA group or partition, perform the following steps.

i Click on the SAPs tab.

ii Click on one or more of the following buttons and use the list form that opens to add one or more objects, as required:

- Add Per-SAP Protocols—to add a SAP for per-protocol monitoring
- Add Per-SAP Applications—to add a SAP for per-application monitoring

The list form closes, and the SAP is listed on the ISA-AA group or partition properties form.

14 To add one or more special-study spoke SDP bindings to the ISA-AA group or partition, perform the following steps.

i Click on the Spoke SDP Bindings tab.

ii Click on one or more of the following buttons and use the list form that opens to add one or more objects, as required:

- Add Per-Spoke SDP Binding Protocols—to add a SAP for per-protocol monitoring
- Add Per-Spoke SDP Binding Applications—to add a SAP for per-application monitoring

The list form closes, and the spoke SDP binding is listed on the ISA-AA group or partition properties form.

15 To add one or more special-study transit subscribers to the group or partition, perform the following steps.

i Click on the Transit Subscribers tab.

ii Click on the Create button. The AA Special Study Transit Subscriber Config (Create) form opens.

iii Configure the parameters:

- Transit Subscriber Name
- AA Stats Type

iv Click on the OK button. The AA Special Study Transit Subscriber Config (Create) form closes, and a dialog box appears.

v Click on the OK button. The transit subscriber is listed on the ISA-AA group or partition form.

16 To add an AA subscriber policy override to the ISA-AA group or partition, perform Procedure 14-3.

17 To configure one or more residential DCP groups, perform the following steps.

i Click on the 5670 RAM Parameters tab.

ii Click on the Create button. The Residential DCP Group (Create) form opens with the General tab displayed.

iii Configure the parameters:

- ID
- Auto-Assign ID
- Description
- Address Type
- Group Type

iv Click on the Address Rules tab.

v Click on the Create button. The DCP Address Rule (Create) form opens.

vi Configure the parameters:

- ID
- Auto-Assign ID
- Description
- IP Address Low
- High
- Mask

vii Click on the OK button. The DCP Address Rule (Create) form closes, and a dialog box appears.

viii Click on the OK button. The address rule is listed on the Residential DCP Group (Create) form.

ix Click on the OK button. The Residential DCP Group (Create) form closes, and a dialog box appears.

x Click on the OK button. The residential DCP group is listed on the ISA-AA group or partition properties form.

xi To create another residential DCP group, repeat steps 17 ii to x.

18 If you are configuring an ISA-AA partition, click on the OK button. The ISA-AA partition is listed on the ISA-AA group properties form.

19 Click on the OK button. A dialog box appears.

20 Click on the Yes button. The ISA-AA group properties form closes.

Procedure 14-3 To add an AA subscriber policy override to an ISA-AA group or partition

The AA subscriber policy override is rejected if the subscriber does not have an application profile assigned. You can add an AA subscriber policy override to a SAP or Spoke SDP, but not to an ESM subscriber.

1 If you are performing this procedure as part of the ISA-AA group or partition configuration described in Procedure 14-2, go to step 6.

2 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

3 Navigate to the ISA-AA group object. The path is Network→*NE*→Logical Groups→ISA-AA Groups→ISA-AA Group *n*.

4 Right-click on the ISA-AA Group *n* icon and choose Properties. The ISA-AA Group (Edit) form opens with the General tab displayed.

5 If you are configuring the subscriber policy override on an ISA-AA partition, perform the following steps.

i Click on the ISA-AA Partitions tab.

ii Select a partition in the list and click on the Properties button. The ISA-AA Group Partition (Edit) form opens.

6 Click on the AA Subscriber Policy Overrides tab.

Note 1 — An AA subscriber policy override is rejected if the subscriber does not have an assigned application profile.

Note 2 — You can add an AA subscriber policy override only for a SAP, spoke SDP binding, or transit subscriber.

7 Click on the Create button. The AA Subscriber Policy Override (Create) form opens with the General tab displayed.

8 Configure the AA Subscriber Type parameter.

9 Perform one of the following, based on the AA Subscriber Type parameter setting:

a If it is SAP, click on the Select button in the SAP Subscriber panel and choose a subscriber from the Select SAP Subscriber form.

b If it is Spoke SDP Binding, click on the Select button in the Spoke SDP Binding Subscriber panel and choose a subscriber from the Select Spoke SDP Binding Subscriber form.

c If it is Transit, click on the Select button in the Transit Subscriber panel and choose a subscriber from the Select Transit Subscriber form.

The subscriber is listed on the AA Subscriber Policy Override (Create) form.

10 Click on the ASO Characteristics tab.

11 Click on the Create button. The AA Subscriber Policy Override ASO Characteristic (Create) form opens.

12 Click on the Select button beside the Override ASO Characteristic Name parameter. The Select Application Service Option form opens.

13 Select an ASO in the list and click on the OK button. The ASO characteristic name is displayed on the AA Subscriber Policy Override ASO Characteristic form.

14 Click on the Select button beside the Override ASO Characteristic Value parameter. The Select Application Service Option Characteristic Value form opens.

15 Select an ASO Characteristic Value in the list and click on the OK button. The ASO characteristic value is displayed on the AA Subscriber Policy Override ASO Characteristic form.

16 Click on the OK button. The AA Subscriber Policy Override ASO Characteristic (Create) form closes, and a dialog box appears.

17 Click on the OK button. The AA subscriber policy override is listed on the ISA-AA group or partition properties form.

18 If you are configuring a partition, click on the OK button. The ISA-AA partition is listed on the ISA-AA group properties form.

19 Click on the OK button. A dialog box appears.

20 Click on the Yes button. The ISA-AA Group (Edit) form closes.

Procedure 14-4 To configure cflowd on an ISA-AA group or partition

Perform this procedure to enable or configure cflowd collectors on an ISA-AA group or partition.

1 If you are performing this procedure as part of the ISA-AA group or partition configuration described in Procedure 14-2, go to step 5.

2 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

3 Navigate to the ISA-AA group object. The path is Network→*NE*→Logical Groups→ISA-AA Groups→ISA-AA Group *n*.

4 Right-click on the ISA-AA Group *n* icon and choose Properties. The ISA-AA Group (Edit) form opens with the General tab displayed.

5 If you are configuring cflowd on an ISA-AA partition, go to step 16.

6 Click on the CFLOWD tab.

7 Configure the Sampling Rate parameter in the Volume panel.

8 Configure the parameters in the TCP Performance panel:

- Sample Flow Rate
- Sample Flow Rate 2

9 Configure the parameters in the RTP Performance panel:

- Sample Flow Rate
- Sample Flow Rate 2

10 Configure the parameters in the Comprehensive Performance panel:

- Comprehensive Flow Rate
- Comprehensive Flow Rate 2

11 Configure the remaining parameters:

- Template Re-transmit
- Administrative State

12 Click on the Collector tab.

13 Perform the following steps to add a collector.

i Click on the Create button. The Cflowd Collector (Create) form opens.

ii Configure the parameters:

- Host Address
- Collector Port
- Description
- Administrative State
- Version

iii Click on the OK button. The CFLOWD Collector (Create) form closes and a dialog box appears.

iv Click on the OK button. The collector is listed on the ISA-AA group properties form.

14 Repeat step 13 to add another collector, if required.

Note — An ISA-AA group can contain a maximum of two cflowd collectors.

15 Go to step 20.

16 Click on the ISA-AA Partitions tab.

17 Select a partition in the list and click on the Properties button. The ISA-AA Group Partition (Edit) form opens.

18 Click on the CFLOWD tab.

19 To add an AA application or application group for cflowd performance monitoring, click on the Performance tab. Otherwise, go to step 22.

20 To add an AA application for cflowd performance monitoring, perform the following steps.

i Click on the Add Applications RTP, Add Applications Comprehensive, or Add Applications TCP button. The Select Applications form opens.

ii Select one or more applications in the list and click on the OK button. The Select Applications form closes, and the applications are listed on the ISA-AA group or partition properties form.

21 To add an AA application group for cflowd performance monitoring, perform the following steps.

i Click on the Add Application Groups RTP, Add Application Groups Comprehensive, or Add Application Groups TCP button. The Select Application Groups form opens.

ii Choose one or more application groups in the list and click on the OK button. The Select Application Groups form closes, and the application groups are listed on the ISA-AA group or partition properties form.

22 To set the cflowd sampling administrative states, perform the following steps.

i Click on the States tab.

ii Configure the parameters:

- Volume Administrative State
- Performance Administrative State, in the following panels:
  - TCP Performance
  - RTP Performance
  - Comprehensive Performance

23 If you are configuring cflowd on an ISA-AA partition, click on the OK button to close the ISA-AA partition properties form. The ISA-AA group properties form reappears.

24 Click on the OK button. A dialog box appears.

25 Click on the Yes button. The ISA-AA group properties form closes.

Procedure 14-5 To configure an ISA-tunnel group

1 Choose Equipment from the network navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the NE object in the equipment navigation tree.

3 Expand the Logical Groups objects in the equipment navigation tree.

4 Perform one of the following:

a To create an ISA-tunnel group, right-click on the ISA-Tunnel Groups object and choose Create ISA-Tunnel Groups. The ISA-Tunnel Group (Create) form opens with the General tab displayed. Configure the Group Number parameter.

b To configure an ISA-tunnel group, expand the ISA-Tunnel Groups object, right-click on the ISA-tunnel group that you want to configure and choose Properties from the contextual menu. The ISA-Tunnel Groups (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Reassembly (msec)
- Administrative State
- Multiple Active ISA Support
- IPsec Responder Only
- Required Number of Active MDAs

6 Click on the Apply button.

7 Configure the parameters:

- Current OLC State
- Revert OLC State

8 Click on the ISA Tunnel Group Members tab.

9 Click on the Create button. The ISA Group Member (Create) form opens.

10 Click on the Select button. The Select Daughter Card - ISA Group Member form opens with a list of available ISA tunnel cards.

11 Choose the MDA to add to this ISA-Tunnel group and click the OK button. The Select Daughter Card - ISA Tunnel Group Member form closes and the ISA Group Member (Create) form reappears.

12 Click on the OK button. The ISA Group Member (Create) form closes.

13 Click on the OK button. A dialog box appears.

14 Click on the Yes button. The Tunnel Group form closes.

15 Repeat steps 9 to 14 to configure the backup ISA-Tunnel group member.

Procedure 14-6 To configure an ISA-LNS group

Perform this procedure to create and configure an ISA-LNS group. You can configure an IES or VPRN group interface to terminate LNS PPP sessions. See chapter 70 for information about configuring an IES group interface. See chapter 71 for information about configuring a VPRN group interface.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the NE object in the equipment navigation tree.

3 Expand the Logical Groups objects in the equipment navigation tree.

4 Perform one of the following:

a To create an ISA-LNS group, right-click on the ISA-LNS Groups object and choose Create ISA-LNS Groups. The ISA-LNS Group (Create) form opens with the General tab displayed. Configure the Group Number parameter.

b To configure an ISA-LNS group, expand the ISA-LNS Groups object, right-click on the ISA-LNS group that you want to configure and choose Properties from the contextual menu. The ISA-LNS Groups (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Administrative State
- Current OLC State
- Revert OLC State

The Current OLC State and Revert OLC State parameters are configurable when you click on the Apply button on the ISA-LNS Group (Create) form.

6 Click on the Select button in the Port Policy panel. The Select Port Policy form opens.

7 Choose a policy from the list and click on the OK button. The Select Port Policy form closes and your selection is displayed on the ISA-LNS Group (Create) form.

8 Click on the Apply button. The ISA-LNS Group (Edit) form opens with the General tab displayed.

9 Click on the ISA-LNS Group Members tab.

10 Click on the Create button. The ISA-LNS Group Member (Create) form opens with the General tab displayed.

Note — You can configure up to six ISA-LNS group members. For each group member, you must choose an ISA Broadband Applications MDA. An ISA Broadband Applications MDA can be configured only on an IOM3-XP module on a 7750 SR.

11 Click on the Select button. The Select Member MDA - ISA-LNS Group Member form opens with a list of available ISA broadband applications cards.

12 Choose the MDA to add to the ISA-LNS Group and click the OK button. The Select Member MDA - ISA-LNS Group Member form closes and the ISA-LNS Group Member (Create) form reappears. The Slot Name field displays your selection.

13 Click on the OK button. The ISA-LNS Group Member (Create) form closes.

14 Repeat steps 10 to 13 to configure another ISA-LNS Group member, if required.

15 Click on the OK button. A dialog box appears.

16 Click on the Yes button. The ISA-LNS Group Member (Create) form closes.

Procedure 14-7 To configure an ISA-Video group

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the NE object in the equipment navigation tree.

3 Expand the Logical Groups objects in the equipment navigation tree.

4 Perform one of the following:

a To create an ISA-video group, right-click on the ISA-Video Groups object and choose Create ISA-Video Groups. The ISA-Video Group (Create) form opens with the General tab displayed. Configure the Group Number parameter.

b To configure an ISA-video group, expand the ISA-Video Groups object, right-click on the ISA-Video group that you want to configure and choose Properties from the contextual menu. The ISA-Video Groups (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Administrative State
- Local Retransmission Server
- Fast Channel Change Server
- Ad Insert Server
- Reserve Retransmission Bandwidth (Mbps)
- Stream Selection
- Analyzer
- Current OLC State
- Revert OLC State

The Current OLC State and Revert OLC State parameters are configurable when you click on the Apply button on the ISA-Video Group (Create) form.

6 Click on the Apply button. The form displays four additional tabs.

7 Click on the Video Group Members tab.

8 Click on the Create button. The Video Group Member (Create) form opens.

9 Click on the Select button. The Select Daughter Card - Video Group Member form opens with a list of available ISA Video cards.

10 Choose the MDA to add to this Video Group and click the OK button. The Select Daughter Card - Video Group Member form closes and the Video Group Member (Create) form reappears. The Slot Name field displays your selection.

11 Click on the OK button. The Video Group Member (Create) form closes.

12 Repeat steps 5 to 11 to configure another ISA-Video Group member, if required.

13 Click on the OK button. A dialog box appears.

14 Click on the Yes button. The ISA-Video Group (Create) form closes.

Procedure 14-8 To configure an ISA-WLAN GW group

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the NE object in the equipment navigation tree.

3 Expand the Logical Groups objects in the equipment navigation tree.

4 Perform one of the following:

a To create an ISA-WLAN GW group, right-click on the ISA-WLAN GW Groups object and choose Create ISA-WLAN GW Groups. The ISA-WLAN GW Group (Create) form opens with the General tab displayed. Configure the Group Number parameter.

b To configure an ISA-WLAN GW group, expand the ISA-WLAN GW Groups object, right-click on the ISA-WLAN GW group that you want to configure and choose Properties from the contextual menu. The ISA-WLAN GW Groups (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Active IOM Limit

6 Click on the Select button beside the Port Policy parameter and choose a port policy from the Select Policy - ISA-WLAN GW Group form.

7 Click on the Select button beside the Tunnel Port Policy parameter and choose a port policy from the Select Port Policy - ISA-WLAN GW Group form.

8 Configure the parameters:

- Reservation Count
- Session Watermark High
- Session Watermark Low

9 Click on the Select button beside the NAT RADIUS Accounting Policy parameter and choose a NAT RADIUS accounting policy from the The Select Policy - ISA-WLAN GW Group form.

10 Click on the Apply button. The ISA-WLAN GW Group (Create) form refreshes with additional tabs, and the form name changes to ISA-WLAN GW Group (Edit).

11 Configure the parameters:

- Current OLC State
- Revert OLC State

12 Click on the ISA-IOMs tab.

13 Click on the Create button. The ISA-WLAN GW Group IOM (Create) form opens.

14 Click on the Select button. The Select Card form opens.

15 Select a card in the list and click on the OK button. The Select Card form closes and the ISA-WLAN GW Group (Create) form displays the card information.

16 Repeat steps 13 to 15 to configure another ISA-IOM, if required.

17 Click on the General tab.

18 Configure the Administrative State parameter.

19 Click on the OK button. A dialog box appears.

20 Click on the Yes button. The ISA-WLAN GW Group (Edit) form closes.

Procedure 14-9 To create an IGH and add members

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the IGHs object. The path is Network→*NE*→Logical Groups→IGHs.

3 Right-click on the IGHs icon and choose Create IGH. The Create IGH form opens with the Define General Properties step displayed.

4 Configure the parameters:

- IGH ID
- Minimum Active Link Threshold
- Administrative State

5 Click on the Next button. The Configure IGH Members step displays.

6 Click on the Create button. The Create IGH Member form opens with the Select Ports step displayed.

7 Configure the filter criteria, if required, and click on the Search button.

8 Choose a port from the list and click on the Finish button. The Create IGH Member form closes and a dialog opens.

9 Click on the OK button.

10 Repeat steps 6 and 9 to add more members, if required.

11 Click on the Finish button.

12 Click on the Close button. The Create IGH form closes.

14.13 LAG configuration procedures

Use the following procedures to manage LAGs using the navigation tree.

Procedure 14-10 To create a LAG

Note — This procedure applies to 7950 XRS, 7210 SAS, 7450 ESS, 7710 SR, 7705 SAR, and 7750 SR NEs. See Procedure 14-13 for information about how to configure a LAG on an OmniSwitch. See the *5620 SAM MPR User Guide* about how to configure a LAG on a 9500 MPR.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the NE object in the equipment navigation tree.

3 Expand the Logical Groups objects in the equipment navigation tree.

4 Right-click on the LAGs object and choose Create LAG from the contextual menu. The Create LAG step form opens.

5 Configure the parameters:

Note — The parameters that appear, and which can be configured, depend on the device type that the LAG is being configured for.

- Port Type
- Description
- Configured Address
- L2Uplink
- Mode
- Encapsulation Type
- Administrative State

If you are creating a LAG for HSMDA, the Port Type parameter must be set to hsmda. The Encapsulation Type must be either Dot1Q or QinQ. Setting Mode to network creates a network LAG, and setting it to access creates an access LAG.

If you are creating a LAG containing ports on an XMDA card on the 7705 SAR-18, then the Encapsulation Type must be either Dot1 Q or Null and the Mode must be set to Access.

6 If you are configuring a LAG on a 7210 SAS, you can add the LAG to an SHG. See Procedure 16-16 in chapter 16 for information about creating a 7210 SAS SHG.

i Click on the Select button in the Split Horizon Group panel. The Select Split Horizon Group - LAG form opens.

ii Choose an SHG and click on the OK button. The Select Split Horizon Group - LAG form closes and the Create LAG form refreshes with the SHG name.

Note 1 — A LAG cannot be added to or deleted from an SHG if it has a SAP configured on it.

Note 2 — A LAG cannot belong to more than one SHG; you must remove all SHGs from the LAG before you can add the LAG to a different SHG.

7 If you are configuring a LAG on a 7210 SAS-D 6F 4T ETR or 7210 SAS-E, go to step 12.

8 Click on the Next button. The Configure LAG Parameters form opens.

9 Configure the parameters:

- Port Threshold
- Port Threshold Action
- Dynamic Cost

10 Click on the Next button.

a If you set the Mode parameter in step 5 to Access or Hybrid, the Configure Access Parameters form opens. Go to step 11.

b If you set the Mode parameter in step 5 to Network, or if you did not configure the Mode parameter, the Configure LACP form opens. Go to step 13.

11 Configure the parameters:

- QoS Adaptation
- Enable Per Forwarding Path Ingress Queue
- Enable Per Forwarding Path Egress Queue
- Enable Lag Access Including Egress Hash Config

Note — If you are creating a LAG for HSMDA, the QoS Adaptation parameter must be set to Link, otherwise the LAG will not be created.

12 Click on the Next button. The Configure LACP form opens.

13 Configure the parameters:

Note — The availability of configurable parameters depends on the NE type for which the LAG is being configured.

- LACP Enabled
- Standby Signalling
- LACP Mode
- LACP Transmit Interval
- LACP Transmit Standby
- Auto-Generate
- Actor System ID
- Partner System ID
- LACP System ID
- LACP System Priority
- Actor System Priority
- Partner System Priority
- Hold Time (100s of milliseconds)
- Active Sub-Group Selection Criteria
- Slave to Partner

The LACP Mode, LACP Transmit Interval, Actor Administration Key, LACP System ID, and LACP System Priority parameters are configurable when the LACP Enabled parameter is enabled.

14 Click on the Next button. The Configure LAG Members form opens.

15 Click on the Create button to add network ports to LAGs. The Only show compatible ports form appears.

16 Configure the Show Only Compatible Ports and Class parameters.

17 Click on the Next button. The Select Ports form opens.

18 Choose compatible ports from the list to construct the LAG.

Add ports to the LAG as follows:

- Choose one or more ports. The maximum number of ports you can choose depends on the NE type.
- Click on the Next button. The Specify the Member Properties form opens.

Note 1 — For ports to appear as compatible ports, ensure no SAPs or services are configured on them.

Note 2 — You must use the same load balance algorithm for the ports associated with the LAG.

Note 3 — If there are no compatible ports to choose from and you want to edit some of the existing ports to be compatible, then disable the Show Only Compatible Ports parameter. Click on the Next button. Choose ports to edit from the list and click on the Properties button.

Note 4 — For HSMDAv2 ports in a LAG, you must set the Auto-negotiate parameter to False or Limited. Refer to Procedure 16-1 in chapter 16 for more information on configuring Ethernet ports.

Note 5 — If you are creating a LAG containing ports on an XMDA card in the 7705 SAR-18, then the following conditions apply to the ports:

- The Encapsulation Type must be set to either Dot1Q or Null.
- The Mode parameter must be set to Access.
- The Auto-negotiate parameter must be set to False or Limited.

19 Configure the parameters:

- Priority
- Sub-Group ID

20 If required, perform step 40 of Procedure 16-1 to add Egress Secondary Shapers to a port member of an HSMDA LAG. The following devices support this function:

- 7450 ESS-6
- 7450 ESS-7
- 7450 ESS-12
- 7750 SR-7
- 7750 SR-12

Note 1 — The add/delete/modify functions for Egress Secondary Shapers apply only to the primary port.

Note 2 — There can be a total of 64 egress secondary shapers per MDA, including the default shaper.

Note 3 — The Egress Secondary Shapers on the primary port of the LAG are propagated to each non-primary port member of the LAG, with a maximum 8 ports per LAG. These propagated shapers cannot be deleted.

For adding any new port to the LAG, the user must configure each Egress Secondary Shaper as per the primary port, otherwise the addition of the port is blocked.

Note 4 — When adding a port member to a LAG, the primary port and each selected port (maximum 8 ports) secondary shapers must have the same name and rate.

Ports with Egress Secondary Shapers cannot be added to a configured LAG which do not match the Egress Secondary Shapers of the primary port.

Note 5 — Shapers are not removed from the port when the port is removed from a LAG.

Note 6 — The SAP reference to the Egress Secondary Shapers within a LAG is supported. Only the primary port of the SAP on the LAG is used to determine the list of Egress Secondary Shapers for the SAP.

When port members are removed from the LAG, care must be taken to ensure that the last port member is not removed if the LAG is referenced to a SAP. Shapers must exist on a LAG to be referenced on a SAP. See chapters 61 to 74 for more information.

21 Click on the Finish button. The Specify Member Properties form closes and the Configure LAG Members form reappears. A dialog box appears.

22 Click on the OK button.

23 Click on the Finish button. The Configure LAG Members form closes and the Create LAG form reappears.

24 Click on the Close button.

25 Use the Properties contextual menu to view information about the created LAG or to modify LAG parameters.

- The General tab displays the LAG ID, the LAG description and configured MAC address.
- The Link Aggregation Group tab displays the threshold parameters, cost information, and the primary port in the LAG, along with all the other LAG member ports.
- LAG member ports can be added from the LAG Members tab.
- Statistics, terminations, and fault information is available from the appropriate tabs.

26 Expand the LAG object in the navigation tree to view the created LAG groups. Expand the LAG group object to view the subgroup member ports, the priority, the subgroup ID, and the subgroup mode.

Procedure 14-11 To configure a LAG

Note — This procedure applies to 7950 XRS, 7210 SAS, 7450 ESS, 7710 SR, 7705 SAR, and 7750 SR NEs. See Procedure 14-13 for information about how to configure a LAG on an OmniSwitch. See the *5620 SAM MPR User Guide* for information about how to configure a LAG on a 9500 MPR.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the LAG object that you want to configure. The path is Network→*NE*→Logical Groups→LAGs→LAG *n*.

3 Right-click on the LAG *n* icon and choose Properties. The LAG (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Description
- Configured Address
- Mode
- Current OLC State

5 If you are configuring a LAG on a 7210 SAS you can add the LAG to an SHG. See Procedure 16-16 in chapter 16 for information about creating a 7210 SAS SHG.

i Click on the Select button in the Split Horizon Group panel. The Select Split Horizon Group - LAG form opens.

ii Choose an SHG and click on the OK button. The Select Split Horizon Group - LAG form closes and the Create LAG form refreshes with the SHG name.

Note 1 — A LAG cannot be added to or deleted from an SHG if it has a SAP configured on it.

Note 2 — A LAG cannot belong to more than one SHG; you must remove all SHGs from the LAG before you can add the LAG to a different SHG.

6 If you are configuring a LAG on a 7210 SAS, go to step 11.

7 Click on the Link Aggregation Group tab.

8 Configure the parameters:

- Port Threshold
- Port Threshold Action
- Dynamic Cost

9 Click on the States tab.

10 Configure the Administrative State parameter.

11 Click on the Access tab.

12 Configure the parameters:

- QoS Adaptation
- Enable Per Forwarding Path Ingress Queue
- Enable Per Forwarding Path Egress Queue
- Enable Lag Access Including Egress Hash Config

Note — If you are configuring a LAG for HSMDA, the QoS Adaptation parameter must be set to Link.

13 Click on the LACP tab.

14 Configure the parameters:

- LACP Enabled
- LACP Mode
- LACP Transmit Interval
- LACP Transmit Standby
- Auto-Generate
- Actor System ID
- Partner System ID
- LACP System ID
- LACP System Priority
- Actor System Priority
- Partner System Priority
- Hold Time (100s of milliseconds)
- Active Sub-Group Selection Criteria
- Slave to Partner

The LACP Mode, LACP Transmit Interval, and Actor Administration Key parameters are configurable when the LACP Enabled parameter is enabled.

15 Click on the Next button. The Configure LAG Members form opens.

16 Click on the LAG Members tab. To add LAG members, perform steps 15 to 23 of Procedure 14-10.

17 If the LAG that you are configuring is in Network mode, the Network Interfaces tab is displayed. Click on the Create button. The Create Network Interface form opens. Perform steps 4 to 50 of Procedure 22-9 to create a network interface. Otherwise go to step 21.

18 If the LAG that you are configuring is in access mode or hybrid mode with dot1q or QinQ encapsulation, or in network mode with dot1q encapsulation, the MEPs tab is displayed. To add a facility MEP to the LAG:

Note — Only one facility MEP can be configured on a LAG.

i Click on the MEPs tab.

ii Click on the Create button. The MEP (Create) form opens on the General tab.

iii Click on the Select button to choose a global MEG. The Select Maintenance Entity Group form opens.

iv Choose an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- Description
- CCM Messages Enabled
- Interface Type
- Priority Level for CCM Messages
- CCM TLV Ignore
- Low-priority Defect
- MAC Address
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)
- CCM Padding Packet Size (Bytes)
- Facility Fault Notify
- Facility VLAN ID

Note 1 — To enable fault propagation on a LAG facility MEP, Facility Fault Notify must be enabled.

Note 2 — The CCM Padding Packet Size (Bytes) parameter cannot be configured when the CCM interval parameter is set to 10 ms or 100 ms.

vi If the MD for the MEP has a Name Type of none the Y.1731 Tests tab is configurable; click on the Y.1731 Tests tab. Otherwise, go to step vii.

vii Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

viii Click on the OK button. A dialog box appears.

ix Click on the OK button. The MEP (Create) form closes.

19 To add a tunnel facility MEP to the LAG, perform the following steps.

Note — The LAG that you are configuring must be in Access mode or Hybrid mode and must have an encapsulation type of QinQ.

i Click on the MEPs tab.

ii Click on the Create button. The MEP (Create) form opens on the General tab.

iii Click on the Select button to choose a global MEG. The Select Maintenance Entity Group form opens.

iv Choose an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- Description
- CCM Messages Enabled
- Interface Type
- Priority Level for CCM Messages
- CCM TLV Ignore
- Low-priority Defect
- MAC Address
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)
- CCM Padding Packet Size (Bytes)
- Facility Fault Notify
- Facility VLAN ID

Note 1 — To enable the fault propagation on a tunnel facility MEP, Facility Fault Notify must be enabled.

Note 2 — To link the tunnel facility status to the SAP, Facility VLAN ID must match the outer encapsulation value of the SAP.

Note 3 — To accept the fault notification from a facility MEP on the site where the SAP is located and on the SAP, Tunnel Fault Management must be set to Accept.

Note 4 — The CCM Padding Packet Size (Bytes) parameter cannot be configured when the CCM interval parameter is set to 10 ms or 100 ms.

vi If the MD for the MEP has a Name Type of none the Y.1731 Tests tab is configurable; click on the Y.1731 Tests tab. Otherwise, go to step vii.

vii Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

viii Click on the OK button. A dialog box appears.

ix Click on the OK button. The MEP (Create) form closes.

20 To configure Ethernet-CFM redundancy on a facility MEP:

Note 1 — You must enable Ethernet CFM redundancy globally on a device before it can function on child objects such as LAGs. See chapter 13 for information about device object configuration.

Note 2 — The tunnel MEP must be part of an MC-LAG with Ethernet CFM redundancy configured.

i Click on the MEPs tab.

ii Click on the Search button. A list of MEPs is displayed.

iii Choose the facility MEP for which you need to configure Ethernet-CFM redundancy and click on the Properties button. The MEP (Edit) form opens.

iv Scroll to the Facility MEPS panel and select the Create Redundant MEP check box.

v Click on the OK button. The MEP (Edit) form closes. A redundant tunnel MEP with the same ID and Operational MAC address is created on the peer LAG. The redundant MEP has the same state as the MC-LAG in which that MEP resides.

21 Click on the OK button. A dialog box appears.

22 Click on the Yes button. The LAG (Edit) form closes.

Procedure 14-12 To configure an OmniSwitch LAG

Perform the following procedure to configure a static or dynamic LAG.

Workflow for a static LAG:

- create a static LAG on the local and remote switches
- assign ports to the LAG on the local and remote switches
- create a VLAN for the static LAG on the local and remote switches (optional)

Workflow for a dynamic LAG:

- create a dynamic LAG on the local (actor) and remote (partner) switches
- assign ports with the same actor administrative key (which allows them to be aggregated) to the local and remote LAG
- create a VLAN for the dynamic link aggregation group on the local and remote switch (optional)

Note 1 — You can configure MVRP fixed ports/LAGs, 802.1 Q ports/LAGs, aggregate ports/LAGs, and VLAN Stacking Network ports/LAGs.

Note 2 — When a port is assigned to a LAG member, you cannot modify the port properties using the 5620 SAM.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure the LAG and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Expand the LAGs icon, right-click on a LAG object and choose Create LAG from the contextual menu. The Create LAG - Define General Properties form opens.

5 Configure the parameters:

- LAG ID
- Auto-Assign ID
- Mode
- Administrative State
- Automatic VLAN Binding

The Automatic VLAN Binding parameter can only be configured for network LAGs and Stacked VLANs.

6 Click on the Next button. The Create LAG - Configure LAG Parameters form opens.

7 Configure the parameters:

- Size
- Name
- Type

8 Perform one of the following:

a If you set the Type parameter to Static, go to step 15.

b If you set the Type parameter to Dynamic, go to step 9.

9 Click on the Next button. The Create LAG - Configure LACP form opens.

10 Configure the parameters:

- Actor Administration Key
- Actor System ID
- Partner System ID
- Actor System Priority
- Partner System Priority
- Partner Administration Key

11 Click on the Finish button. The Create LAG - Wizard Completed form opens.

12 Enable the View the newly created interface check box if you need to view the LAG properties.

13 Click on the Close button. The Create LAG form closes.

See Procedure 14-13 in this section for information about adding members to a dynamic LAG.

14 Go to step 25.

15 Click on the Next button. The Create LAG - Configure LAG Members form opens.

16 Click on the Create button to add ports to the LAG. The Create LAG Member - Only show compatible ports form appears.

17 Configure the Show Only Compatible Ports and Class parameters.

18 Click on the Next button. The Create LAG Member - Select Ports form opens.

19 Click on the Search button to display a list of compatible ports. Choose ports from the list to construct the LAG.

Add ports to the LAG as follows:

- Choose up to the maximum number of ports you require from the list of ports. You can select more than one port at a time from the list.
- Click on the Next button. The Specify the Member Properties form opens.

Note 1 — If there are no compatible ports to choose from and you want to edit some of the existing ports to be compatible, then disable the Show Only Compatible Ports parameter. Click on the Next button. Choose ports to edit from the list and click on the Properties button.

Note 2 — Mobile, UNI, and NNI ports cannot be members of a LAG.

Note 3 — Only network ports can be members of a network LAG and only access ports can be members of an access LAG.

20 Click on the Finish button. A dialog box appears.

21 Click on the OK button. The Create LAG - Configure LAG Members form displays the LAG members.

22 Click on the Finish button. The Create LAG - Wizard Completed form opens.

23 Enable the View the newly created interface check box if you need to view the LAG properties.

24 Click on the Close button to close the form.

25 Use the Properties contextual menu to view information about the created LAG or to modify LAG parameters.

- The General tab displays the LAG ID and LAG description.
- The Link Aggregation Group tab displays the primary port in the LAG along with all the other LAG member ports.
- LACP parameters can be modified from the LACP tab.
- LAG member ports can be added from the LAG Members tab.
- A UNI policy can be applied to a LAG used as a SAP in a stacked VLAN from the Policies tab.
- An MVRP configuration and VLAN restriction can be applied to a LAG from the MVRP tab. If a port is a LAG member, you cannot modify parameters on the MVRP general tab on that physical port.
- Statistics, network interfaces, and fault information is available from the appropriate tabs.

26 Expand the LAG object in the navigation tree to view the created LAG groups and the unassigned dynamic LAG members group. Expand the LAG group object to view the subgroup member ports, the priority, and the LACP state. Expand the Unassigned Dynamic LAG Members group object to view dynamic LAG members that have not been assigned to a dynamic LAG group.

Procedure 14-13 To configure OmniSwitch dynamic LAG members

Perform the following procedure to add members to a dynamic LAG and modify existing dynamic LAG members.

Note 1 — LAG members are not added during the creation of the dynamic LAG, as they are with static LAGs. When a new dynamic LAG member is created it is placed into the Unassigned Dynamic LAG Members object. The new dynamic LAG members remain under the Unassigned Dynamic LAG Members object until the system identifies a LAG with matching properties. When an unassigned LAG member joins a LAG, the member is removed from the Unassigned Dynamic LAG Members object and added to the appropriate LAG object.

Note 2 — When a port is assigned to a LAG member, you cannot modify the port properties using the 5620 SAM.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure the LAG members and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Logical Groups icon.

4 Right-click on the Unassigned Dynamic LAG Members object and choose Create LAG Members from the contextual menu. The Create LAG Member - Only show compatible ports form appears.

5 Configure the Show Only Compatible Ports and Class parameters.

6 Click on the Next button. The Create LAG Member - Select Ports form opens.

7 Click on the Search button to display a list of compatible ports. Choose ports from the list to construct the LAG.

Add ports to the LAG as follows:

- Choose up to the maximum number of ports you require from the list of ports. You can select more than one port at a time from the list.
- Click on the Next button. The Specify the Member Properties form opens.

Note 1 — If there are no compatible ports to choose from and you want to edit some of the existing ports to be compatible, then disable the Show Only Compatible Ports parameter. Click on the Next button. Choose ports to edit from the list and click on the Properties button.

Note 2 — For all ports in an LAG, you must disable auto-negotiation, configure the same speed, and set the ports to full duplex. Mobile ports cannot be part of a LAG.

8 Configure the parameters:

- Priority
- System Id
- System Priority
- Admin Key
- Admin State

9 Click on the Finish button. The Create LAG - Wizard Completed form opens.

10 Enable the View the newly created interface check box if you need to view the LAG properties.

11 Click on the Close button to close the form.

12 If you need to modify a dynamic LAG member, go to step 13.

13 Right click on a LAG member and choose Properties from the contextual menu.

14 The LAG Member (edit) form opens on the General tab.

15 Configure the Priority parameter in the LAG Member panel, if required.

16 Configure parameters in the Actor panel, if required.

- System Id
- System Priority
- Admin Key
- Admin State

17 Configure parameters in the Partner panel, if required.

- Admin Key
- Admin System Id
- Admin Port
- Admin System Priority
- Admin Port Priority
- Admin State

18 Click on the OK button. A dialog box appears.

19 Click on the Yes button to save your changes and close the form.

20 Click on the Close button to close the form.

Procedure 14-14 To create a LAG link mapping profile

A LAG link mapping profile specifies the LAG egress port used by SAPs and interfaces associated with the profile, and what action the LAG should take if the assigned port fails.

Note — You can only use LAG link mapping profiles on an NE that is in chassis mode D or higher.

1 Create a LAG as described in Procedure 14-10, or configure a LAG as described in Procedure 14-11. Table 14-1 describes the required parameter values that must be set in order to use LAG link mapping profiles.

Table 14-1 LAG link mapping prerequisites

Tab	Parameter	Required values
General	Port Type	Access or Hybrid
Access	QoS Adaptation	Link
LAG Members	Sub-Group ID	All LAG members must be in the same sub-group.

2 Click on the Link Mapping Profiles tab in the LAG (edit) form.

3 Click on the Create button. The Link Mapping Profile (New Instance) form appears.

4 Configure the parameters on the General tab:

- ID
- Description
- Failure Mode

5 Click on the Mapping Profile Links tab.

6 Click on the Create button. The Link Mapping Profile Link (New Instance) form appears.

7 Click on the Select button. A list of LAG member ports appears.

8 Select a port from the list and click on the OK button. The selected port will be used for egress traffic for interfaces assigned to this LAG link mapping profile.

9 Configure the Type parameter.

10 Click on the OK button. The assigned port appears in the list.

11 Configure a secondary port by repeating steps 6 to 10, if required.

12 Assign the LAG link mapping profile to an interface or MSAP Policy by performing one of the following, if required:

a To assign the LAG link mapping profile to a network interface, access interface, or SAP, perform the following:

i Click on the Apply button.

ii Click on the Network Interface, L2 Access Interface, L3 Access Interface, or Service Access Points tab. A list of interfaces that terminate on the LAG appears.

iii Select an interface from the list, and click on the Properties button. The Interface (Edit) form appears.

iv Click on the Port tab.

v Click on the Select button beside the LAG Link Map Profile ID parameter. A list of LAG link mapping profiles appears.

vi Select a LAG link mapping profile and click on the OK button.

vii Click on the OK button. The Interface (edit) form closes.

b To assign the LAG link mapping profile to an MSAP policy, perform the following:

i Click on the Apply button.

ii From the 5620 SAM main menu, select Policies→Residential Subscriber. The Residential Subscriber Policies form appears.

iii Configure the filters and click on the Search button.

iv Select an MSAP policy from the list and click on the Properties button. The MSAP Policy (edit) form appears.

v Click on the Local Definitions tab.

vi Select the local definition for the site where the LAG link mapping profile is configured, and click on the Properties button. The MSAP Policy (Local Policy) form appears.

vii If the Distribution Mode parameter is set to Sync With Global, click on the Switch Mode button.

viii Set the LAG Link Map Profile parameter to the ID of the LAG link mapping profile you need to assign to the MSAP policy.

ix Click on the OK button.

x Close the MSAP Policy and Residential Subscriber Policies forms.

13 Click on the OK button. The new LAG link mapping profile appears in the list.

Procedure 14-15 To configure BFD on a LAG

1 Create a LAG as described in Procedure 14-10, or configure a LAG as described in Procedure 14-11.

2 Click on the BFD tab in the LAG (edit) form. A list of BFD entries appears.

3 Select the IPv4 or IPv6 entry and click on the Properties button. The BFD Configuration on LAG form appears.

4 Configure the parameters on the LAG tab:

- Family
- BFD State
- BFD on Distributing Links Only
- Multiplier
- Max Admin Down Time
- Max Setup Time
- Transmit Interval
- Receive Interval
- Local IP Address
- Remote IP Address

5 Click on the OK button. The BFD Configuration on LAG form closes.

Procedure 14-16 To view micro-BFD sessions on a LAG

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the LAG object that you want to configure. The path is Network→*NE*→Logical Groups→LAGs→LAG *n*.

3 Right-click on the LAG *n* icon and choose Properties. The LAG (Edit) form opens with the General tab displayed.

4 Click on the BFD tab in the LAG (edit) form. A list of BFD entries appears.

5 Select the IPv4 or IPv6 entry and click on the Properties button. The BFD Configuration on LAG form appears.

6 Click on the Micro BFD Session tab. A list of BFD sessions associated with the LAG appears.

7 Select a BFD session and click on the Properties button to view information about the selected session.

15 — Shelf object configuration

15.1 Shelf object configuration overview *15-2*

15.2 Working with shelf objects *15-2*

15.3 Working with card and card slot objects *15-6*

15.4 Working with daughter card objects *15-9*

15.5 Working with bundle objects *15-10*

15.6 Workflow to manage shelf objects *15-12*

15.7 Shelf object configuration procedures *15-14*

15.8 Card and card slot object configuration procedures *15-38*

15.9 Daughter card slot object configuration procedures *15-47*

15.10 Bundle configuration procedures *15-59*

15.1 Shelf object configuration overview

In the equipment navigation tree, shelf objects are children of device objects. They appear below logical group objects in the navigation tree. Card slot objects are children of shelf objects, and as such appear below the shelf object in the navigation tree. Daughter card slot objects are created in the navigation tree as children of the card slot object, after the card slot object is configured. APS bundle objects appear below the shelf object and Bundle objects appear below daughter card objects that are configured as channelized MDAs.

This chapter contains the procedures to configure shelf, card slot, daughter card slot, and bundle objects using the navigation tree. See chapter 5 for more information about using the navigation tree. See chapter 34 for more information about APS bundles.

15.2 Working with shelf objects

Shelf objects represent the hardware that is configured on a shelf. When you choose the shelf object in the navigation tree and click on Properties in the contextual menu, you can view the states and conditions of the shelf including:

- general information
- fan tray state and speed
- power supply tray statuses
- LED statuses
- card slots
- hardware environment information
- CCM properties
- PoE
- timing
- statistics
- dry contacts
- faults
- port segregation
- software control module
- software bank information
- cross connects

The Display tab displays a graphical representation of the device's shelf and its equipment components, such as the empty card slots and the cards that are installed on the device. You can double-click on an object under this tab to open its Properties configuration form. Right-click on the object and you have full access to the contextual menus for the object and any child objects, for example the ports of a card (dynamic graphical representation only).

Chassis modes

The chassis mode of a device indicates the minimum IOM or IMM card type that is initialized by the device and determines the scaling numbers and features that are available to the system. The chassis mode can be configured on the following device types:

- 7450 ESS-4, 7450 ESS-6, 7450 ESS-7, and 7450 ESS-12
- 7450 ESS-6v
- 7750 SR-7 and 7750 SR-12

See the appropriate device Release Notice for scaling information.

Note — Chassis modes are not supported on the 7950 XRS.

Tables 15-1 and 15-2 list the chassis modes that you can configure on each IOM and IMM card type for the supported devices.

Table 15-1 Chassis modes and 7750 SR IOM and IMM card compatibility

Card	Chassis mode	NE release
2 x 10-Gig MDA IOM	A	All supported releases
2 x 10-Gig MDA IOM Card, B	A and B	
2 x 10-Gig MDA IOM 2	A, B, and C	
2 x XP MDA IOM 3	A, B, C, and D	
2 x XP MDA IOM 3, B	A, B, C, and D	9.0 R6 or later
4-Port 10 GE XFP IMM	A, B, C, and D	All supported releases
8-Port 10 GE XFP IMM		
48-Port GIGE SFP IMM		
48-Port GIGE SFP IMM, B		9.0 R6 or later
48-Port GIGE TX IMM		All supported releases
48-Port GIGE TX IMM, B		9.0 R6 or later
12-Port 10GE SFP IMM		8.0 R5 or later
1-Port 100GE CFM IMM		
3-Port 40GE QSFP possibly oversubscribed IMM		9.0 R4 or later

Table 15-2 Chassis modes and 7450 ESS IOM card compatibility

Card	Chassis mode	7450 ESS-7, 7450 ESS-12, and 7450 ESS-4	7450 ESS-6	7450 ESS-6v
2 x 10-Gig MDA IOM	A	All supported releases	All supported releases	All supported releases
2 x 10-Gig MDA IOM Card, B	A and B			
2 x 10-Gig MDA Oversubscribed IOM	A and B	8.0 and 9.0	8.0 and 9.0	8.0 and 9.0
2 x XP MDA IOM 3	A, B, and B	All supported releases	All supported releases	All supported releases

(1 of 2)

Card	Chassis mode	7450 ESS-7, 7450 ESS-12, and 7450 ESS-4	7450 ESS-6	7450 ESS-6v
2 x XP MDA IOM 3, B	A, B, C, and D	9.0 R6 or later	9.0 R6 or later	9.0 R6 or later
48-Port GIGE SFP IMM		All supported releases	All supported releases	All supported releases
48-Port GIGE SFP IMM, B		9.0 R6 or later	9.0 R6 or later	9.0 R6 or later
48-Port GIGE TX IMM		All supported releases	All supported releases	All supported releases
48-Port GIGE TX IMM, B		9.0 R6 or later	9.0 R6 or later	9.0 R6 or later
3-Port 40GE QSFP possibly oversubscribed IMM		9.0 R4 or later	—	—

(2 of 2)

Timing synchronization

Timing synchronization parameters can be configured on 7210 SAS, 7450 ESS, 7705 SAR, 7705 SAR-H, 77710 SR, 7750 SR, 7750 SR-c4, 7750 SR-12E, 7750 SR-c12, and 7950 XRS shelves that contain the following daughter cards:

- 10 Gigabit Ethernet with 2- and 4-port configurations
- 10/100/1000 Ethernet SFP with 20 ports
- 10 Gigabit Ethernet XFP with 4-, 8-, and 48-port configurations
- 10-port Gigabit Ethernet SFP HA
- 16 x Channelized DS1/E1 ASAP
- 16 x Channelized DS1/E1 ASAP v2
- 8-port Ethernet
- 8-port Ethernet v2
- 4-port OC3/STM1 ASAP SFP
- 4 X MWA Gig Ethernet (2 TX, 2 SFP) + 4 X Gig Ethernet SFP
- 8-port GIGE SPF card V2 (-48/+24 VDC)
- 2-port 100 Gigabit Ethernet CFP C-XMA
- 20-port 10 Gigabit Ethernet SFP + C-XMA
- 40-port 10 GE SFP+ XMA
- 4-port 100 GE CXP XMA
- 2-port OC-192c/STM-64c XFP MDA

See Procedure 15-7 for more information about configuring timing synchronization.

IEEE 1588 PTP clock

The 5620 SAM supports IEEE 1588 PTP clocks for packet-based timing synchronization from a master clock to one or more slave clocks in a network. You can configure IEEE 1588 PTP clocks on the following NEs:

- 7210 SAS-D ETR
- 7210 SAS-M
- 7210 SAS-X
- 7450 ESS
- 7705 SAR
- 7705 SAR-A
- 7705 SAR-H
- 7705 SAR-W
- 7705 SAR-M/ME
- 7710 SR
- 7750 SR
- 7750 SR-c4
- 7750 SR-12E
- 7750 SR-c12

Depending on the device, NEs can be configured with an ordinary master, ordinary slave, or boundary clock. The 7705 SAR-A, 7705 SAR-M/ME and the 7705 SAR-W, can also be configured with a transparent clock.

Synchronization management

You can use the 5650 CPAM to manage synchronization domains and assign IP path monitors to PTP peers. See "Synchronization management" in the *5650 CPAM User Guide* for more information.

Time of Day management on the 7705 SAR-H

The 7705 SAR-H provides Time of Day information using unmodulated (B000) or modulated (B12X) formats using an RJ45 connector. Only output operations are supported on the 5620 SAM.

SNTP Time Synchronization

The 7705 SAR-H supports Simple Network Time Protocol (SNTPv4). It is a compact, client-only version of NTP. It can receive time from SNTP and NTP servers.

SNTP provides time accuracy within 100 ms of the time source. SNTP can only receive the time from NTP servers; it is not used to provide time services to other systems. SNTP does not authenticate traffic.

The 7705 SAR-H supports SNTP in both uni-cast client modes (point-to-point) and broadcast client modes (point-to-multipoint).

IEEE1588 Time Synchronization

The 7705 SAR-H supports Precision Timing Protocol as defined in IEEE1588v2. The slave capability allows for the transfer to the Time of Day for a 1588 grand master or master clock. The accuracy based on this method can achieve sub-microsecond stability, which is superior to NTP or SNTP. This accuracy is used for OAM 1-way latency measurements.

Power management on the 7950 XRS

The 5620 SAM supports configuring power management zones on 7950 XRS nodes, and power priority values on MDA cards installed on 7950 XRS nodes. Each MDA and APEQ provisioned on 7950 XRS nodes is associated with a power management zone, and during startup MDAs with higher power priority values are started first. You can view information and collect statistics about power availability and shedding using the 5620 SAM.

See Procedure 15-21 for information about configuring a power management zone. See Procedure 15-33 for information about configuring power priority values on an MDA. See the *5620 SAM Statistics Management Guide* for information about gathering power statistics using the 5620 SAM.

Detailed information about power usage is available on the power management zone, shelf, card slot, and daughter card slot configuration forms for 7950 XRS nodes. Use the Hardware Environment tab to view information about power usage.

15.3 Working with card and card slot objects

When you click on the plus sign beside a shelf object, the card slots in the shelf appear in the navigation tree. They can appear as empty card slots when a card is not provisioned for the slot.

Card slot objects for the OS 6250, OS 6400, OS 6450, OS 6850, OS 6850E, and OS 6855 appear automatically when a physical device exists because the entire device is represented by a card slot object and no daughter cards are associated with these devices.

Card slots can be configured with CMM or Ethernet card types for the OS 9600, OS 9700, OS 9800, OS 9700E, and OS 9800E devices, but there are no daughter cards associated with these devices.

When the 5620 SAM discovers a 7210 SAS or 7705 SAR-F, the integrated IOM and daughter card objects appear automatically in the navigation tree.

When the 5620 SAM discovers a supported PAC FP3 IMM in a card slot, the daughter cards and ports appear automatically in the navigation tree. Daughter cards and ports that are discovered in this way cannot be manually deleted.

Choose Configure Card from the contextual menu of the object and assign a supported card type for the slot. The Assigned Card Type parameter lists the card types can be assigned to the card slots.

Some card types can be pre-provisioned in a slot before the card is installed in the chassis. A card and daughter card must be provisioned before a port can be configured.

When a card is first configured, the administrative state can be down. The resource is not operationally up until the card is equipped and the administrative state is up. A card can only be provisioned in a slot that is vacant, and no other card can be provisioned (configured) for that specific slot.

To reconfigure a slot position, delete the card currently in the slot and configure the new card type added to the slot. A card can only be provisioned in a slot when the card type is allowed in the slot.

Note — You can also reconfigure a slot position by changing the chassis mode. The chassis mode determines the minimum card requirements. See section 15.2 for more information about chassis modes.

For example, if a 2 x 10-Gig MDA IOM 2 card is installed in the chassis that is running in chassis mode B, the card behaves as a 2 x 10-Gig MDA IOM Card, B. You can upgrade the chassis mode to C to make the IOM card behave as a 2 x 10-Gig MDA IOM 2 card.

You can configure forwarding plane properties on the properties forms for IOM 3, IMM, and XCM cards. IOM 3 and IMM cards support one forwarding plane, and XCM cards support two forwarding planes — one for each XMA card slot.

Note 1 — You cannot configure a forwarding plane on an XCM card until you have provisioned the corresponding XMA card.

Note 2 — You cannot remove a provisioned XMA card when any of the following is true on the corresponding XCM forwarding plane:

- Egress WRED queue control is administratively enabled
- Access ingress queue groups are configured
- Network ingress queue groups are configured
- The Dynamic Enforcement Policer Pool Size parameter is configured with a nonzero value

Card provisioning and chassis modes

The behavior of the installed card depends on the chassis mode that has been configured on the device. Table 15-3 describes the behavior of the provisioned (configured) card types and installed cards in each chassis mode.

Table 15-3 Behavior of installed IOM cards

Provisioned card type	Installed card type	Behavior
2 x 10-Gig MDA IOM	2 x 10-Gig MDA IOM	The IOM card appears and behaves at the scaling limits of the 2 x 10-Gig MDA IOM.
	2 x 10-Gig MDA IOM Card, B	The IOM card appears and behaves as a 2 x 10-Gig MDA IOM. The 2 x 10-Gig MDA IOM Card, B is fully backward-compatible with the 10-Gig MDA IOM.
	2 x 10-Gig MDA IOM 2	The IOM card appears and behaves as a 2 x 10-Gig MDA IOM. The 2 x 10-Gig MDA IOM 2 is fully backward-compatible with the 10-Gig MDA IOM.
	2 × XP MDA IOM 3 (1)	The IOM card appears and behaves as a 2 x 10-Gig MDA IOM. The 2 x XP MDA IOM is fully backward-compatible with the 10-Gig MDA IOM.

(1 of 3)

Provisioned card type	Installed card type	Behavior
2 x 10-Gig MDA IOM Card, B	2 x 10-Gig MDA IOM	The IOM card fails because the minimum card requirements are not met.
	2 x 10-Gig MDA IOM Card, B	The IOM card appears and behaves at the scaling limits of the 2 x 10-Gig MDA IOM Card, B.
	2 x 10-Gig MDA IOM 2	The IOM card appears and behaves as a 2 x 10-Gig MDA IOM Card, B. The 2 x 10-Gig MDA IOM 2 is fully backward-compatible with the 10-Gig MDA IOM Card, B.
	2 × XP MDA IOM 3 (1)	The IOM card appears and behaves as a 2 x 10-Gig MDA IOM Card, B. The 2 x XP MDA IOM 3 is fully backward-compatible with the 10-Gig MDA IOM Card, B.
2 x 10-Gig MDA IOM 2	2 x 10-Gig MDA IOM	The IOM card fails because the minimum card requirements are not met.
	2 x 10-Gig MDA IOM Card, B	The IOM card fails because the minimum card requirements are not met.
	2 x 10-Gig MDA IOM 2	The behavior of the card depends on the operational chassis mode: • 2 x 10-Gig MDA IOM in chassis mode A • 2 x 10-Gig MDA IOM Card, B in chassis mode B • 2 x 10-Gig MDA IOM 2 in chassis mode C and D
	2 × XP MDA IOM 3 (1)	The behavior of the card depends on the operational chassis mode: • 2 x 10-Gig MDA IOM in chassis mode A • 2 x 10-Gig MDA IOM Card, B in chassis mode B • 2 x 10-Gig MDA IOM 2 in chassis mode C and D
2 × XP MDA IOM 3 card (1)	2 x 10-Gig MDA IOM	The IOM card fails because the minimum card requirements are not met.
	2 x 10-Gig MDA IOM Card, B	The IOM card fails because the minimum card requirements are not met.
	2 x 10-Gig MDA IOM 2	The IOM card fails because the minimum card requirements are not met.
	2 × XP MDA IOM 3 (1)	The behavior of the card depends on the operational chassis mode: • 2 x 10-Gig MDA IOM in chassis mode A • 2 x 10-Gig MDA IOM Card, B in chassis mode B • 2 x 10-Gig MDA IOM 2 in chassis mode C • 2 x XP MDA IOM 3 in chassis mode D. With mixed mode enabled for 7750 SR, only the IPv6 features of the IOM3 card are enabled, but no other IOM3 features are available.

(2 of 3)

Provisioned card type	Installed card type	Behavior
2 × XP MDA IOM 3, B card [(1)]	2 x 10-Gig MDA IOM	The IOM card fails because the minimum card requirements are not met.
	2 x 10-Gig MDA IOM Card, B	The IOM card fails because the minimum card requirements are not met.
	2 x 10-Gig MDA IOM 2	The IOM card fails because the minimum card requirements are not met.
	2 × XP MDA IOM 3 [(1)]	The behavior of the card depends on the operational chassis mode: • 2 x 10-Gig MDA IOM in chassis mode A • 2 x 10-Gig MDA IOM Card, B in chassis mode B • 2 x 10-Gig MDA IOM 2 in chassis mode C • 2 x XP MDA IOM 3 in chassis mode D. With mixed mode enabled for 7750 SR, only the IPv6 features of the IOM3 card are enabled, but no other IOM3 features are available.

(3 of 3)

Note
(1) Also applies to any IMM

15.4 Working with daughter card objects

After the card is created in the card slot you can create and configure MDAs, also known as daughter card objects, in the daughter card slot that appears when you click on the plus sign beside the card object. The daughter card slots in the card appear in the navigation tree. They appear as empty daughter card slots when a daughter card is not provisioned for the slot. When a daughter card is provisioned for the slot, it is identified.

See the appropriate device section in chapter 8 for device-specific daughter card information.

A 5620 SAM license allows the management of a specific number of MDAs for each device type. You can purchase additional MDA capacity as required. MDAs fall into two licensing categories: premium and standard. Generally, non-high-performance MDA cards are considered standard. All IMM, HSMDA, XMDA, and XP MDA cards are premium.

Each IMM card is associated with a platform, and counts towards the licensed IMMs for that platform regardless of where it is installed. For example, a 7750 SR IMM installed on a 7450 ESS is counted as a premium 7750 SR MDA for the purposes of licensing. Enabling or disabling mixed mode does not change the associated platform type of a card.

Note — After the 5620 SAM discovers the number of premium MDAs allowed by the license, the 5620 SAM can no longer discover 7705 SAR-8, 7705 SAR-18, 7710 SR, and 7450 ESS devices.

IMM daughter cards

The IMM card integrates IOM 3 and high bandwidth MDA functionality on a single card that fits into existing IOM slots. When you configure the IMM the integrated MDAs are automatically configured. The 5620 SAM equipment tree displays the IMM with two daughter cards, each having half of the total number of ports supported by the IMM.

Each daughter card object contains a number of ports that are specific to the type of service required. The port objects are created automatically under the daughter card but they must be configured based on the function served by the port; for example, as an access interface for a VPRN service.

You can associate policies to daughter cards. Network buffer policies are used to create and edit QoS buffer pool resources on egress network ports, channels, and ingress ports. Ingress and egress network ports and channels have a dedicated buffer pool for egress queuing. The ingress and egress network traffic is handled by a buffer pool at the ingress and a buffer pool at the egress.

You can also configure multicast path management on an IMM daughter card. See chapter 45 for more information.

MDA modes for the 7705 SAR

The 5620 SAM allows you to configure the MDA mode of some MDA types on the 7705 SAR. The MDA mode on a channelized ASAP determines the capabilities that are available to the MDA. The MDA mode on an XMDA determines the number of ports that are available to the MDA. See the MDA Mode parameter description for more information.

15.5 Working with bundle objects

Bundle objects can be configured as multilink PPP, IMA group, or FR group bundles. Multilink PPP, IMA group, and FR group bundles appear as Bundle objects under the daughter card object if the daughter card has been configured as a channelized MDA.

APS Bundle objects appear in the navigation tree as children of the shelf object. APS Bundle objects are configured to protect multilink PPP and IMA bundles on channelized ASAP MDAs. See chapter 34 for more information on APS and APS bundles.

Multilink PPP bundles

You can create multilink PPP bundles to:

- bundle DS0 channels together to be used as a SAP
- provide a mechanism to distribute data across multiple links to achieve higher bandwidth

The following general rules apply to multilink bundles.

- Table 15-4 lists the maximum number of multilink bundles that can be created on each MDA.
- DS0 channels can be aggregated on a single MDA only.
- Up to 8 members can be added to a bundle.
- The Encap Type parameter of a member cannot be set to FR.
- A DS0 channel can host only one SAP.
- If a channel is being used as a SAP, it cannot be added to a bundle.

Table 15-4 Multilink bundle configuration maximum

MDA	Bundle maximum
All MDAs other than channelized ASAP MDAs	56
• 1 x OC12 Deep Channel • 4 x OC3 Deep Channel • 12 x DS3/E3 Deep Channel • 4 x DS3/E3 Deep Channel • 8 x DS1/E1 Channel CMA (7710 SR)	56
4 x Channelized DS3/E3 ASAP MDA	112
• 4 x Channelized OC3 ASAP • 1 x Channelized OC12 ASAP • 12 x Channelized DS3/E3 ASAP	256

See Procedure 15-41 to create a multilink PPP bundle.

IMA group bundles

IMA group bundles combine ATM-encapsulated DS0 channel groups into a single ATM interface. The following general rules apply to IMA group bundles.

- IMA group bundles can only be created on:
  - channelized ASAP MDAs with SDH or SONET framing the 7750 SR or 7710 SR
  - ATM DS1/E1 CMA on the 7710 SR
  - channelized DS1/E1 ASAP daughter cards on the 7705 SAR
- The encapsulation type of the DS0 group channel must be ATM.
- The Clock Source parameter of the DS1 channel must be set to Node-Timed.
- Table 15-5 lists the maximum number of IMA group bundles that can be created on each MDA.
- IMA group members must be on the same MDA.

Table 15-5 IMA group bundle configuration maximums

Device	MDA	Bundle maximum
7750 SR	All MDAs other than channelized ASAP MDAs	56

(1 of 2)

Device	MDA	Bundle maximum
7750 SR 7710 SR	4 x Channelized DS3/E3 ASAP MDA	112
7750 SR 7710 SR	• 4 x Channelized OC3 ASAP • 1 x Channelized OC12 ASAP • 12 x Channelized DS3/E3 ASAP	256
7710 SR	8 x ATM DS1/E1 CMA	8
7705 SAR	16 x Channelized DS1/E1 ASAP	8
7705 SAR	2 x Channelized OC3/STM1 ASAP	16

(2 of 2)

See Procedure 15-39 to create a multilink PPP bundle.

FR group bundles

FR group bundles are used to fragment lower priority DLCI frames to minimize jitter and delay on higher priority DLCI frames. The following general rules apply to FR group bundles.

- FR group bundles can only be created on channelized ASAP MDAs.
- FRF12 cannot be enabled on a SAP that is using an FR group bundle.
- DS0 channel groups must have all their timeslots selected and have their encapsulation type set to FR to be configured as bundle members.

Note — You can configure a maximum of 128 FR group bundles on an MDA.

See Procedure 15-37 to create a multilink PPP bundle.

15.6 Workflow to manage shelf objects

The following workflow describes the sequence of high-level tasks required to manage and configure shelf objects and shelf object children. This workflow assumes that the physical devices have been installed, commissioned, and discovered. See chapter 9 for more information about device commissioning. See chapter 10 for more information about device discovery.

Note — Shelf objects and shelf object children can be accessed using the equipment navigation tree. See chapter 5 for more information about using the equipment navigation tree.

1 As required, perform the following procedures to configure shelf objects.

   a Configure the chassis mode of a device. See Procedure 15-1.

   b Configure dry-contact sensor monitoring. See Procedure 15-3.

c Configure switch fabric multicast ingress replication rates. See Procedure 15-4.

d Configure IMPM overrides. See Procedure 15-5.

e Enable mixed mode on a 7450 ESS or 7750 SR device. See Procedure 15-6.

f Configure timing synchronization. See Procedure 15-7.

g Configure the IEEE 1588 clock on a 7705 SAR. See Procedure 15-8.

h Configure the IEEE 1588 PTP port on a 7705 SAR. See Procedure 15-9.

i Configure NTP on supported device types. See Procedure 15-10.

j Configure a 7705 SAR microwave link. See Procedure 15-11.

k Configure a 7705 SAR MW link member. See Procedure 15-12.

l Configure auxiliary alarm definitions on a 7705 SAR. See Procedure 15-13.

m Configure the IEEE 1588 PTP clock on supported devices. See Procedure 15-14.

n Configure the IEEE 1588 PTP peer on supported devices. See Procedure 15-15.

o Manage OmniSwitch running configuration. See Procedure 15-16.

p Configure OmniSwitch health monitoring. See Procedure 15-17.

q Configure a CCM on a 7950 XRS-20. See Procedure 15-18.

r Configure power supply trays. See Procedure 15-20.

s Configure power management zones on a 7950 XRS. See Procedure 15-21.

2 Assign a card type to a chassis slot. See Procedure 15-23.

3 As required, configure the card and card slot objects as follows:

a Configure an egress WRED queue control on an IOM 3 or IMM forwarding plane. See Procedure 15-24.

b Configure IMPM on a 2 × XP MDA IOM 3 or IMM forwarding plane. See Procedure 15-25.

c Enable named pool mode. See Procedure 15-28.

d Configure OmniSwitch stacks. See Procedure 15-30.

e Configure an OmniSwitch CPU temperature threshold. See Procedure 15-31.

f Configure a CPM on a 7950 XRS. See Procedure 15-32.

4 As required, configure daughter card objects as follows:

a Configure an MDA. See Procedure 15-33.

b Configure IMPM on an MDA. See Procedure 15-34.

c View operational multicast channel properties on an MDA. See Procedure 15-35.

d Configure a module card on the 7705 SAR-M/ME. See Procedure 15-36.

5 As required, create or modify bundle objects as follows:

a Multilink PPP bundle. See Procedures 15-41 and 15-42.

b IMA group bundle. See Procedures 15-39 and 15-40.

c FR group bundle. See Procedures 15-37 and 15-38.

d MLPPP bundle as a network interface on a channelized ASAP MDA. See Procedure 15-44.

15.7 Shelf object configuration procedures

Use the following procedures to configure shelf objects using the navigation tree.

Procedure 15-1 To configure the device chassis mode

Perform this procedure to configure the chassis mode for the device. See chapter 12 for more information about chassis modes.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the shelf object on which you want to configure the chassis mode. The path is Network→*NE*→Shelf.

3 Right-click on the Shelf object and choose Properties. The Shelf (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Administrative Mode
  If you downgrade the administrative chassis mode, the device must be rebooted to change the operational chassis mode.
- Force Mode
  Forcing a chassis mode change does not change the operational chassis mode unless there is a compatible card type equipped on the device. See chapter 12 for more information about the minimum card type that must be installed for each chassis mode.

5 Click on the OK button. The Shelf (Edit) form closes.

Procedure 15-2 To configure a VWM shelf for a 7210 SAS

The 1830 VWM is an add-on optical module that attaches to the USB port of a 7210 SAS-E, 7210 SAS-M, or 7210 SAS-X, Release 5.0 R4 or later. Perform this procedure to create an equipment shelf that identifies the 1830 VWM module. You can create one VWM shelf per NE. See the 7210 SAS documentation.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the VWM Shelves object. The path is Network→NE→VWM Shelves.

3 Right-click on VWM Shelves and choose Configure VWM Shelf from the contextual menu. The VWM Shelf (Create) form opens.

4 Configure the parameters:

- Administrative State
- Shelf ID

You must configure the Shelf ID parameter with the hardware shelf ID value that is pre-set on the rotary dial of the 1830 VWM module. The Shelf ID parameter value must be an integer from 1 to 7.

Note — If the Shelf ID parameter does not match the hardware shelf ID, the correct manufacturer details do not appear on the VWM Shelf form.

5 Click on the OK button. The VWM Shelf (Create) form closes.

Procedure 15-3 To configure 7210 SAS dry contact sensors

Perform this procedure to configure dry contact sensors on a 7210 SAS-E, 7210 SAS-M, 7210 SAS-T, or 7210 SAS-X.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the shelf object on which you want to configure dry contact sensors. The path is Network→*NE*→Shelf.

3 Right-click on the Shelf object and choose Properties. The Shelf (Edit) form opens with the General tab displayed.

4 Click on the External Alarms tab. The Shelf Dry Contacts tab is displayed.

5 Choose one of the dry contacts and click on the Properties button. The DryContact (Edit) form opens.

6 Configure the parameters:

- Name
- Description
- Monitored Status
- Polarity
- Alarm Severity
- Alarm Trigger Message
- Alarm Clear Message
- Control Status
- Control Type
- Connected To

7 Click on the OK button to close the DryContact (Edit) form.

8 Click on the OK button. A dialog box appears.

9 Click on the Yes button. The Shelf (Edit) form closes.

Procedure 15-4 To configure switch fabric multicast ingress replication rates

Perform this procedure to configure the total multicast replication rates for primary and secondary ingress paths for each switch fabric multicast plane.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the shelf object on which you want to configure switch fabric multicast ingress replication rate. The path is Network→*NE*→Shelf.

3 Right-click on the Shelf object and choose Properties. The Shelf (Edit) form opens with the General tab displayed.

4 Click on the Multicast tab.

5 Configure the parameters:

- Primary Multicast Bandwidth (mbps)
- Secondary Multicast Bandwidth (mbps)
- Primary Multicast Bandwidth for Dual-SFM Mode (mbps)
- Secondary Multicast Bandwidth for Dual-SFM Mode (mbps)

6 Click on the OK button. The Shelf (Edit) form closes.

Procedure 15-5 To configure IMPM overrides

Perform this procedure to configure IMPM overrides. See Procedure 15-25 to configure IMPM on an IOM or XCM. See chapter 45 for more information on multicast path management.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the shelf object on which you want to configure MMRP IMPM overrides. The path is Network→*NE*→Shelf.

3 Right-click on the Shelf object and choose Properties. The Shelf (Edit) form opens with the General tab displayed.

4 Click on the Multicast tab.

5 Configure the parameters:

- Administrative Mode
- Round-Robin Inactive Records

Note — The Operational Mode parameter is not configurable. If the Administrative Mode parameter is changed, the value of the Operational Mode parameter changes to indicate the same mode as the Administrative Mode parameter after the system is rebooted.

6 Click on the OK button. The Shelf (Edit) form closes.

Procedure 15-6 To enable mixed mode

Perform this procedure to enable mixed mode on a 7450 ESS or 7750 SR. Enabling mixed mode on a 7450 ESS-6, 7450 ESS-6v, 7450 ESS-7, or 7450 ESS-12, enables the support of features on the IOM3-XP and associated MDA-XPs or IMMs.

Release 9.0 and later 7750 SR-7 and 7750 SR-12 devices support mixed mode, which allows you to enable IPv6 on a 7750 SR in chassis mode A or B without having to upgrade the entire chassis. Slots with network ports, and ports that require IPv6 support, can then be selectively upgraded for IOM3-XPs or IMMs.

Note — On Release 9.0 R5 and later 7750 SR-7 and 7750 SR-12 devices, mixed mode cannot be enabled when an ISA TMS MDA is provisioned.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the shelf object on which you want to enable mixed mode. The path is Network→*NE*→Shelf.

3 Right-click on the Shelf object and choose Properties. The Shelf (Edit) form opens with the General tab displayed.

4 Enable the Mixed Mode State on Chassis Enabled parameter.

5 Click on the OK button. The Shelf (Edit) form closes.

Procedure 15-7 To configure timing synchronization

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the shelf object on which you want to configure timing synchronization. The path is Network→*NE*→Shelf.

3 Right-click on the Shelf object and choose Properties. The Shelf (Edit) form opens with the General tab displayed.

4 Click on the Timing tab.

5 Configure the parameters, as required:

Note — The displayed parameters vary depending on the NE type, release, and the settings of other parameters.

- Reference Input Mode
- Reference Input Mode (revertive)
- Quality Level Reference
- First Timing Reference Input
- Second Timing Reference Input
- Third Timing Reference Input
- Fourth Timing Reference Input
- Type
- Interface Name
- Port or Channel Name
- Administrative State
- Quality Level Override
- First Timing Reference PTP Clock
- Second Timing Reference PTP Clock
- Role
- Wait to Restore Time (Min):
- Wait to Restore Time (Secs):
- Interface Type
- Input Administrative State
- Output Administrative State
- Output Line Length
- SSM
- Input Type
- Impedance Type
- Output Type
- Status
- Primary Reference Type
- Secondary Reference Type
- Sync In Port
- Sync Out Port

You must enable the Synchronous Ethernet parameter on the daughter card in order to configure the Timing Reference One and Timing Reference Two panels for SyncE. See Procedure 15-33.

When you select a port as a timing reference for SyncE, the Port Clock Mode parameter for the port must be set to Manual Slave. See Procedure 16-1. Other restrictions may also apply for SyncE port selection, depending on the device. See the NE documentation for more information.

For the 7210 SAS-D ETR, 7210 SAS-M, and 7210 SAS-X, PTP and SyncE are mutually exclusive. Consider the following when configuring timing synchronization on these 7210 SAS NEs:

- You can only choose PTP as an option for First Timing Reference Input when the Administrative State parameter in the PTP panel is set to Up.
- You cannot configure the Second Timing Reference Input parameter when the First Timing Reference Input parameter is set to PTP.
- You can only set the Administrative State parameter in the PTP panel to Up when the Administrative State parameter in both the Timing Reference One and Timing Reference Two panels is set to Down.
- You can only set the Administrative State parameter in the Timing Reference One and Timing Reference Two panels to Up when the Administrative State parameter in the PTP panel is set to Down.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Shelf (Edit) form closes.

Procedure 15-8 To configure a 7705 SAR IEEE 1588 PTP clock

Perform this procedure to configure the IEEE 1588 PTP clock on a 7705 SAR that is configured as an IEEE 1588 PTP client: See Procedure 15-7 for information about how to configure a 7705 SAR as a PTP client.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the NE object on which you want to configure the IEEE 1588 PTP clock. The path is Network→*NE*.

3 Right-click on the NE and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 Click on the IEEE PTP Clock tab.

5 Click on the Create button. The IEEE 1588 PTP Clock (Create) form opens.

6 Configure the parameters:

- Clock Index
- Clock Type
- Clock Slave Only
- Admin State
- PTP Profile
- Dynamic Peers
- Clock Priority 1
- Clock Priority 2
- Domain
- Frequency Source
- Clock Time Reference Priority

7 Click on the Select button beside the Clock MDA parameter and choose a source MDA for the PTP clock.

8 Click on the Select button beside the Interface Name parameter and choose a source interface for the PTP clock.

9 Click on the Apply button. A dialog box opens.

10 Click on the OK button.

11 As required, turn up PTP ports on the IEEE 1588 PTP clock.

i Choose a PTP port from the PTP Port panel and click on the Properties button. The IEEE 1588 PTP Port (Edit) form opens with the General tab displayed.

ii Configure the Admin State parameter.

iii Click on the OK button. The IEEE 1588 PTP Port (Edit) form closes.

12 Click on the OK button. A dialog box appears.

13 Click on the OK button. The IEEE 1588 PTP Clock (Create) form closes.

14 Click on the OK button. The Network Element (Edit) form closes.

Procedure 15-9 To configure a 7705 SAR IEEE 1588 PTP port

Perform this procedure to configure the IEEE 1588 PTP port on a 7705 SAR that is configured as an IEEE 1588 PTP client. See Procedure 15-7 for information about how to configure a 7705 SAR as a PTP client.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the shelf object on which you want to modify the IEEE 1588 PTP port. The path is Network→*NE*→Shelf.

3 Right-click on the Shelf object and choose Properties. The Shelf (Edit) form opens with the General tab displayed.

4 Click on the Timing tab.

5 Click on the PTP Port Properties button. The PTP Port (Edit) form opens with the General tab displayed.

6 Configure the parameters:

- Master 1 Address
- Master 2 Address
- Announce Receive Timeout
- Announce Interval
- Sync Interval

7 Click on the Recovered Clock History Master One tab to view master 1 clock recovery statistics.

8 Click on the Recovered Clock History Master Two tab to view master 2 clock recovery statistics.

9 Click on the OK button. The PTP Port (Edit) form closes.

10 Click on the OK button to save the configuration and close the Shelf (Edit) form.

Procedure 15-10 To configure NTP on supported devices

Perform this procedure to configure NTP on an NE. NEs can act as NTP servers, clients, or peers.

NTP configuration is supported on the following device types:

- 7705 SAR, Release 5.0 R5 or later
- 7705 SAR-H, Release 5.0 R3 or later
- 7750 MG, Release 3.1 or later
- 7750 SR, Release 8.0 or later
- 7950 XRS, Release 10.0 or later
- 9500 MPR

The 7705 SAR acts only as an NTP client and not as an NTP server. The 7705 SAR does not support NTP on a VPRN service.

Note 1 — For the 9500 MPR, if the main and spare NTP servers are defined with the same IP address in NEtO, only the IP address for the main server will be displayed in the 5620 SAM. Main and primary NTP servers with the same IP address should be avoided.

Note 2 — For any failed operation related to NTP server addition or modification, you must close the current GUI session on the NTP tab and reopen it before proceeding. This action removes the failed entry from the GUI cache so that it is not applied again.

Note 3 — The tabs and parameters that are configurable vary depending on the NE.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Choose Network→*NE* where *NE* is the object on which you need to configure NTP.

3 Right-click on the NE and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 If you are configuring a 7705 SAR or 9500 MPR, click on the NTP tab and configure the NTP State parameter, then go to step 7.

You must set the NTP State parameter to Enabled in order to configure the remaining NTP parameters.

5 Configure the NTP parameters on the General tab:

- NTP State

You must set the NTP State parameter to Enabled in order to configure the remaining NTP parameters.

When you change the NTP State parameter from Disabled to Enabled, you must click on the Apply button and confirm the action in order to activate the NTP tab.

6 Click on the NTP tab. The General tab is displayed.

7 Configure the parameters:

- Authentication Check
- Admin State
- NTP Server
- Server Authenticate
- MDA Time Stamp

8 Click on the Authentication tab and perform the following:

i Click on the Create button. The Network Time Protocol Authentication (Create) form opens.

ii Configure the parameters:

- Authentication Key Id
- Authentication Key
- Authentication Key Type

The values of the Authentication Key Id and Authentication Key parameters must be the same on the reference clock server and the NE.

iii Click on the OK button. The Network Time Protocol Authentication (Create) form closes and a dialog box appears.

iv Click on the OK button. The authentication key appears on the Authentication form.

9 Click on the Server tab and perform the following:

i Click on the Create button. The Network Time Protocol Server (Create) form opens.

ii Configure the parameters, as required:

- PTP Server
- IP Address
- Authentication Key Id
- NTP Version
- Preferred Server

Note — When the PTP Server parameter is enabled, the IP Address parameter becomes non-configurable. The address that is displayed in that field is not the PTP server address, it is an internal reference.

The Authentication Key Id and NTP Version parameters are only displayed when the PTP Server parameter is not enabled.

iii Click on the OK button. The Network Time Protocol Server (Create) form closes and a dialog box appears.

iv Click on the OK button.

If you are configuring a 9500 MPR, go to step 15.

10 Click on the Peer tab and perform the following:

i Click on the Create button. The Network Time Protocol Peer (Create) form appears.

ii Configure the parameters:

- Peer Address
- Authentication Key Id
- NTP Version
- Preferred Peer

iii Click on the OK button. The Network Time Protocol Peer (Create) form closes and a dialog box appears.

iv Click on the OK button. The NTP peer server appears on the Peer form.

11 Click on the Broadcast tab and perform the following:

i Click on the Create button. The NTP Broadcast (Create) form opens.

ii Click on the Select button beside the Interface Name parameter and select a source interface.

iii Click on the OK button.

iv The Select Source Interface - NTP Broadcast form closes and the NTP Broadcast (Create) form reappears.

v Configure the parameters:

- Direction
- Authentication Key Id
- NTP Version
- Authenticate
- Time to Live

You can only set the Direction parameter to transmit if the NTP Server parameter is enabled in step 7.

When the value of the Direction parameter is set to transmit, the Authentication Key Id, NTP Version, and Time to Live parameters are displayed.

vi Click on the OK button. The NTP Broadcast (Create) form closes and a dialog box appears.

vii Click on the OK button. The broadcast source interface appears on the Broadcast form.

12 Click on the Multicast tab and perform the following:

i Click on the Create button. The NTP Multicast (Create) form opens.

ii Configure the parameters:

- Direction
- Authentication Key Id
- NTP Version
- Authenticate

When the value of the Direction parameter is set to transmit, the Authentication Key Id and NTP Version parameters are displayed.

iii Click on the OK button. The NTP Multicast (Create) form closes and a dialog box appears.

iv Click on the OK button.

13 Click on the Associations tab and perform the following to view the properties of the NTP associations, if required:

i Configure the filters and click on the Search button. A list of NTP-associated NEs appears.

ii Choose an NE and click on the Properties button. The Network Time Protocol Associations (View) form opens. You can view information about the status and mode of the NTP server.

iii Close the Network Time Protocol Associations (View) form.

14 Click on the Clients tab and perform the following to view the properties of the NTP clients, if required:

i Configure the filters and click on the Search button. A list of NTP clients appears.

ii Choose an NTP client and click on the Properties button. The Network Time Protocol Clients (View) form opens. You can view information about the status and mode of the NTP client.

iii Close the Network Time Protocol Clients (View) form.

15 Click on the OK button. A dialog box appears.

16 Click on the Yes button. The Network Element (Edit) form closes.

Procedure 15-11 To configure a 7705 SAR MW link

Perform this procedure to configure a microwave link on the 7705 SAR-8 or 7705 SAR-18. To support an MW link, the NE must be configured with 4 × MWA Gig Ethernet (2 TX, 2 SFP) + 4 × Gig Ethernet SFP daughter cards. See Procedure 15-33 for information about how to configure daughter cards.

Note — The 5620 SAM supports the creation of an MW link in 1+0 protection mode and 1+1 protection mode. You can only configure 1+1 protection if the NE is in network mode.

For information about the 7705 SAR and 9500 MPRe, see the 9500 MPRe 4.1.0 user documentation and the appropriate 7705 SAR 6.0 R1 hardware guides.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Choose Network→NE→*Shelf* where Shelf is the 7705 SAR shelf object on which you need to create an MW link.

3 Click on the shelf object to expand the tree view.

4 Right-click on the MW Links item and choose Create MW Link from the contextual menu. The Create MW Link (Create) form opens, with the General tab displayed.

Note — Up to 12 MW links are supported on the 7705 SAR, Release 5.0 R5, and up to 24 MW links are supported on the 7705 SAR, Release 6.0 R1 or later.

5 Configure the Description parameter, if required.

6 Click on the MW Link tab.

7 Configure the parameters in the Hold Time panel:

- Auto-Assign ID
- Hold Time Up (seconds)
- Hold Time Down (seconds)

8 Click on the States tab and configure the Administrative State parameter.

9 Click on the Protection tab and configure the Protection Scheme parameter.

If you choose the value One Plus One Hsb, the Protection form displays additional panels.

10 To configure 1+1 radio protection, configure the following:

i In the Equipment Protection Scheme panel, configure the parameters, if required:

- Revertiveness
- Main Operation
- Spare Operation

ii In the Radio Protection Scheme panel, configure the parameters, if required:

- Revertiveness
- Main Operation
- Spare Operation

iii In the Transmission Protection Scheme panel, configure the parameters, if required:

- Main Operation
- Spare Operation

11 Click on the OK button. The MW Link (Create) form closes and the new MW link appears under the MW Links item in the navigation tree.

12 To modify the MW Link properties, right-click on the MW link and choose Properties. The MW Link (Edit) form appears with the General tab displayed.

13 Click on the MW Link tab and configure the parameters in the Hold Time panel, if required.

- Hold Time Up (seconds)
- Hold Time Down (seconds)

Note — The Peer IP Address parameter in the Peer Info panel is read-only and is displayed as follows:

- When the 9500 MPRe is in standalone mode, the Peer IP Address displays 0.0.0.0.
- When the 9500 MPRe is in single NE mode, the Peer IP Address displays the IP address of the other end 9500 MPRe if the other end of the radio link terminates on a 9500 MPRe in standalone mode.
- When the 9500 MPRe is in single NE mode, the Peer IP Address displays the IP address of the other end 7705 SAR if the other end of the radio link terminates on a 9500 MPRe in single NE mode.
- The Peer IP Address changes only when the 7705 SAR discovers a new peer after the radio link is operationally up between both 9500 MPRes or when the 7705 SAR reboots.

14 Configure the Peer Discovery parameter in the Peer Discovery panel.

15 Click on the Statistics tab to view statistical information, if required.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The MW Link (Edit) form closes.

Procedure 15-12 To configure a 7705 SAR MW link member

Perform this procedure to configure a 7705 SAR MW link member on the 7705 SAR-8 or 7705 SAR-18. To support an MW link and an MW link member, the NE must be configured with 4 × MWA Gig Ethernet (2 TX, 2 SFP) + 4 × Gig Ethernet SFP daughter cards. See Procedure 15-33 for information about how to configure daughter cards.

If you configured 1+1 HSB protection in Procedure 15-11, you can configure a main radio and a spare radio for each MW link. By default, the main radio assumes the active status and the spare radio assumes the standby status.

If you configured 1+1 HSB protection and you want to revert back to 1+0 protection, you must delete the spare radio. You cannot delete the main radio.

1+1 HSB protection is displayed on the 5620 SAM physical topology map. The protection state is shown on the links, and 1+1 links are grouped in a common link group. The expansion of links on the physical map displays eight links. See section 6.2 for more information about the 5620 SAM physical topology maps.

For information about the 7705 SAR and 9500 MPRe, see the 9500 MPRe 4.1.0 user documentation and the appropriate 7705 SAR 6.0 R1 hardware guides.

1 Choose Network→NE→Shelf→Card Slot n→Daughter Card Slot n→Port n/n/n where the port object is the port that you need to use for the MW link.

Note 1 — Only the first four ports on the MDA are microwave-aware.

Note 2 — If a port is associated with an MW link, the port cannot be used as a timing reference. Also, if a port is already being used as a timing reference, the port cannot be associated with an MW link member.

2 Right-click on a port and choose Properties. The Physical Port (Edit) form opens with the General tab displayed.

3 Configure the Encapsulation Type parameter to be Dot1 Q.

4 Configure the Mode parameter.

Note 1 — Setting the Mode parameter to Access allows you to later associate the MW link with an L2 or L3 access interface for services. Setting the Mode parameter to Access is the typical setting. Setting the parameter to Network allows you to associate the MW link with a network interface.

Note 2 — 1+1 HSB radio protection can only be configured on a port in Network mode.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Physical Port (Edit) form closes.

7 Create an MW link member:

a If you configured 1+0 radio protection in Procedure 15-11, right-click on the MW link you created and choose Create MW Link Member. The Create MW Link Member step form opens.

b If you configured 1+1 HSB radio protection in Procedure 15-11, right-click on the MW link you created and choose Create MW Link Main Radio. The Create MW Link Member step form opens.

8 Configure the parameters on the Specify the Member Properties form, as required:

- Radio Name
- StandAlone
- Database Filename

The Database Filename must be the same name as the database file in the config file of the cflash directory and must be in a *.tar format.

9 Click on the Next button. The Select Ports form opens.

10 Choose the port from the list and click on the Finish button. Only eligible ports are displayed in the list and only one port per link is supported.

To configure a main radio, you must choose a port in an odd numbered slot.

11 Select the View the newly created Port Termination check box if you need to view the MW link member properties, and click on the Close button.

12 To configure a spare radio, right-click on the MW link where you created the main radio, and choose Create MW Link Spare Radio. Repeat steps 8 to 11.

To configure a spare radio, you must choose a port in an even numbered slot.

13 Click on the Radio tab. The tab displays information about MPT hardware and the software state of the connected radio.

14 Associate the MW link with an L2/L3 access interface or a network interface, if required.

i If you set the MW Link Member port Mode to Access in step 4, you can associate the MW link with a service, if required.

The MW links can be used in the L2 Access Interfaces of the following service types:

- VLL Epipe (see Procedure 67-27)
- VLL Ipipe (see Procedure 67-27)
- VPLS (see Procedure 68-24)
- MVPLS (see Procedure 68-24)

The MW links can also be used in the L3 Access Interfaces of the following service types:

- VPRN (see Procedure 71-22)
- IES (see Procedure 70-17)

The created access interface appears in the list on the L2 Access Interface or L3 Access Interface tab of the MW Link (Edit) form, as appropriate.

See the specific service chapter and forms when you create the required L2 or L3 access interfaces. Specify the MW Link Member as the Terminating Port.

ii If you set the MW Link Member port Mode setting to Network in step 4, the Network Interface tab is displayed. Click on the tab and then the Create button to create a network interface. The network interface that you create appears in the list. See Procedure 22-9 for more information.

15 Click on the Statistics tab to view radio analog statistical information, if required.

16 Click on the Faults tab to view alarm information, if required.

17 Click on the OK button. A dialog box appears.

18 Click on the Yes button. The MW Link Member (Edit) form closes.

Procedure 15-13 To configure 7705 SAR auxiliary alarm definitions

Perform this procedure to configure auxiliary alarm definitions for the auxiliary alarms daughter card on a 7705 SAR.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the shelf object on which you want to configure auxiliary alarm definitions. The path is Network→*NE*→Shelf.

3 Right-click on the Shelf object and choose Properties. The Shelf (Edit) form opens with the General tab displayed.

4 Click on the External Alarms tab.

5 As required, configure auxiliary alarm digital inputs.

i Click on the Auxiliary Alarm Digital Inputs tab.

ii Select a digital input from the list and click on the Properties button. The Auxiliary Alarm Digital (Edit) form opens with the General tab displayed.

iii Configure the parameters:

- Optional Name
- Description
- Administrative State
- Detection (s)
- Clearing (s)
- State

iv Click on the OK button. The Auxiliary Alarm Digital (Edit) form closes.

v Repeat steps i to iv to configure more auxiliary alarm digital inputs, as required.

6 As required, configure auxiliary alarm port inputs.

i Click on the Auxiliary Alarm Port Inputs tab.

ii Click on the Create button. The Auxiliary Alarm Ports (Create) form opens.

iii Click on the Select button beside the CLI Name parameter. The Select Port Reference - Auxiliary Alarm Ports form opens.

iv Choose a port reference from the list and click on the OK button. The Select Port Reference - Auxiliary Alarm Ports form closes.

Only Ethernet ports can be selected.

v Configure the parameters:

- Port Name
  The Port Name parameter value is automatically configured when you configure the CLI Name parameter in step iii.
- Optional Name
- Description
- Administrative State

vi Click on the OK button. A dialog box appears.

vii Click on the OK button. The Auxiliary Alarm Ports (Create) form closes.

viii Repeat steps i to vii to configure more auxiliary alarm port inputs, as required.

7 Click on the Auxiliary Alarm Definitions tab on the Shelf (Edit) form.

8 Click on the Create button. The Auxiliary Alarm Definition (Create) form opens.

9 Configure the following parameters:

- Image Files Directory
- Auto-Assign ID
- Description
- Administrative State
- Severity

10 Click on the Inputs tab and configure the following parameters:

- Trigger Rule
- Analog Threshold (mV)
- Operation
- Input 1 through Input 8 (as required)

11 Click on the Outputs tab and configure the following parameters:

- Log Event
- Update Chassis Relays

12 Click on the OK button in the Auxiliary Alarm Definition (Create) form. A dialog box appears.

13 Click on the OK button to save the configuration.

Procedure 15-14 To configure the IEEE 1588 PTP clock on a 7210 SAS, 7450 ESS, or 7750 SR

Perform this procedure to configure the IEEE 1588 PTP clock on one of the following devices that is configured as an IEEE 1588 PTP client:

- 7210 SAS-D 6F 4T ETR
- 7210 SAS-M, Release 5.0 R2 or later
- 7210 SAS-X Release 5.0 R3 or later
- Release 9.0 R4 or later 7450 ESS-7
- Release 9.0 R4 or later 7450 ESS-12
- Release 9.0 R4 or later 7750 SR-7
- Release 9.0 R4 or later 7750 SR-12
- Release 9.0 R4 or later 7750 SR-c4

See Procedure 15-7 for information about how to configure a device as a PTP client.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure the IEEE 1588 PTP clock and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the IEEE PTP Clock tab.

4 Select an IEEE 1588 PTP Clock from the list and click on the Properties button. The IEEE 1588 PTP Clock (Edit) form opens.

5 Configure the parameters:

- Clock Type
- Admin State
- PTP Profile
- Clock Priority 1
- Clock Priority 2
- Domain
- Network Type
- Log sync interval

At least one IEEE PTP peer must be created before you can set the Admin State parameter to Enabled. See Procedure 15-15.

When the Admin State parameter is set to Enabled, you cannot change the Clock Type, PTP Profile, Domain or Log sync interval parameters.

For the 7210 SAS-D 6F 4T ETR, 7210 SAS-M, and 7210 SAS-X, when the Clock Type parameter is set to Boundary, you must set the PTP Profile parameter to IEEE-1588-2008.

6 Click on the OK button. The IEEE 1588 PTP Clock (Edit) form closes.

7 Click on the OK button to save the configuration and close the Network Element (Edit) form.

Procedure 15-15 To configure the IEEE 1588 PTP peer of a 7210 SAS, 7450 ESS, or 7750 SR

Perform this procedure to configure the IEEE 1588 PTP peer of one of the following devices that has the IEEE 1588 PTP clock configured:

- 7210 SAS-D 6F 4T ETR
- 7210 SAS-M, Release 5.0 R2 or later
- 7210 SAS-X Release 5.0 R3 or later
- Release 9.0 R4 or later 7450 ESS-7
- Release 9.0 R4 or later 7450 ESS-12
- Release 9.0 R4 or later 7750 SR-7
- Release 9.0 R4 or later 7750 SR-12
- Release 9.0 R4 or later 7750 SR-c4

See Procedure 15-14 for information about how to configure the IEEE 1588 PTP clock on a device.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure the IEEE 1588 PTP clock and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the IEEE PTP Clock tab.

4 Choose an entry in the list and click on the Properties button. The IEEE 1588 PTP Clock (Edit) form opens.

5 Click on the IEEE PTP Peers tab.

6 Perform one of the following:

a To create an IEEE 1588 PTP peer on a slave, go to step 7.

b To modify an existing IEEE 1588 PTP peer on a slave, go to step 10.

7 Click on the Create button. The IEEE 1588 PTP Peer (Create) form opens

8 Configure the parameters:

- Peer ID
- Peer IP Address
- Peer Priority
- Administrative State

9 Go to step 12.

10 Select an IEEE 1588 PTP peer from the list and click on the Properties button. The IEEE 1588 PTP Peer (Edit) form opens.

11 Configure the parameters:

- Peer Priority
- Administrative State

12 Click on the OK button. The IEEE 1588 PTP Peer (Create) form closes and a dialog box appears.

13 Click on the OK button. The IEEE 1588 PTP Clock (Edit) form reappears with the IEEE 1588 PTP Peer information displayed.

14 Click on the OK button. The Network Element (Edit) form reappears.

15 Click on the OK button. A dialog box appears.

16 Click on the OK button to save the configuration and close the Network Element (Edit) form.

Procedure 15-16 To manage an OmniSwitch running configuration

Caution — When you reboot an OmniSwitch that is in service it is service-affecting. Ensure that the reboot activity occurs during a maintenance window.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the OmniSwitch object.

3 Right-click on a device and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 Click on a shelf object. The Shelf (Edit) form opens with the General tab displayed.

5 Click on the Software Control Module tab.

6 Configure the Command to Apply parameter.

a If you specify Copy certified to working, configure the Active Timeout parameter.

b If you specify Reload from working, configure the Delayed Activation Timer parameter.

7 Click on the OK button. The Shelf (Edit) form closes.

Procedure 15-17 To configure OmniSwitch health monitoring

The health monitoring function monitors the consumable resources, such as bandwidth and CPU usage of the OmniSwitch at fixed intervals and collects the current values for each resource being monitored. You can specify the resource threshold limits. If a resource value is greater or less than the threshold, traps are sent to the 5620 SAM.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the OmniSwitch NE object.

3 Right-click on the OmniSwitch device for which you need to configure health monitoring and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 Click on a shelf object. The Shelf (Edit) form opens with the General tab displayed.

5 Click on the Health Monitoring tab.

6 Configure the following parameters:

- Rx Threshold (%)
- TxRx Threshold (%)
- Temperature Threshold Unit
- Temperature Threshold
- Memory Threshold (%)
- CPU Threshold (%)
- Sampling Interval (seconds)

7 Click on the Statistics tab and search for Card Health Stats (Physical Equipment) or Device Health Stats (Physical Equipment) to view card statistics or chassis statistics respectively. Statistics can also be viewed from the card-level statistics tab.

8 Click on the Faults tab to view alarm information.

9 Click on the OK button. A dialog box appears.

10 Click on the Yes button. The Shelf (Edit) form closes.

Procedure 15-18 To configure a CCM on a 7950 XRS-20

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7950 XRS-20 device where you want to view CCM properties and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object.

4 Right-click on a CCM object and choose Properties from the contextual menu. The CCM (Edit) form opens with the General tab displayed.

5 Click on the tabs to view CCM properties, as required.

6 If required, perform the following steps to configure a flash memory module.

i Click on the Flash Memory Modules tab.

ii Select a flash memory module in the list and click on the Properties button. The Flash Memory (Edit) form opens with the General tab displayed.

iii Configure the Administrative State parameter.

iv Click on the OK button. The Flash Memory (Edit) form closes.

7 If required, click on the View CPM button to open the properties form of the associated CPM.

See Procedure 15-32 for more information about the CPM properties form.

8 Click on the OK button. The CCM (Edit) form closes.

9 Close the Network Element (Edit) form.

Procedure 15-19 To manage the internal fan on a 7210 SAS-D

Perform this procedure to change the administration mode and view the fan operational state for the 7210 SAS-D 128 Mbyte variant, Release 5.0 R2 or later.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the Fan Tray object. The path is NE→Shelf→Fans→Fan Tray.

3 Right-click on Fan Tray and choose Properties from the contextual menu. The Fan Tray (Edit) form opens with the General tab displayed.

4 Click on the Fans tab. A list form opens.

5 Choose a fan from the list. The Fan (Edit) form opens with the General tab displayed.

6 Configure the Admin Mode parameter. The operational state of the fan (On or Off) is displayed in the Oper Mode field.

7 Close the Fan (Edit) form.

8 Close the Fan Tray (Edit) form.

Procedure 15-20 To configure a power supply tray

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the power supply tray object. The path is NE→Shelf→Power Supplies→Power Supply Tray.

3 Right-click on power supply tray and choose Properties from the contextual menu. The Power Supply Tray (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Current OLC State
- Revert OLC State

5 Click on the OK button. The Power Supply Tray (Edit) form closes.

Procedure 15-21 To configure a power management zone

Use this procedure to configure a power management zone on a 7950 XRS node

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7950 XRS and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Power Management Zones tab. A list of power management zones is displayed.

4 Select a power management zone from the list and click on the Properties button. The Power Management Zone (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Management Mode
- Power Safety Level (%)
- Power Safety Alert (Watts)
- Overload On Power Shortage

6 Click on the Power Utilization and Power Requirements tabs to view information about power usage in the power management zone. Click on the ellipsis button (...) for detailed information about each entry.

7 Click on the OK button. The Power Management Zone (Edit) form closes.

8 Close the Network Element (edit) form.

Procedure 15-22 To provision a PEQ on a 7950 XRS

Use this procedure to provision PEQ and APEQ objects on 7950 XRS nodes.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the Power Supplies tray object. The path is NE→Shelf→Power Supplies→Power Supply Tray.

3 Right-click on a power supply tray and choose Configure PEQ. The Power Supply Tray form appears.

4 Configure the parameters:

- Assigned PEQ Type
- Current OLC State
- Revert OLC State

5 Click on the OK button. The Power Supply Tray form closes, and the Equipment navigation tree is updated with the provisioned PEQ.

15.8 Card and card slot object configuration procedures

Use the following procedures to configure card and card slot objects using the navigation tree.

Procedure 15-23 To assign a card type

Perform this procedure to assign a card type to an empty card slot or SFM slot.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to assign a card type and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object.

4 Right-click on an empty Card Slot object or SFM Slot object and choose Configure Card from the contextual menu. The Card Slot (Create) or SFM Slot (Create) form opens.

5 Configure the parameters:

- Capability
- Assigned Card Type
- Shutdown IOM for Memory Parity Errors

Note — The correct chassis mode must be configured for the assigned card types. The chassis mode determines the behavior of the card and establishes the scaling limits and available features. See Procedure 15-1and 15-6 for more information.

6 Configure the following parameters in the Virtual Scheduler panel, if applicable:

- Fast Queue (%)
- Slow Queue (%)
- Schedule Minimum Interval (%)
- Task Scheduling Interval (%)
- Slow Queue Rate Threshold (kbps)

7 Configure the following parameters in the OLC panel:

- Current OLC State
- Revert OLC State

8 Click on the OK button. The Card Slot (Create) or SFM Slot (Create) form closes.

The card and slot appear in the navigation tree and in the equipment inventory list.

Procedure 15-24 To configure egress WRED queue control on an XCM, IOM 3 or IMM forwarding plane

Perform this procedure to configure the egress WRED queue control function on an XCM,IOM 3 or IMM.

Note — You cannot configure a forwarding plane on an XCM card until you have provisioned the corresponding XMA card.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the card slot object on which you want to configure egress WRED queue control on an IOM 3 or IMM forwarding plane. The path is Network→*NE*→Shelf→Card Slot *n*.

3 Right-click on the Card Slot object and choose Properties. The Card Slot (Edit) form opens with the General tab displayed.

4 Click on the Forwarding Plane tab.

5 Choose an entry in the list and click on the Properties button. The Forwarding Plane (Edit) form opens with the General tab displayed.

6 Configure the Egress WRED Queue Control parameters:

- Administrative State
- Buffer Allocation Min (%)
- Buffer Allocation Max (%)
- Reserved CBS Min (%)
- Reserved CBS Max (%)

7 Click on the Select button in the Slope Policy panel. The Select Slope Policy - Forwarding Plane form opens.

8 Choose a policy in the list and click on the OK button. The Select Slope Policy - Forwarding Plane form closes, and the slope policy name is displayed in the Slope Policy panel.

9 Click on the OK button. The Forwarding Plane (Edit) form closes.

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The Card Slot (Edit) form closes.

Procedure 15-25 To configure IMPM on an XCM, 2 x XP MDA IOM 3, or IMM forwarding plane

Perform this procedure to configure IMPM on an XCM, 2 x XP MDA IOM 3, or an IMM.

Note 1 — See Procedure 15-34 for information about configuring IMPM on an MDA that is not installed in an XCM, 2 × XP MDA IOM 3, or in an IMM.

Note 2 — You cannot configure a forwarding plane on an XCM card until you have provisioned the corresponding XMA card.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the card slot object on which you want to configure IMPM. The path is Network→*NE*→Shelf→Card Slot *n*.

3 Right-click on the Card Slot object and choose Properties. The Card Slot (Edit) form opens with the General tab displayed.

4 Click on the Forwarding Plane tab.

5 Choose an entry in the list and click on the Properties button. The Forwarding Plane (Edit) form opens.

6 Click on the Clear button to remove the selected policy. The Select button in the BW Policy panel is enabled.

7 Click on the Select button in the BW Policy panel. The Select BW Policy form opens.

8 Choose a policy in the list and click on the OK button. The Select BW Policy form closes, and the policy name is displayed in the BW Policy panel.

9 Configure the Administrative State parameter.

10 Configure the following parameters:

- High Bandwidth Source
- High Bandwidth Multicast Traffic Taps Group
- High Bandwidth Alarm
- High Bandwidth Default Paths Only

11 Click on the OK button. The Forwarding Plane (Edit) form closes.

12 Click on the OK button. A dialog box appears.

13 Click on the Yes button. The Card Slot (Edit) form closes.

Procedure 15-26 To configure an ingress queue group on a forwarding plane

Note 1 — You can configure ingress queue groups only on the forwarding planes of XCM, IOM3, and IMM cards.

Note 2 — You cannot configure a forwarding plane on an XCM card until you have provisioned the corresponding XMA card.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the card slot object on which you want to configure ingress queue groups. The path is Network→*NE*→Shelf→Card Slot *n*.

3 Right-click the Card Slot object and choose Properties. The Card Slot (Edit) form opens with the General tab displayed.

4 Click the Forwarding Plane tab.

5 Choose an entry in the list and click the Properties button. The Forwarding Plane (Edit) form opens with the General tab displayed.

6 Perform one of the following:

a Click the Access Ingress Queue Group tab.

b Click the Network Ingress Queue Group tab.

7 Click the Create button. The Forwarding Plane Ingress Queue Group (Create) form opens with the General tab displayed.

8 Click the Select button in the Queue Group Instance panel. The Select Queue Group Template Policy form opens.

9 Choose an ingress queue group template policy from the list and click the OK button. The Select Queue Group Template Policy form closes.

Note — If you select a policy that contains queues, a configuration error message will appear when you try to apply the changes.

10 Configure the Instance ID parameter.

11 Configure the Description parameter.

12 Click the Select button beside the ID parameter in the Accounting Policy panel. The Select Accounting Policy list form opens.

13 Choose an accounting policy from the list and click the OK button. The Select Accounting Policy list form closes and the Forwarding Plane Ingress Queue Group (Create) form refreshes with the accounting policy information.

Note 1 — Only accounting policies with Queue Group Packets as record type are supported.

Note 2 — You can also choose to create an accounting policy from this form by clicking the Create button instead of the Search button. Refer to Procedure 76-7 for information on creating an accounting policy and the *5620 SAM Statistics Management Guide* for general information about configuring and collecting accounting statistics.

14 Configure the Collect Accounting Statistics parameter.

15 Click the Select button in the Policer Control Policy panel to assign a policer policy to the card. The Select Policer Control Policy form opens.

16 Choose a policer policy from the list and click the OK button. The Select Policer Control Policy form closes.

17 Click the Create button in the Ingress Policer Control Override panel. The Ingress Policer Control Override (Create) form opens, with the General tab displayed.

18 Configure the parameters:

- Maximum Frame Based Bandwidth (kbps)
- Minimum Separation Buffer Space (bytes)

19 A message is displayed. Click OK.

20 Click the Level Override Policy Items tab.

21 Select an item from the list and click OK. The FP Ingress Policer Level Override form opens, with the General tab displayed.

22 Click the Override tab.

23 Configure the Maximum Cumulative Buffer Space (bytes) parameter.

24 Click OK. The FP Ingress Policer Level Override form closes.

25 Click OK. The Ingress Policer Control Override (Create) form closes.

26 Click the Override Policy Items tab.

27 Click the Create button. The Forwarding Plane Ingress Queue Group Policer Override (Create) form opens.

28 Click the Select button beside the ID parameter to select a policer. The Select Ingress Queue Group Policer form opens.

29 Choose an entry from the list and click the OK button. The Select Ingress Queue Group Policer closes and the Forwarding Plane Ingress Queue Group Policer Override (Create) form refreshes with the policer information.

30 Click the Override tab.

31 Configure the parameters in the Overridden Queue Group Template Policer panel:

- Override PIR
- Override CIR
- Override Maximum Burst Size
- Override Committed Burst Size
- Override Packet Offset
- Stats Mode

The parameters are configurable when the associated override check box is enabled.

32 Click the OK button to save the configuration and close the Forwarding Plane Ingress Queue Group Policer Override (Create) form. A dialog box appears.

33 Click the OK button.

34 Click the OK button. The Forwarding Plane Ingress Queue Group (Create) form closes and the list in the Forwarding Plane (Edit) form is refreshed.

35 To add another access ingress or network ingress queue group, repeat steps 6 to 34. Otherwise, continue to step 36.

36 Click the OK button. A dialog box appears.

37 Click the Yes button to save the configuration and close the Forwarding Plane (Edit) form.

38 Close the Network Element (Edit) form.

Procedure 15-27 To configure NE DDoS protection on a forwarding plane

Perform this procedure to configure the maximum number of enforcement policers for a DDoS protection configuration on a forwarding plane. See “DDoS protection” in the *5620 SAM System Administrator Guide* for more information.

Note — You cannot configure a forwarding plane on an XCM card until you have provisioned the corresponding XMA card.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the card slot object on which you want to configure ingress queue groups. The path is Network→*NE*→Shelf→Card Slot *n*.

3 Right-click on the Card Slot object and choose Properties. The Card Slot form opens with the General tab displayed.

4 Click on the Forwarding Plane tab.

5 Choose an entry in the list and click on the Properties button. The Forwarding Plane (Edit) form opens with the General tab displayed.

6 Configure the NE DDoS Protection - Dynamic Enforcement Policer Pool Size parameter. Select the Default check box to specify a default value.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button to save the configuration and close the Forwarding Plane (Edit) form.

9 Close the Card Slot form.

Procedure 15-28 To enable named pool mode

Perform this procedure to allow named pools to be created for an MDA. Set the Pool Mode parameter when you are configuring the card. Enabling the Named Pool mode is mutually exclusive with enabling Stable Pool sizing.

Caution — The Pool Mode parameter can be enabled and disabled at anytime, however changing the pool mode resets the IOM when MDAs are provisioned on the slot. If MDAs are not provisioned the IOM is not reset.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the card slot object on which you want to enable named pool mode. The path is Network→*NE*→Shelf→Card Slot *n*.

3 Right-click on the Card Slot object and choose Properties. The Card Slot (Edit) form opens with the General tab displayed.

4 Click on the IO Card tab.

5 Configure the Pool Mode parameter.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Card Slot (Edit) form closes.

Procedure 15-29 To enable Stable Pool Sizing

Perform this procedure to enable an even split of buffering amongst all possible MDAs.

When Stable Pool sizing is enabled, then for each MDA, the buffering is split between all ports based on the port maximum bandwidth and adjusted by the port's modify buffer allocation rate percentages. You cannot enable Stable Pool Sizing on any forwarding plane on a card while the card is either administratively or operationally in Named Pool mode.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the card slot object on which you want to enable Stable Pool sizing. The path is Equipment→*NE*→Shelf *n*→Card Slot *n*.

3 Right-click on the Card Slot object and choose Properties. The Card Slot (Edit) form opens with the General tab displayed.

4 Click on the Forwarding Plane tab.

5 Select the required forwarding plane from the list and click Properties. The Forwarding Plane (Edit) form opens.

6 Configure the Stable Pool Sizing parameter.

7 Click on the OK button. The Forwarding Plane (Edit) form closes.

8 Click on the OK button. A dialog box appears.

9 Click on the Yes button. The Card Slot (Edit) form closes.

Procedure 15-30 To configure OmniSwitch stacks

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on an OmniSwitch object and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object.

4 Click on a slot object. The Card Slot (Edit) form opens with the General tab displayed.

5 Click on the Stack Configuration tab.

6 Configure the parameters, as applicable to a given OmniSwitch NE:

- Saved Slot NI Number
- Command Action
- Stacking Action
- Administrative
- Operational

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The Card Slot (Edit) form closes.

Procedure 15-31 To configure an OmniSwitch CPU temperature threshold

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on an OmniSwitch object and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object.

4 Click on a slot object. The Card Slot (Edit) form opens with the General tab displayed.

5 Click on the Hardware Environment tab.

6 Configure the Temperature Threshold (Celsius) parameter.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The Card Slot (Edit) form closes.

Procedure 15-32 To configure a CPM on a 7950 XRS

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7950 XRS device where you want to view CPM properties and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object.

4 Right-click on Card Slot A or Card Slot B and choose Properties from the contextual menu. The Card Slot (Edit) form opens with the General tab displayed.

Note — Card Slot A and Card Slot B are automatically configured with CPMs. The CPMs cannot be removed, and they cannot be configured in any other card slot.

5 Configure the parameters:

- Current OLC State
- Revert OLC State

6 Click on the tabs to view CPM properties, as required.

7 If you are configuring a CPM on a 7950 XRS-16c, the Flash Memory Modules tab is available. If required, perform the following steps to configure a flash memory module on a 7950 XRS-16c.

i Click on the Flash Memory Modules tab.

ii Select a flash memory module in the list and click on the Properties button. The Flash Memory (Edit) form opens with the General tab displayed.

iii Configure the Administrative State parameter.

iv Click on the OK button. The Flash Memory (Edit) form closes.

Note — You can configure flash memory modules on the 7950 XRS-20 from the CCM properties form. See Procedure 15-18 for more information.

8 If you are configuring a CPM on a 7950 XRS-20, the View CCM button is available. If required, click on the View CCM button to open the properties form of the associated CCM.

See Procedure 15-18 for more information about the CCM properties form.

9 Click on the OK button. A dialog box appears.

10 Click on the OK button. The Card Slot (Edit) form closes.

11 Close the Network Element (Edit) form.

15.9 Daughter card slot object configuration procedures

Use the following procedures to configure daughter card slot objects using the navigation tree.

Procedure 15-33 To configure an MDA

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure an MDA and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object and the Card Slot object.

4 Perform one of the following.

a To add a daughter card to an empty daughter card slot, right-click on the daughter card slot and choose Configure Daughter Card from the contextual menu. The Daughter Card Slot (Create) form opens.

b To modify an existing daughter card, click on the daughter card slot. The Daughter Card Slot (Edit) form opens.

Note — If a daughter card in your configuration is managed by 5620 SAM but becomes no longer supported by 5620 SAM (for instance, an obsoleted MDA), it will be displayed under the equipment tree as type Unspecified. To delete such a card from 5620 SAM, you must remove the MDA from the device. Once a card is removed from the device, it is also automatically deleted from 5620 SAM.

5 Configure the parameters, if applicable:

- Assigned Daughter Card Type
- In MDA Carrier Module Slot
- Clock Mode
  The Clock Mode parameter value must be set to Differential in order to configure the Differential Timestamp Frequency (kHz) parameter.
- Differential Timestamp Frequency (kHz)
- Current OLC State
- Revert OLC State
- ATM Mode

Note 1 — The Assigned Daughter Card Type and In MDA Carrier Module Slot parameters are configurable only during daughter-card creation.

Note 2 — The Clock Mode and Differential Timestamp Frequency (kHz) parameters are configurable on a 16/32 × Channelized DS1/E1 ASAP v2 in a Release 6.0 R1 or later 7705 SAR-8, 7705 SAR-8 v2, or 7705 SAR-18, a 4 × Channelized DS3/E3 ASAP in a Release 6.0 R3 or later 7705 SAR, and an ASAP channelized card in a Release 6.0 R2 or later 7705 SAR-A. Combo MDA is supported on the 7705 SAR-H.

Note 3 — The ATM Mode parameter can only be configured on an MDA card of type 4 × ATM OC3/OC12, 4 × ATM OC3 STM1, or 16 port ATM OC3 STM1 on 7750 SR cards (excluding 7750 SR-c4 and 7750 SR-c12) on an IOM 3 card.

Note 4 — The ATM Mode parameter must be set to a value of max16k-vc for PPPoA and PPPoEoA to be supported.

6 If you are creating a daughter card on a 7710 SR, perform the following steps.

i Click on the MDA Carrier Module tab.

ii Configure the Assigned MCM Card Type parameter.

7 Click on the Apply button.

8 Click on the Daughter Card tab.

9 Configure the parameters:

- Administrative State
- MDA Mode
- Synchronous Ethernet
- Fabric Stats
- Power Priority Level

Note 1 — The MDA Mode parameter can only be configured on 16 x Channelized DS1/E1 ASAP v2, 32 x Channelized DS1/E1 ASAP v2, 4 x Channelized DS1/E1 ASAP, or XMDA 1p x 10GigE / 10p x 1GigE SFP.

Note 2 — Before you configure the MDA Mode parameter, you must shut down all of the ports and remove all of the subchannels and bundles from the MDA.

10 Configure the following parameters in the Voice panel, if required:

- Companding Law
- Signalling Type

11 Perform the following steps to configure named buffer pools, if required.

Note — You must enable pool mode on the parent I/O card to enable named buffer pool support. See Procedure 15-28 for more information.

i Click on the Select button beside the Name parameter in the Ingress Pool Policy panel. The Select Ingress Pool Policy form opens.

ii Choose a policy in the list and click on the OK button. The Select Ingress Pool Policy form closes, and the policy name is displayed in the Ingress Pool Policy panel.

iii If you are configuring an HSMDA daughter card, go to step 13.

Note — HSMDA daughter cards support only ingress named buffer pool policies, and not egress named buffer pool policies.

iv Click on the Select button beside the Name parameter in the Egress Pool Policy panel. The Select Egress Pool Policy form opens.

v Choose a policy in the list and click on the OK button. The Select Egress Pool Policy form closes, and the policy name is displayed in the Egress Pool Policy panel.

12 Perform the following steps to assign a network queue policy, if required.

i Click on the Select button in the Network Queue Policy panel. The Select Network Queue Policy form opens.

ii Select a policy in the list and click on the OK button. The Select Network Queue Policy form closes, and the policy is displayed in the Network Queue Policy panel.

13 Perform the following steps to configure HSMDA pool policies, if required.

Note — You must enable pool mode on the parent I/O card to enable HSMDA pool support. See Procedure 15-28 for more information.

i Click on the Select button in the Egress HSMDA Pool Policy panel. The Select Egress HSMDA Pool Policy form opens.

ii Choose a policy in the list and click on the OK button. The Select Egress HSMDA Pool Policy form closes, and the policy is displayed in the Egress HSMDA Pool Policy panel.

14 Configure the following parameters in the HSMDA Aggregate Queue Burst panel, if required:

- Threshold Low Burst Multiplier
- Threshold High Burst Increase

15 Perform the following steps to add a fabric profile, if required.

i Click on the Select button in the Network Ingress Fabric Profile panel. The Select Fabric Profile form opens.

ii Choose a profile in the list and click on the OK button. The Select Network Ingress Fabric Profile form closes, and the profile name is displayed in the Network Ingress Fabric Profile panel.

iii Click on the Select button in the Access Ingress Fabric Profile panel. The Select Fabric Profile form opens.

iv Choose a profile in the list and click on the OK button. The Select Access Ingress Fabric Profile form closes, and the profile name is displayed in the Access Ingress Fabric Profile panel.

16 Perform the following steps to assign a network queue policy and network policy of ring type for a 7705 SAR, if required.

i Click on the Select button in the Ring Policies panel. The Select Network Queue Policy form opens.

ii Choose a network queue policy in the list and click on the OK button. The Select Network Queue Policy closes, and the policy is displayed in the Ring Policies panel.

iii Click on the Select button in the Network Policy panel. The Select Network Policy form opens.

iv Choose a network policy in the list and click on the OK button. The Select Network Policy form closes and the policy is displayed in the Network Policy panel.

Note — To assign a network policy of ring type to a 7705 SAR-8 or 7705 SAR-18 MDA, you must set the Network Policy Type for 7705 parameter to Ring when you configure a network policy on the MDA. See Procedure 43-6 for more information.

17 Perform the following steps to configure MAC management, if required.

i Click on the MAC Operation tab. The FDB Mac Management tab appears.

ii Configure the parameters, if applicable:

- Mac Learning
- Mac Aging
- Discard Unknown Source
- Remote Age (seconds)
- Forwarding DB Size (entries)
- Mac Pinning on Port 1
- Mac Pinning on Port 2
- Fdb Table High Watermark

iii To create an FDB Mac entry, click on the FDB Entries tab. The MDA MAC FDB Management (Create) form opens.

iv Configure the parameters:

- Mac Address
- Name

v Click on the Select button in the Port panel. The Select Port - MDA MAC FDB Management form opens.

vi Choose a port in the list and click on the OK button. The Select Port - MDA MAC FDB Management form closes, and the port is displayed in the Port panel of the MDA MAC FDB Management form.

Note — You can only bind a ring port to an FDB Mac entry.

vii Click on the OK button. The FDB Mac entry is displayed in the FDB Entries form.

18 Click on the Network Interfaces tab to add a network interface card, if required.

19 Click on the Add button. The Create Network Interface - Routing Instance form opens. Perform steps 4 to 49 of Procedure 22-9 to create a network interface.

20 Perform steps 2 to 5 of Procedure 15-34 to configure IMPM on the daughter card, if required.

21 If you configured named buffer pools in step 11, perform the following steps to configure the associated Q1 pools. Otherwise, go to step 22.

Note — You cannot use this step to configure 7710 SR QoS policies.

i Click on the QoS Pool tab.

ii Choose a pool in the list and click on the Properties button. The QoS Pool (Edit) form opens.

iii Configure the parameters:

- Reserved CBS (%)
- Default Reserved CBS
- Amber Alarm Action Max (%)
- Amber Alarm Action Step (%)
- Amber Alarm Threshold (%)
- Red Alarm Threshold (%)

iv Click on the Select button in the Slope Policy panel. The Select Slope Policy - QoS Pool form opens.

v Choose a policy in the list and click on the OK button. The Select Slope Policy - QoS Pool form closes, and the slope policy name is displayed in the Slope Policy panel.

22 Perform the following steps to configure ATM, if required.

i Click on the ATM tab.

ii Select an ATM configuration from the list and click on the Properties button. The ATM Configuration (Edit) form opens.

iii Click on the VP Shaping tab.

iv Click on the Create button. The ATM VP Shaper (Create) form opens.

v Configure the VP ID parameter.

vi Click on the Select button in the ATM QoS Policy panel. The Select ATM QoS Policy - ATM VP Shaper form opens.

vii Select an ATM QoS Policy from the list and click on the Properties button. The ATM QoS Policy (Edit) form opens.

viii Click on the QoS tab.

ix Configure the VP Shaping Weight parameter.

x Click on the OK button. A dialog box appears.

xi Click on the Yes button. The ATM QoS Policy (Edit) form closes.

xii Click on the OK button. The Select ATM QoS Policy - ATM VP Shaper form closes.

xiii Click on the OK button. A dialog box appears.

xiv Click on the OK button. The ATM VP Shaper (Create) form closes.

xv Repeat steps iv to xiv to create additional ATM VP shapers, if required.

xvi Click on the OK button. A dialog box appears.

xvii Click on the Yes button. The ATM Configuration (Edit) form closes.

23 Click on the OK button. A dialog box appears.

If you are adding a new daughter card, the daughter card and the contained ports are displayed in the navigation tree.

24 Click on the Yes button. The Daughter Card Slot properties form closes.

Procedure 15-34 To configure IMPM on an MDA

Perform this procedure to configure IMPM on an MDA that is not installed in an XCM, 2 x XP MDA IOM 3 or an IMM.

Note — See Procedure 15-25 for information about configuring IMPM on an XCM, 2 × XP MDA IOM 3 or IMM.

1 Perform steps 1 to 8 of Procedure 15-33.

2 Configure the following parameters in the Daughter Card Details panel:

- High Bandwidth Source
- High Bandwidth Multicast Traffic Taps Group
- High Bandwidth Alarm

3 Click on the Select button in the BW policy panel to choose a multicast bandwidth policy. The Select BW Policy form opens.

4 Choose a policy in the list and click on the OK button. The Select BW Policy form closes and the policy name is displayed in the BW Policy panel.

Note — The multicast bandwidth policy named “default” cannot be modified or deleted.

5 Configure the following parameters in the Multicast Path Management panel:

- Administrative State
- Primary Path Limit (mbps)
- Secondary Path Limit (mbps)
- Ancillary Path Limit (mbps)

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Daughter Card Slot properties form closes.

Procedure 15-35 To view the operational multicast channel properties of an MDA

Perform this procedure to view specific information about an operational multicast channel on an MDA that is configured to use an Ingress Multicast Bandwidth policy.

Note — You can also view operational multicast channel information in the following locations:

- the Mcast Path Mgmt tab on the properties form of a VPLS or VPRN service site
- the Mcast Path Mgmt Channels tab on the properties form of a routing instance.

Each properties form contains information about the ingress MDA of each operational channel.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to view operational multicast channel properties on an MDA and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object.

4 Expand the Card Slot object. The Card Slot (Create) form opens with the General tab displayed.

5 Click on the daughter card slot object. The Daughter Card Slot (Edit) form opens with the General tab displayed.

6 Click on the Mcast Path Mgmt Channels tab.

7 Click on the Search button. A list of operational channels is displayed.

8 View the information, which includes the service site or routing instance associated with the channel, and the following properties:

Note — Channel information is displayed only when the MDA receives multicast traffic for a previously configured multicast group.

- Group Address—the operational channel multicast group address
- Source Address—the operational channel multicast source address
- Bandwidth—the operational bandwidth of the channel
- Administrative Bandwidth—the administrative bandwidth of the channel
- Last Highest Bandwidth—the value of the multicast bandwidth that is currently allocated to the channel forwarding path on the MDA. This value is calculated based on periodic statistics polls and represents the highest recorded bandwidth value since the most recent restart of the bandwidth update timer for the channel.
- Second Highest Bandwidth—the second-highest recorded bandwidth value for the channel since the most recent restart of the bandwidth update timer. The value is calculated based on periodic statistics polls and is reset to zero every time the bandwidth update timer for the channel is restarted.
- BW Update Timer expiration—the time that remains before the bandwidth update timer for the channel expires
- Current Path—the path that the channel traffic uses to reach the switching fabric; the path value is primary, secondary, or ancillary
- Explicit Path—indicates whether the current path is explicitly specified by a Multicast Info Policy
- Preference Level—the preference level of the channel
- Black-Hole—whether the channel is in the Black-Hole state
- Black-Hole Rate—specifies the bandwidth rate, in kb/s, at which the channel enters the Black-Hole state

9 Close the Daughter Card Slot (Edit) form.

Procedure 15-36 To configure a 7705 SAR module card

Perform this procedure to configure a module card on a 7705 SAR-M or 7705 SAR-ME.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7705 SAR-M/ME device on which you need to configure an MDA and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object and the Card Slot object.

4 Right-click on the third Daughter Card Slot object and choose Configure Daughter Card from the contextual menu. The Daughter Card Slot (Create) form opens with the General tab displayed.

Note — Only the third daughter card slot can be configured with module cards. The other two slots are configured with integrated cards that cannot be removed.

5 Configure the Assigned Daughter Card Type parameter.

6 Click on the Apply button. The Daughter Card Slot form refreshes.

7 Click on the Daughter Card tab.

8 Configure the parameters:

- Administrative State
- Fabric Stats

9 Add a fabric profile, if required:

i Click on the Select button in the Network Ingress Fabric Profile panel. The Select Fabric Profile form opens.

ii Choose a profile and click on the OK button. The Select Network Ingress Fabric Profile form closes and the profile name is displayed in the Network Ingress Fabric Profile panel.

iii Click on the Select button in the Access Ingress Fabric Profile panel. The Select Fabric Profile form opens.

iv Choose a profile and click on the OK button. The Select Access Ingress Fabric Profile form closes and the profile name is displayed in the Access Ingress Fabric Profile panel.

If you are configuring a 1 Colour Optical Add/Drop Mux card, go to step 25.

10 Click on the Ports tab.

11 Choose a port and click on the Properties button. The Physical Port (Edit) form opens with the General tab displayed.

Note — The first port on the DCM includes four SHDSL lines. The second port includes two XDSL lines.

12 Configure the parameters:

- Description
- Configured MAC
- Mode
- Encap Type
- Speed
- MTU (bytes)
- DDM Event Suppression
- Current OLC State

13 Click on the States tab.

14 Configure the Administrative State parameter. If you are configuring a DCM or DSL module, go to step 17.

15 Click on the GPON tab.

16 Configure the parameters and go to step 22:

- Subscriber Location ID (SLID)
- Subscriber Location ID (SLID) Format
- Dot1 Q Ethertype
- CFM LoopBack Mode
- Down When Looped
- Egress Rate (Kbps)
- Type
- Time (seconds)
- Keep Alive Interval (Sec)
- Retry Timeout (Sec)
- Use Broadcast Address

17 Click on the DSL tab.

18 Configure the parameters:

- Dot1 Q Ethertype
- CFM LoopBack Mode
- Adsl2Plus
- Down When Looped
- Egress Rate (Kbps)
- Type
- Time (seconds)
- Synchronous status messages
- SSM Code-Type
- Keep Alive Interval (Sec)
- Retry Timeout (Sec)
- Use Broadcast Address

19 Configure XDSL or SHDSL lines, if required.

i Click on the XDSL or SHDSL tab, as appropriate.

ii Choose an XDSL or SHDSL line and click on the Properties button. The XDSL Line (Edit) or SHDSL Line (Edit) form opens with the General tab displayed.

iii Configure the Administrative State parameter.

iv Click on the OK button. The XDSL Line (Edit) or SHDSL Line (Edit) form closes.

v Repeat steps i to iv to configure more lines, if required.

20 Click on the Ethernet tab.

21 Perform steps 7 to 11 of Procedure 32-42.

22 Click on the OK button. A dialog box appears.

23 Click on the Yes button. The Physical Port (Edit) form closes.

24 If you are configuring a DCM, repeat steps 11 to 23 to configure the second port.

25 Close the Daughter Card Slot (Edit) form.

15.10 Bundle configuration procedures

Use the following procedures to manage bundles using the navigation tree. You can configure bundles only on channelized MDAs.

Procedure 15-37 To create an FR group bundle

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you need to create an FR group bundle and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object.

4 Expand the card slot object on which the channelized daughter card resides, on which you want to create the bundle.

5 Expand the channelized daughter card slot object on which you need to create the bundle.

6 Right-click on the Bundles object and choose Create Bundle from the contextual menu. The Create Multilink Bundle form opens.

7 Configure the parameters:

- Bundle ID
- Auto-Assign ID
- Description
- Administrative State

8 Click on the Next button. The Configure Bundle Parameters form opens.

9 Set the Bundle Type parameter to FR.

Note 1 — To create a PPP group bundle, perform Procedure 15-41.

Note 2 — To create an IMA group bundle, perform Procedure 15-39

10 Configure the parameters:

- Fragment Threshold (bytes)
- Red Diff Delay (milliseconds)
- Red Diff Delay Action
- Minimum Links
- Yellow Diff Delay (milliseconds)

11 Click on the Next button. The Configure Bundle Members form opens.

12 Perform one of the following:

a To create the multilink bundle without adding any members, go to step 13.

b Add DS0 channel groups to the bundle by performing the following steps.

i Click on the Create button. The Add Bundle Member series of configuration steps appears.

ii Configure the Show Only Compatible Channels parameter.

iii Click on the Next button. The Select Channels form opens.

iv Choose up to 8 channel groups from the list of channels to construct the bundle.

Note — The channel group with the lowest Port ID is chosen as the primary member for the bundle. The Encap Type of the primary member is used for all other members. When adding members to a bundle at a later time, the Encap Type must be the same as the primary member to select it as a compatible member.

13 Click on the Finish button. The Configure Bundle Members form closes and the Create Multilink Bundle form reappears.

14 Click on the Finish button to close the Create Multilink Bundle form.

Procedure 15-38 To modify an FR group bundle

Perform the following procedure to modify FR group bundle parameters, add group members, and specify a test member for FR group bundle connectivity testing.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to modify an FR group bundle and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object.

4 Expand the card slot object on which the channelized daughter card resides, on which you want to modify the bundle.

5 Expand the channelized daughter card slot object on which you want to modify the bundle.

6 Expand the Bundles object and click on an FR group bundle object. The Multilink Bundle (Edit) form for the FR group bundle opens with the General tab displayed.

7 Configure the Description parameter.

8 Click on the Multilink Bundle tab.

9 Configure the parameters:

- Fragment Threshold (bytes)
- Red Diff Delay (milliseconds)
- Red Diff Delay Action
- Minimum Links
- Yellow Diff Delay (milliseconds)

10 Click on the States tab and configure the Administrative State parameter, if required.

11 Click on the MLFR tab.

12 Configure the parameters:

- Hello Timer
- Ack Timer
- Hello Retry Count

13 Click on the Select button beside the MCFR Ingress Qos Profile parameter. The Select MCFR Ingress Qos Profile - MultiClass Mlfr list form opens.

14 Choose a profile from the list and click on the OK button. The Select MCFR Ingress Qos Profile - MultiClass Mlfr list form closes and the Multilink Bundle (Edit) form is refreshed with the MCFR Ingress QoS Profile information.

15 Click on the Select button beside the MCFR Egress Qos Profile parameter. The Select MCFR Egress Qos Profile - MultiClass Mlfr list form opens.

16 Choose a profile from the list and click on the OK button. The Select MCFR Egress Qos Profile - MultiClass Mlfr list form closes and the Multilink Bundle (Edit) form is refreshed with the MCFR Egress QoS Profile information.

17 To add members to the FR group bundle, perform the following steps.

i Click on the Bundle Members tab.

ii Click on the Create button to add DS0 channel groups to the bundle. The Add Bundle Member series of configuration steps appears.

iii Perform step 12 b of Procedure 15-39.

Note — You can also add bundle members to the FR group bundle using the contextual menu in the navigation tree.

18 Click on the L2 Access Interfaces and L3 Access Interfaces tabs to view the interfaces that the bundle is assigned to.

19 Click on the Service Access Points tab to view SAP information.

20 Click on the Statistics tab to view statistical information.

21 Click on the Faults tab to view information about alarms.

22 Configure the FR interface, if required. Perform the following steps:

i Click on the Edit FR button. If the Edit FR button is not visible, click on the More Actions button and choose Edit FR. The FR Interface Bundle form opens with the General tab displayed.

ii Configure the parameters:

- LMI Type
- LMI Mode
- Error Threshold
- Monitored Events
- Polling Interval (seconds)
- Full Enquiry Interval

23 Click on the OK button. The FR Interface Bundle form closes.

24 Close the Multilink Bundle (Edit) form.

Procedure 15-39 To create an IMA group bundle

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to create an IMA group bundle and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object.

4 Expand the card slot object on which the channelized daughter card resides, on which you want to create the bundle.

5 Expand the channelized daughter card slot object on which you want to create the bundle.

6 Right-click on the Bundles object and choose Create Bundle from the contextual menu. The Create Multilink Bundle form opens.

7 Configure the parameters:

- Bundle ID
- Auto-Assign ID
- Description
- Administrative State

8 Click on the Next button. The Configure Bundle Parameters form opens.

9 Set the Bundle Type parameter to IMA.

Note 1 — To create a PPP group bundle, perform Procedure 15-41.

Note 2 — To create an FR group bundle, perform Procedure 15-37

10 Configure the parameters:

- Red Diff Delay (milliseconds)
- Minimum Links
- IMA Version
- ATM Interface Cell Format
- ATM Minimum VPI Value
- Test Pattern
- Link Activation Timer
- Link Deactivation Timer
- Maximum Links

11 Click on the Next button. The Configure Bundle Members form opens.

12 Perform one of the following:

a To create the multilink bundle without adding any members, go to step 13.

b Add DS0 channel groups to the bundle by performing the following steps.

i Click on the Create button. The Add Bundle Member series of configuration steps appears.

ii Click on the Next button. The Select Channels form opens.

iii Choose up to 8 channel groups from the list of channels to construct the bundle.

Note — The channel group with the lowest Port ID is chosen as the primary member for the bundle. The Encap Type of the primary member is used for all other members. When adding members to a bundle at a later time, the Encap Type must be the same as the primary member to select it as a compatible member.

13 Click on the Finish button. The Configure Bundle Members form closes and the Create Multilink Bundle form reappears.

14 Click on the Finish button to close the Create Multilink Bundle form.

Procedure 15-40 To modify an IMA group bundle

Perform the following procedure to modify IMA group bundle parameters, add group members, and specify a test member for IMA group bundle connectivity testing.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to modify an IMA group bundle and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object.

4 Expand the card slot object on which the channelized daughter card resides, on which you want to modify the bundle.

5 Expand the channelized daughter card slot object on which you want to modify the bundle.

6 Expand the Bundles object and click on an IMA group bundle object. The Multilink Bundle (Edit) form for the IMA group bundle opens with the General tab displayed.

7 Configure the Description parameter.

8 Click on the Multilink Bundle tab.

9 Configure the parameters:

- Red Diff Delay (milliseconds)
- Minimum Links
- IMA Version
- ATM Interface Cell Format
- ATM Minimum VPI Value
- Test Pattern
- Link Activation Timer
- Link Deactivation Timer
- Maximum Links

10 To specify the IMA member that is used to test link connectivity in the IMA group bundle, perform the following steps.

   i Click on the Select button beside the Test Member parameter. The Select Interface - Multilink Bundle form opens.

   ii Choose an interface from the list.

   iii Click on the OK button. The Select Interface - Multilink Bundle form closes and the Multilink Bundle (Edit) form refreshes with the test member information.

11 Click on the Test Pattern Start button to run the test. If the Test Pattern Start button is not visible, click on the More Actions button and choose Test Pattern Start. You can click on the Test Pattern Stop button at any time to stop the test. If there Test Pattern Stop button is not visible, click on the More Actions button and choose Test Pattern Stop. The Multilink Bundle (Edit) form refreshes with the link connectivity information.

12 Click on the States tab.

13 Configure the Administrative State parameter, if required.

14 To add members to the IMA group bundle, perform the following steps.

i Click on the Bundle Members tab.

ii Click on the Create button to add DS0 channel groups to the bundle. The Add Bundle Member series of configuration steps appears.

iii Perform step 12 b of Procedure 15-39.

Note — You can also add bundle members to the IMA group bundle using the contextual menu in the navigation tree.

15 Click on the L2 Access Interfaces and L3 Access Interfaces tabs to view the interfaces that the bundle is assigned to.

16 Click on the Service Access Points tab to view SAP information.

17 Click on the Statistics tab to view statistical information.

18 Click on the Faults tab to view information about alarms.

19 Close the Multilink Bundle (Edit) form.

Procedure 15-41 To create an MLPPP bundle

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the NE on which you want to create a MLPPP bundle and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object.

4 Expand the card slot object on which the channelized daughter card resides, on which you want to create the bundle.

5 Expand the channelized daughter card slot object on which you want to create the bundle.

6 Right-click on the Bundles object and choose Create Bundle from the contextual menu. The Create Multilink Bundle form opens.

7 Configure the parameters:

- Bundle ID
- Auto-Assign ID
- Description
- Administrative State

8 Click on the Next button. The Configure Bundle Parameters form opens.

9 Set the Bundle Type parameter to PPP.

Note 1 — To create an FR group bundle, perform Procedure 15-37

Note 2 — To create an IMA group bundle, perform Procedure 15-39.

Note 3 — If you create an MLPPP bundle and the DS1 BER exceeds a threshold, the PPP link is automatically removed from the MLPPP bundle.

10 Configure the parameters:

- Fragment Threshold (bytes)
- Red Diff Delay (milliseconds)
- Red Diff Delay Action
- Minimum Links
- Yellow Diff Delay (milliseconds)
- Bundle MRRU (bytes)
- Short Sequence
- Link Fragmentation and Interleaving

11 Click on the Next button. The Configure Bundle Members form opens.

Note — If you want to configure this MLPPP bundle for multiclass service transmission, you must not add any bundle members. Go to step 17. See Procedure 15-44 for information about how to configure the MLPPP bundle for multiclass service transmission.

12 Click on the Create button to add DS0 channel groups to the bundle. The Add Bundle Member series of configuration steps appears.

13 Configure the Show Only Compatible Channels parameter.

14 Click on the Next button. The Select Channels form opens.

15 Select compatible channels from the list to construct the bundle. Choose up to eight channel groups from the list of channels.

Note 1 — If there are no compatible channels to choose from and you have decided that you want to edit some of the existing channels that are not compatible to be compatible, click on the Back button and disable the Show Only Compatible Channels parameter. Click on the Next button. Choose channels to edit from the list and click on the Properties button.

Note 2 — The channel group with the lowest Port ID is chosen as the primary member for the bundle. The Encap Type of the primary member is used for all other members. When adding members to a bundle at a later time, the Encap Type must be the same as the primary member to select it as a compatible member.

16 Click on the Finish button. The Configure Bundle Members form closes and the Create Multilink Bundle form reappears.

17 Click on the Finish button.

18 Click on the Close button. The Create Multilink Bundle form closes.

Procedure 15-42 To modify an MLPPP bundle

Perform the following procedure to modify multilink PPP bundle parameters, add group members, and configure MC MLPPP to allow multiple classes of services to be transmitted over the bundle.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the NE on which you want to modify a multilink PPP bundle and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object.

4 Expand the card slot object on which the channelized daughter card resides, on which you want to modify the bundle.

5 Expand the channelized daughter card slot object on which you want to modify the bundle.

6 Expand the Bundles object and click on a multilink bundle object. The Multilink Bundle (Edit) form for the PPP bundle opens with the General tab displayed.

7 Configure the Description parameter.

8 Click on the Multilink Bundle tab.

9 Configure the parameters:

- Fragment Threshold (bytes)
- Red Diff Delay (milliseconds)
- Red Diff Delay Action
- Minimum Links
- Yellow Diff Delay (milliseconds)
- Bundle MRRU (bytes)
- Short Sequence
- Link Fragmentation and Interleaving

10 Click on the States tab.

11 Configure the Administrative State parameter, if required.

12 To add members to the multilink bundle, perform the following steps.

Note — If you want to configure this MLPPP bundle for multiclass service transmission, you must not add any bundle members. Go to step 17. See Procedure 15-44 for information about how to configure the MLPPP bundle for multiclass service transmission.

i Click on the Bundle Members tab.

ii Click on the Create button to add DS0 channel groups to the bundle. The Add Bundle Member series of configuration steps appears.

iii Perform steps 13 to 15 of Procedure 15-41.

iv Click on the Finish button. The Add Bundle Member series of configuration steps closes.

Note — You can also add bundle members to the multilink bundle using the contextual menu in the navigation tree.

13 Click on the L2 Access Interfaces and L3 Access Interfaces tabs to view the interfaces that the bundle is assigned to.

14 Click on the Service Access Points tab to view SAP information.

15 Click on the Statistics tab to view statistical information.

16 Click on the Faults tab to view information about alarms.

17 Close the Multilink Bundle (Edit) form.

Procedure 15-43 To configure an MLPPP bundle for multiclass service transmission

Note — Consider the following when you configure multiclass MLPPP.

- Multiclass MLPPP is supported only on channelized ASAP MDAs on the 7705 SAR, 7710 SR, and 7750 SR.
- You must configure multiclass MLPPP before you add bundle members to the multilink bundle.
- Multiclass MLPPP is not supported when the port is configured as network mode.
- Multiclass MLPPP is not supported when LFI is enabled.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the NE on which you want to modify a multilink PPP bundle and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object.

4 Expand the card slot object on which the channelized daughter card resides, on which you want to modify the bundle.

5 Expand the channelized daughter card slot object on which you want to modify the bundle.

6 Expand the Bundles object and click on a multilink bundle object. The Multilink Bundle (Edit) form for the PPP bundle opens with the General tab displayed.

7 Click on the MLPPP tab.

8 Configure the parameters:

- End Point ID
- End Point Class ID
- Class Count
- Magic Number

Note — The Magic Number parameter is configurable only on 7710 SR and 7750 SR channelized ASAP MDAs.

9 Click on the Select button in the MLPPP Ingress QoS Profile or MLPPP Egress QoS Profile panel to choose an MLPPP ingress or egress QoS profile. If a profile is already selected, click on the Clear button to clear the selection and enable the Select button. The Select MLPPP Ingress QoS Profile or Select MLPPP Egress QoS Profile form opens.

Note — You can only apply QoS profiles to an MLPPP bundle if the Class Count parameter is set to 4.

10 Select a profile and click on the OK button. The Select MLPPP Ingress QoS Profile or Select MLPPP Egress QoS Profile form closes.

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button.

13 Close the Multilink Bundle (Edit) form.

Procedure 15-44 To configure an MLPPP bundle as a network interface on a channelized ASAP MDA

1 Perform Procedure 15-41 to create a MLPPP bundle on a channelized ASAP MDA.

Note — Consider the following when configuring an MLPPP as a network interface.

- LFI is not supported on MLPPP network interfaces.
- MC MLPPP is not supported on MLPPP network interfaces.
- IPv6 network interfaces are not supported.
- Up to 8 network interface members can be added to a bundle.

2 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

3 Right-click on the device where you want to configure an MLPPP bundle and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 On the Network Element (Edit) form navigation tree, expand the Shelf object.

5 Expand the Bundles object and click on the bundle created in step 1. The Multilink Bundle (Edit) form opens with the General tab displayed.

6 Click on the Bundle Members tab.

7 Click on the Search button and choose a bundle member from the list. Click on the Properties button. The Bundle Member (Edit) form opens.

8 Click on the Port tab.

9 Click on the Properties button beside the port name. The DS0 Channel Group (Edit) form opens with the General tab displayed.

10 Set the Mode parameter to Network.

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The DS0 Channel Group (Edit) form closes.

13 Close the Bundle Member (Edit) form.

14 The Multilink Bundle (Edit) form refreshes with new tabs.

15 Click on the Network Interfaces tab.

16 Click on the Create button. The Create Network Interface - Routing Instance form opens.

17 Perform steps 4 to 43 of Procedure 22-9 to create a network interface on the DS0 channel.

The port in step 6 of Procedure 22-9 is set to the DS0 channel by default. Go to step 12 of Procedure 22-9.

18 The L3 interface appears on the Network Interfaces tab. Close the Multilink Bundle (Edit) form.

16 — Port and channel object configuration

16.1 Port and channel object configuration overview *16-2*

16.2 Working with port and channel objects *16-2*

16.3 SONET and SDH sub-channel applications and structure *16-18*

16.4 Workflow to manage port objects *16-25*

16.5 Workflow to manage channel objects *16-26*

16.6 Port configuration procedures *16-27*

16.7 Channel and framing link configuration procedures *16-72*

16.1 Port and channel object configuration overview

Port objects are children of daughter card slot objects. They appear below the daughter card slot after the daughter card is configured. Channel objects are children of port objects. They appear on the navigation tree below the port object after the channel is configured.

Properties forms for port objects and channel objects are accessed using the 5620 SAM navigation tree.

This chapter contains the procedures to configure devices using the navigation tree. See chapter 5 for more information about using the navigation tree.

16.2 Working with port and channel objects

The types of ports that are available depend on the daughter cards that are configured in the chassis. For some OmniSwitch devices, the ports that are available depend on the chassis type, for others the type of card that is configured for the card slot. Ethernet ports cannot be channelized. SONET/SDH and TDM ports can be channelized. The following types of ports are supported:

- Fast Ethernet (10/100/1000 Base-T)
- Gigabit Ethernet (1000Base-T)
- 10 Gigabit Ethernet (10000Base-T)
- 10 Gigabit Ethernet (10GBase-T)
- 40 Gigabit Ethernet (10GBase-T)
- Ethernet combo
- PoE
- OC-3/STM-1, OC-12/STM-4, OC-48/STM-16, and OC-192/STM-64 SONET/SDH
- channelized OC-3 and DS3/E3
- channelized ASAP OC-3/STM-1, OC-12/STM-4, DS1/E1, and DS3/E3

The port syntax for most devices that support daughter cards is card slot/daughtercard/port. For example, Port 1/1/1 represents port 1 of daughter card 1 in slot 1. The port syntax for the OmniSwitch is card slot/port. In every case, ports are created automatically when the daughter card is created. You must select one port object at a time and configure the properties of the port for the service that you need the port to provide. The properties vary depending on whether the port type is one of the Ethernet ports, SONET/SDH ports, TDM ports, or microwave ports. Channel objects are created on SONET/SDH or TDM ports for any type of channelization on the port whether it is a clear channel application or a sub-channel application.

Use the properties forms from the contextual menus in the navigation tree to configure port and channel parameters. You can configure the port mode as network, access, or hybrid.

- Network ports pass network-level traffic.
- Access ports are customer-facing and pass service-level traffic.
- Hybrid ports can pass network-level and access-level traffic.

Note 1 — By default, a port is in network mode.

Note 2 — See Procedure 16-2 to change the port mode.

Clear channel ports (OC-192/OC-48c/OC-12c/OC-3c) are network or access ports. Channelized ports (CHOC-12/CHOC-3c/ DS3/E3) are always in access mode, however, the ASAP CHOC-3 supports both access and network modes. The ASAP DS1/E1 ports support:

- access mode for ATM/IMA and TDM
- network mode for PPP/MLPPP

Network ports are used in the service provider transport or infrastructure network, such as an IP/MPLS-enabled backbone network or uplink ports for rings using L2 Ethernet switches. A port that is in network mode can be assigned an IP address and host an L3 interface that can perform IP routing functions.

Access ports are associated with a SAP, a subscriber, and a service to provide connectivity. Access ports and channels are configured with encapsulation values to differentiate the service on the port or channel. When a port is access mode, one or more services can be configured on the port. A channelized port that is to act as an endpoint must be in access mode. You can convert access ports to hybrid ports and migrate any existing SAPs. See Procedure 16-3 for more information.

Hybrid ports are ports that can host SAPs and network interfaces simultaneously. This enables a customer to use one uplink port for enterprise and end-user traffic. A hybrid port preserves the existing network and access port functionality, and uses the same QoS, scheduler, and port scheduler resources as other ports, but requires the configuration of weight values that allocate buffer percentages to the access and network traffic on the port.

The 5620 SAM supports hybrid mode configuration for Ethernet ports on the 7210 SAS-M (in Network mode), Release 6.0 R1or later, 7210 SAS-X, Release 6.0 R1 or later, 7450 ESS, 7750 SR-7, 7750 SR-12, and 7950 XRS.

Note — Single-slot chassis such as the 7450 ESS-1 and 7750 SR-1 do not support hybrid port mode.

You can configure a hybrid port on an Ethernet MDA in an IOM-3XP, or on a CMA in an IOM-XP. The 7750 SR supports hybrid port configuration on an IMM in addition to an IOM-3XP.

Note — Hybrid port configuration is not supported on an HSMDA or a VSM MDA.

A hybrid port supports dot1q and QinQ encapsulation, but does not support null encapsulation, in order to accommodate single-SAP operation. The available VLAN tags are shared among the VLAN SAPs and VLAN network IP interfaces. When you create a SAP or L3 interface on a hybrid port, the outer VLAN tag must not be in use by another SAP or L3 interface on the port.

By default, the MTU of a hybrid port is set to the larger of the network and access MTUs to accommodate the creation of L3 interfaces and SAPs.

Note 1 — A hybrid port can participate in a single-chassis LAG.

Note 2 — A hybrid port cannot participate in an MC-LAG or MC ring.

See the appropriate device documentation for more information about hybrid ports.

When working with a TDM port, you must specify the Line Buildout as either short or long. That is, for a DS3 port the Line Buildout parameter must be configured. If the TDM port is in the context of a SONET STS-1 sub-channel, for example, the DS3 channel is built on the STS-1 channel of a SONET port, the line buildout parameter is not required.

At the connection termination points, you are required to configure the Encap Type as required, the MTU size as required, and the configured MAC address as required when configuring the port or channel.

Policies can be added or deleted as required using the manage policy forms.

You can associate policies to ingress and egress access and network ports. Buffer policies are used to create and edit QoS buffer pool resources on network ports, access ports, and access channels. Egress network ports, access ports, and access channels have a dedicated buffer pool for queuing. The traffic is handled by a single buffer pool, one at the ingress, and one at the egress.

You can configure the amount of egress buffer space to be allocated to the port or channel. By default, all egress buffers are allocated fairly among the egress ports and channels based on their relative egress bandwidth.

The egress buffers for egress network ports and channels are put into per-port or per-channel egress buffer pools and are used by the egress network forwarding class queues on that port or channel. The ingress buffers allocated to network ports and channels are summed into a single pool and are used by the ingress network forwarding class queues (defined by the network ingress buffer policy).

The egress and ingress buffers allocated to access ports and channels are put into an egress buffer pool and ingress buffer pool for the port or channel. The access buffer pools are used by egress and ingress service queues created by the SAP-egress and SAP-ingress policies in use by services on the port or channel.

Changing the size of an egress buffer pool should be carefully planned. By default, there are no free buffers to increase the size of a pool. In order to increase a pool on one port or channel, the same amount of buffers must be freed from other egress buffer pools on the same daughter card.

Digital diagnostics monitoring

The 5620 SAM displays the following digital diagnostics monitoring data and alarm and warning information for ports on CFPs, QSFPs, SFPs and XFPs optical modular transceivers:

- temperature
- supply voltage (SFP)
- TX bias
- TX output power
- RX received optical power
- external calibration

The transceiver is programmed with warning and alarm thresholds for low and high conditions that can generate system events. The thresholds for CFPs, QSFPs, SFPs, and XFPs are programmed by the transceiver manufacturer. The 5620 SAM raises an alarm when these thresholds are exceeded.

You can view digital diagnostics monitoring information from the DDM tab and the Lane DDM tab on the property form of supported ports. The External Calibration tab is available if the ports on CFPs, QSFPs, SFPs, and XFPs optical modular transceivers support the external calibration functionality.

Tagged and untagged VLAN ports

The 5620 SAM supports tagged and untagged ports as VLAN access ports.

Table 16-1 describes the behavior when ingress tagged or untagged traffic enters and then exits a VLAN.

Table 16-1 Tagged and untagged traffic behavior

Ingress traffic configuration	Ingress VLAN port configuration	Action	Egress VLAN port configuration and action
Untagged	Untagged	The VLAN allows the traffic and passes it based on the default VLAN ID. The MAC address of the destination is learned.	If the egress VLAN port is untagged, the traffic remains untagged.
			If the egress VLAN port is tagged, a tag is added to the traffic.
	Tagged		If the egress VLAN port is untagged, the traffic remains untagged.
			If the egress VLAN port is tagged, a tag is added to the traffic.

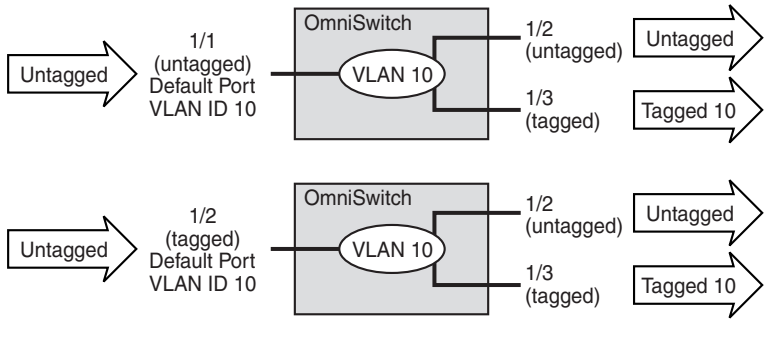
(1 of 2)

Ingress traffic configuration	Ingress VLAN port configuration	Action	Egress VLAN port configuration and action
Tagged	Untagged	The VLAN allows the traffic if the tag matches the default VLAN ID. The MAC address of the destination is learned. If the tag does not match the default VLAN ID, the traffic is dropped.	If the egress VLAN port is untagged, the tag of the traffic is removed. If the egress VLAN port is tagged, the traffic remains tagged.
	Tagged	The VLAN allows the traffic: • if the tag matches the default VLAN ID • if the tag matches another VLAN ID The MAC address of the destination is learned. If the tag does not meet either condition, the traffic is dropped.	If the egress VLAN port is untagged, the tag of the traffic is removed. If the egress VLAN port is tagged, the traffic remains tagged.

(2 of 2)

Figures 16-1 and 16-2 show how tagged and untagged traffic is handled on the devices, based on the VLAN ID.

Figure 16-1 Untagged traffic and VLANs



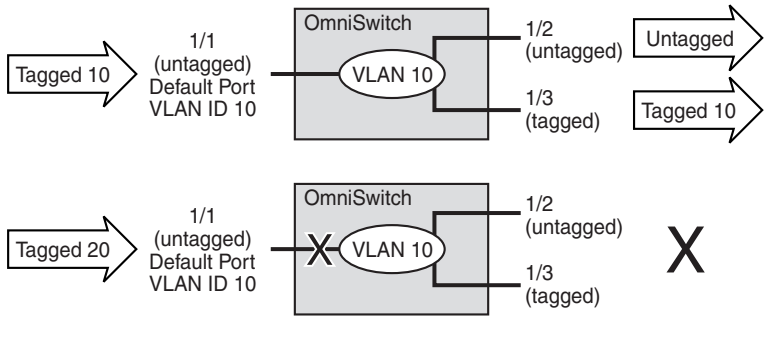


Figure 16-2 Tagged traffic and VLANs

Connection termination points for services and interfaces

Connection termination points are objects that represent terminating endpoints for a service, for example the endpoint of a VLL service. Connection termination points can be Layer 2 or Layer 3 interfaces, depending on the type of service being created. At the connection termination points you must configure the mode as Access or Network, the Encap Type as required, the MTU size as required, and the configured MAC address as required when configuring the port or channel. The following objects can be used for connection termination points:

- STS-3 to STS-192 clear channels
- DS3 clear channel
- DS0 groups
- ports
- bundle

STS-3 to STS-192 clear channel

STS-3 to STS-192 clear channel SONET/SDH ports can be used to create SAPs or IP interfaces with one clear channel on each port that operates at the rate of the parent object. Clear channel SONET applications can be performed on any OC-*n* card. SONET channel termination for 1 × 10-Gig MDAs are not supported. See "SONET clear channel applications" in this section for more information.

DS3 clear channel

A DS3 clear channel can be a connection termination point when it is explicitly configured as unchannelized, that is, when the Configuration Type is set to None, which is the default setting for a DS3. DS3 clear channel connections cannot be channelized to a lower level than the one full DS3 channel. See "TDM channelization and clear channel applications" in this section for more information.

DS0 channel groups

A TDM channel group connects a group of DS0s by allocating a specific number of spans or interfaces and channels to a group of channels. The DS0 channel group defines the incoming and outgoing parameters for a group of channels such as IP profiles, routing tables, and translation tables to be assigned during the configuration of the specific channel group.

To use a DS1 or E1, you must create at least one DS0 group for the DS1 or E1. The 5620 SAM supports the automatic configuration of sub-channels and assignment of timeslots on the ports within DS0 groups. Depending on the TDM port selected, the 5620 SAM automatically creates the DS0 channel groups with the appropriate type of timeslots. For example, you can assign timeslots to a DS0 channel group as follows:

- For DS1 channel types: Use four timeslots per channel group, which results in six DS0 channel groups with IDs from 1 to 6. Each contains four timeslots.
- For E1 channel types: Use five timeslots per channel group, which results in six DS0 channel groups with IDs from 1 to 6. Each contains five timeslots, with one timeslot not assigned.

You can view the channels that are assigned in DS0 groups using the associate properties form. You can also disable, enable, or reassign the assignment of timeslots as required, in a DS0 group.

See "TDM channelization and clear channel applications" in this section for more information about DS0 channel groups. See Procedure 16-26 for information about creating channels on ports for card types that support multiple sub-channels. See Procedure 16-31 for information about creating TDM DS1 or E1 channels and DS0 channel groups.

SONET STS-1 sub-channels

Only the DS0 group level can be used as a connection termination point for SONET STS-1 sub-channels. Channelization on the 1 × OC12 can be used to create up to 12 SONET STS-1 sub-channels. Each STS-1 channels can be used to create a DS3 frame on which you can build DS1 or E1 channels that can be configured to the DS0 channel group level. You can configure the DS0s of a DS0 group in any sequence and you do not need to use all DSOs. For example, you can use DS0 1, 3, 5, and 9. See "SONET VT1.5 and VT2 payloads" in this section for more information.

Only the DS0 group level can be used as an endpoint on the channelized 12 × DS3 card. Channelization can be used on each DS3 port of the card to create independent TDM channels in the form of DS1 or E1 data channels that handle DS0 groups. The DS0s of a DS0 group can be configured in any sequence and you do not need to use all DS0s. For example, you can use DS0 1, 3, 5, and 9. See "SONET and SDH sub-channel applications and structure" in this section for more information.

Ethernet ports

Ethernet ports can be configured as connection termination points in SAPs and IP interfaces. They cannot be channelized.

You must configure the class of port, such as fast Ethernet, GigE, or 10G Ethernet. You must also configure the port encapsulation at the connection termination point. Ethernet access ports use:

- dot1q—supports multiple services on the port; the outer encapsulation value that distinguishes services is the VLAN ID in the IEEE 802.1Q header
- QinQ—supports multiple services on the port/channel; the inner and outer encapsulation values that distinguish services is the VLAN ID in the IEEE 802.1Q header
- null—supports a single service on the port

You must configure the duplex parameter from the Ethernet tab if the port is to be added to a LAG. Configure the Dot1 Q Ethertype and Q in Q Ethertype parameters from the Ethernet tab, if required. The range is 1536 to 65 535.

You must also configure the speed parameter from the General tab. The options are 10, 100, 1000, or 10 000, depending on the speed of the Ethernet interface.

Most OmniSwitch chassis offer four hybrid or combo ports. These ports consist of four paired 10/100/1000Base-T ports and four 1000 SFP ports. Preferences for these ports are configurable and, depending on the configuration, redundancy can be provided if a link fails.

OmniSwitch learned port security

LPS provides a mechanism to control network device access on one or more OmniSwitch ports. Configurable LPS parameters allow you to restrict the source learning of host MAC addresses to:

- a specific amount of time in which the switch allows source learning to occur on all LPS ports
- a maximum number of learned MAC addresses allowed on the port
- a list of configured authorized source MAC addresses allowed on the port

The following options allow you to specify how the LPS port handles unauthorized traffic.

- Block only traffic that violates LPS port restrictions; authorized traffic is forwarded on the port.
- Disable the LPS port when unauthorized traffic is received; all traffic is stopped and a port reset is required to return the port to normal operation.

See Procedure 23-63 for information about enabling LPS on Ethernet ports and configuring LPS properties. See Procedure 16-23 for information about configuring static MAC addresses on LPS enabled Ethernet ports.

Note — A deployment error is displayed in 5620 SAM while creating a LAG with ports. This deployment failure occurs if there is an LPS/VLAN configuration done on a specific port, using CLI.

MTU size and port configuration

You must specify the MTU size for an Ethernet port using the MTU (bytes) parameter on the General tab at the connection termination endpoint.

Consider the following when you configure MTU parameters.

- The managed devices must handle MTU limitations at many service points. The physical (access and network) ports, service, and service tunnel MTU values must be individually defined.
- The ports to be designated as network ports and the ports to be designated as access ports intended to carry service traffic must be identified.
- MTU values should not be frequently modified.
- Service MTU values must be less than or equal to the service tunnel MTU.
- Service MTU values must be less than or equal to the access port MTU.
- The MTU value for an in-band management port should be less than or equal to the MTU value for the peer port connected to the in-band management port.

See the device specific documentation for end-to-end considerations for configuring maximum MTU size throughout the managed network.

The Ethernet port MTU parameter indirectly defines the largest physical packet that the port can transmit or that the far-end Ethernet port can receive. Packets received that are larger than the MTU are discarded. Packets that cannot be fragmented at egress and that exceed the MTU are discarded.

The parameters for MTU configuration include the destination MAC address, source MAC address, Ethernet encapsulation type, length field, and complete Ethernet payload.

The MTU value for a port is associated with the port mode, such as access or network, and the port encapsulation type. If you change the mode or encapsulation type value for a port, the 5620 SAM adjusts the MTU value to a default value. If you do not want the MTU values for ports to revert to the defaults, you can configure the 5620 SAM to retain the currently configured MTU values for ports regardless of a mode or encapsulation type change. See Procedure 16-4 for more information.

HSMDA Egress Secondary Shapers

The egress port scheduler combines all subscriber queues of the same scheduling class and services the queues in a byte fair round robin fashion. This results in more packets being forwarded into the aggregation network towards a DSLAM than the DSLAM can accept. If the HSMDA egress port is congested, the egress bandwidth represented by the downstream discarded packets to the DSLAM may be allocated packets destined to other DSLAMs.

The HSMDA supports egress secondary shapers to provide a control mechanism to prevent downstream overruns without affecting the class-based scheduling behavior on the port. All subscribers destined to the same DSLAM have their queue groups mapped to the same egress secondary shaper. As the scheduler services the queues within the groups according to scheduler class, the destination shaper is updated.

After the shapers rate threshold is exceeded, scheduling for all queues associated with the shaper is stopped. When the dynamic rate drops below the threshold, the queues are allowed to be placed back on the scheduler service lists. By removing the queues from their scheduling context for a downstream congested DSLAM, the port scheduler is allowed to fill the egress port with packets destined to other DSLAMs without affecting class behavior on the port.

Egress secondary shapers are configured per port.

PoE

The 5620 SAM supports Power over Ethernet on the following devices:

- 7210 SAS-T ETR; see Procedure 16-18
- 7705 SAR-H; see Procedure 16-19 and "PoE on the 7705 SAR-H"
- 7705 SAR-W; see Procedure 16-20
- OmniSwitch (except for the Metro version of the OS 6250); see Procedure 16-24

PoE provides power directly from the Ethernet ports. Powered devices such as IP phones, wireless LAN stations, Ethernet hubs, and other access points can be plugged directly into PoE-enabled Ethernet ports. The 5620 SAM supports PoE and PoE Plus on supporting devices.

PoE on the 7705 SAR-H

The 7705 SAR-H PoE functionality uses the main shelf power supply and an external power supply. The four 10/100/1000 copper ports on the main assembly have PoE capabilities. These ports are used to connect remote VoIP phones, CCTV cameras, and radios that require in-line power. Power is carried over data lines. You can configure internal or external PoE power.

Internal PoE

Two of the 10/100/1000 copper ports on the main assembly provide standard PoE (15.4 W) using the existing power supply to provide the PoE line power. Only ports 5 and 6 support PoE when the power mode is configured as internal. See Procedure 16-19 for more information.

External PoE

For an external PoE power supply, up to four PoE ports are supported. Standard PoE ports (15 W) and PoE Plus ports (34 W) can be combined to deliver up to 83 W of power. You can configure one of the following combinations:

- up to four PoE ports
- up to three PoE ports and one PoE Plus port. Only port 7 can be configured as PoE Plus.
- one PoE and up to two PoE Plus ports

Note — Ports 5 and 6, or ports 7 and 8 can only support one PoE Plus port per pair (for example, ports 5 and 6 cannot support two PoE Plus ports). Only ports 5 and 7 can be configured as PoE Plus.

See Procedure 16-19 for more information.

Moving and copying SAPs between ports

You can move and copy SAPs between physical Ethernet ports, logical ports, or a combination of both. You can also move and copy SAPs between endpoints configured with ATM encapsulation. For example, you can move a SAP on an IMA bundle to another bundle or to a TDM channel configured with ATM encapsulation. This functionality is typically used in redundancy scenarios, or to recover from a hardware failure.

Consider the following before you attempt to copy or move a SAP:

- Ports:
  - The source and destination ports can be on the same or different chassis. Inter-chassis copy or move is supported only when both NEs are of the same type, in the same chassis mode, and at the same major software release, for example, 10.0 R1 and 10.0 R3.
  - The source and destination ports can be the same. This configuration allows you to change the encapsulation values for a group of SAPs on the same port using outer and inner encapsulation offset values. These values can be positive or negative, depending on whether the encapsulation values must increase or decrease.
  - The physical Ethernet ports can be of different types; for example, Fast Ethernet (10/100/1000 Base-T), Gigabit Ethernet (1000 Base-T), and 10 Gigabit Ethernet (10 GBase-T).
  - The source and destination ports must be configured as access ports.
  - The encapsulation type must be the same on the source and destination ports.
  - You cannot copy or move a SAP between an HSMDA port and a non-HSMDA port.
- SAPs:
  - The SAPs can be associated with either L2 access interfaces on services such as Apipes, Epipes, Ipipes, VPLS, and MVPLS, or L3 access interfaces or subscriber interfaces that are associated with services such as IES and VPRN.
  - The copy and move operation does not copy and move MEPs that are configured on a VPLS, MVPLS and Epipe L2 access interface. MEP configuration is discarded during the copy and move operation.
  - For L2 and L3 access interfaces, you can move all SAPs or a subset of the SAPs on a port. You can also copy all SAPs or a subset of the SAPs on a port for L2 access interfaces.
  - All SAPs associated with a specific port within a group interface contained in an L3 subscriber interface can be moved at the same time.
  - The copy and move operations fail if the encapsulation value for a SAP on the source port is used by a SAP on the destination port. You can modify the SAP encapsulation values used on the destination port, if required.
  - The selected SAPs on the source port do not need to belong to the same service.
  - If a SAP on the source port belongs to a service not supported on the destination port, the SAP is not copied or moved.
  - The maximum number of SAPs varies for ports and MDAs. The SAP copy or move operation fails if the SAP capacity is exceeded for the destination port.
  - You cannot change SAP encapsulation from bridged to routed if ARP and DHCP options have been configured.
- SAP attributes:
  - VPLS and MVPLS dynamic FIB entries that are associated with copied or moved SAPs are discarded. Static FIB entries are transferred to the destination port after a successful SAP copy or move.
  - All SAP redundancy relationships at the source port, such as those provided by an MVPLS, are discarded during a copy or move operation.
  - All alarms, statistics, or OAM test results that are associated with a copied or moved SAP are discarded.

- When a source SAP belongs to an SHG, the 5620 SAM attempts to preserve the SHG membership. The destination SHG must have the same name as the source SHG, and must have the same residential SHG status. If an SHG with the same name does not exist on the destination service site, the 5620 SAM creates it.
- When a source SAP is uses an aggregation scheduler, the scheduler is copied to the destination. The aggregation scheduler must be unique to the destination NE and must have the same scope, for example, MDA or port.

See Procedures 16-5, 16-6, and 16-7 to move access interface SAPs between ports.

SONET/SDH and TDM port encapsulation

SONET/SDH and TDM ports can be configured as connection termination points in SAPs and IP interfaces. They can be channelized.

An access port is used for customer-facing traffic on which services are configured. SAPs can only use an access port. When a port is configured for access mode, the appropriate encapsulation type must be specified to distinguish the services on the port.

You must configure the Encap Type parameter from the General tab at the connection termination point. SONET/SDH or TDM ports or channels support the following encapsulation types, depending on the MDA type:

- BCP Null
- IPCP
- BCP Dot1 Q
- FR — Support multiple services using the DLCI header to distinguish services
- ATM — Support multiple services using the VCI or VPI of the PVC
- PPP Auto
- CEM

MTU size considerations apply to SONET/SDH and TDM channels. See "MTU size and port configuration" in section 16.2 for more information.

SONET clear channel applications

Ports on OC-*n* cards can be used for SONET clear channel applications. SONET or TDM clear channel applications allow you to create a full channel on a port which can be configured as access or network mode for SONET and access only for TDM. For example, when you create a 16 × OC3 SFP card, 16 ports are created. You can create one full channel on each of these ports. For more information about the 4-port OC3/STM1 ASAP SFP card for clear channel support on the 7705 SAR-8, see OC3/STM1 clear channel support on the 7705 SAR-8 and 7705 SAR-18 in this section.

STS-192/48/12/3 clear channel applications use the following syntax:

```
card slot/daughtercard/port.STSType
```

For example, the clear channel STS-12 on slot 4, MDA 1, port 1 is named 4/1/1.sts12

Table 16-2 lists available SONET channel applications and parameters for clear channel, sub-channel, and TDM applications.

Table 16-2 SONET channel parameters

Applications	Channel ranges								
	STS-192	STS-48	STS-3	STS-1	DS3	DS1	DS0	E1	DS0
SONET Clear channel	1	1	1		1				
SONET Sub channel			1 to 4	1 to 3	1	1 to 28	1 to 24	1 to 21	2 to 32
TDM					1	1 to 28	1 to 24	1 to 21	2 to 32

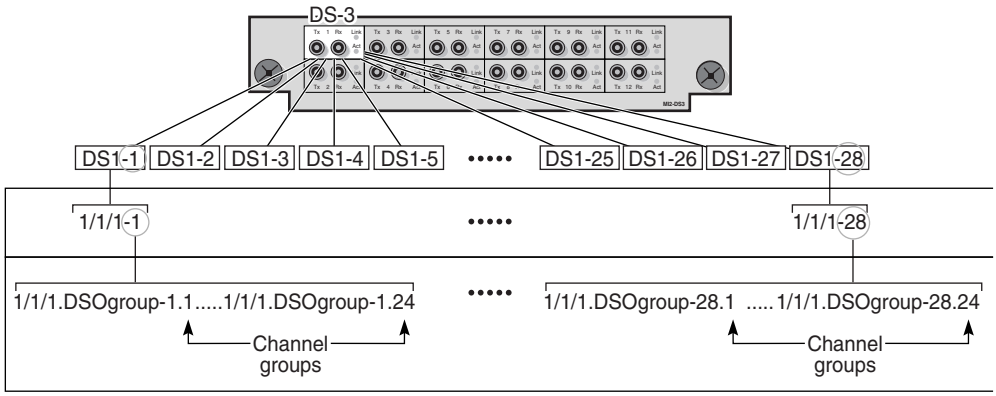
OC3/STM1 clear channel support on the 7705 SAR-8 and 7705 SAR-18

The 7705 SAR-8 and 7705 SAR-18 support the 4-port OC3/STM1 ASAP SFP card. The 4-port OC3/STM1 ASAP SFP card has four SFP-based ports that can be independently configured for ATM in access mode or for Packet over SONET/SDH (POS) in network mode. Each port can be independently configured to be SONET (OC3) or SDH (STM1) framing. See ATM encapsulation in this section for more information. The interface must be configured as UNI. The transmit clock rate for a port can be device- or loop-timed.

The section trace (J0) byte can be configured by the operator to check the physical cabling. The port can activate and deactivate local line and internal loopbacks. The MTU size for a 4-port OC3/STM1 ASAP SFP access port is fixed at 1572 for ATM encapsulation.

CSM activity switches for a 4-port OC3/STM1 ASAP SFP card on the 7705 SAR-8 and 7705 SAR-18 are hitless on the data path.

The 7705 SAR-8 and 7705 SAR-18 support the 2-port OC3/STM1 ASAP SFP card. The 2-port OC3/STM1 ASAP SFTP card has two SFP-based ports (optical or electrical) that can be configured for ATM/IMA or TDM in access mode or for MLPPP in access or network mode. The port type must be configured to be either SONET (OC3) or SDH (STM1).



Note — Channels on the 4-port OC3/STM1 ASAP SFP adapter card cannot be configured as IES SAPs.

TDM channelization and clear channel applications

When you create a 4 or 12 ×DS3/E3 card, 4 or 12 DS3/E3 ports are created. You can then create DS3/E3 channels using the 5620 SAM, one per port. Each DS3/E3 channel can be channelized into 28 independent DS1 or 21 independent E1 data channels or, in clear channel applications, the DS3 can be the connection termination point. For channelized DS3 connections, each DS1 channel can be channelized to 24 DS0 groups and each E1 channel can be channelized to 31 DS0 groups. To use a DS1 or E1, you must create at least one DS0 group for the DS1 or E1.

By default, DS3 ports are automatically created for clear channel connections. To create a channelized DS3, you must configure the DS3 channel type as E3 or DS3 on the port. To channelize the DS3 to the DS0 level, you must set the Channelization Type to Channelized DS1 or E1. Figure 16-3 shows the channelized DS3 port structure for DS1 channels.

Figure 16-3 Channelized 12 × DS3 port structure for DS1 Channels

The channelized DS3 port structure for E1 channels has the following parameter values:

- each DS3 port supports 21 E1 channels
- each E1 channel supports 31 DS0 channel groups

TDM-based DS3 channelization uses the following syntax:

DS3 channel configured for TDM:

```
card slot/daughtercard/port.DS3-
```

DS1 channel from a TDM-based DS3 channel:

```
slot/daughtercard/port.DS1-[DS3#].[DS1#]
```

E1 channel from a TDM-based DS3 channel:

```
slot/daughtercard/port.DS1-[DS3#].[E1#]
```

DS0 group channel from the DS1 channel:

```
slot/daughtercard/port.DS0Grp-[STS3#].[STS1#].[DS1#/E1#].[Group#]
```

Table 16-3 provides an example of the naming conventions for a 12 × DS3 port.

Table 16-3 Example of TDM channel naming convention

Syntax	Description	Additional information
Channel 1/1/1.ds3	1/1/1 is the slot number/daughtercard number/port number .ds3 identifies the channel as DS3	Because DS3s are unchannelized by default, you must configure the Channelization Type as Channelized.
Channel 1/1/1.ds1-1.2	.ds1 identifies the channel as DS1 1 is the DS3 number .2 is the DS1 number (1 to 28)	Identifies the DS1 channel and shows how the DS3 level acts as a place holder for the DS1s.
Channel 1/1/1.e1-1.2	.e1 identifies the channel as E1 1 is the DS3 number .2 is the E1 number (1 to 21)	Identifies the E1 channel and shows how the DS3 level acts as a place holder for the E1s.
Channel 1/1/1.ds0Grp-1.2.23	.ds0Grp- identifies the channel as a DS0 group 1 is the DS3 number .2 is the DS1 number (1 to 28) or E1 number (1 to 21) .23 identifies the DS0 channel group (1 to 24) on the DS1 or (2 to 32) on the E1	The DS0 group is configured on the DS1 or E1 channel. Only a DS0 can be used as a CTP.

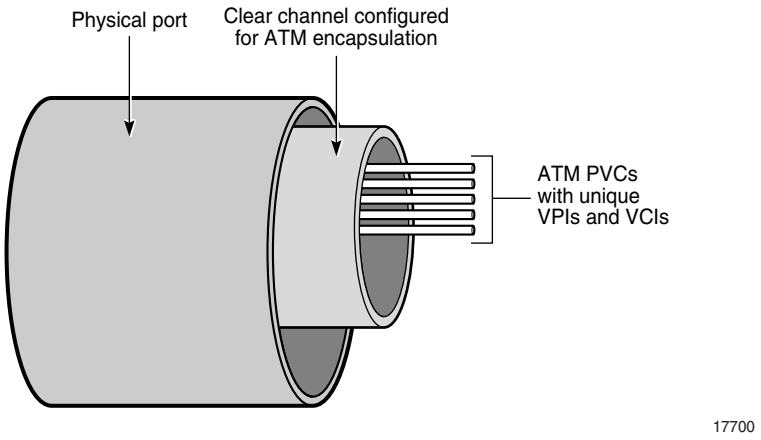
ATM encapsulation

SONET/SDH clear channels can be provisioned so that ATM cells are encapsulated in SONET/SDH frames. The entire SONET/SDH path of the port is then used to carry ATM cells. The channel of the port becomes the ATM interface. ATM encapsulation is supported on the following daughter cards:

- 16 × ATM OC3 SFP
- 16 × ATM OC3 SFP B
- 4 × ATM OC12/OC3 SFP
- 4 × ATM OC12/OC3 SFP B
- 4 × OC3/STM1 ASAP SFP
- 4 × Any Service Channelized OC3
- 16 × Any Service Channelized DS1/E1

SONET/SDH clear channel applications with ATM encapsulation use the following syntax:

```
Daughter Card Slot - 3 (16 × ATMOC3), OK



Port 3/1/1 - Speed: OC3, State: OK

Channel 3/1/1.sts3, Mode: Access, Encap: ATM, State: Ok
```

Customer devices with ATM interfaces are connected directly or using the ATM access network to a 7750 SR that offers IES or VPRN services.

A SONET/SDH clear channel with ATM encapsulation can carry multiple ATM PVCs. ATM PVCs cannot be created from the 5620 SAM. They are created automatically by the router when a new Layer 3 interface over ATM is created. Figure 16-4 shows an example of ATM PVCs on a SONET/SDH clear channel.

Figure 16-4 ATM PVCs on a SONET/SDH clear channel

ILMI links between ATM interfaces

ILMI links can be configured between ATM interfaces. ILMI is a protocol that sets and sends physical layer, ATM layer, virtual path, and virtual channel parameters that are exchanged by ATM interfaces.

When ILMI is run between two ATM interfaces, the interfaces exchange ILMI packets that consist of SNMP messages across the physical connection. An ILMI link allows ILMI to run on an available virtual channel. When an ILMI link is created to carry ILMI messages, a PVC is automatically created with default PVC attributes. The PVC is deleted when the ILMI link is removed.

IMA

IMA is supported on channelized ASAP MDAs on the 7750 SR, 7710 SR, 7705 SAR, and ATM DS1/E1 CMA on the 7710 SR. For 9500 MPR/9500 MPRe device IMA support, see the *5620 SAM MPR User Guide*.

IMA group bundles aggregate E1 or DS1 ATM paths into a single logical ATM interface. Each IMA group bundle can have from 1 to 8 members, or links. Up to 56 IMA group bundles can be configured on a single 7750 SR or 7710 SR MDA. Up to 8 IMA group bundles can be configured on a single 7705 SAR daughter card.

Each ATM Interface supports up to 48 VP/VC connection points. Each 16 × E1 ASAP Access (ETSI) board supports up to 128 VP/VC connection points.

An IMA group bundle has the following common interface properties:

- ATM encapsulation type is displayed on the ATM Interface properties form by clicking on the “Edit ATM button”.
- MTU value (of the primary link)

Member links inherit the common properties of the IMA group to which they belong. Only the properties of the primary link can be changed. The primary link is the member with the lowest interface index or initialization sequence. The primary link may change as member links are added and deleted from the IMA group.

Consider the following when you create a multilink IMA group bundle.

- When a path becomes a member of an IMA group bundle, it is no longer a physical ATM path interface.
- The members of the IMA group bundle inherit all of the properties of the primary link, such as the SONET configuration and MTU. If you modify the configuration of the primary link, the configuration of the bundle members is also modified.
- Member links that are added after the primary link has been added to the IMA group bundle must match the configuration of the primary link.
- You cannot configure services on a member link.

16.3 SONET and SDH sub-channel applications and structure

SONET sub-channel applications allow you to create multiple STS-1 channels on deep channelized OC-12 and OC-3 ports, and to configure multiple DS0 connection termination points.

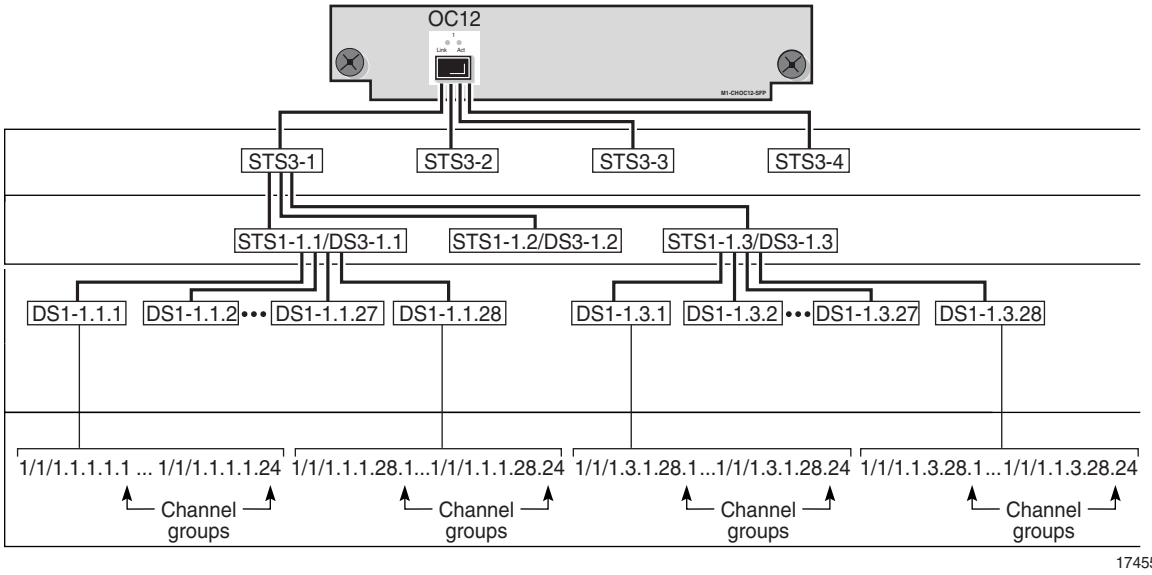
An STS-1 sub-channel is configured, or channelized, to carry one of the following payload types:

- DS3
- VT1.5
- VT2

Because of the differences between SONET and SDH in multiplexing and mapping of tributary payloads into higher digital levels, some building blocks of SDH have no SONET equivalent and therefore the containment hierarchy and terminology for SDH is different from SONET. See "Comparison of SONET and SDH hierarchies" and "SDH AU-4 and AU-3 sub-channel applications" in this section.

SONET DS3 payload

The following example, illustrated in Figure 16-5, shows the channelization sequence for a DS3 payload on a 1 × OC12 Deep Channel card.



1 One OC-12 port is created when you create a channelized 1 × OC12 Deep Channel card.

2 This port can be channelized into 12 SONET STS-1 sub-channels from the four STS-3s available on the port.

3 You can then configure each of these STS-1s to carry a DS3 frame

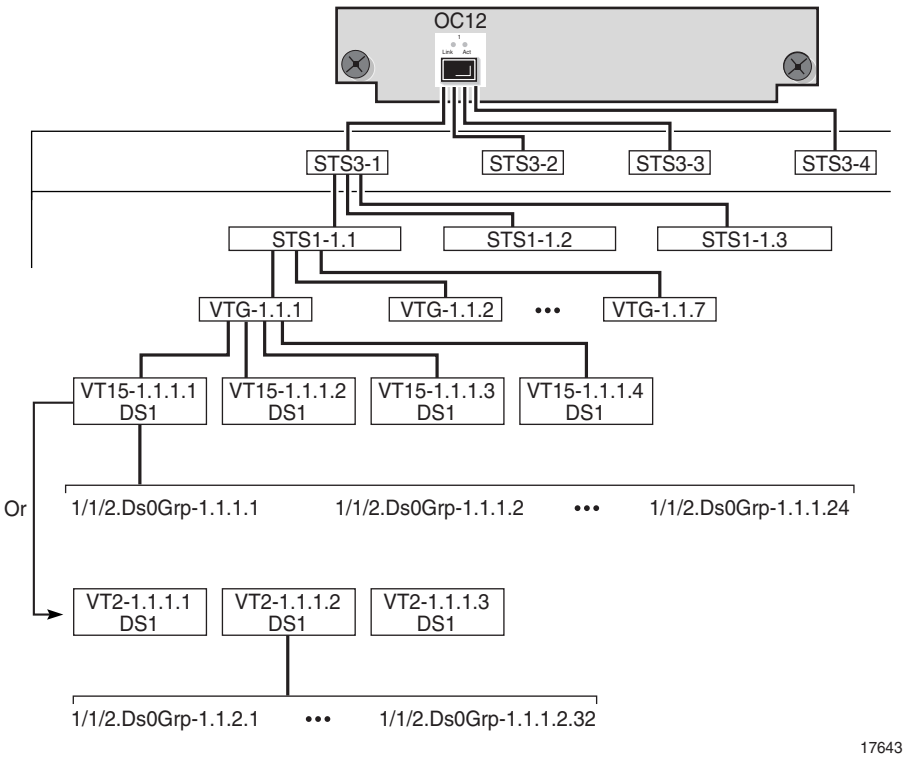
4 Each DS3 frame can be channelized into 28 independent DS1 data channels or 21 independent E1 data channels. Each channel must be created one at a time.

Figure 16-5 Channelized 1 × OC-12 port structure using STS-1/DS3 sub-channels

SONET VT1.5 and VT2 payloads

The following example, illustrated in Figure 16-6, shows the channelization sequence for a VT1.5 or VT2 payload on a 1 × OC12 Deep Channel card.

1 One OC-12 port is created when you create a channelized 1 × OC12 Deep Channel card.



2 This port can be channelized into 12 SONET STS-1 sub-channels from the four STS-3s available on the port.

3 You can then configure each of these STS-1s to be channelized to carry up to 28 DS1. For SONET sub-channel configuration you must select payload type VT1.5 or VT2. When you choose VT1.5 payload type, seven VTG are implicitly created.

4 Each VTG is channelized into four independent VT1.5 channels or three VT2 channels, each of which can carry an independent DS1 data channel. Each channel must be created one at a time.

5 Each VT1.5 DS1 channel can be configured to handle up to 24 DS0 groups. Each VT2 DS1 channel can be configured to handle up to 32 DS0 groups. To use a DS1, you must create at least one DS0 group for the DS1 or E1.

Figure 16-6 Channelized 4 × OC-3 port structure using VT sub-channels

SONET sub-channel syntax

The 5620 SAM uses the following SONET syntax for the STS-1 sub-channel:

```
card slot/daughtercard/port.STS1-[STS3#].[STS1#]
```

DS3 channels from an STS-1 sub-channel use the following syntax:

```
slot/daughtercard/port.DS3-[STS3#].[STS1#]
```

DS1 channels from a DS3 channel use the following syntax:

```
slot/daughtercard/port.DS1-[STS3#].[STS1#].[DS1#]
```

E1 channels from a DS3 channel use the following syntax:

```
slot/daughtercard/port.DS1-[STS3#].[STS1#].[E1#]
```

VT15 or VT2 from a VT group use the following syntax:

```
slot/daughtercard/port.VTG#-[STS3#].[STS1#]
```

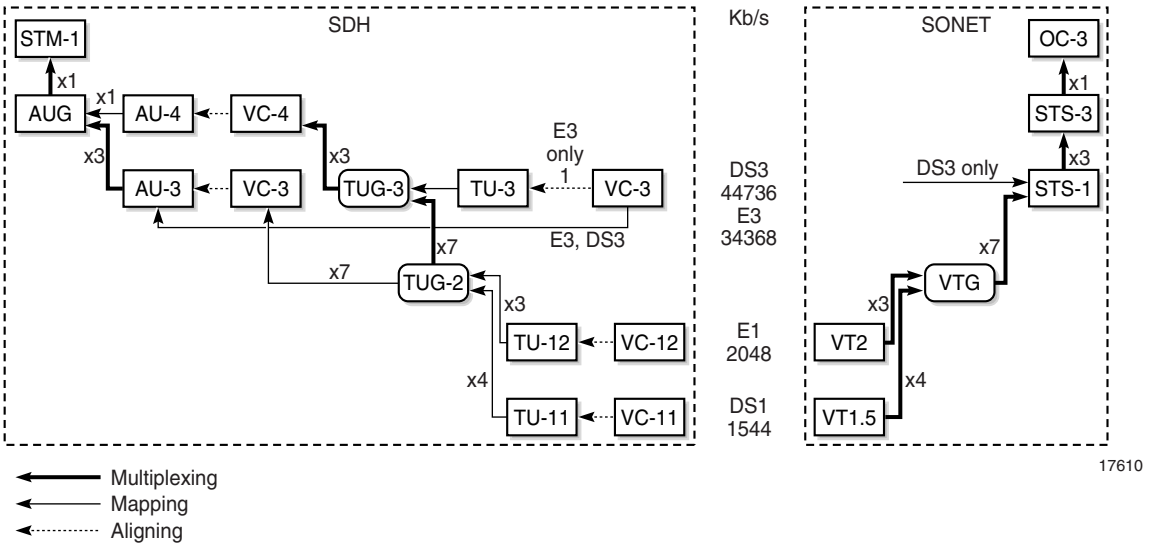
DS1 channels from a VT15 or VT2 use the following syntax:

```
slot/daughtercard/port.DS1-[STS3#].[STS1#].[VT15#] or
[VT2#}.[VTG#].[DS1#]
```

Table 16-4 shows an example of the SONET sub-channel syntax.

Table 16-4 Example of SONET sub-channel syntax for an OC-12 port

Syntax	Description	Additional information
Channel 1/1/1.sts1-2.2	1/1/1 is the slot number/daughtercard number/port number 2 is the STS-3 number (1 to 4) .2 is the STS-1 number (1 to 3)	The sts1 parameter is 2.2 which means that it is the fifth STS-1. There are four STS-3s for an OC-12 and each STS-3 has three STS-1s such that the fifth STS-1 is the second STS-1 of the second STS-3.
Channel 1/1/1.ds3-2.2	.ds3-2 is the STS3 number (1 to 4) .2 identifies the STS-1 number (1 to 3)	Identifies the DS3 channel and shows how the sts1 level acts as a place holder for the DS3
Channel 1/1/1.ds1 2.2.25	.ds1-2.2.25 identifies a DS1 channel (1 to 28) on the DS3	The DS1 is configured on the DS3.
Channel 1/1/1.e1 2.2.21	.e1-2.2.21 identifies a E1 channel (1 to 21) on the DS3	The E1 is configured on the DS3.
Channel 1/1/1.DS0Grp-2.2.20.5	.DS0Grp-2.2.20.5 identifies one of the DS0 channel groups: 1 to 28 for DS1; 2 to 32 for E1	The DS0 is configured on the DS1 or E1 channel.
Channel 1/1/1.ds1 2.2.3.18	ds1 2.2.3.18 identifies a DS1 channel on the VT15 or VT2 payload, where 3 is the VT group.	—



Comparison of SONET and SDH hierarchies

SONET and SDH are compatible digital hierarchies that support identical transmission rates with similar framing structures. However, SONET and SDH standards differ in the way they multiplex and map tributary payloads into higher digital levels. Because of these differences, some SDH framing blocks do not have equivalent blocks in SONET.

SONET provides one STS sub-channel, the STS-1, for mapping lower-capacity, deep-channel payloads while SDH provides two alternative sub-channels, the AU3 and the AU4. After an AU3 sub-channel is created, an AU4 cannot be created on that port in the case where the port is an OC-3 (STM-1). Conversely, if an AU4 sub-channel is created, an AU3 cannot be created on that port in the case where the port is an OC-3 (STM-1).

SONET and SDH transmission rates converge at 155.520 Mb/s where the SONET STS-3c is equivalent to the SDH STM-1 bit rate. For lower-capacity payloads, such as DS1, E1, DS3, and E3, SONET provides one unique mapping path for each payload while SDH permits two alternative paths for each payload as shown Figure 16-7.

Figure 16-7 Supported SONET/SDH multiplexing structures

SDH AU-4 and AU-3 sub-channel applications

SDH sub-channel applications allow you to create AU4 or AU3 channels on deep channelized OC-12 (STM-4) and OC-3 (STM-1) ports, and to configure multiple DS0 connection termination points.

After an AU4 sub-channel is created, it implicitly contains three TUG-3 groups. A TUG-3 is channelized to carry one of the following payload types:

- TU3
- TU11
- TU12

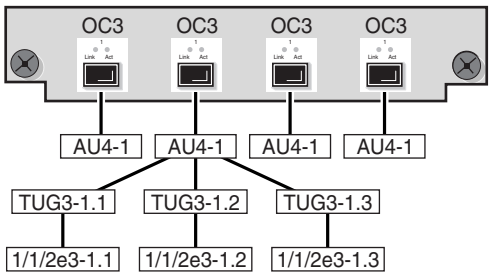
After an AU-3 sub-channel is created, it is channelized to carry one of the following payload types:

- DS3, E3
- TU11
- TU12

SDH TU3 payload

The following example, illustrated in Figure 16-8, shows the channelization sequence for a TU3 payload on a 4 × OC3 Deep Channel card.

1 Four OC-3 ports are created when you create a channelized 4 × OC3 Deep Channel card.



2 The user creates each required AU4 sub-channel.

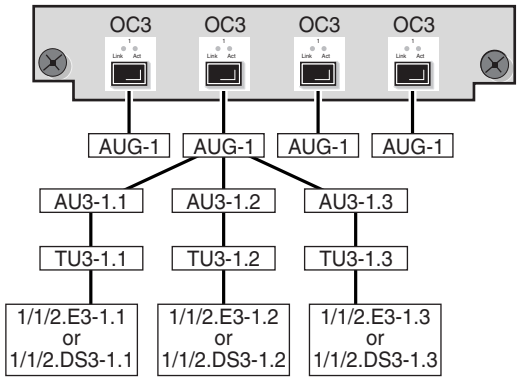
3 Each AU4 sub-channel implicitly contains three TUG3 groups.

4 You can then configure each TUG3 to carry a TU3 frame

5 Each TU3 frame is channelized into an independent E3 data channel and cannot be changed.

Figure 16-8 Channelized 4 × OC-3 port structure using AU4/TU3 sub-channels

SDH E3 or DS3 payload



The following example, illustrated in Figure 16-9, shows the channelization sequence for an E3 or DS3 payload on a 4 × OC3 Deep Channel card using AU3 sub-channels.

1 Four OC-3 ports are created when you create a channelized 4 × OC3 Deep Channel card.

2 Each port can be channelized into up to three AU3 sub-channel.

3 Each AU3 frame can be channelized into an independent E3 or DS3 data channel.

Figure 16-9 Channelized 4 × OC-3 port structure using AU3/E3 sub-channels

SDH TU11 and TU12 payloads

TU11 and TU12 payloads can be channelized using an AU4 sub-channel or an AU-3 sub-channel. An AU4 sub-channel implicitly contains three TUG3 groups. A TUG3 and an AU3 channelized to carry TU11 or TU12 payloads implicitly contain seven TUG2 tributary groups.

The following example, illustrated in Figure 16-10, shows the channelization sequence for a TU11or a TU12 payload on a 4 × OC3 Deep Channel card.

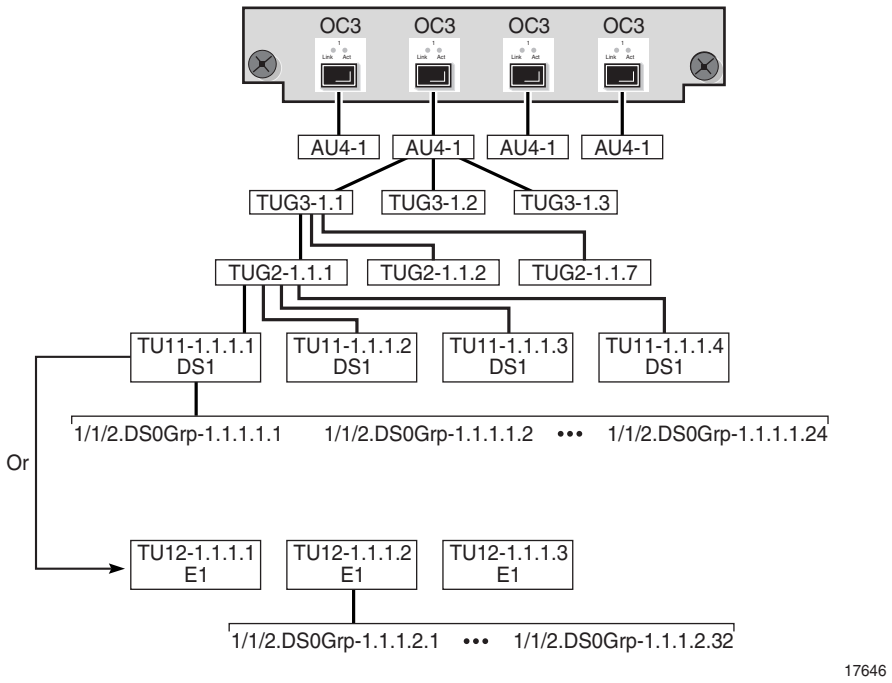
1 Four OC-3 ports are created when you create a channelized 4 × OC3 Deep Channel card.

2 Each port can be channelized into one AU4 sub-channel or three AU3 sub-channels.

3 Each AU4 sub-channel implicitly contains three TUG3 groups.

4 You can then configure each TUG3 group or each AU3 sub-channel to carry a TU11 or TU12 payload.

5 Each TUG3 group or AU3 sub-channel implicitly contains seven TUG2 tributary groups.



6 Each TUG2 group can be channelized into three independent TU12 channels or four independent TU11 channels.

7 Each TU12 can contain an E1 or DS1 data signal. Each TU11 can contain a DS1 data signal. Each E1 can be configured to handle up to 31 DS0 groups. Each DS1 can be configured to handle up to 24 DS0 groups. To use an E1 or a DS1, you must create at least one DS0 group for the DS1 or E1.

Note — On the same TUG3 or AU3, you cannot mix TU-1*X* with DS1 and E1 payload types. Every TU-1*X* on the same TUG3 or AU3 must use the same payload type, either E1 or DS1, not a mix of both. The mix is shown in for illustrating the structure.

Figure 16-10 Channelized 4 × OC-3 port structure using AU4/TU sub-channels

16.4 Workflow to manage port objects

The following workflow describes the sequence of high-level tasks required to manage and configure port objects. This workflow assumes that the physical devices have been installed, commissioned, and discovered. See chapter 9 for more information about device commissioning. See chapter 10 for more information about device discovery.

Note — After they are configured, port objects can be accessed using the equipment navigation tree. See chapter 5 for more information about using the equipment navigation tree. for more information.

1 As required, configure Ethernet ports; see Procedure 16-1.

2 As required, change the port mode; see Procedure 16-2.

3 As required, migrate SAPs from access mode to hybrid mode; see Procedure 16-3.

4 As required, configure the 5620 SAM to retain non-default port MTU values; see Procedure 16-4.

5 As required, copy or move L2 access interface SAPs between ports; see Procedure 16-5.

6 As required, move L3 access interface SAPs within or between ports on the same NE; see Procedure 16-6.

7 As required, move L3 subscriber interface SAPs between ports on the same NE; see Procedure 16-7.

8 As required, add a queue group to an Ethernet port; see Procedure 16-8.

9 As required, configure SONET ports; see Procedure 16-9.

10 As required, configure an HSMDA port scheduler override; see Procedure 16-10.

11 As required, configure TDM DS3 ports; see Procedure 16-11.

12 As required, configure serial ports; see Procedure 16-12.

13 As required, configure PW ports; see Procedure 16-13.

14 As required, configure ports on 7210 SAS devices, as follows:

- **a** Configure a 7210 SAS-M channelized TDM DS1 or E1 port; see Procedure 16-14.
- **b** Assign policies to a 7210 SAS Ethernet port; see Procedure 16-15.
- **c** Configure an SHG for 7210 SAS NEs; see Procedure 16-16.

15 As required, configure ports on 7705 SAR devices, as follows:

- **a** virtual Ethernet ports on a 7705 SAR 2-port ring MDA; see Procedure 16-17.
- **b** PoE ports on a 7705 SAR-H daughter card; see Procedure 16-19.
- **c** PoE ports on a 7705 SAR-W daughter card; see Procedure 16-20.
- **d** 7705 SAR ASAP channelized TDM port; see Procedure 16-21.

16 As required, configure a 7710 SR channelized TDM DS1 or E1 port; see Procedure 16-22.

17 As required, configure the following on OmniSwitch devices:

- **a** OmniSwitch Ethernet ports; see Procedure 16-23.
- **b** OmniSwitch PoE ports; see Procedure 16-24.

16.5 Workflow to manage channel objects

The following workflow describes the sequence of high-level tasks required to manage and configure channel objects. This workflow assumes that the physical devices have been installed, commissioned, and discovered, and that the port objects have been configured. See chapter 9 for more information about device commissioning. See chapter 10 for more information about device discovery.

Note — After they are configured, channel objects can be accessed using the equipment navigation tree. See chapter 5 for more information about using the equipment navigation tree.

1 As required, configure SONET clear channels; see Procedure 16-25.

2 As required, create channels on ports for card types that support multiple sub-channels; see Procedure 16-26.

3 As required, configure SONET sub-channels; see Procedure 16-27.

4 As required, configure SDH sub-channels; see Procedure 16-28.

5 As required, create VT15 (TU11) or VT2 (TU12) sub-channels; see Procedure 16-29.

6 As required, create TDM DS1 channels; see Procedure 16-32.

7 As required, configure TDM DS1 or E1 channels; see Procedure 16-31.

8 As required, configure serial channels; see Procedure 16-32.

9 As required, create TDM DS3 channels; see Procedure 16-33.

10 As required, configure TDM DS3 channels; see Procedure 16-34.

11 As required, configure a DS3 or E3 channel as a network interface on a channelized ASAP MDA; see Procedure 16-35.

12 As required, configure an L3 interface on a DS3 or E3 channel on a channelized ASAP MDA; see Procedure 16-36.

13 As required, configure a PVC; see Procedure 16-37.

14 As required, create an ILMI link; see Procedure 16-38.

15 As required, modify an ILMI link; see Procedure 16-39.

16.6 Port configuration procedures

Use the following procedures to manage ports using the navigation tree.

Procedure 16-1 To configure Ethernet ports

Perform this procedure, as required, depending on the daughter card and port type that you are configuring. Different card types display different port configuration parameters.

Note — Before you can configure 802.1X on an Ethernet access port, 802.1X must be enabled on the device and an 802.1X policy must be created and distributed to the device.

See Procedure 13-8 for information about enabling 802.1X on a device. See chapter 50 for information about creating and distributing 802.1X policies.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the port object where you want to configure an Ethernet port. The path is Network→*NE*→Shelf→Card Slot *n*→Daughter Card Slot *n*→Port *n*/*n*/*n*.

3 Right-click on the Port icon and choose Properties. The Physical Port (Edit) form opens with the General tab displayed.

4 Configure the parameters:

Note — Only the parameters that are supported on the NE, daughter card, or port are displayed.

- Description
- Configured MAC
- Mode
- L2Uplink
- Encapsulation Type
- Speed
- MTU (bytes)
- DDM Event Suppression
- Load Balance Algorithm
- Hold Time Up (seconds)
- Hold Time Down (seconds)
- Ingress Percentage of Rate (%)
- Egress Percentage of Rate (%)
- Default VLAN
- Channel
- Rx Decision Threshold Voltage Adjustment
- Optical Transport Channel Unit
- Current OLC State
- Revert OLC State

Only one MAC address can be assigned to a port. When a new MAC address is configured while the port is operational, IP issues an ARP, if appropriate, and BPDUs are sent with the new MAC address. A default MAC address is assigned by the system.

If the port is a LAG member, the Hold Time Up (seconds) parameter is configurable only if the port is the primary member. The Hold Time Down (seconds) parameter is not configurable when the port is a LAG member.

The DDM Event Suppression parameter is configurable only on ports on SFPs and XFPs optical modular transceivers.

When you set the Mode parameter to Hybrid, you cannot set the Encapsulation Type parameter to Null.

The MTU value for a port is associated with the port mode and the port encapsulation type. By default, the MTU of a hybrid port is set to the larger of the network and access MTUs.

5 If you set the Mode parameter to Hybrid, configure the following parameters in the Hybrid Ingress Buffer Allocation panel. Otherwise, go to step 8:

- Access Weight
- Network Weight

6 If you set the Mode parameter to Hybrid, configure the following parameters in the Hybrid Egress Buffer Allocation panel:

- Access Weight
- Network Weight

7 If you change the Mode parameter from Access to Hybrid and there are SAPs on the port, perform Procedure 16-3 to migrate the SAPs.

8 If you are configuring a 7210 SAS Ethernet port you can add the port to an SHG. See Procedure 16-16 for information about creating a 7210 SAS SHG.

i Click on the Select button in the Split Horizon Group panel. The Select Split Horizon Group - Physical Port list form opens.

ii Choose an SHG and click on the OK button. The Select Split Horizon Group - Physical Port list form closes, and the Physical Port (Edit) form refreshes with the SHG name.

Note 1 — A port cannot be added to or deleted from an SHG if it has a SAP configured on it or is a member of a LAG.

Note 2 — A port cannot belong to more than one SHG; you must remove any SHGs from the port before you can add the port to a different SHG.

9 Configure the Named Pool Buffer Policy for the port.

i Click on the Select button beside the Name parameter in the Ingress Pool Policy panel. A Select Ingress Pool Policy form opens with a list of ingress pool policies.

ii Choose a policy from the list.

iii Click on the OK button, the Select Ingress Pool Policy form closes and the Name parameter refreshes with the selected policy.

iv Click on the Select button beside the Name parameter in the Egress Pool Policy panel. A Select Egress Pool Policy form opens with a list of egress pool policies.

v Choose a policy from the list.

vi Click on the OK button, the Select Egress Pool Policy form closes and the Name parameter refreshes with the selected policy.

vii Configure the parameters:

- Egress Percentage of Rate (%)
- Ingress Percentage of Rate (%)

Note — Ensure that the named pool mode is enabled. See Procedure 15-28 in chapter 15 for more information.

10 Click on the States tab.

11 Configure the Administrative State parameter.

12 Click on the Policies tab. The Policies form opens with the General tab displayed.

Note — The types of policies that you can choose depend on the type of NE, daughter card, and the mode type of the port you are configuring.

- The Network Queue and Accounting Policies panel are only displayed for network and hybrid ports.
- The Port Scheduler panel is only displayed for ports on non-HSMDA daughter cards.
- The HSMDA Egress Scheduler panel is only displayed for ports on HSMDA daughter cards.

13 Click on the Select button in the Accounting Policy panel to assign an accounting policy to the port, if applicable. The Select Accounting Policy - Physical Port form opens.

14 Choose an accounting policy from the list and click on the OK button. The Select Accounting Policy - Physical Port form closes.

15 Configure the Collect Accounting Statistics parameter, if required.

16 If you are configuring an access port on a 7210 SAS-E for the collection of packet forwarding statistics on egress queues, configure the parameters in the Egress Packets Forwarding panel:

- Queue 1
- Queue 2
- Queue 3
- Queue 4
- Queue 5
- Queue 6
- Queue 7
- Queue 8

For the 7210 SAS-E, access ports always contain eight queues. You can enable up to eight queues on any port for the collection of packet forwarding statistics. However, only eight counters can be enabled for each 7210 SAS-E device. If no queues are enabled on a port, no accounting statistics are collected for that port.

17 If you are configuring a 7210 SAS Ethernet port, perform Procedure 16-15, then go to step 24.

18 Click on the Select button in the Network Queue panel to assign a network queue policy to the port, if applicable. The Select Network Queue Policy - Physical Port form opens.

19 Choose a network queue policy from the list and click on the OK button. The Select Network Queue Policy - Physical Port form closes.

20 Click on the Select button in the Port Scheduler Policy panel to assign a port scheduler policy to the port, if applicable. The Select Port Scheduler Policy - Physical Port form opens.

21 Choose a port scheduler policy from the list and click on the OK button. The Select Port Scheduler Policy - Physical Port form closes.

22 Click on the Select button in the HSMDA Egress Scheduler Policy panel to assign a scheduler policy to the port, if applicable. The Select HSMDA Egress Scheduler Policy - Physical Port form opens.

23 Choose a policy from the list and click on the OK button. The Select HSMDA Egress Scheduler Policy - Physical Port form closes.

24 Click on the DDM tab to view digital diagnostics monitoring information, if required.

25 Click on the Media Adaptor tab to view information about the SFP, if required.

26 Click on the Ethernet tab. The Ethernet port configuration form opens with the General tab displayed.

27 Configure the parameters:

Note — Only the parameters that are supported on the NE, daughter card, or port are displayed.

- Duplex
- Auto-negotiate
- Dot1 Q Ethertype
- QinQ Ethertype
- Down When Looped
- Keep Alive Interval (Sec)
- Retry Timeout (Sec)
- Use Broadcast Address
- Ingress Rate (Mbps)
- Egress Scheduler Mode
- CFM LoopBack Mode
- CFM LoopBack VLAN Range
- Connector Type
- Timestamp Capable
- Egress Rate (Kbps)
- Egress Unshaped SAP CIR (kbps)
- Egress Max-Burst
- Ingress CBS
- LACP Tunnel
- Src Pause
- Flow
- Down On Internal MAC Tx Error
- IP MTU (bytes)
- Port Clock Mode
- XGig Mode
- Forward All Multicast Traffic
- Forbid IGMP Snooping
- Backpressure
- Broadcast Limit (Pkts/s)
- Detect Remote Faults
- Detection
- Single Fiber
- Minimum Frame Length
- Synchronous status messages
- SSM Code-Type
- Tx DUS/DNU
- Type
- Time (seconds)
- Swap MAC Address
- Source MAC Address
- Destination MAC Address
- PBB Ethertype
- Window Size

Note 1 — Management connectivity between the 5620 SAM and the 7705 SAR may be lost if a line loopback is applied to an Ethernet port that is carrying in-band management traffic. The line loopback remains in effect until the timer expires and the 7705 SAR removes the loopback.

Note 2 — Statistics are collected for IEEE 1588 PTP timestamps only when the Timestamp Capable parameter is enabled on the 7705 SAR-A and 7705 SAR-W. See “Statistics collection overview” and “Viewing statistics” in the *5620 SAM Statistics Management Guide* for more information about how to collect and view statistics.

28 To configure CRC threshold parameters, perform the following steps:

i Remove the check mark from the Disable check box and configure the CRC SD Threshold and CRC SD Threshold Multiplier parameters.

ii Remove the check mark from the Disable check box and configure the CRC SF Threshold and CRC SF Threshold Multiplier parameters.

iii Configure the Window Size (seconds) parameter.

29 If you are configuring an Ethernet port on a 7210 SAS-X, Release 4.0 R1 or later, a 7210 SAS-D or 7210 SAS-M, Release 4.0 R3 or later, or a 7210 SAS-T, the SAP panel is displayed. Perform the following:

i Click on the Select button in the SAP panel. The Select SAP form opens.

ii If required, configure the filter criteria, and click on the Search button.

iii Choose a SAP and click on the OK button. The Select SAP form closes.

30 If you are configuring an Ethernet port on a Release 6.0 R1 or later 2-port ring MDA on a 7705 SAR-8 or 7705 SAR-18, the Vlan Filter panel is displayed.

i Click on the Select button in the Vlan Filter panel. The Select Vlan Filter - Ethernet Port form opens.

ii If required, configure the filter criteria, and click on the Search button.

iii Choose a Vlan Filter and click on the OK button. The Select Vlan Filter - Ethernet Port form closes.

31 If the port is an access or hybrid port with QinQ or dot1q encapsulation, or a network port with dot1q encapsulation, the MEPs tab is displayed. Click on the MEPs tab to add a facility MEP, if required:

Note — Only one facility MEP can be configured on a port.

i Click on the Create button. The MEP (Create) form opens on the General tab.

ii Click on the Select button to choose a global MEG. The Select Maintenance Entity Group form opens.

iii Choose an entry and click on the OK button. The Select Maintenance Entity Group form closes.

Note — For port-based facility MEPs, the Maintenance Domain must be set for a Level of 0 or 1. See Procedure 78-1 for information on creating the MD.

iv Configure the parameters:

Note — Only the parameters that are supported on the NE, daughter card, or port are displayed.

- Auto-Assign ID
- Description
- CCM Messages Enabled
- Priority Level for CCM Messages
- CCM TLV Ignore
- Low-priority Defect
- MAC Address
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)
- CCM Padding Packet Size (Bytes)
- Facility Fault Notify

Note 1 — To enable fault propagation on a LAG facility MEP or on a tunnel facility MEP, the Facility Fault Notify parameter must be enabled.

Note 2 — To link the facility tunnel status to the SAP, the Facility VLAN ID parameter must match the outer encapsulation value of the SAP.

Note 3 — The CCM Padding Packet Size (Bytes) parameter cannot be configured when the CCM interval parameter is set to 10 ms or 100 ms.

v If the MD for the MEP has a Name Type of none the Y.1731 Tests tab is configurable; click on the Y.1731 Tests tab. Otherwise, go to step vii.

vi Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

vii Click on the OK button. A dialog box appears.

viii Click on the OK button. The MEP (Create) form closes.

32 Click on the 802.3ah tab to configure and initiate the 802.3ah EFM OAM diagnostic as described in Procedure 32-42. Otherwise, continue to step 33.

33 Click on the 802.1x Port tab, if required.

34 Configure the parameters:

Note — Only the parameters that are supported on the NE, daughter card, or port are displayed.

- Initialize
- Reauthenticate Control

35 Click on the 802.1x Port Authenticator tab, if required.

36 Configure the parameters:

Note — Only the parameters that are supported on the NE, daughter card, or port are displayed.

- Controlled Port Control
- Quiet Period
- Tx Period
- Supplicant Timeout
- Server Timeout
- Max Req
- Reauth Period
- Reauth Enabled
- Tunneling

You can enable the Tunneling parameter only when:

- the port is in access mode
- the Controlled Port Control parameter is set to Force Authorized
- the port is not used as a SAP (except in an Epipe service)

37 Click on the Select button to choose a RADIUS server policy. The Select Policy - Physical Port form opens.

38 Choose a RADIUS server policy in the list and click on the OK button. The Select Policy - Physical Port form closes and the Physical Port (Edit) form displays the RADIUS policy name.

39 Go to Procedure 16-8 to add a queue group to the port.

40 If the port is an HSMDA access port, the Egress Secondary Shapers tab is present. Click on the Egress Secondary Shapers tab to add an egress secondary shaper to the port, if required, and perform the following steps.

Note 1 — An HSMDA port is initially created with a default egress secondary shaper. The default shaper cannot be deleted, but it can be modified.

Note 2 — Non-default egress secondary shapers can only be created if the port's Mode parameter is not set to the network option.

Note 3 — You cannot switch the Mode of an HSMDA port to network if there are non-default egress secondary shapers on that port. An error message will be issued. You must delete any non-default egress secondary shapers from the port before switching its Mode to network.

i Click on the Create button. The HSMDA Egress Secondary Shaper (Create) form opens, with the General tab displayed.

ii Configure the parameters:

- Name
- Low Burst Max Class
- Rate (Mbps)
- Monitor Threshold (Kbytes)
- Low Burst Limit
- High Burst Increase

  The Rate (Mbps) parameter can only be configured if the associated MAX check box is not enabled.

iii Click on the Classes tab.

iv Configure the Class Rate (kbps), Class Monitor Threshold (Kbytes) and Class Burst Threshold (bytes) parameters for Classes 1 through 8, as required.

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The new entry appears in the list.

41 Click on the LLDP tab, if required. The LLDP configuration form opens with the Nearest Bridge sub-tab displayed.

42 Configure the parameters:

- Administrative Status
- Notifications
- Transmit Management Address
- LLDP TLVs
- Tunneling

43 Repeat step 42 for the Nearest Non TPMR and Nearest Customer sub-tabs under the LLDP tab, as required.

44 Click on the Remote Peers sub-tab under the LLDP tab to search for and display LLDP remote peers associated with the port. These remote peers are used to determine the physical topology of the network.

45 Click on the Qos Pool tab, if required.

46 Choose a QoS pool from the list and click on the Properties button. The QoS Pool (Edit) form opens.

47 Click on the Select button in the Slope Policy panel. The Select Slope Policy - QoS Pool form opens.

48 Choose a slope policy in the list and click on the OK button. The Select Slope Policy- QoS Pool form closes and the QoS Pool (Edit) form reappears with the name of the slope policy.

49 Configure the parameters:

- Reserved CBS (%)
- Default Reserved CBS
- Amber Alarm Action Max (%)
- Amber Alarm Action Step (%)
- Amber Alarm Threshold (%)
- Red Alarm Threshold (%)

50 Click on the OK button. The QoS Pool (Edit) form closes.

51 Perform one of the following:

a Click on the Override Policy Items tab to configure HSMDA overrides. See Procedure 16-10 for more information.

b Continue to step 52.

52 To configure a tunable optic DWDM MDA or IMM on a 7750 SR or 7450 ESS, click on the Optical Transport Channel Unit tab. Otherwise, go to step 67.

53 Configure the following parameters on the General tab:

- FEC Mode
- SF-SD Method
- Configured Data Rate (Gb/s)
- Transmitter Mode
- Transmitter String
- Async Mapping
- Transmitter Bytes
- Expected Rx Mode
- Expected Rx String
- Expected Rx Bytes
- OTU-TIM reaction
- ODU-TIM reaction
- OPU-TIM reaction
- Payload Type (hex)
- Expected Payload Type (hex)
- OPU-PLM reaction
- SF Threshold (1/10E-n bits received)
- SF Threshold Coeff
- SD Threshold (1/10E-n bits received)
- SD Threshold Coeff
- SF Clr Threshold (1/10E-n bits received)
- SF Clr Threshold Coeff
- SD Clr Threshold (1/10E-n bits received)
- SD Clr Threshold

54 Click on the OTU Alarms tab and select the OTU alarms for the Configured Alarms parameter.

55 Click on the Select button in the DWDM panel to choose a channel. The Wave Length Reference - Physical Port form opens.

56 Use the configurable filter and click on the Search button to generate a list of configurable channels and related wavelengths and frequencies.

57 Select a channel and click on the OK button. The Wave Length Reference - Physical Port form closes and the channel number, wavelength, and frequency are displayed in the DWDM panel of the Physical Port (Edit) form.

58 Click on the Optical tab and configure the following parameters on the Wavelength Track tab:

- Wave Tracker Encode
- Wave Tracker Power Control
- Configured Alarms
- Wave Key1
- Wave Key2
- Target Power

59 Click on the Optical Amplifier tab and configure the Configured Alarms parameter.

60 Click on the Optical Tunable Dispersion Compensation Module tab.

61 Configure the following parameters:

- Channel
- Dispersion
- Control Mode
- Configured Alarms

62 Click on the Apply button. A dialog box appears.

63 Click on the Yes button.

64 To configure coherent optics options for a 1-Port 100GE OTU4 DWDM tunable optic IMM on a 7750 SR or 7450 ESS, click on the Coherent Optics tab. Otherwise, go to step 67.

65 Configure the parameters on the Coherent Optical Module tab:

- Coherent Optical Channel
- Dispersion Control Mode
- Dispersion
- Dispersion Sweep Start
- Dispersion Sweep End
- Tx Target Power
- Rx LOS Threshold
- Rx LOS Reaction
- Carrier Phase Recovery
- Configured Alarms

66 Click on the Operational Status tab to view information about the state of the optical port.

67 Click on the other tabs to view and edit additional port information.

68 Click on the OK button. The Physical Port (Edit) form closes.

Procedure 16-2 To change the port mode

Perform this procedure to change the port mode between Network, Access, and Hybrid modes.

Note — Save the device configuration before you perform this procedure. See the appropriate NE documentation for more information.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the port object where you want to change the port mode. The path is Network→*NE*→Shelf→Card Slot *n*→Daughter Card Slot *n*→Port *n*/*n*/*n*.

3 Right-click on the Port icon and choose Properties. The Physical Port (Edit) form opens with the General tab displayed.

4 Change the Mode parameter as required and click on the Apply button.

5 If you are changing the mode from Access to Network and services are configured on the port, warnings are displayed in a dialog box, depending on the permissions that are associated with your user role. Perform one of the following:

a The default warning dialog indicates that the object has dependencies that will be deleted if you apply the port mode change.

i Click on View Dependencies button to see the number of dependencies (services and interfaces) associated with the port.

ii Click on the OK button.

iii Confirm that you understand the implications of changing the port mode by enabling the "I understand the implications of this action" check box. A confirmation dialog box appears.

iv Click on the Yes button. Any services and interfaces associated with the port, including SAPs, are deleted, and the mode for the port is changed to Network.

Note — Changing the port mode from Access to Network without first removing the dependencies results in a TopologyMisconfigured alarm.

b For users who have the port.RestrictNodeConfigModify permission associated with their role, a warning form appears, indicating that the object has dependencies that must be removed before proceeding.

i Click on View Dependencies button to see the number of dependencies (services and interfaces) associated with the port.

ii Click on the OK button.

iii Remove the services or interfaces associated with the port. You can manually delete them or move them to other ports as described in this chapter.

iv Repeat steps 3 and 4 to change the port mode to Network.

Procedure 16-3 To migrate SAPs from access mode to hybrid mode

Perform this procedure on Ethernet or SC-LAG access ports that contain SAPs.

Note — Save the device configuration before you perform this procedure. See the appropriate NE documentation for more information.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the port object where you want to migrate SAPs. The path is Network→*NE*→Shelf→Card Slot *n*→Daughter Card Slot *n*→Port *n*/*n*/*n*.

3 Right-click on an Ethernet port or SC-LAG port icon and choose Properties. The Physical Port (Edit) form opens with the General tab displayed.

4 Change the Mode parameter from Access to Hybrid. A dialog box opens.

5 Click on the Yes button. A warning form appears.

6 Perform an admin save.

7 Select the I understand the implications of this action check box and click on the Yes button. The SAP Migration Result form displays information about the number of SAPs migrated.

8 Click on the OK button to close the forms.

Procedure 16-4 To configure the 5620 SAM to retain non-default port MTU values

Perform this procedure to configure the 5620 SAM server for non-default MTU refresh behavior.

The MTU value for a port is associated with the port mode, such as access or network, and the port encapsulation type. If you change the mode or encapsulation type of a port, the MTU value changes to the associated default. If you do not want the port MTU values to change, you can use this procedure to configure the 5620 SAM to retain each port MTU value, regardless of a mode or encapsulation type change.

Note — You must perform this procedure on each main server in a redundant 5620 SAM deployment.

1 Log in to the 5620 SAM main server station as the samadmin user.

2 Navigate to the 5620 SAM server configuration directory, typically /opt/5620sam/server/nms/config.

3 Open the nms-server.xml file with a plain-text editor.

Caution — Contact your Alcatel-Lucent technical support representative before you attempt to modify the nms-server.xml file. Modifying the nms-server.xml file can have serious consequences that can include service disruption.

4 Add the following line to the end of the file:

```
<customMTURefresh refresh="true"/>
```

5 Save and close the nms-server.xml file.

6 Open a console window.

7 Navigate to the 5620 SAM server binary directory, typically /opt/5620sam/server/nms/bin.

8 If the main server is a standalone server, or the primary server in a redundant deployment, enter the following:

```
bash$ ./nmsserver.bash read_config ↵
```

The main server reads the nms-server.xml file and puts the configuration change into effect.

9 If the main server is the standby server in a redundant deployment, enter the following:

```
bash$ ./nmsserver.bash force_restart ↵
```

The main server restarts and puts the configuration change into effect.

10 Close the console window.

Procedure 16-5 To copy or move L2 SAPs between ports

You can also use the 5620 SAM clipboard to copy or move SAPs. See chapter 3 for information about using the 5620 SAM clipboard.

1 For the source NE, disable automatic configuration backup if enabled in the backup policy assigned to the NE, by configuring the Auto Backup Scheme parameter appropriately. See "NE maintenance overview" in the *5620 SAM System Administrator Guide* for information about configuring automatic configuration backup for an NE.

2 On the source NE, use a CLI to back up the device configuration to a file. Ensure that you use a unique name for the backup file to ensure that it is not accidentally overwritten. Enter the following at the CLI prompt:

admin save *file_name* ↵

where *file_name* is a name that differs from the existing configuration file names on the NE and identifies this as the configuration in effect before the copy or move operation

Caution — An unsuccessful SAP copy or move may result in the deletion of one or more source SAPs from the source NE. The backed-up configuration file is required to restore the configuration on the source NE if a SAP copy or move operation fails.

See the appropriate device documentation for more information about saving the device configuration to a file.

3 For the destination NE, disable automatic configuration backup if enabled in the backup policy assigned to the NE by configuring the Auto Backup Scheme parameter appropriately. See "NE maintenance overview" in the *5620 SAM System Administrator Guide* for more information about configuring automatic configuration backup for an NE.

4 On the destination NE, use a CLI to back up the device configuration to a file. Ensure that you use a unique name for the backup file to ensure that it is not accidentally overwritten. Enter the following at the CLI prompt:

admin save *file_name* ↵

where *file_name* is a name that differs from the existing configuration file names on the NE and identifies this as the configuration in effect before the copy or move operation

See the appropriate device documentation for more information about saving the device configuration to a file.

5 Open the Deployment form to monitor deployments as they occur during the SAP copy or move operation. Choose Administration→NE Maintenance→Deployment from the 5620 SAM main menu. The Incomplete Deployments tab is displayed.

Caution — Alcatel-Lucent strongly recommends that you monitor the NE deployments and the alarm window during a SAP copy or move operation to ensure that faults that may arise during the operation are immediately detected.

The Incomplete Deployments tab of the Deployment form notifies the 5620 SAM operator of configuration changes that are not successfully deployed to the NE, and the 5620 SAM alarm window alerts the operator to object failures on the NE that are related to the copy or move operation.

6 Choose Tools→Copy/Move SAPs. The Copy/Move SAPs form opens with the General tab displayed.

7 Arrange the forms on the GUI so that the Copy/Move SAPs form, the Deployment form, and the alarm window are all shown.

8 Click on the Result Export Path tab. The Result Export Path form opens.

9 Specify the file name and location in which to save a text file that contains the results of the SAP copy or move operation.

10 Click on the Set button. The Result Export Path form closes.

11 Click on the Select button beside the Source Node parameter. The Select Network Elements form opens.

12 Choose a source NE from the list and click on the OK button. The Select Network Elements form closes and the NE identifier is displayed in the Source panel.

13 Click on the Select button beside the Source Port parameter. The Select Port form opens.

14 Configure the filter criteria. A list of available ports is displayed.

15 Select a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed in the Source panel.

16 Click on the Select button beside the Destination Node parameter. The Select Network Elements form opens.

17 Select a destination NE in the list and click on the OK button. The Select Network Elements form closes and the NE identifier is displayed in the Destination panel.

18 Click on the Select button beside the Destination Port parameter. The Select Port form opens.

19 Configure the filter criteria. A list of available ports is displayed.

20 Select a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed in the Destination panel.

21 Configure the parameters:

- Current Mode
- Outer Encap Value Start
- Outer Encap Value End
- Inner Encap Value Start
- Inner Encap Value End
- Service Type
- Outer Encap Value Offset
- Inner Encap Value Offset
- Action Type
- Continue on individual Failure

22 Click on the Execute button to begin the copy or move operation. The Execution Result panel displays the execution state of the copy or move operation and the number of successful and failed operations based on the input criteria.

Note — When you copy or move a SAP on an L2 interface and there is a non-zero value assigned to the PIM Snooping parameter Maximum Number of Groups, the value is not copied or moved to the new location. You must manually configure the Maximum Number of Groups parameter in the new location.

23 Monitor the Deployments form and the alarm window for any deployment failures and faults related to the SAP copy or move operation. Click on the Refresh button of the Deployments form to update the list, if required.

24 Click on the Result tab to view a list of the successful and failed operations as identified by the 5620 SAM.

25 Click on the Refresh Result button to view the most recent results.

26 To view the information for an individual SAP copy or move operation, move the mouse pointer over the Message field of the operation.

27 If a copy or move operation fails, you can restore the previous source NE configuration using the backup configuration file created in step 2. To restore the previous NE configuration:

i Open a CLI on the source NE.

ii Enter the following at the command prompt to load the saved configuration file:

```
exec file_name ↵
```

where *file_name* is the name of the configuration file that was specified in step 2

The SAPs that were deleted during the unsuccessful copy or move operation are restored on the NE.

iii Enter the following at the command prompt to save the NE configuration:

```
admin save ↵
```

28 If a copy or move operation partially fails, you can restore the previous destination NE configuration using one of the following methods.

Note — If the copy or move operation fails completely, there is no need to restore the previous configuration because no SAPs are created on the destination NE.

a Restore the backed-up configuration file.

i Open a CLI on the destination NE.

ii Enter the following at the command prompt to load the saved configuration file:

exec *file_name* ↵

where *file_name* is the name of the configuration file specified in step 4

The previous configuration is restored on the NE.

iii Enter the following at the command prompt to save the NE configuration:

admin save ↵

b Manually delete the SAPs that the copy or move operation created on the destination NE.

29 Restore the previous automatic configuration backup functionality in the backup policy used by the source NE, if required, by configuring the Auto Backup Scheme parameter appropriately. See “NE maintenance overview” in the *5620 SAM System Administrator Guide* for information about configuring automatic configuration backup for an NE.

30 Restore the previous automatic configuration backup functionality in the backup policy used by the destination NE, if required, by configuring the Auto Backup Scheme parameter appropriately. See “NE maintenance overview” in the *5620 SAM System Administrator Guide* for information about configuring automatic configuration backup for an NE.

31 Close the Copy/Move SAPs and the Deployments forms.

Procedure 16-6 To move L3 SAPs within or between ports on the same NE

Perform this procedure to move one or more L3 access interface SAPs within a port, or from one port to another port on the same NE.

To copy or move L3 access interface SAPs from one port to another on different NEs, see “XML API template administration” in the *5620 SAM Scripts and Templates Developer Guide* for information about the administrative tasks associated with service templates.

You can also use the 5620 SAM clipboard functionality to move SAPs. See chapter 3 for information about using the 5620 SAM clipboard.

Note — L3 access interfaces are not bound to a port; for example, loopback interfaces cannot be moved.

1 For the NE, disable automatic configuration backup if enabled in the backup policy assigned to the NE, by configuring the Auto Backup Scheme parameter appropriately. See "NE maintenance overview" in the *5620 SAM System Administrator Guide* for information about configuring automatic configuration backup for an NE.

2 On the NE, use a CLI to back up the device configuration to a file. Ensure that you use a unique name for the backup file to ensure that it is not accidentally overwritten. Enter the following at the CLI prompt:

admin save *file_name* ↵

where *file_name* is a name that differs from the existing configuration file names on the NE and identifies this as the configuration in effect before the move operation

See the appropriate device documentation for more information about saving the device configuration to a file.

3 Open the Deployment form to monitor deployments as they occur during the SAP move operation. Choose Administration→NE Maintenance→Deployment from the 5620 SAM main menu. The Incomplete Deployments tab is displayed.

Caution — Alcatel-Lucent strongly recommends that you monitor the NE deployments and the alarm window during a SAP move operation to ensure that faults that may arise during the operation are immediately detected.

The Incomplete Deployments tab of the Deployment form notifies the 5620 SAM operator of configuration changes that are not successfully deployed to the NE, and the 5620 SAM alarm window alerts the operator to object failures on the NE that are related to the move operation.

4 Choose Tools→Copy/Move SAPs. The Copy/Move SAPs form opens with the General tab displayed.

5 Arrange the forms on the GUI so that the Copy/Move SAPs form, the Deployment form, and the alarm window are all shown.

6 Click on the Result Export Path tab. The Result Export Path form opens.

7 Specify the file name and location in which to save a text file that contains the results of the SAP move operation.

8 Click on the Set button. The Result Export Path form closes.

9 Click on the Select button beside the Source Node parameter. The Select Network Elements form opens.

10 Choose an NE from the list and click on the OK button. The Select Network Elements form closes and the NE identifier is displayed in the Source panel.

11 Click on the Select button beside the Source Port parameter. The Select Port form opens.

12 Configure the filter criteria. A list of available ports is displayed.

13 Choose a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed in the Source panel.

14 Click on the Select button beside the Destination Port parameter. The Select Port form opens.

15 Configure the filter criteria. A list of available ports is displayed.

16 Select a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed in the Destination panel.

17 Configure the parameters:

- Current Mode
- Outer Encap Value Start
- Outer Encap Value End
- Inner Encap Value Start
- Inner Encap Value End
- Service Type
- Outer Encap Value Offset
- Inner Encap Value Offset
- Continue on individual Failure

18 Click on the Execute button to start the move operation. The Execution Result panel displays the execution state of the move operation and the number of successful and failed operations based on the input criteria.

19 Monitor the Deployments form and the alarm window for any deployment failures and faults related to the SAP move operation. Click on the Refresh button of the Deployments form to update the list, if required.

20 Click on the Result tab to view a list of the successful and failed operations as identified by the 5620 SAM.

21 Click on the Refresh Result button to view the most recent results.

22 To view the information for an individual SAP move operation, move the mouse pointer over the Message field of the operation.

23 If a move operation fails, you can restore the previous NE configuration using the backup configuration file created in step 2. To restore the previous NE configuration:

i Open a CLI on the NE.

ii Enter the following at the command prompt to load the saved configuration file:

exec *file_name* ↵

where *file_name* is the name of the configuration file specified in step 2

The SAPs that were deleted during the unsuccessful move operation are restored on the NE.

iii Enter the following at the command prompt to save the NE configuration:

```
admin save ↵
```

24 Restore the previous automatic configuration backup functionality in the backup policy used by the NE, if required, by configuring the Auto Backup Scheme parameter appropriately. See "NE maintenance overview" in the *5620 SAM System Administrator Guide* for information about configuring automatic configuration backup for an NE.

25 Close the Copy/Move SAPs and the Deployments forms.

Procedure 16-7 To move L3 subscriber interface SAPs between ports on the same NE

Perform this procedure to move one or more L3 subscriber interface SAPs from one port to another port on the same NE.

To copy or move L3 subscriber interface SAPs from one port to another on different NEs, see "XML API template administration" in the *5620 SAM Scripts and Templates Developer Guide* for more information about the administrative tasks associated with service templates.

You can also use the 5620 SAM clipboard functionality to move SAPs. However, you can only move all of the SAPs in a group interface; you cannot be used to move a subset of SAPs. See chapter 3 for information about using the 5620 SAM clipboard.

1 For the NE, disable automatic configuration backup if enabled in the backup policy assigned to the NE, by configuring the Auto Backup Scheme parameter appropriately. See "NE maintenance overview" in the *5620 SAM System Administrator Guide* for information about configuring automatic configuration backup for an NE.

2 On the NE, use a CLI to back up the device configuration to a file. Ensure that you use a unique name for the backup file to ensure that it is not accidentally overwritten. Enter the following at the CLI prompt:

```
admin save file_name ↵
```

where *file_name* is a name that differs from the existing configuration file names on the NE and identifies this as the configuration in effect before the move operation

See the appropriate device documentation for more information about saving the device configuration to a file.

3 Open the Deployment form to monitor deployments as they occur during the SAP move operation. Choose Administration→NE Maintenance→Deployment from the 5620 SAM main menu. The Incomplete Deployments tab is displayed.

Caution — Alcatel-Lucent strongly recommends that you monitor the NE deployments and the alarm window during a SAP move operation to ensure that any faults that arise during the operation are immediately detected.

The Incomplete Deployments tab of the Deployment form notifies the 5620 SAM operator of configuration changes that are not successfully deployed to the NE, and the 5620 SAM alarm window alerts the operator to object failures on the NE that are related to the move operation.

4 Choose Tools→Copy/Move SAPs. The Copy/Move SAPs form opens with the General tab displayed.

5 Arrange the forms on the GUI so that you can view the entire Copy/Move SAPs form, the Deployment form, and the alarm window.

6 Click on the Result Export Path tab. The Result Export Path form opens.

7 Specify the file name and location in which to save a text file that contains the results of the SAP move operation.

8 Click on the Set button. The Result Export Path form closes.

9 Click on the Select button beside the Source Node parameter. The Select Network Elements form opens.

10 Choose an NE from the list and click on the OK button. The Select Network Elements form closes and the NE identifier is displayed in the Source panel.

11 Click on the Select button beside the Source Port parameter. The Select Port form opens.

12 Configure the filter criteria. A list of available ports is displayed.

13 Choose a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed in the Source panel.

14 Configure the filter criteria. A list of available ports is displayed.

15 Choose a port in the list and click on the OK button. The Select Port form closes and the port identifier is displayed in the Destination panel.

16 Configure the parameters:

- Current Mode
- Service Type
- Outer Encap Value Offset
- Inner Encap Value Offset
- Continue on individual Failure

17 Click on the Execute button to start the move operation. The Execution Result panel displays the state of the move operation, and the number of successful and failed operations based on the input criteria.

18 Monitor the Deployments form and the alarm window for any deployment failures and faults related to the SAP move operation. Click on the Refresh button of the Deployments form to update the list, if required.

19 Click on the Result tab to view a list of the successful and failed operations, as identified by the 5620 SAM.

20 Click on the Refresh Result button to view the most recent results.

Note — If one SAP fails, all SAPs under the same group interface fail because the SAPs can only move together. In this case, there is insufficient information to determine which SAP caused the problem using the 5620 SAM.

21 To view information about an individual SAP move operation, move the mouse pointer over the Message field of the operation.

22 If a move operation fails, you can restore the previous NE configuration using the backup configuration file created in step 2. To restore the previous NE configuration:

i Open a CLI on the source NE.

ii Enter the following at the command prompt to load the saved configuration file:

exec *file_name* ↵

where *file_name* is the name of the configuration file specified in step 2

The SAPs that were deleted during the unsuccessful move operation are restored on the NE.

iii Enter the following at the command prompt to save the NE configuration:

admin save ↵

23 Restore the previous automatic configuration backup functionality in the backup policy used by the NE, if required, by configuring the Auto Backup Scheme parameter appropriately. See "NE maintenance overview" in the *5620 SAM System Administrator Guide* for information about configuring automatic configuration backup for an NE.

24 Close the Copy/Move SAPs and the Deployments forms.

Procedure 16-8 To add a queue group to an Ethernet port

You can create a port queue group on an Ethernet port after creating an Ingress/Egress Queue Group Template policy.

Note — You must use the same name for the port queue group and Ingress/Egress Queue Group Template policy.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the port object where you want to add a queue group. The path is Network→*NE*→Shelf→Card Slot *n*→Daughter Card Slot *n*→Port *n*/*n*/*n*.

3 Right-click on an Ethernet port icon and choose Properties. The Physical Port (Edit) form opens with the General tab displayed.

4 Click on the Ethernet tab.

5 Perform one of the following:

- **a** Click on the Network Egress Queue Group tab.
- **b** Click on the Access Egress Queue Group tab.
- **c** Click on the Access Ingress Queue Group tab.

Note — The Network Egress Queue Group tab is available if queue groups are supported on the port, depending on the NE release and IOM type. See section "Port queue groups" in chapter 62 for more information about supported devices and IOM types.

6 Click on the Create button. The Queue Group (Create) form opens with the General tab displayed.

7 Click on the Select button in the Queue Group Template Policy panel. The Select Queue Group Template Policy list form opens.

8 Choose a queue group template policy from the list and click on the OK button. The Select Queue Group Template Policy list form closes.

9 Configure the parameters:

- Instance ID
- Description

10 If you are adding a network egress queue group, go to step 11. Otherwise, continue to step 13.

11 Click on the Select button in the Policer Control Policy panel to select a policer control policy. The Select Policer Control Policy list form opens.

12 Choose a policer control policy from the list and click on the OK button. The Select Policer Control Policy list form closes and the Network Egress Queue Group (Create) form refreshes with the Policer Control Policy information.

13 Click on the Select button in the Accounting Policy panel to select an accounting policy. The Select Accounting Policy list form opens.

Note — Only the accounting policies with the Type parameter configured to one of the following options are listed:

- Queue Group Octets
- Queue Group Packets
- Combined Queue Group

14 Choose an accounting policy from the list and click on the Ok button. The Select Accounting Policy list form closes and the Queue Group (Create) form refreshes with the accounting policy information.

15 Configure the Collect Accounting Statistics parameter.

16 Click on the Select button in the Scheduler Policy panel to assign a scheduler policy to the port. The Select Scheduler Policy list form opens.

17 Choose a scheduler policy from the list and click on the OK button. The Select Scheduler Policy list form closes.

18 If you are adding an access ingress queue group, go to step 25. Otherwise, continue to step 19.

19 Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are configurable only if you did not select a scheduler policy in step 17.
The Frame-Based Accounting parameter is configurable only if you configure the Aggregate Rate Limit (kbps) parameter.

20 If you are adding a network egress queue group (including queue groups for HSMDA), go to step 25. Otherwise, continue to step 21.

21 Click on the Host Matching tab.

Note — The Host Matching tab will only be available if the Instance ID is set to 1.

22 Click on the Create button. The Host String (Create) form opens.

23 Configure the Host String parameter.

24 Click OK. The Host String (Create) form closes and the information on the Host Matching tab is updated.

25 Click on the Overrides: Type Queue tab, where Type will be Network Egress, Access Egress, or Access Ingress, depending on your selection in step 5.

26 Click on the Create button. The Queue Override (Create) form opens.

27 Click on the Select button to choose a Queue ID. The Select Queue - Queue Override list form opens.

28 Choose an entry from the list and click on the OK button. The Select Queue - Queue Override list form closes and the Queue Override (Create) form refreshes with the queue information.

29 Click on the Override tab.

30 If you are configuring an access egress queue group queue override for HSMDA, then go to step 33.

31 Configure the parameters:

- Committed Burst Size (kb)
- Maximum Burst Size (bytes)
- High Priority Reserved
- PIR Adaptation
- CIR Adaptation
- PIR (kbps)
- CIR (kbps)
- Weight
- CIR Weight

The Weight and CIR Weight parameters are only applicable to access egress queue group overrides.

The parameters are configurable when the Override check box is enabled.

32 Go to step 36.

33 Configure the parameters as required:

- PIR (kbps)
- MBS (bytes)
- WRR Weight

The parameters are configurable when the associated Override check box is enabled.

34 If you need to configure an override for a Slope Policy, then enable the associated Override check box and click the Select button.The Select Slope Policy form opens.

35 Select the required Slope Policy and click OK. The Select Slope Policy form closes and the Queue Override (Create) form refreshes with the Slope Policy information.

36 Click on the OK button to save the configuration and close the Queue Override (Create) form. A dialog box appears.

37 Click on the OK button.

38 Click on the OK button to save the configuration and close the Queue Group (Create) form. A dialog box appears.

39 Click on the OK button. A dialog box appears.

40 Click on the Yes button to save the configuration and close the Physical Port (Edit) form.

41 Close the Network Element (Edit) form.

Procedure 16-9 To configure SONET ports

Perform the steps in this procedure as required depending on the daughter card and port type that you are configuring.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the port object where you want to configure a SONET port. The path is Network→*NE*→Shelf→Card Slot *n*→Daughter Card Slot *n*→Port *n*/*n*/*n*.

3 Right-click on a port icon and choose Properties. The Physical Port (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Description
- Speed
- DDM Event Suppression
- Current OLC State

The DDM Event Suppression parameter is configurable only on ports on SFPs and XFPs optical modular transceivers.

5 Click on the States tab.

6 Configure the Administrative State parameter.

7 Click on the Channels tab to configure the SONET/SDH channel.

a Click on the Create button to create a new channel.

b Choose a channel from the list and click on the Properties button to view and edit the channel parameters.

c Choose a channel from the list and click on the Delete button to remove a channel from the port.

8 Click on the SONET tab.

9 Configure the parameters:

- Framing
- Clock Source
- Loopback
- Single Fiber
- Hold Time Down (100s of ms)
- Hold Time Up (100s of ms)
- Tx DUS/DNU

10 Click on the SONET Monitoring tab.

11 Configure the parameters:

- BER Signal Degradation Threshold
- BER Signal Failure Threshold
- Report Alarms

12 Click on the SONET Overhead tab.

13 Configure the parameters:

- SONET Section Trace Mode
- J0 Byte

  Enter a J0 byte that identifies the circuit. This byte is inserted continuously at source. This can be checked against the expected value by the receiver. If no byte is entered, then null is used. The parameter is configurable when the SONET Section Trace Mode is set to Byte.
- J0 String

  The parameter is configurable when the SONET Section Trace Mode is set to String.

14 Click on the other tabs in the properties form to view and edit additional port information.

15 Click on the OK button. The Physical Port (Edit) form closes.

Procedure 16-10 To configure an HSMDA override

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure an HSMDA override and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon to the HSMDA card level.

4 Expand the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

5 Click on the Override Policy Items tab. The Override configuration form opens with the HSMDA Scheduler tab displayed.

6 Click on the Create button. The Port Egress HSMDA Scheduler Policy Override (Create) form opens with the General tab displayed.

7 Click on the Override tab.

8 Configure the parameters:

- Maximum Rate (Mbps)
- Rate (Mbps)
- Weight in Group

The Rate (Mbps) parameter is configurable when a Group is not specified for the applied HSMDA scheduler policy. The Weight in Group parameter is only configurable when Group 1 or Group 2 is specified for the HSMDA scheduler policy.

9 Click on the OK button. A dialog box appears.

10 Click on the OK button. The Override configuration form is updated with the scheduler override.

11 Close the Physical Port (Edit) form.

Procedure 16-11 To configure TDM DS3 ports

Perform the steps in this procedure as required depending on the port type that you are configuring.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the port object where you want to configure a TDM DS3 port. The path is Network→*NE*→Shelf→Card Slot *n*→Daughter Card Slot *n*→Port *n*/*n*/*n*.

3 Right-click on a port icon and choose Properties. The Physical Port (Edit) form opens with the General tab displayed.

4 Configure the General tab parameters:

- Description
- Speed
- Current OLC State
- DDM Event Suppression

5 Click on the States tab.

6 Configure the Administrative State parameter.

7 Click on the DS3/E3 tab.

8 Configure the parameters:

- Line Buildout
- Type

9 Click on the other tabs in the properties form to view and edit additional port information.

10 Click on the OK button. The Physical Port (Edit) form closes.

Procedure 16-12 To configure serial ports

Perform this procedure to configure a port on a 12 × Serial Data card on the 7705 SAR.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the port object where you want to configure a serial port. The path is Network→*NE*→Shelf→Card Slot *n*→Daughter Card Slot *n*→Port *n*/*n*/*n*.

3 Right-click on a port icon and choose Properties. The Physical Port (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Description
- Speed
- Serial Type
- Current OLC State
- Revert OLC State

5 Click on the States tab.

6 Configure the Administrative State parameter.

7 Click on the other tabs in the properties form to view and edit additional port information.

8 Click on the OK button. The Physical Port (Edit) form closes.

Procedure 16-13 To configure PW ports

Perform this procedure to configure a pseudo-wire port on an NE.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on an NE and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the PW Ports tab. A list of existing PW ports is displayed.

4 Click on the Create button. The PW Port (Create) form opens.

5 Configure the parameters:

- PW Port ID
- Auto-Assign ID
- Encapsulation Type

6 Configure node redundancy for the PW port, if required.

i Click on the Node Redundancy button. The Manage Node Redundancy form appears, preconfigured for MC peer groups.

ii Click on the Search button and configure an existing MC peer group, or click on the Create button and configure a new MC peer group (see Procedure 36-1.

The Node Redundancy button allows you to access the MC sync group configuration within the MC peer group in order to add PW port sync tags.

7 Click on the OK button. The PW Port (Create) form closes and a dialog box appears.

8 Click on the OK button. The dialog box closes and the Network Element (Edit) form reappears with the new PW port listed.

9 Click on the Apply button. A dialog box appears.

10 Click on the Yes button. The dialog box and the Network Element (Edit) form close.

Procedure 16-14 To configure a 7210 SAS-M channelized TDM DS1 or E1 port

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the port object where you want to configure a 7210 SAS-M channelized TDM DS1 or E1 port. The path is Network→*NE*→Shelf→Card Slot *n*→Daughter Card Slot *n*→Port *n*/*n*/*n*.

3 Right-click on a 7210 SAS-M port object that contains a channelized DS1 or E1 and choose Properties. The Physical Port (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Description
- Current OLC State

5 Click on the Select button in the Split Horizon Group panel. The Select Split Horizon Group - Physical Port form opens.

6 Choose an SHG and click on the OK button. The Select Split Horizon Group - Physical Port form closes and the Physical Port (Edit) form refreshes with the SHG name.

Note — To create or delete a 7210 SAS SHG, see Procedure 16-16.

7 Click on the DS1/E1 tab.

8 Configure the parameters:

- Port Type
- Line Length
- Line Impedance

Note — The Line Impedance parameter only appears when the Port Type parameter is set to E1.

9 Click on the QoS Pool tab.

10 Choose a QoS pool from the list and click on the Properties button. The QoS Pool (Edit) form opens.

11 Click on the Select button in the Slope Policy panel. The Select Slope Policy - QoS Pool form opens.

12 Choose a slope policy in the list and click on the OK button. The Select Slope Policy - QoS Pool form closes and the QoS Pool (Edit) form refreshes with the name of the slope policy.

13 Click on the OK button. The QoS Pool (Edit) form closes.

14 Click on the States tab.

15 Configure the Administrative State parameter.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The Physical Port (Edit) form closes.

Procedure 16-15 To assign policies to a 7210 SAS Ethernet port

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to a configured Ethernet port object on a 7210 SAS device. The path is Network→*NE*→Shelf→Card Slot *n*→Daughter Card Slot *n*→Port *n*/*n*/*n*.

3 Right-click on a configured Ethernet port object and choose Properties. The Physical Port (Edit) form opens with the General tab displayed.

4 Click on the Policies tab. The Policies form opens with the General tab displayed.

5 Perform one of the following to assign policies to a 7210 SAS Ethernet port.

- **a** If the port is in access or hybrid mode, go to step 6.
- **b** If the port is in network mode or is an L2Uplink port, go to step 7.

6 You can assign port scheduler and access egress policies to 7210 SAS ports in access mode.

- **i** Click on the 7210 Specific tab.
- **ii** Click on the Clear button in the PortScheduler Policy panel to remove the selected policy.
- **iii** Click on the Select button in the PortScheduler Policy panel to assign a port scheduler policy to the port. The Select PortScheduler Policy - Sas Port form opens.
- **iv** Choose a policy from the list and click on the OK button. The Select PortScheduler Policy - Sas Port form closes.
- **v** Click on the Clear button in the Access Egress Policy panel to remove the selected policy.
- **vi** Click on the Select button in the Access Egress Policy panel to assign an access egress policy to the port. The Select Access Egress Policy - Sas Port form opens.
- **vii** Choose a policy from the list and click on the OK button. The Select Access Egress Policy - Sas Port form closes.
- **viii** If the port is in access mode, go to step 8.

7 You can assign accounting, port scheduler, network, and network queue policies when the 7210 SAS port mode is network or hybrid or when it is an L2Uplink port.

- **i** Click on the 7210 Specific tab.
- **ii** Click on the Clear button in the PortScheduler Policy panel to remove the selected policy.
- **iii** Click on the Select button in the PortScheduler Policy panel to assign a port scheduler policy to the port. The Select PortScheduler Policy - Sas Port form opens.
- **iv** Choose a policy from the list and click on the OK button. The Select PortScheduler Policy - Sas Port form closes.
- **v** Click on the Clear button in the Network Policy panel to remove the selected policy.
- **vi** Click on the Select button in the Network Policy panel to assign a network policy to the port. The Select Network Policy - Sas Port form opens.

vii Choose a policy from the list and click on the OK button. The Select Network Policy - Sas Port form closes.

viii Click on the Clear button in the Network Queue panel to remove the selected policy.

ix Click on the Select button in the Network Queue panel to assign a network queue policy to the port. The Select Network Queue Policy - Physical Port form opens.

x Choose a policy from the list and click on the OK button. The Select Network Queue Policy - Physical Port form closes.

8 Click on the OK button. A dialog box appears.

9 Click on the Yes button to apply the changes. The Physical Port (Edit) form closes.

10 Close the Network Element (Edit) form.

Procedure 16-16 To create a 7210 SAS SHG

Traffic that arrives on a access or access uplink port or LAG within an SHG is not copied to other ports and LAGs in the same SHG; the traffic is copied to ports and LAGs in other SHGs if they exist within the same VPLS. Ports and LAGs are added to an SHG when you configure a port or LAG on a 7210 SAS. SHGs are not supported for a VPLS instance.

1 Choose Equipment from the view selector in the navigation tree. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure the SHG and select Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Split Horizon Groups tab.

4 Click on the Create button. The Split Horizon Group (Create) form opens.

5 Configure the parameters:

- Name
- Description

6 Click on the OK button. A dialog box appears.

7 Click on the OK button. The SHG is added to the displayed list.

Note 1 — Only one SHG can be configured per service.

Note 2 — A SHG and a Mesh SDP Binding cannot exist simultaneously on a single service.

8 Repeat steps 4 to 7 to add another SHG, if required.

9 To view the ports, LAGs, and faults that are associated with an SHG, choose an SHG from the list and click on the Properties button.

10 If you need to delete an SHG, select the SHG and click on the Delete button. A dialog box appears.

11 Enable the check box and click on the Yes button. You cannot delete an SHG if there are any ports or LAGs bound to it.

12 Close the Network Element (Edit) form.

Procedure 16-17 To configure a virtual Ethernet port on a 7705 SAR 2-port ring MDA

Perform this procedure to configure a virtual Ethernet port on a 7705 SAR 2 × 10-Gig Bridged Ethernet XFP + 1 × 2.5G Virtual Ethernet card on a 7705 SAR-8 and 7705 SAR-18, Release 6.0 R1 or later. See Procedure 43-6 for information about configuring a network policy of ring type for a 7705 SAR. See Procedure 15-33 for information about configuring a ring port on a 7705 SAR 2 × 10-Gig Bridged Ethernet XFP + 1 × 2.5G Virtual Ethernet card.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Choose Network→*NE*→Shelf→Card Slot *n*→Daughter Card Slot *n*→Virtual Port *n*/*n*/*n*, where the virtual port is the port object you need to configure.

3 Right-click on the Virtual Port icon and choose Properties. The Virtual Port (Edit) form opens with the General tab displayed.

4 Configure the parameters:

Note — Only the parameters that are supported on the NE, daughter card, or port are displayed.

- Description
- Configured MAC
- Mode
- Encapsulation Type
- MTU (bytes)
- DDM Event Suppression
- Load Balance Algorithm
- Current OLC State
- Revert OLC State

5 Click on the States tab.

6 Configure the Administrative State parameter.

7 Click on the Policies tab. The Policies form opens with the General tab displayed.

8 Click on the Select button in the Network Queue panel and select a network queue policy from the list.

9 Click on the OK button. The network queue policy appears in the Network Queue panel.

10 Click on the Ethernet tab. The Ethernet form opens with the General tab displayed.

11 Configure the parameters:

Note — Only the parameters that are supported on the NE, daughter card, or port are displayed.

- Down When Looped
- Egress Scheduler Mode
- CFM Loopback Mode
- Keep Alive Interval (Sec)
- Retry Timeout (Sec)
- No Retry
- Use Broadcast Address
- Egress Rate (Kbps)
- Type
- Time (seconds)

You must configure the Down When Looped parameter value as Enabled to see the Down When Looped Configuration panel parameters.

12 Click on the Network Interfaces tab to create a network interface on the virtual Ethernet port.

13 Click on the Add button. The Create Network Interface - Routing Instance form opens. Perform steps 4 to 49 of Procedure 22-9 to create a network interface.

Note — You can only bind a virtual Ethernet port to a network interface.

14 Click on the other tabs in the properties form to view additional virtual port information such as physical links, statistics, and faults.

15 Click on the Apply button. A dialog box appears.

16 Click on the Yes button.

17 Click on the OK button. The Virtual Port (Edit) form closes.

Procedure 16-18 To configure PoE ports on a 7210 SAS-T ETR

The 7210 SAS-T ETR supports PoE and PoE Plus on ports 19 through 22. See the *7210 SAS M, T, and X Interface Configuration Guide* for more information about 7210 SAS-T ETR support of PoE.

Perform this procedure to configure PoE on applicable Ethernet ports or to view PoE connection information.

Note 1 — For 7210 SAS devices, only the 7210 SAS-T ETR chassis variant supports PoE.

Note 2 — You can view information about power consumption and availability on the PoE tab of the shelf properties form for the 7210 SAS-T ETR.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the port object on a 7210 SAS-T ETR device. The path is Network→*NE*→Shelf→Card Slot *n*→Daughter Card Slot *n*→Port *n*/*n*/*n*.

3 Right-click on port 19, 20, 21, or 22 and choose Properties. The Physical Port (Edit) form opens with the General tab displayed.

4 Click on the PoE tab.

5 Configure the PoE Mode parameter.

6 Click on the Apply button. A dialog box appears.

7 Click on the Yes button. The Physical Port (Edit) form reappears.

8 View the information about the PoE connection.

9 Close the Physical Port (Edit) form.

Procedure 16-19 To configure PoE ports on a 7705 SAR-H

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7705 SAR-H where you want to configure PoE and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object and the Card Slot object.

4 Right-click on the Daughter Card Slot object and choose Properties. The Daughter Card Slot (Edit) form opens.

5 Configure the PoE Power Supply Source parameter in the PoE panel.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Daughter Card Slot (Edit) form closes.

8 Navigate to the port object where you want to configure PoE. The path is Network→NE→Shelf→Card Slot→Daughter Card Slot→Port n/n/n.

9 Right-click on Port 5, 6, 7, or 8 and choose Properties. The Physical Port (Edit) form opens with the General tab displayed.

Note — Only ports 5, 6, 7 or 8 support PoE, and only ports 5 and 7 support PoE Plus.

10 Click on the PoE tab.

11 Configure the PoE Mode parameter.

Note 1 — If you set the PoE Power Supply Source parameter to Internal in step 5, you can only configure ports 5 and 6:

- port 5 to PoE Plus and port 6 to Disabled
- port 5 to Standard and port 6 to Standard

Note 2 — If you set the PoE Power Supply Source parameter to External in step 5, you must set the PoE power supply source on all ports to Disabled in the PoE Mode parameter on the Physical Port (Edit) form before you configure the PoE Power Supply Source parameter for ports 7 and 8 to External.

Note 3 — You cannot configure PoE on port 6 when port 5 is configured as PoE Plus.

12 Click on the OK button to save the configuration changes. A dialog box appears.

13 Click on the Yes button. The Physical Port (Edit) form closes.

Procedure 16-20 To configure PoE ports on a 7705 SAR-W daughter card

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the Card Slot and the Daughter Card Slot objects. The six ports on the daughter card are displayed.

3 Right-click on either Port 4 or 5 and choose Properties from the contextual menu. The Physical Port (Edit) form opens with the General tab displayed.

4 Click on the PoE tab.

5 Configure the parameters:

- Slot Id
- Power Class
- PoE mode
- PoE Status
- Port Id
- Power State

6 Set the PoE Mode to PoE Plus to enable PoE.

7 Click on the OK button to save the configuration changes and close the form.

Procedure 16-21 To configure a 7705 SAR ASAP channelized TDM port

This procedure applies to 7705 SAR channelized TDM DS1/E1 ports and channelized TDM DS3/E3 ports.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the port object where you want to configure a 7705 SAR ASAP channelized TDM port. The path is Network→*NE*→Shelf→Card Slot *n*→Daughter Card Slot *n*→Port *n*/*n*/*n*.

3 Right-click on a port object that contains a channelized port (DS1/E1 or DS3/E3) and choose Properties. The Physical Port (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Description
- Current OLC State

5 Click on the DS1/E1 or DS3/E3 tab.

6 Configure the parameters:

- Port Type
- Line Length
- Line Impedance

All ports of the ASAP daughter card are automatically configured to the same port type when the first port is configured. A mix of DS1 and E1 ports or DS3 and E3 ports is not supported. The Port Type parameter can only be modified when no channels are configured on any port of the daughter card. If all of the channels are deleted on the daughter card, the port type is automatically set to DS1 or DS3 for all ports.

7 Click on the States tab.

8 Configure the Administrative State parameter.

9 Click on the OK button. A dialog box appears.

10 Click on the OK button. The Physical Port (Edit) form closes.

Procedure 16-22 To configure a 7710 SR channelized TDM DS1 or E1 port

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you need to configure a 7710 SR channelized TDM DS1 or E1 port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a 7710 SR port object that contains a channelized DS1 or E1. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Current OLC State

6 Click on the DS1/E1 tab.

7 Configure the parameters:

- Port Type
- Line Buildout
- Line Length
- Db Loss

8 Click on the States tab.

9 Configure the Administrative State parameter.

10 Click on the OK button. A dialog box appears.

11 Click on the OK button. The Physical Port (Edit) form closes.

Procedure 16-23 To configure OmniSwitch Ethernet ports

Perform the steps in this procedure as required depending on the OmniSwitch chassis type and port type that you are configuring. Different chassis types display different port configuration parameters.

Note — You can configure MVRP fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the OmniSwitch NEs icon.

3 Right-click on the device for which you need to configure an OmniSwitch Ethernet port and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 On the Network Element (Edit) form navigation tree, expand the Shelf icon to the port level and click on a port object. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Mode

  An access port is used for customer-facing traffic on which VLAN services are configured.

  A network port or channel is configured for network access in the service provider transport or infrastructure network. Typically, only one OmniSwitch network port is required for tree topology, and two ports are required for ring topology.
- Speed
- MTU (bytes)
- Automatic VLAN Binding
- Current OLC State

The Automatic VLAN Binding parameter is only supported on Stacked VLANs.

6 Click on the States tab.

7 Configure the Administrative State parameter.

8 Click on the Policies tab.

Note — A port must have a service access point associated with it before you can apply a UNI policy to the port.

9 Click on the Select button in the UNI Profile panel to assign a UNI policy to the port. The Select UNI Profile - Physical Port form opens.

10 Choose a User Network Interface (UNI) profile policy from the list and click on the OK button. The Select UNI Policy - Physical Port form closes.

11 Click on the Ethernet tab. The Ethernet port configuration form opens with the General tab displayed.

12 Perform one of the following:

a For OS 6900 and OS 10K devices, configure the following parameters:

- Duplex
- Enable Broadcast Limit Mode
- Broadcast Limit
- Enable Multicast Limit Mode
- Multicast Limit
- Enable Unknown Unicast Limit Mode
- Unknown Unicast Limit
- Type

b For all other OmniSwitch devices, configure the following parameters:

- Duplex
- Auto-negotiate
- Enable Port Mobility
- Dot1 Q Acceptable Frames
- Broadcast Limit (kbps)
- Enable Multicast Limit Mode
- Inter-Frame Gap (bytes)
- Detection
- Default VLAN Restore
- Default VLAN Enable
- Ignore BPDU
- Authenticate
- Ingress Filtering

The Inter-Frame Gap (bytes) parameter is only configurable on Gigabit Ethernet ports.

The Default VLAN Restore, Default VLAN Enable, Ignore BPDU, Authenticate, and Ingress Filtering parameters are only configurable when the Enable Port Mobility parameter is set to Enable.

13 Click on the LLDP tab, if required. The LLDP configuration form opens with the Nearest Bridge tab displayed.

14 Configure the parameters:

- Administrative Status
- Notifications
- Transmit Management Address
- LLDP TLVs

15 Click on the Remote Peers sub-tab under the LLDP tab to search for and display LLDP remote peers that are associated with the port. The remote peers are used to determine the physical topology of the network.

16 Click on the MVRP tab to configure MVRP, if required.

17 Configure the parameters on the General tab:

- Status
- Registration Mode
- Applicant Mode
- Periodic Transmission Status
- Join Timer
- Leave Timer
- Leave All Timer
- Periodic Timer

18 Click on the VLAN Restrictions tab to configure VLAN restrictions, if required:

i Click on the Create button. The MVRP VLAN Registration form appears.

ii Configure the parameters:

- VLAN
- Restrict-Static-VLAN-Registration
- Restrict-Registration
- Restrict-Advertisement

iii Click on OK to close the MVRP VLAN Registration form. The list on the VLAN Restrictions tab is updated with the new MVRP VLAN Registration entry.

19 Click on the QoS tab, if required. The QoS configuration form opens with the General tab displayed.

20 Configure the parameters:

- Trusted
- Default 802.1p
- Default DSCP
- Max Egress BW (kbps)
- Max Ingress BW (kbps)
- Servicing Mode
- Default Classification

Note — The Servicing Mode parameter does not apply to OS 6900 and OS 10K devices.

21 Perform on the following:

a For OS 6900 and OS 10K devices, go to step 26.

b For all other OmniSwitch devices, go to step 22.

22 Click on the Queue tab.

23 If you specified WRR or DRR for the Servicing Mode parameter, configure the Q0 to Q7 parameters in the Weight panel.

24 Configure the Q0 to Q7 parameters in the Minimum Bandwidth (Kbps) panel.

25 Configure the Q0 to Q7 parameters in the Maximum Bandwidth (Kbps) panel.

26 Click on the DHCP Snooping tab, if required. The tab is only available when the port is associated with a VLAN that has DHCP snooping enabled or DHCP snooping is enabled at the switch level.

27 Configure the parameters:

- Trust Mode
- IP Source Filtering

28 Click on the Ethernet Hybrid tab, if required. The tab is only available for hybrid Ethernet ports.

29 Configure the parameters:

- Mode
- Speed
- Duplex
- Auto-negotiate
- Detection

30 Click on the PoE tab, if required. The tab is only available for PoE ports.

31 Configure the parameters:

- Power State
- Maximum Power (milliwatt)
- Power Priority

32 Click on the LPS Learned MAC Entries tab to view the MAC addresses learned on the port. LPS must be enabled on the port. See Procedure 23-63 for information about configuring LPS on an Ethernet port.

33 Click on the Create button to add static MAC address entries, if required. The MAC Entries (Create) form opens.

Note — A port must be LPS-enabled and belong to a VLAN before you can add static MAC addresses to the port.

34 Click on the Select button. The Select VLAN Site - MAC Entries form opens.

35 Configure the filter criteria. A list of VLANs appears at the bottom of the Select VLAN Site - MAC Entries form.

36 Choose a VLAN from the list.

37 Click on the OK button. The Select VLAN Site - MAC Entries form closes.

38 Configure the MAC Address parameter and click on the Apply button to save the changes

39 Repeat steps 33 to 38 to add another MAC address, if required.

40 Click on the OK button. A dialog box appears.

41 Click on the Yes button. The Select VLAN Site - MAC Entries form closes.

42 Click on the OK button. The Physical Port (Edit) form closes.

Procedure 16-24 To configure OmniSwitch PoE Ports

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on an OmniSwitch object and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf object.

4 Click on a slot object. The Card Slot (Edit) form opens with the General tab displayed.

5 Click on the PoE tab.

6 Configure the parameters:

- Slot Priority
- Power State
- Port Maximum Power (MilliWatts)
- Maximum Power (Watts)
- Enable Priority Disconnect
- Enable Power Capacitor Detection
- Combo Port

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The Card Slot (Edit) form closes.

16.7 Channel and framing link configuration procedures

Use the following procedures to manage channels and framing links using the navigation tree.

Procedure 16-25 To configure SONET clear channels

Perform this procedure to configure SONET clear channels on OC3 to OC192 ports that provide clear channel services. Each port supports one clear channel.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to create a clear channel port and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a clear channel port object. The Physical Port (Edit) form opens with the General tab displayed. SONET is the default framing scheme.

Note — A clear channel port is a port on a card that is not designated Deep Channelized.

5 Configure the parameters:

- Description
- Speed

6 Click on the Apply button.

7 In the navigation tree, right-click on the port and choose Create Channel. The Channel (Create) form opens with the General tab displayed. If there are no channels available on that port, the Create Channel menu option menu is dimmed.

8 Configure the parameters:

- Description
- Configured MAC
- Mode
- Encapsulation Type
- MTU (bytes)
- DDM Event Suppression
- Load Balance Algorithm

The Encapsulation Type parameter is configurable when the Mode parameter is set to Access.

The DDM Event Suppression parameter is configurable only on ports on SFPs and XFPs optical modular transceivers.

9 Click on the Apply button to save the changes. The STS*n* clear channel appears in the navigation tree under the port of the daughter card.

a If the Encapsulation Type parameter of the port is ATM, the form is refreshed.

b If the Encapsulation Type parameter of the port is not ATM, go to step 14.

10 Click on the Edit ATM button. If the Edit ATM button is not visible, click on the More Actions button and choose Edit ATM to configure the ATM interface. The ATM interface form opens with the General tab displayed.

11 Configure the parameters:

- ATM Interface Cell Format
- ATM Minimum VPI Value
- Interface Mapping

12 To create an ILMI link, see Procedure 16-38.

13 Click on the OK button. The ATM Interface form closes.

14 Close the Channel (Edit) form.

Procedure 16-26 To perform a bulk channel creation on ports that support multiple sub-channels

Perform this procedure to create the maximum number of channels on ports that support multiple sub-channels. Table 16-5 lists the port types that support bulk channel creation.

Table 16-5 Bulk channel creation support

Node	OC3	OC12	DS3 ASAP	E3 ASAP	APS common port	APS SONET VTG
7450 ESS	X	X	X	X	X	X
7705 SAR-M	X	—	—	—	X	X
7710 SR	X	X	X	X	X	X
7750 MG	X	X	X	X	X	X

Note — This procedure assumes you have pre-configured a NE with an appropriate daughter card that supports multiple sub-channels.

1 Choose Equipment from the view selector in the navigation tree. The navigation tree displays the Equipment view.

2 Locate and expand the device on which you need to perform a bulk channel creation.

3 Perform one of the following:

a For OC3, OC12, DS3 ASAP, and E3 ASAP ports, right-click on a port icon and choose Create Maximum # of Channels from the contextual menu. The Create Maximum # of Channels form opens.

b For APS common ports and APS SONET VTGs, right click on an APS Common Config SONET channel icon and choose Create Maximum # of Channels from the contextual menu. The Create Maximum # of Channels form opens.

Note — APS common ports and APS SONET VTGs are created when you create APS groups. See Procedure 34-1 for more information.

4 Configure the parameters, as required:

- Channel Type
- STs1 Channel Payload Type
- Ds3 Channel Payload Type
- Vt15 Channel Payload Type
- Time Slots per DS0 Channel Group
- Encapsulation Type

5 Click on the Execute button. The channels and sub-channels appear in the navigation tree under the port of the daughter card.

Procedure 16-27 To configure SONET sub-channels

SONET sub-channels are available on deep channelized OC12 and OC3 ports. SONET STS1 channels support the following payload types:

- DS3
- VT15
- VT2

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure SONET sub-channels and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level, right-click on a port object and choose Create Channel. The Create Channel form opens with the General tab displayed.

Note — When there are no channels available on that port, the Create Channel menu option menu is dimmed

5 Configure the parameters:

- Local Channel ID
  - For an OC3 port, use a value from 1 to 3.
  - For an OC12 port, use a value in the format <1 to 4>.<1 to 3>
- Payload Type
- DDM Event Suppression

The DDM Event Suppression parameter is configurable only on ports on SFPs and XFPs optical modular transceivers.

6 Click on the Apply button.

The STS1 (AU3) channel appears in the navigation tree under the port of the daughter card.

7 Create the STS1 (AU3) sub-channels according to the payload type configured:

a To create VT15 (Sdh TU11) sub-channels, go to Procedure 16-29.

b To create VT2 (Sdh TU12) sub-channels, go to Procedure 16-29.

c To create a DS3 or E3 (SDH framing only) clear channel, go to step 8.

8 To create a DS3 or E3 clear channel, perform the following steps:

i From the navigation tree, select an STS1 or AU3 channel and choose Create Channel from the contextual menu. The DS3/E3 Channel (Create) form opens.

- For AU3 channels, DS3 and E3 channelization is available.
- For STS1 channels, only DS3 channelization is available.

ii Configure the Description parameter.

iii Configure the Channelized parameter.

- Choose Ds1 to channelize the DS3 to carry up to 28 DS1 channelized to the DS0 level.
- Choose E1 to channelize the DS3 to carry up to 21 E1 channelized to the DS0 level.
- Choose None to create a DS3 or E3 clear channel. Configure the following parameters:
  - Configured MAC
  - Encapsulation Type
  - Speed
  - MTU (bytes)
  - Load Balance Algorithm

iv Click on the OK button.

If you set the Channelized parameter to None, a DS3 clear channel in Access mode is created under the STS1 or the AU3 in the navigation tree.

If you set the Channelized parameter to DS1, a DS3 channelized for DS1 is created under the STS1 (AU3). Go to step 11 in Procedure 16-33 to create the DS1 channels.

If you set the Channelized parameter to E1, a DS3 channelized for E1 is created under the STS1 (AU3) in the navigation tree. Go to step 11 in Procedure 16-33 to create the E1 channels.

Procedure 16-28 To configure SDH sub-channels

SDH sub-channels are available on deep channelized OC12 and OC3 ports. SDH AU4 channels support the following payload types:

- TU3
- TU11
- TU12

SDH AU3 channels support the following payload types:

- DS3
- E3
- TU11
- TU12

Perform this procedure to configure SDH sub-channels on ports that provide channelized services. You must first configure port framing to SDH since default framing on SONET/SDH ports is SONET.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure SDH sub-channels and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a deep channelized port. The Physical Port (Edit) form opens with the General tab displayed.

5 Click on the SONET tab and set the Framing parameter to SDH.

6 Click on the OK button.

7 Right-click on the port again and choose Create Channel from the contextual menu. The Channel Type Selection form opens.

8 Choose one of the following channel types and click on the OK button:

a SONET Sts1 (Sdh Au3).

SONET STS1 channelization and SDH AU3 channelization are equivalent. Go to step 5 of Procedure 16-27.

b SONET Sts3 (Sdh Stm1).

The Sts3 SONET Channel (Create) form opens with the General tab displayed. If there are no channels available on that port, the Create Channel menu option menu is dimmed.

The Payload Type parameter for SDH STM1 (AU4) is set to TUG3. There is no SONET framing equivalent. Go to step 9.

9 Configure the parameters:

- Description
- Local Channel ID

10 Click on the States tab.

11 Configure the Administrative State

12 Click on the OK button. The STM1 (AU4) channel appears in the navigation tree under the port of the daughter card. It contains three TUG3 groups.

13 Right-click on a TUG3 group and choose Properties from the contextual menu. The Sdh Tug3 (Edit) form opens with the General tab displayed.

14 Choose one of the following options to configure the Payload Type parameter:

a PDH Tu3. Click on the Cancel button and go to step 15 to create a TU3 channel.

b SONET VT15 (SDH Tu11). Click on the Apply button and go to Procedure 16-29.

c SONET VT2 (SDH Tu12). Click on the Apply button and go to Procedure 16-29.

15 To create a TU channel, right-click on the TUG3 group and choose Create Channel from the contextual menu. The TU3 Channel (Create) form opens.

16 Configure the parameters:

- Description
- Payload Type

17 Click on the States tab.

18 Configure the Administrative State.

19 Click on the OK button. A TU3 channel is created under the TUG3 group in the navigation tree.

20 Right-click on the Tu3 and choose Create Channel from the contextual menu. The DS3/E3 Channel (Create) form opens with the General tab displayed.

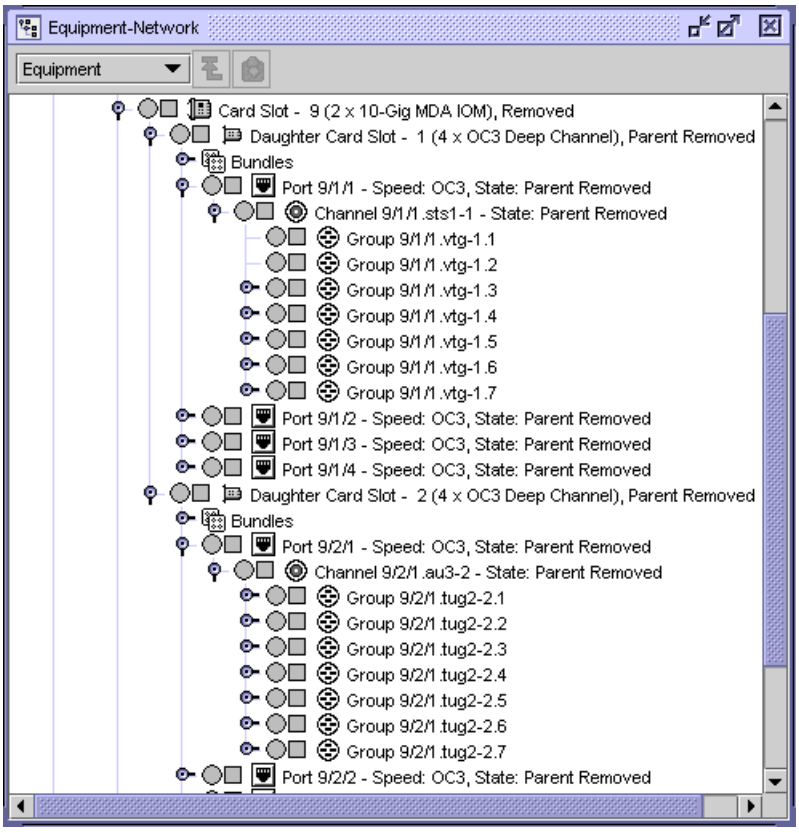
The E3 is the only payload type available.

21 Configure the parameters:

- Description
- Configured MAC
- Encapsulation Type
- Speed
- MTU (bytes)
- Load Balance Algorithm

22 Click on the States tab.

23 Configure the Administrative State



24 Click on the OK button. An E3 clear channel is created under the AU4/TUG3 in the navigation tree.

Procedure 16-29 To create VT15 (TU11) or VT2 (TU12) sub-channels

A SONET VTG and an SDH TUG2 are equivalent groups. A VTG contains four VT15 channels or three VT2. A TUG2 contains four TU11 channels or three TU12. An SDH TUG 3 has no SONET equivalent, however, it contains seven TUG2. (An STM1/AU4 contains three TUG3). See "Comparison of SONET and SDH hierarchies" in section 16.3.

An STS1 channelized to carry a VT15 or VT2 payload type contains seven VTG. An AU3 or a TUG3 channelized to carry a TU11 or TU12 payload type contain seven TUG2. STS1 and AU3 channelization are shown in Figure 16-11.

Figure 16-11 SONET VTG and SDH TUG2 in navigation tree

Each VTG (TUG2) supports up to four VT15 (TU11) channels or three VT2 (TU12) channels. Create each VTG/TUG2 channel one at time.

1 Complete Procedure 16-27 or Procedure 16-28 to carry a VT15 (TU11) or VT2 (TU12) payload type.

   a Go to step 2 to create a VT15 (TU11) channel.

   b Go to step 3 to create a VT2 (TU12) channel.

2 To create a VT15 (TU11) channel, perform the following steps:

   i Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

   ii Right-click on the device where you want to create a VT15 (TU11) channel and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

   iii On the Network Element (Edit) form navigation tree, expand the Shelf icon.

   iv Expand to the channel level, right-click on a VTG or TUG2 channel group that is to carry a VT15 (TU11) payload and choose Create Channel from the contextual menu. The SONET VT (SDH Tu) Channel (Create) form opens.

   v Configure the parameters:

   - Local Channel ID
     Set the Local Channel ID to a value in the range 1 to 4 since there are four VT15 (TU11) in a VTG (TU2).
   - Description

   The default payload type for a VT15 (TU11) channel is PDH DS1. There is no other available payload type.

   vi Click on the OK button. A VT15 channel is created under the VTG or a TU11 channel is created under the TUG2 in the navigation tree.

   vii Right-click on a VT15 or TU11 channel and choose Create Channel from the contextual menu. The DS1/E1 Channel (Create) form opens.

   The Local Channel ID is equal to the VT15 channel Local Channel ID parameter and the channel type is set to DS1 since a VT15 or TU11 channel supports one DS1.

   viii Click on the OK button A DS1 channel is created under the VT15 or the TU11 in the navigation tree.

   You can create up to 28 VT15 (TU11) channels on a VTG (TUG2).

ix Repeat steps 1 and 2 for each VT15 (TU11) channel that you want to create.

x Since a DS1 channel is not used as a SAP, create a DS0 group for each DS1 channel created. Go to step 12 of Procedure 16-33.

3 To create a VT2/TU12 channel, complete these steps:

i From the navigation tree, select a VTG or TUG2 channel group to carry a VT2 (TU12) payload and choose Create Channel from the contextual menu. The SONET VT (SDH Tu) Channel (Create) form opens.

ii Configure the parameters:

- Local Channel ID

  Set the Local Channel ID to a value in the range 1 to 3 since there are three VT2 (TU12) in a VTG (TUG2).
- Description
- Payload Type

  PDH E1 is not available for SONET framing.

iii Click on the OK button. A VT2 channel is created under the VTG, or a TU12 channel is created under the TUG2 in the navigation tree.

iv Right-click on the VT2 or TU12 channel and choose Create Channel from the contextual menu. The DS1/E1 Channel (Create) form opens.

The Local Channel ID is equal to the VT2 channel Local Channel ID parameter, since a VT2 channel supports one E1 or DS1.

v Click on the States tab.

vi Configure the Administrative State parameter.

vii Click on the OK button. A DS1 channel is created under the VT2 in the navigation tree. An E1 or DS1 is created under the TU12. You can create up to 21 VT2 (TU12) channels on a VTG (TUG2).

viii Repeat steps 1 and 2 for each VT2 (TU12) that you want to create.

ix Since a DS1/E1 channel is not used as a SAP, create a DS0 group for each DS1 or E1 channel created. Go to step 12 of Procedure 16-33.

Procedure 16-30 To create TDM DS1 or E1 channels

Perform this procedure to create DS1/E1 channels and child objects on a channelized DS1/E1 port.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure TDM DS1 or E1 channels and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a port. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Current OLC State
- Revert OLC State

6 Select the DS1/E1 tab and configure the parameters:

- Port Type
- Line Length

7 Click on the OK button.

8 Right-click on the port again and choose Create Channel from the contextual menu. The DS1/E1 Channel (Create) form opens. If there are no channels available on that port, the Create Channel menu option is dimmed.

9 Click on the OK button.

10 To create DS0 channel groups, complete these steps:

i From the navigation tree, right-click a DS1 or E1 channel under the required port and choose Create Channel from the contextual menu. The DS0 Channel Group (Create) form opens with the General tab displayed.

ii Configure the parameters:

- Local Channel ID
  For a DS0 group from a DS1 choose from 1 to 24. For a DS0 group from an E1, choose from 2 to 32.
- Description
- Mode
- Encapsulation Type
- MTU (bytes)

Note 1 — All channel groups on a 7705 SAR ASAP port must have the same mode configured. When the first channel group is configured, all other channel groups on the port must be set to the same mode.

Note 2 — The default encapsulation type for the 7705 SAR is N/A. The encapsulation type must be changed from N/A to a valid type. For instance, to support CAS signaling, the encapsulation type must be set to CEM. After a valid encapsulation type is configured for a channel group, the encapsulation type cannot be changed for that channel group. To change the encapsulation type, the channel group must be deleted and recreated.

Note 3 — On a 16/32x Channelized ASAP, you must configure the MDA mode in order to use certain encapsulation types. See Procedure 15-33 for more information on configuring the MDA mode.

iii Click on the Channel Group tab.

iv Configure the parameters:

- Time Slots
  Choose one or more timeslots. You can use the Select All and Deselect All buttons.
- Idle Payload Fill Type
- Idle Payload Fill Pattern
- Idle Signal Fill Type
- Idle Signal Fill Pattern
- BER SF Link Down
- Signal Mode

v Click on the OK button. The timeslot is assigned to the DS0 channel group in the navigation tree.

Procedure 16-31 To configure TDM DS1 or E1 channels

Perform this procedure to configure DS1/E1 channel parameters and child objects on a channelized DS1/E1 port, add a DS0 channel group, collect and view performance statistics, or view alarm information.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device you need to configure TDM DS1 or E1 channels and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Expand the Shelf icon to the channel level and choose a DS1 or E1 channel. The DS1/E1 Channel (Edit) form opens with the General tab displayed.

4 Click on the States tab.

5 Configure the Administrative State parameter.

6 Click on the Channel tab button. The DS1/E1 Channel (Edit) form opens.

7 Configure the parameters, if applicable:

- Channel Framing
- Clock Source
- Loopback
- Report Alarms
- Hold Time Up (100s of milliseconds)
- Hold Time Down (100s of milliseconds)
- Respond to Remote Loop Signal
- Signal Mode
- Threshold for BER SD Notifications
- Threshold for BER SF Notifications
- Synchronous Status Messages
- E1 Tx DUS/DNU
- E1 SSM-Bit

Note 1 — The Synchronous Status Messages, E1 Tx DUS/DNU, and E1 SSM-Bit parameters are configurable only on E1 channels in a Release 6.0 or later 7705 SAR.

Note 2 — The Clock Source parameter value Differential is only supported on a 16/32 × Channelized DS1/E1 ASAP v2 in a Release 6.0 R1 or later 7705 SAR-8, 7705 SAR-8 v2, or 7705 SAR-18, a 4 × Channelized DS3/E3 ASAP in a Release 6.0 R3 or later 7705 SAR, and an ASAP channelized card in a Release 6.0 R2 or later 7705 SAR-A.

Note 3 — If you create an MLPPP bundle and the DS1 BER exceeds a threshold, the PPP link is automatically removed from the MLPPP bundle.

8 Add a DS0 channel group, if required.

i Click on the SubChannels tab.

ii Click on the Create Cha... tab. The DS0 Channel Group (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Local Channel ID
- Description
- Mode
- Encapsulation Type
- MTU (bytes)

Note 1 — On a 16/32x Channelized ASAP, you must configure the MDA mode in order to specify the encapsulation type. See Procedure 15-33 for more information about configuring the MDA mode.

Note 2 — You must set the value of the Encapsulation Type parameter to CEM if you are configuring an MDA card of type 16 × Channelized DS1/E1 ASAP v2 or 32 × Channelized DS1/E1 ASAP v2 on a 7705 SAR-8 or 7705 SAR-18.

iv Click on the OK button. The DS0 Channel Group (Create) form closes and a dialog box appears.

v Click on the OK button.

9 Click on the Statistics tab to collect and view performance statistics, if required.

10 Perform one of the following:

- **a** Click on the Collect button to collect performance statistics data on demand. The collected statistics are listed on the form.
- **b** Click on the Collect All button to collect one on-demand statistics record for each statistic type that the object supports. The collected statistics are listed on the form.

11 Choose a statistic from the list and click on the Properties button. The Statistics Record form opens.

12 View the statistics data, if required.

13 Close the Statistics Records form.

14 Click on the Faults tab to view alarm information, if required.

Note — If are configuring a 7705 SAR and selected a clock source of adaptive, you can click on the Adaptive Clock History tab to view channel adaptive clock performance data for the preceding 15 min.

15 Click on the OK button. A dialog box appears.

16 Click on the Yes button. The DS1/E1 Channel (Edit) form closes.

Procedure 16-32 To create serial channels

Perform this procedure to create serial channel and child objects from a Serial Data Interface port.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the device where you want to configure serial channels and expand to the port level.

3 Right-click on the port and choose Create Channel from the contextual menu. The Serial Channel (Create) form opens. If there are no channels available on that port, the Create Channel menu option is dimmed.

4 Click on the States tab.

5 Configure the Administrative State parameter.

6 Click on the Apply button. The Serial Channel (Edit) form refreshes with additional tabs.

7 Click on the Channel tab.

8 Configure the parameters:

- Device Mode
- Gender
- Speed
- Loopback
- Multidrop Data Bridge
- S-Bit Signalling
- HCM Data Position
- Character Length
- Parity
- Stop Bits
- Report Alarms
- DTR / DSR Input
- RTS / DCD / C / I Input
- ALB / CTS Input
- RDL / RI Input
- DSR / DTR Output
- DCD / RTS / I / C Output
- CTS / ALB Output
- RI / RDL Output
- Hold Time Up (milliseconds)
- Hold Time Down (milliseconds)

Depending on the serial type of the configured port, different parameters are configurable in the Control Leads panel.

9 Create DS0 channel groups:

i Click on the SubChannels tab.

ii Click on the Create Cha... button. The DS0 Channel Group (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Description
- Encapsulation Type
- MTU (bytes)

Note 1 — The default encapsulation type for the 7705 SAR is N/A. The encapsulation type must be changed from N/A to a valid type. After a valid encapsulation type is configured for a channel group, the encapsulation type cannot be changed for the channel group. To change the encapsulation type, the channel group must be deleted and re-created.

Note 2 — On an SDI MDA, you must configure the serial type to X.21 or V.35 to use the FR, HDLC, or cHDLC encapsulation types. See Procedure 16-12 for more information.

iv Click on the OK button. The DS0 Channel Group (Create) form closes.

10 Close the Serial Channel (Edit) form.

Procedure 16-33 To create TDM DS3 channels

Perform this procedure to create DS3 channel and children objects from a channelized DS3 port.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to create a TDM DS3 channel and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level and click on a port. The Physical Port (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Current OLC State

6 Choose the DS3/E3 tab and configure the parameters:

- Line Buildout
- Type. Choose DS3.

7 Click on the OK button.

8 Right-click on the port again and choose Create Channel from the contextual menu. The DS3/E3 Channel (Create) form opens. If there are no channels available on that port, the Create Channel menu option is dimmed.

9 To create the DS3/E3 channel, complete these steps:

a Configure the Channelized parameter to DS1 or E1, if you want to channelize to the DS0 level.

b Configure the Channelized parameter to None if this is a clear channel application.

Configure the parameters, if applicable:

- Description
- Mode
- Configured MAC
- Encap Type
- Speed
- MTU (bytes)
- Load Balance Algorithm

The Local Channel ID parameter is configured automatically and the Mode parameter is always Access for TDM.

Note 1 — On a 4x Channelized ASAP, you must configure the MDA mode in order to use certain encapsulation types. See Procedure 15-33 for more information on configuring the MDA mode.

Note 2 — If you want to configure a DS3/E3 channel as a network interface on a channelized ASAP MDA, see Procedure 16-35.

10 Click on the OK button.

If this is a Channelized DS1 or E1 application, continue to step 11.

11 To create DS1 or E1 channels, complete these steps:

i From the navigation tree, select a DS3 channel and choose Create Channel from the contextual menu. The Create DS1/E1 Channel form opens.

ii Configure the Local Channel ID parameter.

- For DS1 choose from 1 to 28.
- For E1 choose from 1 to 21.

iii Click on the OK button. The DS1 or E1 channels are created under the DS3 in the navigation tree.

12 To create DS0 channel groups, complete these steps:

i From the navigation tree, select a DS1 or E1 channel and choose Create Channel from the contextual menu to create DS0 groups. The DS0 Channel (Create) form opens with the General tab displayed.

ii Configure the parameters:

- Local Channel ID
- Description
- Configured MAC
- Mode
- Encap Type
- Speed
- MTU (bytes)
- Load Balance Algorithm

For a DS0 group from a DS1 choose from 1 to 24 for the Local Channel ID parameter. For a DS0 group from an E1, choose from 2 to 32.

Note — On a 4x Channelized ASAP, you must configure the MDA mode in order to use certain encapsulation types. See Procedure 15-33 for more information on configuring the MDA mode.

iii Click on the Channel Group tab.

iv Configure the parameters:

- CRC Precision
- Idle Cycle Flags
- Time Slots
- BER SF Link Down

v Click on the OK button. The timeslot is assigned to the DS0 channel group in the navigation tree.

Procedure 16-34 To configure TDM DS3 channels

Perform this procedure to configure DS3 channels and children objects from a channelized DS3 port.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure TDM DS3 channels and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the channel level and click on a DS3 channel. The DS3/E3 Channel (Edit) form opens with the General tab displayed.

5 Configure the Description parameter.

6 Configure the Channelized parameter and click on the Apply button.

a If you choose None, go to step 7.

b If you choose DS1 or E1, perform steps 12 to 35.

7 Configure the parameters:

- Configured MAC
- Speed
- MTU (bytes)
- Load Balance Algorithm

8 Configure the Encapsulation Type parameter and click on the Apply button.

a If you choose BCP Null, BCP DOT1 Q, or IPCP, go to step 9.

b If you choose FR, go to step 10.

c If you choose Cisco HDLC, go to step 11.

d If you choose WAN Mirror, perform steps 13 to 22.

9 Configure the PPP interface for the channel, if required. Perform the following steps:

i Click on the Edit PPP button. If the Edit PPP button is not visible, click on the More Actions button and choose Edit PPP. The PPP Interface form opens with the General tab displayed.

ii Configure the parameters:

- Period
- Drop Count

iii To view port, PPP control protocol, statistics, or alarm information for the PPP interface, click on the appropriate tab.

iv Click on the OK button. The PPP Interface form closes.

v Perform steps 13 to 22.

10 Configure the FR interface, if required. Perform the following steps:

i Click on the Edit FR button. If the Edit FR button is not visible, click on the More Actions button and choose Edit FR. The FR Interface form opens with the General tab displayed.

ii Configure the parameters:

- LMI Type
- LMI Mode
- Link Identifier
- Error Threshold
- Monitored Events
- Polling Interval (seconds)
- Full Enquiry Interval

iii Click on the Frf12 tab.

iv Set the Mode parameter to Enabled.

v Configure the Fragment Threshold parameter.

vi Click on the Select button beside the MCFR Egress QoS Profile parameter. The Select MCFR Egress Qos Profile - FR Configuration form opens.

vii Choose a profile from the list and click on the OK button. The Select MCFR Egress Qos Profile - FR Configuration form closes and the FR Interface form is refreshed with the MCFR Egress QoS Profile information.

viii To view port, statistical, or alarm information for the FR interface, click on the appropriate tab.

ix Click on the OK button. The FR Interface form closes.

x Perform steps 13 to 22.

11 Configure the Cisco HDLC information.

i Click on the Cisco HDLC tab.

ii Configure the parameters:

- Keep Alive (seconds)
- Up Count
- Down Count

iii Perform steps 13 to 22.

12 Configure the DS1 and DS0 channels. Perform the following steps:

i Click on the SubChannels tab.

ii Click on the Create button. The DS1/E1 Channel (Create) form opens with the General tab displayed.

iii Configure the Local Channel ID parameter.

iv Click on the States tab.

v Configure the Administrative State parameter.

vi Click on the OK button. The DS1/E1 Channel (Create) form closes.

13 Click on the States tab.

14 Configure the Administrative State parameter.

15 Click on the Channel tab. The DS3/E3 Channel (Edit) form opens.

16 Configure the parameters, if applicable:

- Channel Framing
- CRC Precision
- Clock Source
- Idle Cycle Flags
- Loopback
- Subrate CSU Mode
- Subrate Range
- Loop Respond
- Report Alarms
- Bit Error Insertion Rate (E3 only)
- Pattern (E3 only)
- Duration (seconds) E3 only

Note — The Clock Source parameter value Differential is only supported on a 16/32 × Channelized DS1/E1 ASAP v2 in a Release 6.0 R1 or later 7705 SAR-8, 7705 SAR-8 v2, or 7705 SAR-18, a 4 × Channelized DS3/E3 ASAP in a Release 6.0 R3 or later 7705 SAR, and an ASAP channelized card in a Release 6.0 R2 or later 7705 SAR-A.

17 Click on the Message Data Link tab.

18 Configure the parameters:

The MDL Message Type parameter specifies the Line Message Data Link message for a DS3 and specifies the transmission method of a message over a channelized interface. The parameter is only applicable if the DS3 is using C-bit framing. The default is disabled. Click on the check boxes to enable transmission methods and enter text strings to choose the message options for this parameter as required. The transmission options are:

- Test Signal
- DS3 Path
- Idle Signal

Table 16-6 describes the MDL message options.

Table 16-6 MDL message options

Option	String Length	Description
Port Number String	0 to 38 characters	specifies the port ID code
Generator Number String	0 to 38 characters	specifies the generator number to send in the MDL test signal message
Equipment ID Code	0 to 10 characters	specifies the Equipment ID code
Location ID Code	0 to 11 characters	specifies the Location ID code
Frame ID Code	0 to 10 characters	specifies the Frame ID code
Unit ID Code	0 to 6 characters	specifies the unit ID code
Facility ID Code	0 to 38 characters	specifies the facility ID code

19 Click on the Terminations tab to view channel termination information.

20 Click on the Statistics tab to view statistical information.

21 Click on the Faults tab to view alarm information.

22 Click on the OK button. The DS3/E3 Channel (Edit) form closes.

23 Right-click on a DS1 channel in the navigation tree and choose Properties from the contextual menu. The property form for the channel opens with the General tab displayed.

24 Click on the States tab.

25 Configure the Administrative State parameter, if required.

26 Add a DS0 channel group, if required. Perform the following steps:

i Click on the SubChannels tab.

ii Click on the Create button. The DS0 Channel Group (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Local Channel ID
- Description
- Configured MAC
- Encapsulation Type
- Speed
- MTU (bytes)
- Load Balance Algorithm

Note — On a 4x Channelized ASAP, you must configure the MDA mode in order to use certain encapsulation types. See Procedure 15-33 for more information on configuring the MDA mode.

iv Click on the OK button. The DS0 Channel Group (Create) form closes.

27 Click on the Channel tab.

28 Configure the parameters:

- Channel Framing
- Clock Source
- Idle Cycle Flags
- Loopback
- Bit Error Insertion Rate (E3 only)
- Pattern (E3 only)
- Duration (seconds) E3 only

29 Click on the Statistics tab to view statistical information.

30 Click on the Faults tab to view information about alarms.

31 Click on the OK button. The channel properties form closes.

32 Configure timeslots for the DS0 channel group. Perform the following steps.

i Choose a DS0 channel in the navigation tree and choose Properties from the contextual menu. The property form for the channel opens with the General tab displayed.

ii Configure the parameters, as required.

iii Click on the States tab.

iv Configure the Administrative State parameter.

v Click on the Channel Group tab.

vi Configure the parameters:

- CRC Precision
- Idle Cycle Flags
- Time Slots

  Choose one or more timeslots. You can use the Select All and Deselect All buttons.

vii If you set the Encapsulation Type parameter to BCP Null, BCP DOT1 Q, or IPCP in step ii, you can configure the PPP for the timeslot on the Channel Groups tab.

- Click on the Edit PPP button. If the Edit PPP button is not visible, click on the More Actions button and choose Edit PPP. The PPP Interface form opens with the General tab displayed.
- Configure the parameters:
  - Period
  - Drop Count
  - Compression

    The Compression parameter is configurable when the DS1 or E1 channel group is on an ASAP MDA in a 7710 SR or 7750 SR.
- Click on the OK button. The PPP Interface form closes and the DS0 Channel Group (Edit) form reappears.

33 Click on the Statistics tab to view statistical information.

34 Click on the Faults tab to view information about alarms.

35 Click on the OK button. The DS3/E3 Channel (Edit) form closes.

Procedure 16-35 To configure a DS3/E3 channel as a network interface on a channelized ASAP MDA

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a DS3/E3 channel and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the port level.

5 Perform one of the following.

a If you are configuring an OC-*n* channelized ASAP MDA, right-click on an available port and choose Create Channel from the contextual menu. The Sts SONET Channel (Create) form opens with the General tab displayed; go to step 6.

b If you are configuring a DS3/E3 channelized ASAP MDA, right-click on an available port and choose Create Channel from the contextual menu. The DS3/E3 Channel (Create) form opens with the General tab displayed; go to step 11.

6 Configure the parameters:

- Local Channel ID
- Description
- Payload Type

7 Click on the States tab.

8 Configure the Administrative State parameter.

9 Click on the OK button.The Sts SONET Channel (Create) form closes and the STS1 channel appears in the navigation tree under the port of the channelized ASAP daughter card.

10 Right-click on the STS1 channel and choose Create Channel from the contextual menu. The DS3/E3 Channel (Create) form opens with the General tab displayed.

11 Configure the parameters:

- Description
- Configured MAC
- Mode
  You must set the Mode parameter to Network.
- Encapsulation Type
  The only available encapsulation type available in network mode is PPP.
- Speed
  The only available speed is line rate.
- MTU (bytes)
- Load Balance Algorithm

12 Click on the States tab.

13 Configure the Administrative State parameter.

14 Click on the Apply button. The form displays additional tabs.

15 Click on the Channel tab.

16 Configure the parameters:

- Channel Framing
- CRC Precision
- Clock Source
- Idle Cycle Flags
- Loopback
- Subrate CSU Mode
- Loop Respond
- Report Alarms

17 Click on the Message Data Link tab.

18 Configure the parameters:

The MDL Message Type parameter specifies the Line Message Data Link message for a DS3 and specifies the transmission method of a message over a channelized interface. The parameter is only applicable if the DS3 is using C-bit framing. The default is disabled. Click on the check boxes to enable transmission methods and enter text strings to choose the message options for this parameter as required. The transmission options are:

- Test Signal
- DS3 Path
- Idle Signal

Table 16-7 describes the MDL message options.

Table 16-7 MDL message options

Option	String Length	Description
Port Number String	0 to 38 characters	specifies the port ID code
Generator Number String	0 to 38 characters	specifies the generator number to send in the MDL test signal message
Equipment ID Code	0 to 10 characters	specifies the Equipment ID code
Location ID Code	0 to 11 characters	specifies the Location ID code
Frame ID Code	0 to 10 characters	specifies the Frame ID code
Unit ID Code	0 to 6 characters	specifies the unit ID code
Facility ID Code	0 to 38 characters	specifies the facility ID code

19 Click on the OK button. The DS3/E3 or Sts SONET Channel (Create) form closes and a DS3/E3 channel appears in the navigation tree under the port on the channelized ASAP MDA.

Procedure 16-36 To configure an L3 interface on a DS3/E3 channel on a channelized ASAP MDA

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure an L3 interface and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the channel level and click on a DS3/E3 channel on a channelized ASAP MDA port. The DS3/E3 Channel (Edit) form opens with the General tab displayed.

5 Click on the Policies tab to configure the policies for the DS3/E3 channel. Perform the following steps.

i Click on the Select button beside the Network Queue Policy Name parameter. The Select Network Queue Policy - DS3/E3 Channel list form opens.

ii Select a network queue policy from the list and click on the OK button. The Select Network Queue Policy - DS3/E3 Channel list form closes and the DS3/E3 Channel (Edit) form reappears.

iii Click on the Select button beside the ID parameter in the Accounting Policy panel. The Select Accounting Policy - DS3/E3 Channel list form opens.

iv Select an accounting policy from the list and click on the Ok button. The Select Accounting Policy - DS3/E3 Channel list form closes and the DS3/E3 Channel (Edit) form refreshes with the accounting policy information.

v Configure the Collect Accounting Statistics parameter.

vi Click on the Select button in the Port Scheduler Policy panel to assign a port scheduler policy to the port. The Select Port Scheduler Policy - Physical Port form opens.

vii Select a port scheduler policy from the list and click on the OK button. The Select Port Scheduler Policy - Physical Port form closes.

6 Click on the Network Interfaces tab.

7 Click on the Create button. The Create Network Interface - Routing Instance form opens.

8 Perform steps 6 to 49 of Procedure 22-9 to create a network interface on the DS3/E3 channel.

The port in step 6 of Procedure 22-9 is set to the DS3/E3 channel by default. Go to step 12 of Procedure 22-9.

9 The L3 interface appears on the Network Interfaces tab. Close the DS3/E3 Channel (Edit) form.

Procedure 16-37 To configure a PVC

PVCs are automatically created by the device when a new L3 interface over ATM is created on the 5620 SAM, and when a new ILMI link is created between ATM interfaces. See Procedure 16-38 for more information about creating ILMI links.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure a PVC and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 On the Network Element (Edit) form navigation tree, expand the Shelf icon.

4 Expand to the channel level and click on a SONET/SDH ATM clear channel. The property form for the channel opens with the General tab displayed.

5 Click on the L3 Interfaces tab.

6 Choose the appropriate interface from the list and click on the Properties button. The L3 Interface form opens.

7 Click on the ATM tab.

8 Configure the parameters:

- AAL5 Encapsulation
- ATM OAM Alarm Cell Handling

9 Click on the Apply button to save the changes.

10 To view more information about the PVC:

i Click on the View PVC Connection button. The ATM PVC Connection form opens.

ii Click on the tabs to view information for the ATM PVC connection.

11 Click on the Cancel button to close the ATM PVC Connection form, the L3 Interface form, and the channel form.

Procedure 16-38 To create an ILMI link

Perform this procedure to create an ILMI link between device ATM interfaces. This functionality is supported on the 7750 SR and 7710 SR. Ensure that ATM QoS policies are configured before you create the ILMI link. See chapter 42 for more information about creating ATM QoS policies.

1 Perform one of the following to open the ATM interface properties form.

a Use the navigation tree

i Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

ii Right-click on the device where you want to create an ILMI link and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

iii On the Network Element (Edit) form navigation tree, expand the Shelf icon.

iv Expand to the port level and click on a clear channel port. The Physical Port (Edit) form opens with the General tab displayed.

Note — A clear channel port is a port on a card that is not designated Deep Channelized.

v Click on the Channels tab.

vi Choose the appropriate channel from the list and click on the Properties button. The Channel (Edit) form opens.

vii Click on the Edit ATM button. If the Edit ATM button is not visible, click on the More Actions button and choose Edit ATM. The ATM Interface form opens with the General tab displayed.

b Use the Manage Equipment list form to search for a clear channel port with an ATM interface.

i Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

ii Choose Port from the object drop-down list.

iii Configure the filter criteria to search for ATM encapsulation types.

iv Click on the Search button. The Select form displays the results of the search.

v Select an entry by double-clicking. Alternatively, select an entry and click on the Properties button. The Select form closes and the Channel (Edit) form opens.

vi Click on the Edit ATM button. If the Edit ATM button is not visible, click on the More Actions button and choose Edit ATM. The ATM Configuration (Edit) form opens with the General tab displayed.

2 Click on the Create ILMI Link button. The Configure ILMI Link form opens with the General tab displayed.

3 Configure the parameters:

- Administrative Status
- Protocol Version
- IME Type
- Keep-Alive Polling Frequency (seconds)
- Keep-Alive Polling Count
- Keep-Alive Test Frequency (seconds)
- Restore Keep-Alive Defaults
- ILMI Link VCI
- ILMI Link VPI

The Restore Keep-Alive Defaults parameter restores the default values of the Keep-Alive Polling Frequency (seconds), Keep-Alive Polling Count, and Keep-Alive Test Frequency (seconds) parameters.

The Keep-Alive Test Frequency (seconds) parameter is configurable when the Protocol Version parameter is set to 4.0.

4 Choose an ingress ATM QoS policy by clicking on the Select button. The Select ATM Policy - ATM ILMI Link Configuration list form opens. Click on the Search button and choose an ingress ATM policy from the list to associate with the ILMI link. Click on the OK button. The Select ATM Policy - ATM ILMI Link Configuration list form closes.

5 Choose an egress ATM QoS policy by clicking on the Select button. The Select ATM Policy - ATM ILMI Link Configuration list form opens. Click on the Search button and choose an egress ATM policy from the list to associate with the ILMI link. Click on the OK button. The Select ATM Policy - ATM ILMI Link Configuration list form closes.

6 Click on the Finish button. The Configure ILMI Link form closes and the ATM Configuration (Edit) form reappears.

7 Close the ATM Configuration (Edit) form. The Channel (Edit) form reappears.

8 Close the Channel (Edit) form.

Procedure 16-39 To configure an ILMI link

1 Perform step 1 of Procedure 16-38 to open the ATM Configuration (Edit) form.

2 Click on the Edit ILMI Link button. The ILMI Link form opens with the ILMI Link Configuration tab displayed.

3 Configure the parameters, as required.

- Administrative Status
- Protocol Version
- IME Type
- Keep-Alive Polling Frequency (seconds)
- Keep-Alive Polling Count
- Keep-Alive Test Frequency (seconds)
- Restore Keep-Alive Defaults

The Restore Keep-Alive Defaults parameter restores the default values of the Keep-Alive Polling Frequency (seconds), Keep-Alive Polling Count, and Keep-Alive Test Frequency (seconds) parameters.

The Keep-Alive Test Frequency (seconds) parameter is configurable when the Protocol Version parameter is set to 4.0.

4 Choose an ingress ATM QoS policy by clicking on the Select button. The Select ATM Policy - ATM ILMI Link Configuration list form opens. Click on the Search button and choose an ingress ATM policy from the list to associate with the ILMI link. Click on the OK button. The Select ATM Policy - ATM ILMI Link Configuration list form closes.

5 Choose an egress ATM QoS policy by clicking on the Select button. The Select ATM Policy - ATM ILMI Link Configuration list form opens. Click on the Search button and choose an egress ATM policy from the list to associate with the ILMI link. Click on the OK button. The Select ATM Policy - ATM ILMI Link Configuration list form closes.

6 Click on the Peer Interface Configuration tab to view ILMI properties of the peer interface of the link.

7 Click on the OK button to close the Configure ILMI Link form. The ATM Configuration (Edit) form reappears.

8 To remove an ILMI link, click on the Remove ILMI Link button. Removing the ILMI link also removes the PVC.

Note — An ILMI link can be removed only if its Administrative Status parameter is set to Disabled.

9 Click on the Cancel button to close the ATM Configuration (Edit) form. The Channel (Edit) form reappears.

10 Click on the Cancel button to close the Channel (Edit) form.

17 — Inventory management

17.1 Inventory management overview *17-2*

17.2 Sample inventory management workflow *17-5*

17.3 Workflow to manage inventory *17-6*

17.4 Inventory management procedures *17-7*

17.1 Inventory management overview

The 5620 SAM client GUI provides multiple ways of generating inventory data about managed devices and the managed network. You can also use the 5620 SAM-O interface to generate inventory data. See “XML requests” in the *5620 SAM XML OSS Interface Developer Guide* for information about using the 5620 SAM-O interface.

Use the list, properties, and equipment management forms to generate inventories for:

- required data for SLA audits
- equipment, such as cards, needed for sparing
- installed and in-operation equipment
- vintages, CLEI codes, and identifications

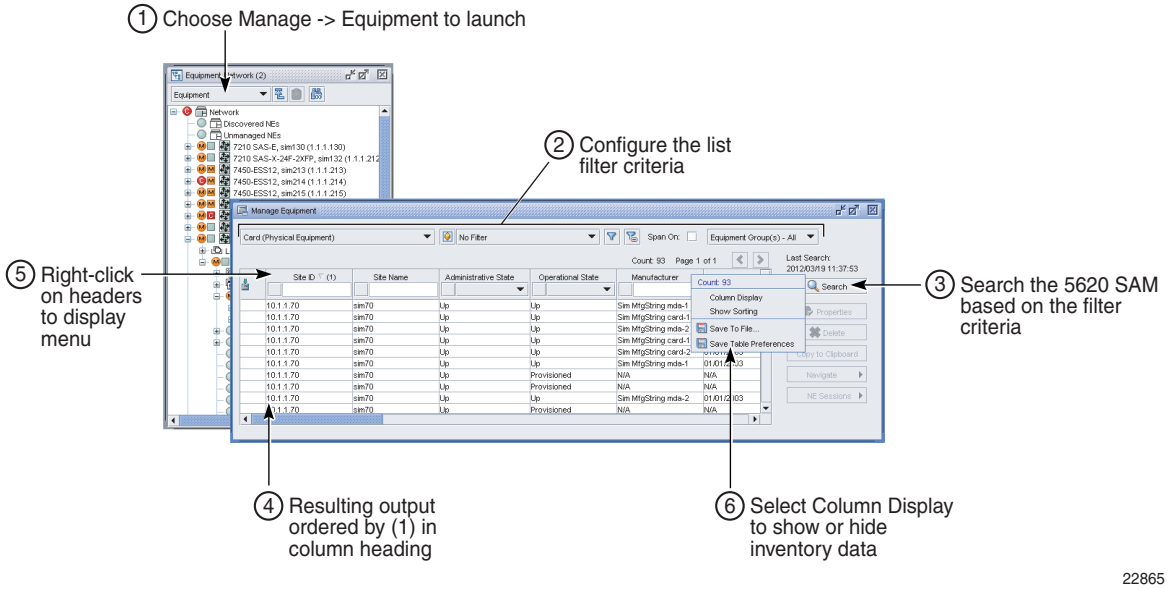
You can generate inventory data based on:

- the entire managed network, which includes all 5620 SAM-managed devices
- a managed device

Note — Not all columns in the inventory lists are applicable to all equipment types. For example, not all card types have an associated CLEI code. In situations such as this, the inventory list displays “N/A” in the column.

Figure 17-1 shows how to use the Manage Equipment form to filter and inventory data for all managed devices.

Figure 17-1 Generating inventory data for all managed devices



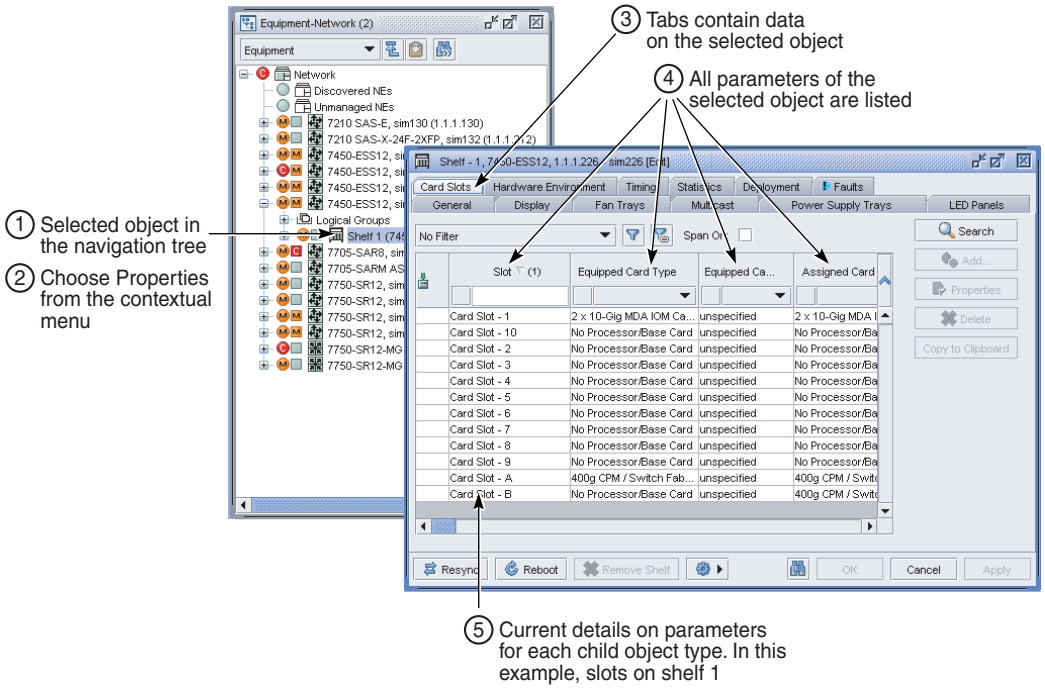


Figure 17-2 shows how to use the properties form for a network object, in this case a shelf on a managed device, to inventory data for the managed device.

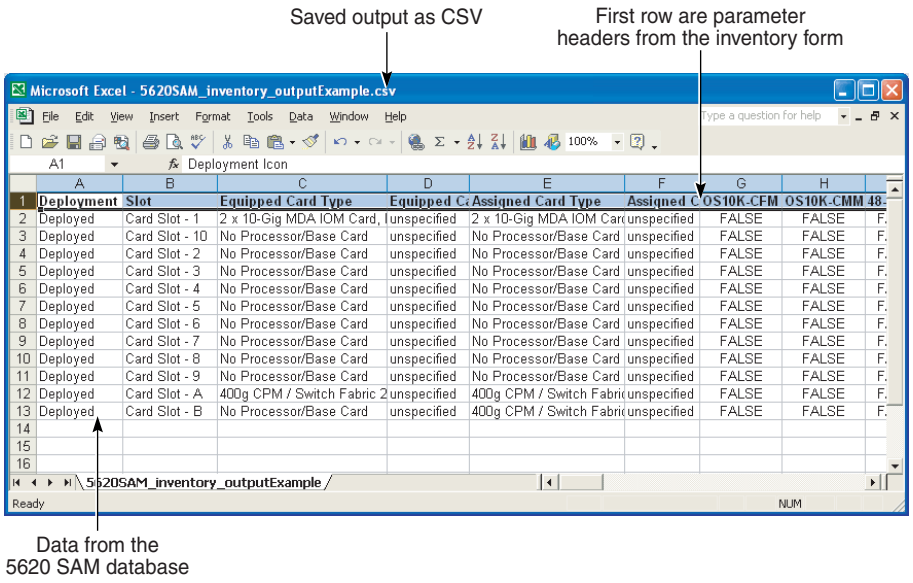
Figure 17-2 Generating inventory data for a managed device

Save the data in CSV or HTML format. You can use the saved file for further processing on another platform; for example, as input to a back-office parts management system. Figure 17-3 shows the output of an inventory list saved in CSV format.

Figure 17-3 CSV inventory output



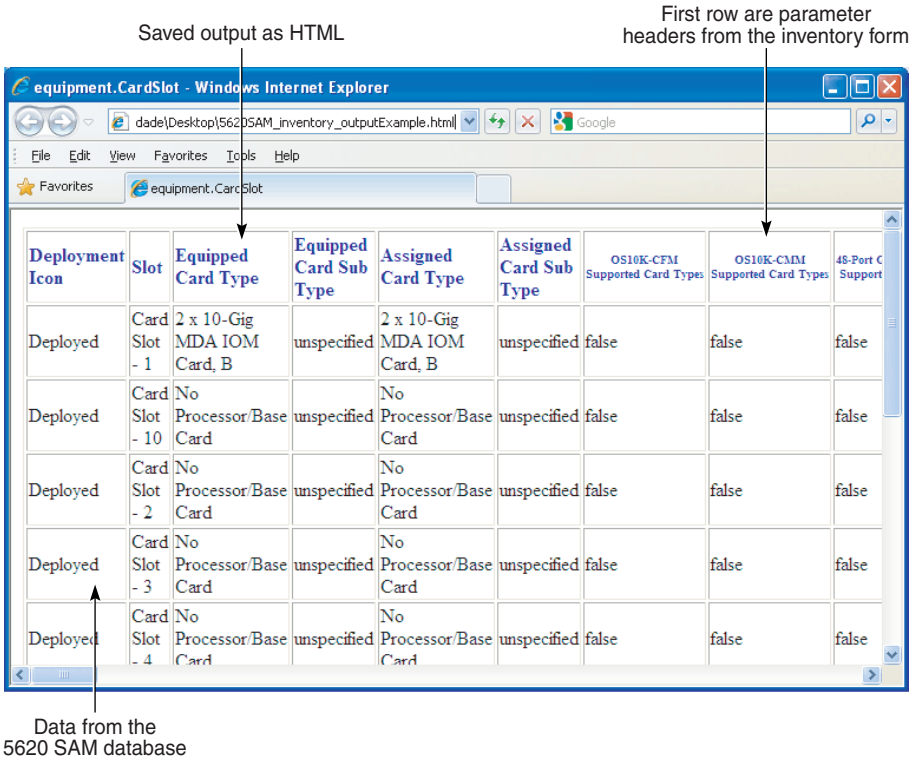


Figure 17-4 shows the output of an inventory list saved in HTML format.

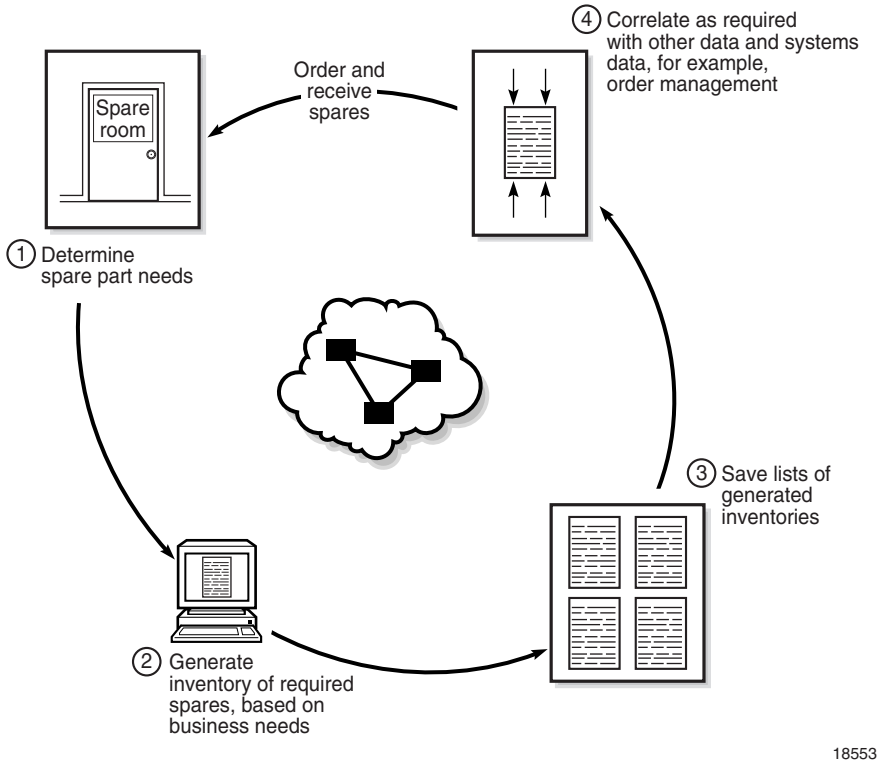

Figure 17-4 HTML inventory output

17.2 Sample inventory management workflow

Figure 17-5 shows an example of an inventory management workflow using the client GUI to generate a list of required spare parts, based on business needs.

Figure 17-5 Example of an inventory management workflow

This example is configured using the following high-level tasks.

1 Determine spare part needs based on business needs and future growth plans.

2 Using the 5620 SAM, generate inventory lists of required spares, keeping in mind the following points.

- Filter the list form to list only those objects that you want; for example, cards of a certain type required for sparing.
- Generate multiple lists, based on business needs.

3 Using the 5620 SAM, save lists of required spares in a format compatible with your back-office systems; for example, CSV or HTML. Move the lists to another system, as required by the back-office applications; for example, an order management or data management system.

4 Correlate inventory lists with data from other back-office systems, as required by business needs.

17.3 Workflow to manage inventory

1. Determine inventory management needs.
2. Provide inventory management list requirements to NOC operators.
3. As required, generate inventory lists for a managed device or for the entire network. See Procedure 17-1 for more information.
4. As required, generate inventory lists for a managed device from the 5620 SAM client GUI:
   - **a** Generate inventory lists for CLEI codes. See Procedure 17-5 for more information.
   - **b** Generate inventory lists for card software versions. See Procedure 17-6 for more information.
   - **c** Generate inventory lists for port types. See Procedure 17-7 for more information.
   - **d** Generate inventory lists for shelf data. See Procedure 17-8 for more information.
5. As required, generate inventory lists for the entire network from the 5620 SAM client GUI:
   - **a** Generate inventory lists for all managed CCMs. See Procedure 17-9 for more information.
   - **b** Generate inventory lists for all managed cards. See Procedure 17-10 for more information.
   - **c** Generate inventory lists for all managed fan trays. See Procedure 17-11 for more information.
   - **d** Generate inventory lists for all managed flash memory. See Procedure 17-12 for more information.
   - **e** Generate inventory lists for all managed physical links. See Procedure 17-13 for more information.
   - **f** Generate inventory lists for all managed ports. See Procedure 17-14 for more information.
   - **g** Generate inventory lists for all managed power supply trays. See Procedure 17-15 for more information.
   - **h** Generate inventory lists for all managed processors. See Procedure 17-16 for more information.
   - **i** Generate inventory lists for all managed shelves. See Procedure 17-17 for more information.

j Generate inventory lists for all management ports. See Procedure 17-18 for more information.

k Generate inventory data for network device SLA audits. See Procedure 17-19 for more information.

6 As required, save search filters. See Procedure 17-4 for more information.

7 As required, save inventory lists in the required formats:

a Save inventory lists in HTML format. See Procedure 17-2 for more information.

b Save inventory lists in CSV format. See Procedure 17-3 for more information.

8 Move inventory lists to other platforms for post-processing.

17.4 Inventory management procedures

Use the following procedures to perform inventory management tasks.

Procedure 17-1 To list and sort inventory data

Perform this procedure to list and sort inventory data for a device or for the entire network.

1 Inventory can be listed and sorted for a device or for the entire network.

a To list and sort inventory for a device, perform steps 2 to 6.

b To list and sort inventory for the entire network, perform steps 7 to 11.

2 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

3 Choose a Network Element (Network) from the object drop-down list and click on the Search button. The list form displays the results of the inventory search.

4 Choose an NE from the list and click on the Properties button. The Network Element (Edit) form opens.

5 Click on the Inventory tab and choose a network object from the object drop-down list. The list form displays the results of the inventory search for the selected device.

6 Go to step 11.

7 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

8 Choose a network object from the object drop-down list.

9 Configure the filter criteria.

10 Click on the Search button. The list form displays the results of the inventory search.

11 Sort the results.

a To count the number of items in the list, generate an inventory of data and right-click on the list heading. The Count shows the number of objects in the list.

b To sort in ascending or descending order, click on the column heading. The arrow direction changes to indicate the order in which the data is sorted.

c To move a column, click on the column, drag the column to the right or left, and drop the column in its new location.

d To remove a column,

i Right-click on the column heading and choose Column Display from the contextual menu. The Column Display window appears.

ii In the Displayed on Table list box, choose the columns that you need to remove from the table and click the left arrow. The specified columns are moved to the Available for Table list box.

iii Click on the OK button to apply the changes and close the Column Display window. The specified columns are removed from the table.

e To sort multiple columns, right-click on a column heading and choose Show Sorting from the contextual menu. The Show Sorting form opens. Choose the property or properties from the Available for Sorting panel and click on the right arrow button. The property or properties appear in the Used for Sorting panel. Click on the Sort Ascending or Sort Descending button, as required.

12 Save the inventory output by performing Procedure 17-2 or 17-3.

13 Close the form.

Procedure 17-2 To save inventory output in HTML format

1 Define the filter properties for the inventory search, and list and sort the output as described in Procedure 17-1.

2 Right-click on a column heading of the inventory output and choose Save to File from the contextual menu. The Save form opens.

3 Save the inventory output.

i To choose a directory in which to save the listed information, use the Save In parameter.

ii To create a filename, use the File Name parameter.

iii Choose HTML (*.htm, *.html) from the Files of Type drop-down menu.

iv Click on the Save button. The results of the inventory search are saved to the specified HTML file.

4 Close the form.

Procedure 17-3 To save inventory output in CSV format

1 Define the filter properties for the inventory search, and list and sort the output as described in Procedure 17-1.

2 Right-click on a column heading of the inventory output and choose Save to File from the contextual menu. The Save form opens.

3 Save the inventory output.

i To choose a directory in which to save the listed information, use the Save In parameter.

ii To create a filename, use the File Name parameter.

iii Choose CSV (*.csv) from the Files of Type drop-down menu.

iv Click on the Save button. The results of the inventory search are saved to the specified CSV file.

4 Close the form.

Procedure 17-4 To save a filter

See Procedure 3-33 for more information.

Procedure 17-5 To inventory CLEI codes for managed device objects

1 You can list CLEI codes for card slots, cards, daughter card slots and daughter cards.

a To view CLEI codes for a device, perform steps 2 to 7.

b To view CLEI codes for the entire network, perform steps 8 to 13.

2 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

3 Choose a Network Element (Network) from the object drop-down list and click on the Search button. The list form displays the results of the inventory search.

4 Choose an NE from the list and click on the Properties button. The Network Element (Edit) form opens.

5 Click on the Inventory tab and choose a network object from the object drop-down list. For example:

- To display the cards and daughter cards that are configured in the slots, expand Slot (Physical Equipment and select one of the following:
  - Card Slot (Physical Equipment)
  - Daughter Card Slot (Physical Equipment)
- To display the IOMs that are installed on, pre-provisioned, or provisioned for the NE, expand Card (Physical Equipment) select IO Card (Physical Equipment)

In each instance, the list form displays the results of the inventory search for the selected device.

6 To obtain a list of CLEI codes for the network object selected in step 5, perform step 11d of Procedure 17-1 to remove all columns from the list except for the object ID or object type and the CLEI code columns.

7 Go to step 12.

8 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

9 Choose a network object from the object drop-down list.

10 Click on the Search button. The list form displays the results of the inventory search.

11 To obtain a list of CLEI codes for the network object selected in step 5, perform step 11d of Procedure 17-1 to remove all columns from the list except for the site ID, object ID, and CLEI code columns

12 Save the CLEI code inventory output.

a To save the results in HTML format, perform steps 2 and 3 of Procedure 17-2.

b To save the results in CSV format, perform steps 2 and 3 of Procedure 17-3.

13 Close the form.

Procedure 17-6 To inventory card software versions for a managed device

You can inventory card software versions for a managed device.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Network Element (Network) from the object drop-down list.

3 Click on the Search button. The list form displays the results of the inventory search.

4 Choose an NE from the list and click on the Properties button. The Network Element (Edit) form opens.

5 Click on the Inventory tab and choose Card (Physical Equipment) from the object drop-down list. The list form displays the results of the inventory search.

6 To obtain a list of card software versions for the selected device, perform step 11d of Procedure 17-1 to remove all columns from the list except for the following:

- Slot ID
- Software Version

7 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 17-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 17-3.

8 Close the form.

Procedure 17-7 To inventory port types for a managed device

Perform this procedure to generate an inventory of port types, such as physical ports, SONET channels, link aggregation groups, terminations, TDM channels, protocols, multilink bundles, and APS groups.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Network Element (Network) from the object drop-down list.

3 Click on the Search button. The list form displays the results of the inventory search.

4 Choose an NE from the list and click on the Properties button. The Network Element (Edit) form opens.

5 Click on the Inventory tab and choose Port (Physical Equipment) from the object drop-down list. The list form displays the results of the inventory search.

6 To display more detailed port inventory information expand to the following sub-objects on the object drop-down list:

- SONET Channels
- Link Aggregation Groups
- TDM Channels
- Multilink Bundles
- APS Groups

7 To sort the inventory output, perform step 11 of Procedure 17-1.

8 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 17-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 17-3.

9 Close the form.

Procedure 17-8 To inventory shelf data for a managed device

Perform this procedure to generate an inventory of shelf manufacturer information, part numbers, serial numbers, CLEI codes, and CLLI codes for the shelves of a managed device.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Network Element (Network) from the object drop-down list.

3 Click on the Search button. The list form displays the results of the inventory search.

4 Choose an NE from the list and click on the Properties button. The Network Element (Edit) form opens.

5 Click on the Inventory tab and choose Shelf (Physical Equipment) from the object drop-down list. The list form displays the results of the inventory search.

6 Choose a shelf from the list and click on the Properties button. The Shelf (Edit) form opens with the General tab displayed.

7 Click on the Display tab. A picture of the selected shelf is displayed.

8 Use screen capture software to record the screen image, or otherwise copy the shelf information to a file for further processing.

Note — You can generate an inventory of shelf data for the managed network, but not for an individual managed devices. See Procedure 17-17 for more information.

9 Close the form.

Procedure 17-9 To inventory all managed CCMs

You can inventory all managed CCMs in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose CCM (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of CCM-specific codes, perform step 11d of Procedure 17-1 to remove all columns from the list except for the following:

- Manufacture Date
- Part Number
- Serial Number
- CLEI Code
- CCM Index
- CCM Equipped Type

6 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 17-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 17-3.

7 Close the form.

Procedure 17-10 To inventory all managed cards

You can inventory all managed cards in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Card (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of card-specific codes, perform step 11d of Procedure 17-1 to remove all columns from the list except for the following:

- Manufacture Date
- Part Number
- Serial Number
- CLEI Code

6 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 17-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 17-3.

7 Close the form.

Procedure 17-11 To inventory all managed fan trays

You can inventory all managed fan trays in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Fan Tray (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of fan tray-specific codes, perform step 11d of Procedure 17-1 to remove all columns from the list except for the following:

- Operational State
- Administrative State
- Device State

6 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 17-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 17-3.

7 Close the form.

Procedure 17-12 To inventory all managed flash memory

You can inventory all managed flash memory in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Flash Memory (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of flash memory-specific codes, perform step 11d of Procedure 17-1 to remove all columns from the list except for the following:

- Serial Number
- Firmware Revision
- Model Number
- Capacity (sectors)
- Amount Used (sectors)

6 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 17-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 17-3.

7 Close the form.

Procedure 17-13 To inventory all managed physical links

You can inventory all managed physical links in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Physical Link (Network) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of physical link-specific codes, perform step 11d of Procedure 17-1 to remove all columns from the list except for the following:

- Endpoint A Type
- Endpoint A - Port
- Endpoint B Type
- Endpoint B - Port

6 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 17-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 17-3.

7 Close the form.

Procedure 17-14 To inventory all managed ports

You can inventory all managed ports in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Port (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of port-specific codes, perform step 11d of Procedure 17-1 to remove all columns from the list except for the following:

- Name
- CLI Name
- MTU (bytes)
- State

6 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 17-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 17-3.

7 Close the form.

Procedure 17-15 To inventory all managed power supply trays

You can inventory all managed power supply trays in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Power Supply Tray (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of power supply tray-specific codes, perform step 11d of Procedure 17-1 to remove all columns from the list except for the following:

- Administrative State
- Operational State
- AC Voltage Status
- DC Voltage Status
- Assigned Type

6 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 17-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 17-3.

7 Close the form.

Procedure 17-16 To inventory all managed processors

You can inventory all managed processors in a network of managed devices.

Note — The eNodeB, 9471 WMM, and 5780 DSC have distinct types of control cards. See "General NE management" in the *5620 SAM LTE RAN User Guide* for information about performing inventory tasks for the eNodeB. See "9471 WMM configuration management" and "Viewing 5780 DSC properties" in the *5620 SAM LTE EPC User Guide* for information about performing inventory tasks for the 9471 WMM and 5780 DSC.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Processor (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of processor-specific codes, perform step 11d of Procedure 17-1 to remove all columns from the list except for the following:

- Operational State
- Administrative State
- CLEI Code
- Manufacturer
- Manufacture Date
- Part Number
- Serial Number

6 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 17-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 17-3.

7 Close the form.

Procedure 17-17 To inventory all managed shelves

You can inventory all managed shelves in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Shelf (Physical Equipment) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of shelf-specific codes, perform step 11d of Procedure 17-1 to remove all columns from the list except for the following:

- Operational State
- Administrative State
- CLEI Code
- Manufacturer
- Manufacture Date
- CLLI Code
- Part Number
- Serial Number (Manufacturer Details)

6 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 17-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 17-3.

7 Close the form.

Procedure 17-18 To inventory all management ports

You can inventory all management ports in a network of managed devices.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Choose Network Element (Network) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. The list form displays the results of the inventory search.

5 To obtain a list of management port-specific codes, perform step 11d of Procedure 17-1 to remove all columns from the list except for the following:

- System ID
- Management IP Address
- Location
- Chassis Type
- Sys Object ID
- Software Version
- Descriptor Version (software release)
- Resource Group ID

6 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 17-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 17-3.

7 Close the Manage Equipment form.

Procedure 17-19 To collect inventory data for network device SLA audits

You can create lists of inventory data to provide the specific summary information required for SLA audits. Ensure the following before you start:

- Inventory collection requirements differ based on SLA agreements. Ensure that the correct data is being collected for your SLA agreement.
- Perform inventory collection during a maintenance window, or during low network activity windows to ensure no impact to systems.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Collect the required SLA audit data.

a For card SLA audits, choose Card (equipment) from the object drop-down list.

b For shelf SLA audits, choose Shelf (equipment) from the object drop-down list.

c For power supply tray SLA audits, choose Power Supply Tray (equipment) from the object drop-down list.

3 Click on the Search button. The SLA audit data appears in the list.

4 Typically, only a subset of data is required for SLA audits. To display only the required information, perform the following:

i Left-click on the list column heading. The list contextual menu appears.

ii Ensure the information that you want displayed has a check mark. These typically include:

- Identification information, such as Site ID, Site Name, Slot ID, and Slot Name
- SLA audit and ordering information, such as Manufacture Date, Part Number, Serial Number, CLEI Code, and Card Type

iii Close the list contextual menu. Only the chosen information is displayed in the list.

iv Choose Save Table Preferences from the list contextual menu to save the refined list for future use. When a similar search from the same client GUI is performed, the refined list is shown by default.

v Confirm the action.

5 Save the inventory output.

a To save the output in an HTML file, perform steps 2 and 3 of Procedure 17-2.

b To save the output in a CSV file, perform steps 2 and 3 of Procedure 17-3.

6 Close the form.

18 — Card migration

18.1 Card migration management overview *18-2*

18.2 Workflow to manage card migration *18-3*

18.3 Card migration management procedures *18-4*

18.1 Card migration management overview

You can use a 5620 SAM GUI utility called the Card Migration Event Manager to facilitate the transition to an IOM 3 on one or more 7450 ESS or 7750 SR NEs. The Card Migration Event Manager transfers the existing IOM and MDA configurations to new modules with minimal service interruption.

The 5620 SAM Card Migration Event Manager can do the following:

- Upgrade from an IOM 1 or IOM 2 to an IOM3 while retaining the same MDAs.
- Upgrade from one MDA type to a newer MDA type that has compatible features.
- Upgrade an IOM and the associated MDAs in one operation.

You can perform an immediate migration, or preconfigure one or more migration events for later execution. A migration event can include an NE reboot to put the new hardware configuration into effect immediately after the migration. You can upgrade multiple IOMs and MDAs in one operation to limit the number of required NE reboots to one.

During a migration event, the 5620 SAM identifies the configured objects that are bound to the IOM or MDA, deletes the objects, and then creates the objects on the new IOM or MDA. The old and new configurations are saved in the 5620 SAM database until the migration completes successfully. The 5620 SAM preserves the statistics data and alarm information that is associated with each object.

Restrictions

The following restrictions apply to 5620 SAM card migration event management:

- **General**
  - Only the 5620 SAM admin user, or a user with an assigned administrator scope of command role, can create, modify, or execute a migration event.
  - The migration functions are not available to 5620 SAM OSS clients.
  - You may need to re-enable SNMP on an NE after the NE reboots following a migration event.
  - You can only perform a card migration if the description associated with the cards being migrated do not contain any numerical values.
- **IOM-specific**
  - An IOM downgrade, for example, a migration from an IOM 3 to an IOM 2, is not supported.
- **MDA-specific:**
  - You cannot migrate an empty MDA slot to an MDA.
  - MDA migration is limited to MDAs of the same physical transmission type; for example, migration from a SONET MDA to an Ethernet MDA is not supported.
  - You cannot upgrade an MDA that is integrated with an IOM, for example, an IMM.
  - For MDAs, you can migrate only to an MDA of similar capacity that has the same or a greater number of ports.

The 5620 SAM raises an alarm during a migration event if a target NE is unreachable. After a migration event, the 5620 SAM raises an alarm to indicate migration success or failure.

Table 18-1 lists the supported MDA migration types.

Table 18-1 Supported MDA migration types

Current MDA	MDAs supported by migration
10 x 1-Gig Ethernet SFP	10 x 1Gig Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance TX
5 x 1-Gig Ethernet SFP	10 x 1Gig Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance TX
1 x 10-Gig Ethernet	4 x 10Gig Extended Performance XFP 2 x 10Gig Extended Performance XFP 1 x 10Gig Extended Performance SFP
20 x 100 Ethernet Fx	20 x 10/100/1000 Ethernet Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance TX
20 x 10/100/1000 Ethernet Tx	20 x 10/100/1000 Ethernet Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance TX
2 x 10-Gig Ethernet XFP	2 x 10Gig Extended Performance XFP 4 x 10Gig Extended Performance XFP
20 x 10/100/1000 Ethernet SFP	20 x 10/100/1000 Ethernet Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance TX
1 x 10-gig Ethernet XFP	4 x 10GigExtended Performance XFP 2 x 10Gig Extended Performance XFP 1 x 10Gig Extended Performance XFP
5 x 10/100/1000	10 x 1Gig Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance TX
10 x 10/100/1000 Ethernet SFP	10 x 1Gig Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance SFP 20 x 10/100/1000 Ethernet Extended Performance TX
60 x 10/100 Ethernet	48 x 10/100/1000 Ethernet Extended Performance TX

18.2 Workflow to manage card migration

The following is the sequence of high-level actions required to manage card migration.

1 Use the 5620 SAM to back up the device configuration of each target NE.

Note — When you attempt a migration on an NE that does not have a recent configuration backup in the 5620 SAM database, the 5620 SAM raises an alarm and the migration fails.

A recent configuration backup is a backup that occurs after the latest configuration save on the NE.

See “NE maintenance” in the *5620 SAM System Administrator Guide* for information about performing NE backups.

2 Create a card migration event and execute or save it, as required. See Procedure 18-1 for more information.

3 Execute a saved card migration event, as required. See Procedure 18-2 for more information.

18.3 Card migration management procedures

Use the following procedures to perform card migration event management tasks.

Procedure 18-1 To create a card migration event

1 Choose Tools→Card Migration Event Manager from the 5620 SAM main menu. The Card Migration Event Manager form opens.

2 Click on the Create button. The Card Migration Event (Create) form opens with the General tab displayed.

3 Configure the parameters:

- ID
- Auto-Assign ID
- Description
- Additional Information
- Auto Reboot

4 Click on the NE Migration Candidates tab.

5 Click on the Add button. The Select Network Elements - Card Migration Event form opens.

6 Select one or more NEs in the list and click on the OK button. The Select Network Elements - Card Migration Event form closes and the NEs are listed on the Card Migration Event (Create) form.

7 Select one or more NEs in the list and click on the Properties button. The Network Element Migration Candidates form opens.

8 Configure the Auto Reboot parameter.

9 Click on the Ok button. The Network Element Migration Candidates form closes, and a dialog box appears.

10 Click on the OK button.

11 Click on the Card Migration Candidates tab.

12 Click on the Add button. The Select Cards - Card Migration Event form opens.

13 Select one or more cards in the list and click on the OK button. The Select Cards - Card Migration Event form closes and the cards are listed on the Card Migration Event (Create) form.

14 Select one or more cards in the list and click on the Properties button. The Migration Details (Create) form opens.

15 Configure the New Type parameter in the IOM panel, if required.

16 Configure the New Type parameter in the MDA 1 panel, if required.

17 Configure the New Type parameter in the MDA 2 panel, if required.

18 Click on the OK button. The Migration Details (Create) form closes, and a dialog box appears.

19 Click on the OK button.

20 To execute the migration event immediately, perform the following steps. Otherwise, you can execute the migration later by performing Procedure 18-2.

i Use the 5620 SAM to back up the device configuration of each target NE.

Note — When you attempt a migration on an NE that does not have a recent configuration backup in the 5620 SAM database, the 5620 SAM raises an alarm and the migration fails.

A recent configuration backup is a backup that occurs after the latest configuration save on the NE.

ii Click on the Apply button. The 5620 SAM saves the card migration event configuration.

iii Click on the General tab to display the Status indicator.

iv Click on the Initiate Migration button. A dialog box appears.

v Click on the Yes button. The 5620 SAM starts to migrate the specified cards.

vi Monitor the card migration as it progresses by viewing the Status indicator on the form. The status can be one of the following:

- Awaiting manual reboot to complete migration
- Failed - Latest configuration not available
- Failed - Unable to migrate configuration
- Failed - Unable to reboot network element
- Failed - Unable to transfer migrated configuration
- Migration completed
- Not Started
- Rebooted network element
- Started
- Swap failed
- Swap failed on some network elements

21 Click on the OK button. The Card Migration Event (Create) form closes.

22 Close the Card Migration Event Manager form.

Procedure 18-2 To execute a saved card migration event

1 Use the 5620 SAM to back up the device configuration of each target NE.

Note — When you attempt a migration on an NE that does not have a recent configuration backup in the 5620 SAM database, the 5620 SAM raises an alarm and the migration fails.

A recent configuration backup is a backup that occurs after the latest configuration save on the NE.

2 Choose Tools→Card Migration Event Manager from the 5620 SAM main menu. The Card Migration Event Manager form opens.

3 Configure the filter criteria and click on the Search button. A list of card migration events is displayed.

4 Select a card migration event and click on the Properties button. The Card Migration Event (Edit) form opens with the General tab displayed.

5 Click on the Initiate Migration button. A dialog box appears.

6 Click on the Yes button. The 5620 SAM starts to migrate the specified cards.

7 Monitor the card migration as it progresses by viewing the Status indicator on the form. The status can be one of the following:

- Awaiting manual reboot to complete migration
- Failed - Latest configuration not available
- Failed - Unable to migrate configuration
- Failed - Unable to reboot network element
- Failed - Unable to transfer migrated configuration
- Migration completed
- Not Started
- Rebooted network element
- Started
- Swap failed
- Swap failed on some network elements

8 Click on the OK button. The Card Migration Event (Create) form closes.

9 Close the Card Migration Event Manager form.

Procedure 18-3 To delete a card migration event

1 Choose Tools→Card Migration Event Manager from the 5620 SAM main menu. The Card Migration Event Manager form opens.

2 Configure the filter criteria and click on the Search button. A list of card migration events is displayed.

3 Select a card migration event and click on the Delete button. A dialog box appears.

4 Click on the Yes button. The 5620 SAM deletes the card migration event.

5 Close the Card Migration Event Manager form.

19 — TCA

19.1 TCA overview *19-2*

19.2 Workflow to configure TCA *19-4*

19.3 TCA management procedures *19-4*

19.1 TCA overview

You can create policies to raise 5620 SAM alarms based on managed-object statistics. When a statistic counter of an object such as an interface reaches a specified threshold, the 5620 SAM alerts GUI operators using a threshold-crossing alarm, or TCA, based on policy specifications.

A TCA policy includes the following:

- the direction of traffic flow to monitor
- the objects that are associated with the policy
- rules that define properties such as the rising and falling thresholds, and the alarm severity
- custom statistics counters that can be used to monitor statistics based on specified formulas

Note — A TCA is not self-clearing. The 5620 SAM clears a TCA only when the TCA policy contains a falling-threshold rule in addition to a rising-threshold rule, and the alarm severity in the falling-threshold rule is set to cleared.

To enable TCA on an object, you must enable collection of performance statistics on the object. To determine whether a specified statistic exceeds a TCA policy threshold, the 5620 SAM compares the utilization value at each statistics collection to the threshold values in the associated TCA policy.

The 5620 SAM TCA function raises an alarm when a statistic threshold is initially crossed. Rather than raise a new alarm for each successive threshold-crossing event associated with a TCA policy, the 5620 SAM changes the severity of the initial alarm based on the rules defined in the policy.

In the 5620 SAM client GUI, you can associate a TCA policy with a managed object from the TCA policy configuration form, or from the object properties form. You can associate one TCA policy with multiple objects.

Statistics counters

Depending on the monitored object, you can create rules to monitor utilization, packets in error, and packets dropped.

The 5620 SAM allows you to monitor custom TCA statistics. You can create a custom TCA profile and build a formula using statistics counters and constant values. See “Accounting statistics collection” in the *5620 SAM Statistics Management Guide* for more information on statistics counters.

For all statistics counters, you can choose to apply the rule to the delta value, rather than the absolute value. The delta value is the difference between the current value and most recent previous value of the statistic counter.

TCA configuration example

The following example describes the 5620 SAM configuration required to raise a TCA, adjust the alarm severity, and clear the alarm, based on the following utilization specifications:

- Raise a minor alarm if utilization is between 60% and 69%.
- Change the alarm severity to major if utilization rises to between 70% and 79%.
- Change the alarm severity to critical if utilization rises to 80% or higher.
- Change the alarm severity to major if utilization falls below 80%.
- Change the alarm severity to minor if utilization falls below 70%.
- Clear the alarm if utilization falls below 60%.

The following are the TCA rules and associated parameter values required to implement the example alarm behavior:

Rule to raise minor alarm for 60% or higher utilization:

- Alarm Severity—minor
- Threshold (%)—60
- Threshold Direction—Rising Above

Rule to change alarm severity to major for 70% or higher utilization:

- Alarm Severity—major
- Threshold (%)—70
- Threshold Direction—Rising Above

Rule to change alarm severity to critical for 80% or higher utilization:

- Alarm Severity—critical
- Threshold (%)—80
- Threshold Direction—Rising Above

Rule to change alarm severity to major if utilization falls below 80%:

- Alarm Severity—major
- Threshold (%)—80
- Threshold Direction—Falling Below

Rule to change alarm severity to minor if utilization falls below 70%:

- Alarm Severity—minor
- Threshold (%)—70
- Threshold Direction—Falling Below

Rule to clear alarm if utilization falls below 60%:

- Alarm Severity—cleared
- Threshold (%)—60
- Threshold Direction—Falling Below

19.2 Workflow to configure TCA

Perform these steps to configure a TCA policy on a monitored object.

1 Enable performance statistics collection on the object that is to be monitored. For example, Table 19-1 lists the port statistics policy objects required to enable TCA on a network interface or physical link.

Table 19-1 Port statistics policy objects for TCA

Statistics policy type	MIB	MIB entry	Monitored class
NE MIB	IF-MIB	ifEntry	—
Specific MIB	IF-MIB	ifEntry	equipment.PhysicalPort
Interface Additional Stats	IF-MIB	ifXEntry	lag.Interface

See "Performance statistics collection" in the *5620 SAM Statistics Management Guide* for more information about collecting performance statistics.

2 If you are creating custom TCA rules, configure a custom TCA profile. See Procedure 19-1 for more information.

3 Configure a TCA policy. See Procedure 19-2 for more information.

- **i** Configure a TCA policy.
- **ii** Configure utilization, error, and drop TCA rules.
- **iii** If required, configure custom TCA rules using custom TCA profiles.

4 Apply a TCA policy to an object. See Procedure 19-3 for more information.

5 As required, customize the TCA system preferences associated with TCA policies such as specifying the default TCA alarm severity or the maximum TCA alarm limit. See "System preferences configuration procedures" in the *5620 SAM System Administrator Guide* for more information about customizing TCA system preferences.

6 As required, delete a TCA policy. See Procedure 19-4 for more information.

19.3 TCA management procedures

The following procedures describe how to manage TCA policies.

Procedure 19-1 To configure a custom TCA profile

Perform this procedure to create a custom TCA profile to apply to a TCA policy.

1 Choose Tools→TCA Policies from the 5620 SAM main menu. The TCA Policies form opens.

2 Choose CustomProfileTCA (TCA Policy) from the object type drop-down menu.

3 Click on the Create button. The CustomProfileTCA (Create) form opens.

4 Configure the parameters:

- Profile ID
- Auto-Assign ID
- Profile Name
- Description

5 Click on the Select button. The Custom Profile TCA (Create) form opens.

6 Configure the filter criteria, if required, and click on the Search button.

7 Select a monitored object from the list and click on the OK button. The Custom Profile TCA (Create) form closes.

8 Configure the Stats Type parameter.

9 Click on the Build Formula button. The Build Formula form opens.

10 Choose a statistic counter from the Counter Field drop-down menu.

11 Click on the Add button.

12 Add as many expressions to the formula as required.

a Add a statistic counter to the formula.

i Click on one of the mathematical operator buttons.

ii Choose a counter from the Counter Field drop-down menu.

iii Click on the Add button.

b Add a constant value to the formula.

i Click on one of the mathematical operator buttons.

ii Enter a number in the Constant Value field.

iii Click on the Add button.

13 Click on the OK button. The Build Formula form closes.

14 Click on the OK button. The CustomProfileTCA (Create) form closes.

15 Close the TCA Policies form.

Procedure 19-2 To configure a TCA policy

Perform this procedure to configure a TCA policy for monitoring object utilization.

1 Choose Tools→TCA Policies from the 5620 SAM main menu. The TCA Policies form opens.

2 Choose TCAPolicy (TCA Policy) from the object type drop-down menu.

3 Click on the Create button. The TCAPolicy (Create) form opens.

4 Configure the parameters:

- Policy ID
- Auto-Assign ID
- Displayed Name
- Description
- TCA Admin State

5 Click on the Select button. The TCAPolicy form opens.

6 Configure the filter criteria, if required, and click on the Search button.

7 Select a monitored object from the list and click on the OK button. The TCAPolicy form closes.

8 Click on the Apply button. The TCAPolicy (Create) form closes and the TCAPolicy (Edit) form opens with the General tab displayed.

Note — The panels that appear on the General tab depend on which object type you are creating a TCA policy for.

9 If applicable, configure utilization TCA rules.

i In the Utilization panel, configure the parameters:

- Disable TCA
- Flow Direction
- Delta Tolerance

ii Click on the Create button in the Rules subpanel. The PercentageTCARule, tca.UtilizationTCA-0 (Create) form opens.

iii Configure the parameters:

- Rule ID
- Auto-Assign ID
- Displayed Name
- Alarm Severity
- Threshold (%)
- Threshold Direction
- Use for Delta TCA

iv Click on the OK button. The PercentageTCARule, tca.UtilizationTCA-0 (Create) form closes.

v Repeat steps ii to iv to create additional rules, as required.

Note — You cannot create two rules that have the same Threshold (%) and Threshold Direction values.

10 If applicable, configure error TCA rules.

i In the Error panel, configure the parameters:

- Disable TCA
- Flow Direction
- Delta Tolerance

ii Click on the Create button in the Rules subpanel. The PercentageTCARule, tca.ErrorTCA-0 (Create) form opens.

iii Configure the parameters:

- Rule ID
- Auto-Assign ID
- Displayed Name
- Alarm Severity
- Threshold (%)
- Threshold Direction
- Use for Delta TCA

iv Click on the OK button. The PercentageTCARule, tca.ErrorTCA-0 (Create) form closes.

v Repeat steps ii to iv to create additional rules, as required.

Note — You cannot create two rules that have the same Threshold (%) and Threshold Direction values.

11 If applicable, configure drop TCA rules.

i In the Drop panel, configure the parameters:

- Disable TCA
- Flow Direction
- Delta Tolerance

ii Click on the Create button in the Rules subpanel. The PercentageTCARule, tca.DropTCA-0 (Create) form opens.

iii Configure the parameters:

- Rule ID
- Auto-Assign ID
- Displayed Name
- Alarm Severity
- Threshold (%)
- Threshold Direction
- Use for Delta TCA

iv Click on the OK button. The PercentageTCARule, tca.DropTCA-0 (Create) form closes.

v Repeat steps ii to iv to create additional rules, as required.

Note — You cannot create two rules that have the same Threshold (%) and Threshold Direction values.

12 If applicable, configure custom TCA rules.

i In the Custom panel, click on the Create button. The CustomTCA (Create) form opens.

ii Configure the parameters:

- ID
- Auto-Assign ID
- Disable TCA
- Displayed Name
- Delta Tolerance

iii Click on the Select button. The Select Custom Profile TCA - CustomTCA form opens.

iv Configure the filter criteria, if required, and click on the Search button.

v Select a Custom TCA Profile from the list and click on the OK button. The Select Custom TCA Profile - CustomTCA form closes.

vi Click on the Create button in the Rules panel. The CustomTCARule, tca.CustomTCA-0 (Create) form opens.

vii Configure the parameters:

- Rule ID
- Auto-Assign ID
- Displayed Name
- Alarm Severity
- Threshold
- Delta Threshold (%)
- Threshold Direction
- Use for Delta TCA

viii Click on the OK button. The CustomTCARule, tca.CustomTCA-0 (Create) form closes.

ix Click on the OK button. The CustomTCA (Create) form closes and a dialog box opens.

x Click on the OK button.

13 Apply the TCA Policy to monitored objects, as required.

i Click on the Monitored Objects tab.

ii Click on the Add button. The Select form opens.

iii Configure the filter criteria, if required, and click on the Search button.

iv Select one or more objects from the list and click on the OK button. The Select form closes.

14 Click on the OK button. A dialog box opens.

15 Click on the OK button to confirm the changes. The TCAPolicy (Edit) form closes.

16 Close the TCA Policies form.

Procedure 19-3 To apply a TCA policy to objects using the object properties forms

Perform this procedure to apply an existing TCA policy to an object from the object properties form.

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Select an object from the Select Object Type drop-down menu.

3 Configure the filter criteria, if required, and click on the Search button.

4 Select an object from the list and click on the Properties button. The properties form for the object opens.

5 If the object is a Physical Link, perform the following steps.

i Click on the End Point A TCA tab.

ii Click on the Assign button. The Select TCA Policy form opens.

iii Configure the filter criteria, if required, and click on the Search button.

iv Select a TCA policy in the list and click on the OK button. The Select TCA Policy form closes and the TCA policy is listed on the object properties form.

v Click on the End Point B TCA tab.

vi Click on the Assign button. The Select TCAPolicy form opens.

vii Configure the filter criteria, if required, and click on the Search button.

viii Select a TCA policy in the list and click on the OK button. The Select TCA Policy form closes and the TCA policy is listed on the object properties form.

ix Go to step 10.

6 Click on the TCA tab.

7 Click on the Assign button. The Select TCAPolicy form opens.

8 Configure the filter criteria, if required, and click on the Search button.

9 Select a TCA policy in the list and click on the OK button. The TCA policy is listed on the object properties form.

10 Close the object properties form.

11 Close the Manage Equipment form.

Procedure 19-4 To delete a TCA policy

Perform this procedure to delete a TCA policy.

1 Choose Tools→TCA Policies from the 5620 SAM main menu. The TCA Policies form opens.

2 Configure the filter criteria, if required, and click on the Search button.

3 Select one or more TCA policies in the list and click on the Delete button. The 5620 SAM deletes the TCA policies.

4 Close the TCA Policies form.

20 — Bulk operations

20.1 Bulk operations overview *20-2*

20.2 Workflow to manage bulk operations *20-2*

20.3 Bulk operations procedures *20-2*

20.1 Bulk operations overview

The 5620 SAM bulk operations function allows you to create bulk changes to modify a large amount of information. Bulk changes may be deployed to NEs or restricted to the 5620 SAM.

A bulk change can contain thousands of target objects. These objects, referred to as batch items, are grouped into batches for efficient bulk change execution. An operator can execute an entire bulk change or individual batches.

You should regenerate batches each time you execute a bulk change to ensure that each target object that matches the bulk change filter is modified.

If one or more of the batch items fail to change during a bulk change operation, the Batch Status and the Batch Status Summary parameters help identify the items. You can also use the Task Manager to view information about a batch.

20.2 Workflow to manage bulk operations

1. Create a bulk change. See Procedure 20-1 for more information.
2. Generate batches for a bulk change. See Procedure 20-3 for more information.
3. Execute one or more batches in a bulk change. See Procedure 20-3 for more information.
4. As required, stop a bulk change. See Procedure 20-5 for more information.
5. View the bulk change execution results to verify that the bulk change was successful and to identify any items which failed to change. See Procedure 20-4 for more information.

20.3 Bulk operations procedures

Use the following procedures to manage 5620 SAM bulk operations.

Procedure 20-1 To create a bulk change

1 Choose Tools→Bulk Operations from the 5620 SAM main menu. The Bulk Operations form opens.

2 Open the Create Bulk Change form by performing one of the following steps.

a Click on the Create button.

b To create a bulk change by copying values from an existing bulk change, perform the following steps.

i Configure the filter criteria and click on the Search button. A list of bulk operations appears.

ii Choose the bulk change from the list and click on the Properties button. The Bulk Change configuration form opens.

iii Click on the Copy button.

3 Configure the parameters, if required:

- Operation ID
- Auto-Assign ID
- Name
- Description
- Admin State
- Object Type

The Operation ID parameter is configurable when the Auto-Assign ID parameter is disabled.

4 Click on the Next button. The Specify the filter form opens.

5 Perform one of the following to specify a filter.

a Create a filter.

i Click on the Attribute drop down and select an option.

ii Click on the Function drop down and select an option.

iii Click on the Value drop down and select or enter an option.

iv Click on the Add to filter icon. The options are displayed in the filter panel.

v Select AND or OR from the Operators drop down option. Repeat steps i to iv to add more options.

vi Click on Save, the Save Filter form opens.

vii Configure the parameters:

- Filter Name
- Description
- Public

viii Click on the Save button. The Save Filter form closes.

b Load a filter.

i Click on the Saved Filters button. The Saved Filters form opens.

ii Select a saved filter in the list and click on the Load button. The Saved Filters form closes and the loaded filter is displayed in the filter panel.

6 Configure the filter criteria, as required and perform the following steps. Creating a filter that contains the attributes that you want to change can limit the number of objects generated for the bulk change.

7 Click on the Count button to determine the number of network objects that are affected based on the filter.

8 Click on the View button to list the target objects. The Filtered List form opens.

9 Click on the Search button. A list of target objects is displayed.

10 Click on the Next button. The Specify the attributes form opens.

11 Double-click on the attribute or attribute group in the attribute tree panel that you want to include in the bulk change. The attribute or attribute group appears in the display panel.

12 If you included an attribute or attribute group that you want to exclude from the bulk change, you can remove it by clicking on the Remove icon in the display panel.

13 Perform one of the following on each listed attribute, as required.

a Enter a value in the attribute field. The drop-down menu changes from Unchanged to Set, which means that the attribute changes to the new value when you execute the bulk change.

b Choose Default from the drop-down menu to specify that the attribute is to change to the default value when you execute the bulk change.

c Choose Clear from the drop-down menu. Depending on the object type, the attribute value is cleared or set to the default value when you execute the bulk change.

14 Click on the Next button. The Change review form opens.

15 Configure the parameters, if required:

- Batch Size
- Continue on Failure
- Admin State

16 Click on the Finish button.

17 Select the View the newly created Bulk Change check box to view the bulk change after closing the form, if required.

18 Click on the Close button. The Create Bulk Change form closes.

19 To create more Bulk Changes, repeat steps 2 to 18.

Procedure 20-2 To modify a bulk change

1 Choose Tools→Bulk Operations from the 5620 SAM main menu. The Bulk Operations form opens.

2 Configure the filter criteria and click on the Search button. A list of bulk operations appears.

3 Choose the bulk change from the list and click on the Properties button. The Bulk Change configuration form opens with the Batch Control tab displayed.

4 Click on the Summary tab.

5 Modify the parameters, if required:

- Description
- Batch Size
- Admin State
- Continue on Failure

6 Click on the Spans tab and specify a span, if required.

7 Click on the OK button. The Bulk Change configuration form closes.

8 Close the Bulk Operations form.

Procedure 20-3 To execute a bulk change

Note 1 — You can only execute one bulk change at a time. All other bulk changes are queued.

Note 2 — You can only generate batches for one bulk change at a time.

Note 3 — You cannot generate batches when a bulk change is executing.

1 Choose Tools→Bulk Operations from the 5620 SAM main menu. The Bulk Operations form opens.

2 Configure the filter criteria and click on the Search button. A list of bulk operations appears.

3 Choose the bulk change from the list and perform one of the following.

a If the bulk change contains batches, click on the Execute button to execute all of the batches.

Note — Changes made to the network after the batches were generated are not affected by the bulk change batches.

b If the bulk change does not contain batches, or you want to regenerate the batches, perform the following.

i Click on the Properties button. The Bulk Change configuration form opens.

ii If the Generate Batches button is dimmed, perform the following:

- Click on the Summary tab.
- Set the Admin State parameter to Enable.
- Click on the Batch Summary tab.

iii Click on the Generate Batches button. The batches are generated and listed on the form.

iv To execute only specific batches, choose one or more batches from the list and click on the Execute Selected button.

v To execute all of the batches, click on the Execute All button.

A dialog box appears. You can modify the bulk change confirmation message behavior from the User Preferences form.

4 Click on the Yes button. The 5620 SAM executes the bulk change.

Procedure 20-4 To view executed batch information

Note — You can also use the 5620 SAM Task Manager to view information about a batch.

1 Choose Tools→Bulk Operations from the 5620 SAM main menu. The Bulk Operations form opens.

2 Configure the filter criteria and click on the Search button. A list of bulk operations appears.

3 Choose the bulk change from the list and click on the Properties button. The Bulk Change configuration form opens with the Batch Control tab displayed.

4 Choose a batch from the list.

5 Click on the Properties button. The Bulk Change Batch configuration form opens with the General tab displayed. View general information about the executed batch.

6 Click on the Batch Items tab.

7 Click on the Search button. A list of items that were changed in the batch appears with the status of each batch item.

8 To view the parameters for each batch item, choose a batch item from the list and click on the Properties button.

9 Close all of the forms.

Procedure 20-5 To stop one or more bulk changes

1 Choose Tools→Bulk Operations from the 5620 SAM main menu. The Bulk Operations form opens.

2 Configure the filter criteria and click on the Search button. A list of bulk operations appears.

3 Perform one of the following:

- **a** Choose one or more bulk change to stop from the list.
- **b** Choose one or more batches to stop by performing the following:
  - **i** Choose a bulk change from the list.
  - **ii** Click on the Properties button. A Bulk Change configuration form opens with the Batch Control tab displayed.
  - **iii** Choose one or more batches from the list.

4 Click on the Stop button. A dialog box appears.

5 Click on the Yes button. The bulk change execution stops.

6 Close the forms.

Procedure 20-6 To delete a bulk change

1 Choose Tools→Bulk Operations from the 5620 SAM main menu. The Bulk Operations form opens.

2 Configure the filter criteria and click on the Search button. A list of bulk operations appears.

3 Choose the bulk change that you want to delete from the list and click on the Delete button. A dialog box appears.

4 Click on the Yes button. The bulk changes is removed from the 5620 SAM.

21 — Auto-provision

21.1 Auto-provision overview *21-2*

21.2 Workflow to configure network devices using auto-provision *21-4*

21.3 Auto-provision procedures *21-4*

21.1 Auto-provision overview

Auto-provision provides a way to reuse a proven configuration and apply the configuration to multiple NEs of the same type. This functionality is useful when a large number of similar NEs must be configured. Auto-provision reduces configuration errors and the time to configure each NE. Auto-provision takes advantage of the validations that are executed for every 5620 SAM configuration. When you configure a source NE from a 5620 SAM, the need to troubleshoot configuration problems is reduced.

After a source NE is configured and backed up, an operator can import the source script to the source profile. Alternatively, an operator can add the source script manually to the source profile. From the source profile, a target template can be generated. An operator can import the target template, enter any required changes and deploy the configuration template on a target NE.

Note — To ensure that the CLI syntax remains intact, the target NE must be of the same device and chassis type, and at the same release, as the source NE.

Auto-provision extends configuration to an adjacent 7750 SR to ensure a prompt and reliable exchange of traffic between the devices. When the configuration profile is successfully deployed to a 7705 SAR target device, the operator can generate configuration modules to configure interactions between the target device and the adjacent devices. An operator can make minor changes to some of the attributes on the configuration modules and deploy the configuration modules to create objects on the selected 7750 SR. When modules are configured, the operator can deploy the modules to configure the connection. A VLL service site is created on the 7705 SAR and the adjacent 7750 SR. The 5620 SAM automatically creates SAPs and SDP bindings.

The 5620 SAM supports the generation of SAP and SDP configuration modules. Configuration between the 7705 SAR and the adjacent 7750 SR requires the following:

- Base configuration of the 7750 SR is complete and the 7705 SAR is auto-provisioned.
- Interface-level configuration is sent to the adjacent 7750 SR.
- The uplink port of the auto-provisioned 7705 SAR is configured to communicate with the network interface of the 7750 SR. Only Ethernet network interfaces are supported.
- The 7750 SR must be able to communicate with the adjacent 7705 SAR.
- A LDP interface is created on the same interface.
- A MPLS interface is created when MPLS is enabled. Choose either RSVP hop by hop or TE.
- MLPPP is configured on the 7750 SR when MLPPP is configured on the adjacent 7705 SAR.
- A LSP is configured between the 7750 SR and the 7705 SAR.
- An Ethernet, TDM or ATM endpoint is created on the 7750 SR that corresponds to the SAP on the 7705 SAR.

The velocity script generator parses a validated source NE configuration so that the NE is compatible with the velocity script management tool that is available in the 5620 SAM. After the layers are identified, the velocity script generator identifies attributes that require configuration before they can be applied to a target NE. Table 21-1 lists the layers that are identified by the velocity script generator. An operator can add, remove, modify, or hide any of the attributes that are listed. The layers must be configured to deploy together.

Table 21-1 Layers and attributes identified by the velocity script generator

Layer	Attributes
Base Equipment layer	SNMP packet size and daughter cards
Channelization layer	SONET SDH paths and channel groups
Policies layer	QoS and ACL related policies
Routing layer	Routing interface configurations and static routes
Routing Protocols layer	Routing Protocol configurations
MPLS layer	Targeted LDP, MPLS interfaces, and LSPs
Service layer	VLL services including Apipe, Cpipe, Epipe, Ipipe, VPRN, SAP, and SDP bindings

Warning — Scripts that are modified and saved must be applied to devices with the same vendor and release.

Access to the script management is controlled by the administration, script management and script execution scope of command roles. Access to auto-provision is controlled by the auto config permissions that are defined in the scope of command roles. Users that are assigned the administration or script management role can create, modify, delete, and execute scripts. Users that are assigned the script execution role can view and run scripts, view and save results, configure script targets and sources, and view historical results.

In addition to the scope of command access roles and profiles, access to the Scripts tool is further defined by span of control. Span of control profiles determine where a user can apply scope of command access roles and profiles. For example, a user may have privileges to execute scripts. However, a span of control profile defines the scripts that the user can execute.

Auto-provision requires a Mobile Services Package license key to operate. See chapter 3 for more information about obtaining and installing software license keys.

21.2 Workflow to configure network devices using auto-provision

1 Configure the source template. See Procedure 21-1 for more information.

   i Determine the NE configuration that you need to use for the source.

   ii Import a source configuration file from the router, or create a source file by performing a backup of the source configuration and naming the backup file a unique name.

   iii Generate a template from the source script.

2 Configure the target template. See Procedure 21-2 for more information.

   i Import the template file to the auto-provision profiles tool.

   ii As required, configure the source script.

   iii Use the GUI builder to customize attributes in the source template. Refer to the *5620 SAM Scripts and Templates Developer Guide* for more information.

3 Apply a target template to an unprovisioned NE. See Procedure 21-3 for more information

Note — Typically, step 1 is performed on one 5620 SAM, and steps 2 and 3 are performed on another 5620 SAM. Step 1 is typically performed in a lab or testing environment.

21.3 Auto-provision procedures

Use the following procedures to perform auto-provision.

Procedure 21-1 To configure a source template

1 Choose Tools→Auto-Provision Profiles from the 5620 SAM main menu. The Auto-Provision Profiles form opens.

2 Choose Auto-Config Source Node Profile (Automatic Configuration) from the drop-down menu.

3 Click on the Create button. The Auto-Config Source Node Profile (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Auto-Assign ID
- Script ID
- Name
- Description
- Network Element Type
- Network Element Version Information

5 Click on the Select button beside the Source Node Name parameter. The Select Source Node Auto-Config Source Node Profile form opens.

6 Choose a source NE from the list and click on the OK button. The Select Source Node Auto-Config Source Node Profile form closes. The following source NE information is displayed:

- Name
- Management IP Address
- System ID (Loopback IP Address)
- Chassis Type
- Software Version

7 Click on the Apply button. The Backup State parameter displays the status of the last backup operation on the NE, and the Script tab is available.

8 Create a backup file of the source NE and import the configuration script by performing one of the following:

a Back up and import from the router.

i Click on the Backup button. If the Backup button is not visible, click on the More Actions button and choose Backup. The Backup State parameter displays the status of the backup. When the status is Success, go to step ii.

ii Click on the Attach Source Node Config button. If the Attach Source Node Config button is not visible, click on the More Actions button and choose Attach Source Node Config. The backed-up script is attached to the source profile and can be viewed from the Script tab.

b Back up and import the device configuration to a file.

i See “To export a device backup to a file” in the *5620 SAM System Administrator Guide* for information about saving a 7705 SAR configuration to a backup file.

ii Click on the Script tab and click on the Create button. A Script Editor window opens.

iii Choose File→Import from the Editor menu. The Import dialog box appears.

iv Scroll to the location of the backup file that you previously created and saved.

v Click on the Import button. The script appears in the Script Editor workspace.

vi Choose File→Save and Close from the Editor menu. The Script Editor form closes.

Warning 1 — Scripts that are not correctly applied or created can cause serious damage to the network. Alcatel-Lucent recommends that system administrators clearly define the user responsibilities for script usage, and ensure that scripts are verified before they are executed on devices in a live network.

Warning 2 — Before you run a script, you need read, write, and execute permissions for the following directories:

- *install_dir*/client/nms/bin, on a RHEL or Solaris station
- *install_dir*\client\nms\bin\clientCache, on a Windows station

where *install_directory* is the 5620 SAM client installation location, typically /opt/5620sam/client on RHEL and Solaris, and C:\5620sam\client on Windows.

vii Choose File→Save and Close from the Editor menu. The Script Editor form closes and the Auto-Config Source Node Profile (Edit) form reappears. The script appears in the list.

9 Click on the Generate Template button. If the Generate Template button is not visible, click on the More Actions button and choose Generate Template.

Template generation can take several minutes to complete depending on the size of the source configuration file and server resource usage. After the process is complete, the Template tab is available.

10 Click on the Template tab. The newly created template appears in the list.

11 Choose a template and click on the Properties button. The script appears in the Script Editor workspace.

12 See "Velocity GUI builder" in the *5620 SAM Scripts and Templates Developer Guide* for more information about using the GUI builder tool to generate and customize a UI.

13 Choose File→Save from the Editor menu and close the GUI Builder window. The Script Editor window reappears.

14 Choose File→Export from the Editor menu. The Export dialog box appears.

15 Scroll to the location where you need to save the text file and enter a file name.

16 Click on the Export button. The Script Editor window reappears.

17 Close the Script Editor window. A dialog box appears if you entered any changes to the script.

18 Click on the OK button to save the changes to the script.

19 Close the Auto-Config Source Node Profile (Edit) form.

Procedure 21-2 To configure a target template

1 Choose Tools→Auto-Provision Profiles from the 5620 SAM main menu. The Auto-Provision Profiles form opens.

Note — Before you can apply a source configuration to a target NE, you must configure and export the source configuration. See Procedure 21-1 for more information about configuring and exporting a source template.

2 Choose Auto-Config Target Node Profile (Automatic Configuration) from the drop-down menu.

3 Click on the Create button. The Auto-Config Target Node Profile (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Auto-Assign ID
- Script ID
- Name
- Description
- Network Element Type
- Network Element Version Information

5 Click on the Apply button. The Template and Targeted Nodes tabs are available.

6 Click on the Template tab and click on the Add button. A Script Editor window opens.

7 Choose File→Import from the Editor menu. The Import dialog box appears.

8 Scroll to the location of the file that you exported in Procedure 21-1.

9 Click on the Import button. The script appears in the Script Editor workspace.

10 See "Velocity GUI builder" in the *5620 SAM Scripts and Templates Developer Guide* for more information about using the GUI builder tool to generate and customize a UI.

11 Choose File→Save from the Editor menu and close the GUI builder window.

12 Choose File→Save and Close from the Editor menu. The Script Editor form closes and the Auto-Config Target Node Profile (Edit) form reappears displaying the template.

13 Close the Auto-Provision Target Node Profile (Edit) form. To apply the source template to a target NE; go to Procedure 21-3.

Procedure 21-3 To apply a target template to an unprovisioned NE

1 Choose Equipment from the drop-down menu on the navigation tree.

Note — You can also access the Auto-Provision Managed Node Wizard from the equipment properties configuration form.

2 Right-click on the target device in the navigation tree and choose Auto-Provision from the drop-down menu. The Auto-Provision Managed Node Wizard form appears with the Profile step displayed.

Note — When a device has been previously configured, the Auto-Provision option is dimmed for the device.

3 Click on the Select button beside the Script ID parameter. A Select Template Name (Profile) - Auto-Provisioning form opens displaying a list of templates.

4 Choose the target template that you configured in Procedure 21-2.

5 Click on the OK button. The Auto-Provision Managed Node Wizard reappears.

6 Perform one of the following:

- **a** Enable the Adjacent NE Managed parameter when the adjacent NE is managed by the 5620 SAM. Go to step 9.
- **b** Disable the Adjacent NE Managed parameter when the adjacent NE is not managed by the 5620 SAM.

7 Click on the Next button. The Adjacent Node step is displayed.

8 Configure the Adjacent Site ID parameter. Go to step 13.

9 Click on the Next button. The Adjacent 7750 Node step is displayed.

10 Click on the Select button beside the Name parameter. A Select Adjacent NE - Auto-Provision Site form opens with a list of NEs.

11 Choose an NE from the list.

12 Click on the OK button. The Auto-Provision Managed Node Wizard reappears with the information about the displayed NE.

13 Click on the Finish button. A dialog box appears prompting you to deploy the script and generate configuration modules for the adjacent device.

14 Click on the OK button. The 5620 SAM prompts you to view the newly created auto-provision configuration.

15 Enable the View the newly created Auto-Provisioning parameter to display the auto-provision configuration after you close the form, if required.

16 Click on the Close button. The Auto-Provision-Site (Edit) form opens displaying the provisioning for the adjacent device.

17 Click on the Deploy Profile button. A Target Configuration form opens displaying the target NE, and the configurable parameters.

18 Configure the parameters, as required.

19 Click on the NE to which you need to deploy the configuration profile.

20 Click on the Execute button. View the status of the auto-provisioning in the Detailed Status/Error panel. After the NE is configured using the configuration profile, the status of the NE changes to configured.

21 Click on the Modules tab.

Note — You must deploy the 7750 SR configuration modules after the 7705 SAR auto-provisioning is successfully deployed and resynchronized.

22 Click on the Generate Modules button to prompt the 5620 SAM to display the interactions between the target device and the adjacent device.

23 Click on the Properties button of a generated module to configure all of the modules that were created. The default values for some of the modules are usable. However, for other modules such as SAP modules, the operator must select a port on the 7750 SR before performing step 24.

24 Click on the Deploy Modules button to configure the connection.

25 Click on the Service Associations tab to view the modified services.

26 Close the Target Configuration form.

22.1 NE routing and forwarding overview

The 5620 SAM allows you to view and configure the routing and forwarding parameters on NEs. You can use the Routing view in the 5620 SAM GUI navigation tree to manage these functions on each managed NE.

Note — For an OmniSwitch, the 5620 SAM supports viewing the status of routing protocols that are enabled using the CLI. The 5620 SAM also supports the configuration and management of routing instances, L3 interfaces, and static routes.

Figure 22-1 shows the routing objects in the network view of the navigation tree.

Figure 22-1 Routing objects

L3 network interfaces

An L3 network interface is a logical IP object that is defined on a physical port, such as an Ethernet port. An L3 interface:

- associates an IP address and subnet mask with a physical port or channel
- has a physical port or channel cabled to another device

- requires QoS policy configuration
- requires routing protocol configuration

The physical connection of one device to another device is through a port or channel. However, the L3 interface determines its IP connectivity. The L3 interface passes both routing information and IP traffic.

The system interface is associated with a network entity, such as a specific device, not a specific interface. The system interface is also referred to as the loopback interface. The system interface is associated during the configuration of the following entities:

- the termination point of service tunnels
- the hops when configuring MPLS paths and LSPs
- the addresses on a target device for BGP and LDP peering

The system interface is used to preserve connectivity when an interface fails or is removed. A system interface must have an IP address and a 32-bit subnet mask. The system interface is used as the device identifier by higher-level protocols such as OSPF and BGP. See chapter 23 for more information about routing protocols.

DoS protection

In a subscriber aggregation network, an NE typically receives few control-plane packets from a specific subscriber. If one or more subscribers generate excessive control-plane traffic, DoS protection policies can help to ensure that NEs do not become overburdened by these unwanted packets. Global DoS protection controls the arrival rate for unprovisioned link-layer protocol packets from CE devices.

You can use the 5620 SAM to create DoS protection policies and apply them to L3 network interfaces. A DoS protection policy limits the number of control-plane protocol packets that are received each second from a subscriber host, and optionally logs a violation notification if a policy limit is exceeded. The interface drops the excessive packets before they are queued or processed by the NE. You can use the NE System Security form to view the violations for a specific NE.

You can apply DoS protection policies to control the following on L3 network interfaces:

- the control-plane packet arrival rate per subscriber host
- the overall control-plane packet arrival rate for the interface
- whether an NE sends a notification trap if a policy limit is exceeded

An NE that supports DoS protection automatically assigns a default DoS protection policy to each L3 network interface. The default policy limits only the overall packet arrival rate for the interface, and cannot be deleted or modified.

You can also apply DoS protection policies to certain L2 and L3 access interfaces. See the appropriate service chapter for information about applying DoS protection policies to access interfaces.

You can configure a global NE DoS protection policy and distribute it to NEs by choosing Administration→Security→NE DoS Protection from the 5620 SAM main menu. See "To configure an NE DoS protection policy" in the *5620 SAM System Administrator Guide* for more information about configuring and applying NE DoS protection policies.

DDoS protection

You can configure a global NE DDoS protection policy and distribute it to NEs by choosing Administration→Security→NE DDoS Protection from the 5620 SAM main menu. You can configure a DDoS protection policy on an L3 network interface. See "To configure an NE DDoS protection policy" in the *5620 SAM System Administrator Guide* for information about configuring a DDoS protection policy.

Routing protocols

When you configure a device, you configure the routing protocols used and the topology of packet handling between different devices in the network.

Networks can be grouped into areas. An area is a collection of network segments within an AS that have been administratively assigned to the same group. Area topology is concealed from the rest of the AS. This means a significant reduction in routing traffic. Routing in the AS takes place on two levels, depending on whether the source and destination of a packet reside in:

- the same area, known as intra-area routing
- different areas, knows as inter-area routing

In intra-area routing, the packet is routed based on information found within the area; no routing information from outside the area is used. This protects intra-area routing from the injection of bad routing information. Two devices, which are not area border routers, and belonging to the same area, have identical topological databases.

Devices that are aware of more than one area are called area border routers. In this case, all devices in an AS do not have an identical topological database. An area border router has a separate topological database for each area it is connected to. ASs share routing information, such as routes to each destination and information about the route or AS path, with other ASs using BGP.

Routing tables contain lists of next hops, reachable addresses, and associated path cost metrics to each device. Routing protocols use the information and path parameters to compile a network topology. The information about routes that is used to update routing tables can be modified using routing policies.

Fast Re-route

Fast Re-route (FRR) allows the user to provide local protection for an LDP FEC by pre-computing and downloading to the IOM both primary and backup next hops for the FEC.

FRR provides for the use of the Loop-free Alternate (LFA) backup next-hop for forwarding in-transit and CPM generated IP packets when the primary next-hop is not available. IP FRR is supported on IPv4 and IPv6 prefixes forwarded in the base router instance over a network IP interface, or an IES SAP or spoke interface. It is also supported for VPRN VPN-IPv4 prefixes and VPN-IPv6 prefixes forwarded to a VPRN SAP or spoke interface.

FRR requires SPF computation of an LFA next-hop (in addition to the primary next-hop) for all prefixes used by LDP to resolve FECs. The LFA next-hop is populated into the routing table along with the primary next-hop for each prefix.

LFA is configured on IS-IS routing instances, enabling LFA computation by SPF under the IS-IS routing protocol. The LFA next hop can be excluded individually on the IS-IS Level 1 and IS-IS Level 2 objects, as well as on IS-IS interface objects.

LFA is configured on OSPF routing instances, enabling LFA computation by SPF under the OSPF routing protocol. The LFA next hop can be excluded individually on the OSPF area objects, as well as on OSPF interface objects.

LLDP

Link Layer Discovery Protocol is a not a routing protocol, but instead, a neighbor-discovery protocol. As such, it is configured in a different manner than the standard routing protocols. LLDP allows a network access device to advertise its identity and capabilities to other stations attached to the same physical IEEE 801 LAN. It also permits information that the devices discover about peer devices to be stored. LLDP is only applicable for devices using Ethernet connectivity.

When LLDP is enabled on a device, it sends and receives LLDP messages on all of the physical interfaces that are enabled for LLDP transmission. These messages are sent periodically to ensure that information is accurate. These messages are stored on the local device for a configurable amount of time, and after this time has expired, the information is discarded.

5620 SAM uses the information stored in the applicable LLDP tables on the node to automatically discover the physical topology in the network. You can use this information to examine the L1/L2 topology and perform appropriate diagnostics and troubleshooting.

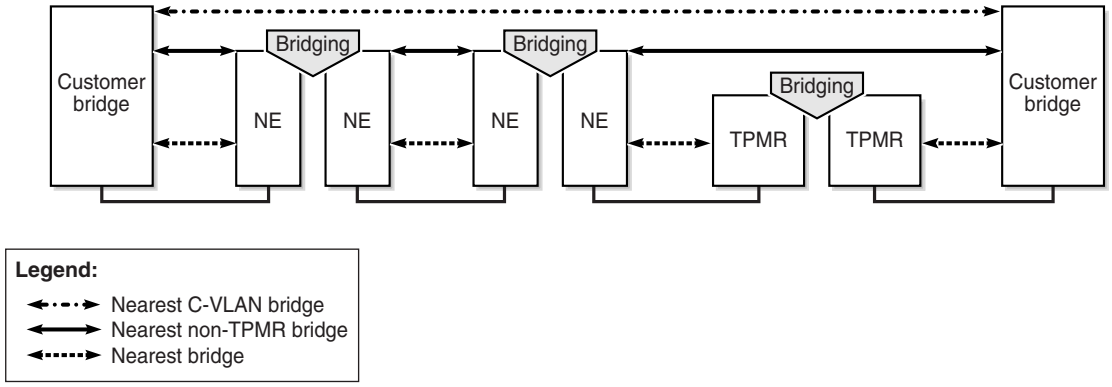
In LLDP, a single LLDP Protocol Data Unit is transmitted in a single Ethernet frame. The basic LLDP PDU consists of a header, followed by a variable number of information elements known as TLVs that each include fields for Type, Length, and Value. Type identifies what kind of information is being sent. Length indicates the length of the information string. Value is the actual information sent. Each LLDP PDU includes three mandatory TLVs followed by optional TLVs.

Mandatory TLVs include:

- Chassis ID: this represent the chassis identification of the device transmitting the LLDP frame
- Port ID: this represents the identification of the specific port transmitting the LLDP frame
- TTL: this represents the length of time the receive frame shall be valid

Optional TLVs include:

- Port Description: this represents the description of the port
- System Name: this is the administratively-assigned name of the device
- System Description: this is a textual description of the device
- System Capabilities: this identifies the capabilities of the device and its function (such as router, switch, repeater, etc.)



LLDP also supports multiple transmission scopes. The destination MAC address in the LLDP PDU determines how a frame is propagated through the network, thereby determining the LLDP message scope. Table 22-1 identifies a set of destination MAC address and describes the different transmission scopes associated with each address.

Table 22-1 MAC Addresses and transmission scopes

Name	Value	Purpose
Nearest Bridge	01-80-C2-00-00-0E	Propagation constrained to a single physical link
Nearest non-TPMR bridge	01-80-C2-00-00-03	Propagation constrained by all bridges other than TPMR; intended for use within provider bridged networks
Nearest Customer Bridge	01-80-C2-00-00-00	Propagation constrained by customer bridges

This information is also presented graphically in Figure 22-2.

Figure 22-2 LLDP Multiple Transmission Scopes

To enable LLDP, you must configure the protocol at both the system level and at the port level. This is best done using the equipment navigation tree. Table 22-2 lists the procedures required to implement LLDP.

Table 22-2 LLDP configuration procedures list

Procedure	See
To enable LLDP on a router	Procedure 13-12
To configure Ethernet ports	Procedure 16-1
To configure OmniSwitch Ethernet ports	Procedure 16-23

You can also use the physical topology map to view and edit various LLDP parameters and interconnections. By default, the physical map displays the topology based on the nearest-bridge LLDP scope. In addition, after the physical topology of a network has been discovered, you can create a reference checkpoint which is basically a snapshot of the topology at a specific time. Any subsequent deviations from this checkpoint can then be displayed. See "Physical topology map" in section 6.1 for more information.

Routing policies

Routing policies, also known as route redistribution policies, control the size and content of the routing tables, the routes that are advertised, and the best route to take to reach a destination.

The 5620 SAM supports routing-policy distribution to the following devices:

- 7210 SAS-M24F
- 7210 SAS-M24F2XFP
- 7210 SAS-M24F2XFP [ETR]
- 7210 SAS-X24F2XFP
- 7950 XRS
- 7450 ESS
- 7705 SAR
- 7710 SR
- 7750 SR

There are no default routing policies. Each policy must be created and applied to an object, a routing protocol, or the forwarding table. Each set of rules that is associated with controlling routes are called routing policy statement entries on the client GUI.

Use routing policies:

- to control routing protocols, such as BGP, to allow routes from another protocol, such as OSPF, into the routing table, which allows the routing table to redistribute packets into other protocols
- to control the import and export of learned active routes of a protocol
- to modify the characteristics of a route, for example, to change the community values of BGP AS path attributes
- to prevent the routes for specific customers from being added to routing tables
- to control BGP route flapping

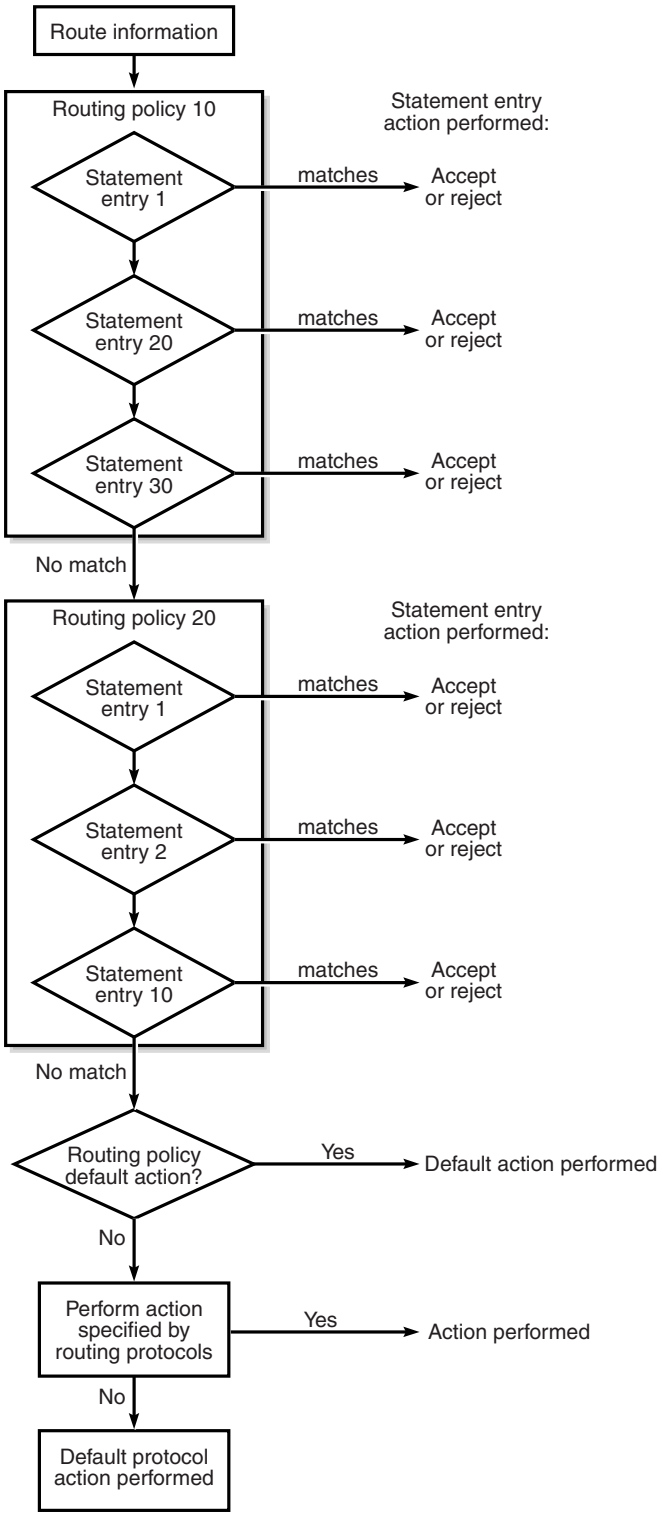
Routing policy statements and routing policy statement entries are compared against incoming route packets in the following sequence.

1 The routing packets arrive.

2 The first routing policy is analyzed.

3 Each entry in the routing policy statement is analyzed.

If a match is found based on the first routing policy statement entry, the specified action is performed. You can use the Action parameter to specify the continued evaluation of route policy entries, or additional policy statements.



4 If no match is found, the packet is compared against the second routing policy statement entry. If a match is found based on the second routing policy statement entry, the specified action is performed.

5 If no match is found, the packet is compared sequentially against all remaining routing policy statements and routing policy statement entries. If a match is found, the specified action is performed.

6 If the packet does not match any routing policy statements or entries, the default action is performed.

Figure 22-3 shows how routes are analyzed using routing policies.

Figure 22-3 Routing policy analysis workflow

To ensure routing configuration flexibility, the following routing policies can be configured as separate policies or can be cross-referenced to form a framework of policies depending on the network requirements:

- Policy Statement
- Prefix List
- Community
- Damping
- AS Path

Policies that are cross-referenced are distributed together. For example a Policy Statement can reference the Prefix List policy by matching the From Criteria and the To Criteria for each policy type.

Careful planning is essential to implement route policies that can affect the flow of routing information or packets traversing managed devices. Before configuring and applying a route policy, consider the following:

- Develop an overall plan and strategy to accomplish your intended routing actions
- Analyze the effect of what happens to a packet that meets the specified criteria in a routing policy statement entry to ensure the proper action is executed and that no routing loops are created
- when possible, redistribute from a less router protocol to a greater routing protocol, for example from RIP to OSPF
- redistribute exported routes at a single device, when possible

When no action or default action in a routing policy is matched on a packet, then the routing protocols determine the default action for the packet. The action can be specified for the protocol. If the action is not specified, there are default routing protocol import and export actions performed, as described in Table 22-3.

Table 22-3 Default routing protocol actions

Protocol	Default import route action	Default export route options
BGP	All routes from BGP peers are accepted and forwarded to the BGP route selection process.	All active internal BGP routes are advertised to BGP peers. All non-BGP learned routes are not advertised to BGP peers.
IS-IS	IS-IS route acceptance cannot be configured. All IS-IS routes are accepted from IS-IS neighbors.	All internal IS-IS routes are advertised to all IS-IS neighbors. All non-IS-IS learned routes are not advertised to IS-IS neighbors.
OSPF	OSPF route acceptance cannot be configured. All OSPF routes are accepted from OSPF neighbors.	All OSPF routes are advertised to all OSPF neighbors. All non-OSPF learned routes are not advertised to OSPF neighbors.
RIP	All RIP-learned routes are accepted from RIP peers.	All non-RIP learned routes are not advertised to RIP peers.

For importing routing, RIP, BGP, or OSPF learned routes can be altered using routing protocols. For example, for devices learning about routes from BGP or OSPF, you can create an import route policy that can limit the number and types of routes accepted and added to the routing tables.

For exporting routes, some default behaviors exist:

- internally learned routes are redistributed using the same protocol
- externally learned routes are not automatically advertised to all neighbors or peers

In the case of externally learned routes, you can create an export policy to determine how the routes are advertised, for example, configuring something learned by BGP to be redistributed using OSPF. This is useful in cases:

- where legacy equipment does not support a specific protocol
- when companies merge and they use different routing protocols on the devices

Cflowd

Cflowd collects statistical data based on traffic flows. A flow is a series of packets in a user session. Cflowd data is typically used to monitor network usage trends and detect security threats. You can use the 5620 SAM to configure Cflowd for:

- traffic that passes through an L3 network interface
- traffic that is redirected to cflowd using an ACL IP filter
- AA traffic

The 5620 SAM supports the configuration of cflowd on the following NE types, depending on the release and chassis type: 7450 ESS, 7710 SR, 7750 MG, 7750 SR, and 7950 XRS.

You must enable cflowd globally on an NE before you can configure cflowd collectors. You can create multiple cflowd collectors on an NE. Each collector is deleted if cflowd is disabled.

AA cflowd is configurable on an ISA-AA group, and supports basic cflowd sampling as well as TCP performance data collection for AA applications and application groups. Each ISA-AA group supports one cflowd instance.

See chapter 13 for information about enabling and configuring global cflowd on an NE, and see chapter 14 for information about enabling and configuring AA cflowd on an ISA-AA group.

Shared Risk Link Group policies

Shared Risk Link Groups, or SRLGs, are constructs which allow you to perform two operations that enhance overall system reliability. You can use SRLGs to establish a FRR LSP path. You can also use SRLGs to establish a secondary LSP path which is disjointed from the primary LSP path. Links that are members of the same SRLG represent resources which share the same risk. For example, fiber links sharing the same conduit, or multiple wavelengths sharing the same fiber.

An SRLG is modeled as a policy object. It therefore follows the normal policy behavior for creation, listing, updating, deletion, distribution, and re synchronization.

Configured SRLGs are associated with MPLS interfaces. The SRLGs are used by the CSPF when computing a FRR detour/bypass path, or a secondary LSP path. SRLGs indicate to the CSPF which interfaces to avoid in the path's computation.

22.2 Network domain overview

The 5620 SAM allows you to create, delete, associate and edit network domains. You can use the network domains view in the 5620 SAM GUI navigation tree to manage these functions. Network domains help determine which network ports are eligible to transport traffic of individual SDPs. This information is used for the SAP-ingress queue allocation which is applied to VPLS SAPs. No SAP-ingress queues are allocated if a given port does not belong to the network domain used in a VPLS.

Note 1 — A maximum of four network domains are supported in any VPLS.

Note 2 — If an SDP is used for E-PIPE, I-PIPE or A-PIPE bindings, the network domain configuration is not considered.

Note 3 — Network domains are not applicable to loopback and system interfaces.

By default, all network interfaces in a routing instance belong to the default network domain. You can associate an interface to any user defined network domain. The loopback and system interfaces cannot be associated with user defined network domains.

An SDP can be assigned to only one network domain. If no user defined network domain is created, an SDP will be assigned to the default network domain. All SAPs in VPLS will have a queue reaching all fwd complexes serving interfaces belonging to the same network domains as the SDPs. You can assign or remove a network domain association of the interface or SDP without deleting the respective object.

22.3 Workflow to configure NE routing and forwarding

1 Use the CLI to configure or verify the following parameters:

- system address (system ID)
- router ID

See the *7750 SR OS Router Guide* for more information about these parameters.

2 Configure a routing instance or VRF instance:

a To configure a routing instance or VRF instance, see Procedure 22-1.

b To configure a local DHCPv4 server on the routing instance, see Procedure 22-2. To configure a local DHCPv6 server on the routing instance, see Procedure 22-3.

c To configure a routing instance on the OmniSwitch, perform the following:

i Configure a routing instance on the OmniSwitch. See Procedure 22-5.

ii Configure UDP relay/DHCP snooping on an OmniSwitch, if required. See Procedure 22-6.

iii If you configured UDP relay/DHCP snooping, then configure all ports within the network connected to DHCP servers to trusted. See Procedure 16-23.

d To configure NAT on the routing instance, see Procedure 24-3 in chapter 24.

e To configure RADIUS servers on the routing instance, see Procedure 22-7.

f To configure RADIUS proxy servers on the routing instance, see Procedure 22-8.

3 Create or configure network or system L3 interfaces.

a On all NEs except the OmniSwitch. See Procedures 22-9 and 22-10.

i Associate a network port with the L3 interface.

ii Configure the appropriate routing protocols on the interfaces, as required. The supported protocols are BGP, MPLS, RIP, LDP, OSPFv2, OSPFv3, IS-IS, and RSVP. See chapter 23 for more information about routing protocol configuration and parameters.

iii Enable the multicast routing types on the interfaces as required. The supported types are PIM, IGMP, and MLD. See chapter 23 for more information about multicast configuration and parameters.

iv Enable bridging on the interfaces as required. The 5620 SAM supports bridging on OmniSwitch devices. See chapter 23 for more information about bridging configuration and parameters.

v Assign a DoS protection policy to the interface, if required. See procedure 22-10 for more information.

vi Assign an IES or network interface to a virtual router as a VRRP instance. See chapter 33 for more information about VRRP configuration and parameters.

b On an OmniSwitch. See Procedures 22-11 and 22-12 for more information.

4 Create static routes, as required. See Procedure 22-13 for all NEs except the OmniSwitch. See Procedure 22-14 for the OmniSwitch.

5 Cable the network ports on the devices to the network ports on other devices.

6 Configure these key device parameters using the 5620 SAM:

- BGP, MPLS, RIP, LDP, OSPF, IS-IS, and RSVP
  Enable routing protocols on the device, as required. If you plan to create signaled LSPs, then you must enable MPLS, and RSVP or LDP.
- IP address ranges for use by services, such as IES and VPLS
  Reserve IP addresses to provide a mechanism to reserve one or more address ranges for services. When services are defined, the address must be in the range specified as a service prefix. Addresses in the range of a service prefix can be allocated to a network port unless set to exclusive. Then, the address range is exclusively reserved for services.
- device-wide AS settings

7 Configure the appropriate routing policies as required:

i Routing policy statements. See Procedure 22-15.

ii Prefix list policy. See Procedure 22-16.

iii Community policy. See Procedure 22-17.

iv Damping policy. See Procedure 22-18.

v AS path policy. See Procedure 22-19. If required, configure BGP for the AS path policy. Configuring BGP optional and should only be implemented to reduce the IBGP mesh inside an AS. An AS can be logically divided into smaller groupings called sub-confederations. See chapter 23 for more information about BGP configuration.

vi MPLS administrative group policy. See Procedure 22-21.

vii Shared Risk Link Group policy. See Procedure 22-22. If required, create a static configuration for the SRLG Policy, see Procedure 22-23.

8 View the following NE routing and forwarding related objects, as required:

a Current network resources such as IP addresses, duplicate IP addresses, RDs and RTs, and MAC addresses. See Procedure 22-24.

b Routing or VRF instances or related objects. See Procedure 22-25.

c DHCPv6 leases. See Procedure 22-27.

d DHCPv6 log events. See Procedure 22-28.

e Routing policies from a CLI session. See Procedure 22-29.

22.4 Workflow to configure network domains

1 Create a network domain. See Procedure 22-33.

2 Associate a network interface with a network domain. See Procedure 22-34. See Procedure 22-35 to remove a network interface from a network domain.

3 Associate a service tunnel with a network domain. see Procedure 22-36. See Procedure 22-37 to remove a service tunnel with a network domain.

4 Delete a network domain, as required. See Procedure 22-38.

22.5 NE routing and forwarding configuration procedures

The following procedures describe how to configure routing.

Procedure 22-1 To configure a routing instance or a VRF instance

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance icon by choosing Network→NE→Routing Instance.

3 Perform one of the following:

a If you are configuring a VRF routing instance on the following OmniSwitch NEs, go to step 4.

- OS 6850E
- OS6855-U24X
- OS 6900
- OS 9700E
- OS 9800E
- OS 10K

b If you are configuring a routing instance, go to step 6.

4 Right-click on the OmniSwitch routing instance icon and choose Create VRF Instance from the menu. The Routing Instance (Create) form opens.

5 Configure the VRF Name parameter. Click on the Apply button. The Routing Instance (Edit) form opens. Go to step 9.

6 Right-click on the routing instance icon and choose Properties from the menu. The Routing Instance (Edit) form opens with the General tab displayed.

7 Configure the Administrative State parameter.

8 If you are configuring a routing instance on a 7750 SR, click on the Select button next to the Reassembly Group field and choose an ISA-BB group from the Select ISA-BB Group form. Only ISA-NAT and ISA-WLAN GW groups are selectable. Otherwise, go to step 9.

9 Click on the Protocols tab.

10 Configure the applicable parameters:

- BGP Enabled
- MPLS Enabled
- OSPFv2 Enabled
- RIP Enabled
- L2TP Enabled
- LDP Enabled
- MPLS-TP Enabled
- RSVP Enabled
- OSPFv3 Enabled
- IS-IS Enabled
- WPP Enabled

The supported protocols are displayed in the navigation tree as sub-items in the routing instance. Click on the Properties button to configure the routing protocols. See chapter 23 for more information about routing protocol configuration using the GUI.

Note — SNMPv3 must be used to manage supported OmniSwitch devices when configuring a VRF routing instance.

11 Click on the Edit Routing Policies button. If the Edit Routing Policies button is not visible, click on the More Actions button and choose Edit Routing Policies. The Routing Policy Manager (Edit) form opens with the General tab displayed.

12 Click on the Show Policy button. If the Show Policy button is not visible, click on the More Actions button and choose Show Policy. A Routing Policy Show Policy form opens. A CLI display is initiated.

13 View the policy.

14 Click on the Close button. The Routing Policy Show Policy form closes.

15 Close the Routing Policy Manager (Edit) form.

16 Click on the Multicast tab.

17 Configure the parameters:

- PIM Enabled
- IGMP Enabled
- MLD Enabled
- MSDP Enabled

The supported multicast protocols are displayed in the navigation tree as sub-items in the routing instance. Click on the Properties button to configure the routing protocols. See chapter 23 for more information about how to configure multicast protocols.

18 Click on the Routing tab.

19 Configure the parameters:

- Router ID
- Maximum Number of Equal Cost Routes
- Autonomous System
- Confederation Autonomous System
- LDP Shortcut Enabled
- Enforce Maximum Number Of Multicast Routes
- Fast Re-route

For the 7210 SAS-M and 7210 SAS-X, the value for the Maximum Number of Equal Cost Routes parameter cannot be greater than the value of the Max ECMP Route Destinations (Active) parameter in the system resource profile. See Procedure 13-20.

The Fast Re-route parameter is configurable only on the 7950 XRS, and on the 7750 SR and 7710 SR in chassis administrative mode D.

When you select the Enforce Maximum Number Of Multicast Routes parameter, the following configurable parameters appear:

- Maximum Number Of Multicast Routes
- Log Only
- Threshold (%)

See chapter 23 for more information about AS and confederation parameters for BGP using the GUI.

20 Configure the parameters:

- Single SFM Overload Admin State
- Hold-Off Time (seconds)

The Hold-Off Time (seconds) parameter and read-only attributes Overload State, Overload Start, and Overload Duration are only displayed when the Single SFM Overload Admin State parameter is set to Up.

21 Configure a Multicast Path Management Info Policy, if required.

i Click on the Select button beside the Name parameter. The Select Ingress Info Policy form is displayed.

ii Choose the required policy and click OK. The Select Ingress Info Policy form closes and the policy name is displayed in the Name field.

Note — The Mcast Path Mgmt Channels tab displays data on the operational channels after actual traffic from a specific multicast source for a specific multicast group passes through the virtual router. You must click on the Search button to refresh the data. See chapter 42 for a listing of the displayed operational channel parameters.

22 To configure WLAN gateway functionality for the routing instance, do the following:

i Click on the General tab and configure the Enable WLAN GW parameter.

ii Click on the WLAN GW tab.

iii On the General child tab, configure the APN Network Identifier parameter.

iv Click on the Mobile GW Address Map child tab.

v Click on the Create button. The Mobile Gateway Address Map form opens.

vi Configure the Mobile Gateway Address Prefix and Prefix Length parameters.

vii Click on the Select button beside the Mobile Gateway Profile field to specify a mobile gateway profile policy.

viii Repeat steps v through vii to create additional MG address maps.

ix Click on the OK button. The Mobile Gateway Address Map form closes.

23 Click on the Interfaces tab. See Procedure 22-9 for more information about creating additional L3 interfaces.

24 Click on the Address tab.

25 Configure IP address parameters for L3 interfaces.

i Choose an address in the list.

ii Click on the Properties button.

The IP Address form opens.

iii Configure the parameters:

- IP Address
- Prefix Length
- Broadcast Address Format

iv Click on the OK button. The IP Address form closes and the Routing Instance form reappears.

Note — The IP Address, Prefix Length, and Broadcast Address Format cannot be changed for the System interface.

26 Click on the Static Routes tab to view a list of static routes and to add static routes. See Procedure 22-13 for more information.

27 Click on the NAT tab to configure NAT on the routing instance. See Procedure 24-3 in chapter 24 for more information.

28 Click on the RSVP Tunnel Interfaces tab to create an RSVP tunnel interface entry, if required.

i Click on the Create button. The RSVP Tunnel Interface (Create) form opens.

ii Click on the Select button beside the Lsp Name parameter. The Select - RSVP Tunnel Interface form opens.

iii Choose an RSVP tunnel interface and click on the OK button. The Select - RSVP Tunnel Interface form closes and the RSVP Tunnel Interface (Create) form reappears.

iv Configure the Sender Address parameter.

v Click on the OK button. The RSVP Tunnel Interface (Create) form closes.

29 Click on the LDP Tunnel Interfaces tab to create an LDP tunnel interface entry, if required.

i Click on the Create button. The LDP Tunnel Interface (Create) form opens, with the General tab displayed.

ii Configure the parameters:

- Description
- P2MP ID
- Root Node
- Sender Address

Note 1 — When the Root Node parameter is enabled, the LDP tunnel interface you are creating is associated with a root node, and you must specify a unique P2MP ID and Sender Address.

Note 2 — When the Root Node parameter is not enabled, the LDP tunnel interface you are creating is associated with a leaf node, and you must specify the same P2MP ID and Sender Address as the root node.

Note 3 — LDP tunnel interfaces can be created using the system address or any local interface address on the root node.

Note 4 — An LDP tunnel can be created on intermediate nodes (that is, between direct and indirect nodes).

Note 5 — The 7450 ESS only supports LDP tunnel interfaces in Mixed Mode.

iii Click on the Apply button. The LDP Tunnel Interface (Create) form is refreshed.

iv Click on the Tests tab to create a P2MP LSP Ping test, if required.

v Click on the P2MP LSP Ping tab.

vi Click on the Create button. The P2MP LSP Ping form is displayed.

vii Perform Procedure 32-27 to configure and run a P2MP LSP Ping test.

Note — The P2MP LSP Ping test can only be performed on a root node. When this test is created here, the 5620 SAM will auto-populate the Target Type (with the P2MP mLDP option), P2MP ID and Sender Address parameters. If the Root Node parameter is not enabled in step ii above, the Test tab will appear blank.

viii Click on the OK button. The LDP Tunnel Interface (Create) form closes.

30 Click on the Multi-Homing Interface tab to create a multi-homing interface entry, if required. the Multi-Homing Interface (Create) form opens with the General tab displayed.

Note 1 — The Multi-Homing Interface is a loopback interface used in multi-homing resiliency for a pair of protected routers. When it is active, the Primary interface can be used to advertise reachability information of the alternate router to the rest of the network. The Secondary interface is used to resolve routes advertised by the alternate router in the event that router becomes unavailable. This mechanism applies to both IP and VPN traffic.

Note 2 — Only one Primary and one Secondary multi-homing interface can be created for a router.

Note 3 — You can configure a multi-homing interface on the 7950 XRS, 7750 SR, 7710 SR, and 7450 ESS (in mixed mode) network elements. Chassis mode “D” must be enabled.

i Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Type
- Hold Time (seconds)
- Administrative State

The Hold Time (seconds) parameter only appears if you specify Secondary as the Interface Type.

ii Click on the Addresses tab. The Multi-Homing Interface Addresses list is displayed.

iii Click on the Create button. The IP Address (Create) form opens.

iv Configure the IP Address parameter.

Note — Only IPv4 addresses are supported when creating the multi-homing interface.

v Click on the OK button. The IP Address (Create) form closes and the new address appears selected in the list.

vi Click on the OK button. The Multi-Homing Interface (Create) form closes.

31 Click on the Route Aggregation tab to configure route aggregates that can be generated into the virtual router.

i Click on the Create button. The Aggregation (Create) form opens.

ii Configure the parameters, if required:

- IP Address Prefix
- Mask
- Summary Only
- As Set
- Aggregator
- Next Hop Type
- Community
- Aggregator AS
- Aggregator IP Address

The Aggregator AS and Aggregator IP Address parameters are configurable when the Aggregator parameter value is set to True.

The Next Hop Type parameter is configurable only on a Release 10.0 R4 or later 7450 ESS, 7710 SR, or 7750 SR.

The 7705 SAR-8 supports Summary Only route aggregation only.

32 Click on the BGP Confederations tab, if present, to view and create BGP confederations. See chapter 23 for more information about BGP confederation configuration.

33 Resync Soft GRE Tunnels, if required or applicable.

i Click on the Soft GRE Tunnels tab.

ii Click on the Resync Soft GRE Tunnels button.

34 Click on the Service Address Ranges tab, if present, to provide a mechanism to reserve one or more IP address ranges for use by services, such as IES.

i Click on the Create button. The Service Address Range form opens.

ii Configure the parameters:

- IP Address
- Prefix Length
- Exclusive

iii Click on the OK button. The Service Address Range form closes and the Routing Instance form reappears.

35 Configure an override source IP address or L3 interface for use by a selected IP application, if required.

i Click on the Source Address tab.

ii Click on the Create button. The Source Address form opens.

36 Choose an IP application from the Source IP Application drop-down menu.

37 Perform one of the following:

Note — If you choose the interface index option, the router must already have a network interface or an IES L3 access interface created on the routing instance.

a Choose IP Address in Source Address Termination to specify a source IP address on the node for use by the IP application.

i Enter an IP address in the Source IP Address field.

ii Go to step 38.

b Choose Interface Index in Source Address Termination to use the primary address on the L3 network interface as the source address on the node for the IP application.

i Click on the Select button to choose an interface. The Select Source Address Network Interface form opens. Choose an interface in the list and click on the OK button. The IP address and Interface ID of the L3 interface appears on the form.

ii Go to step 38.

Note — You must select an IPv6 Source IP Address to select an IPv6 Source IP Application.

38 Click on the OK button. The Source Address form closes and the Routing Instance form reappears. The IP application source address and parameters appear on the form.

39 Configure a local DHCP server on the routing instance, if required. To configure a local DHCPv4 server on the routing instance, see procedure 22-2. To configure a local DHCPv6 server on the routing instance, see procedure 22-3.

40 Click on the Self Generated Traffic tab. The DSCP Marking tab is displayed with a list of all the applications for which the DSCP can be set.

i Choose an application to view or edit the DSCP setting.

ii Click on the Properties button. An Application DCSP Marking form opens.

iii Configure the DSCP parameter.

iv Click on the OK button. A dialog box appears.

v Click on the Yes button.

41 Click on the DSCP Mapping tab.

i Choose a DSCP mapping in the list and click on the Properties button. The Application DCSP Mapping form opens.

ii Configure the Forwarding Class parameter.

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button.

42 Click on the Dot1p Marking tab.

i Choose a Dot1p marking entry in the list and click on the Properties button. The Application Dot1p Marking form opens.

ii Configure the Dot1p parameter.

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The Routing Instance (Edit) form reappears.

43 Close the Routing Instance (Edit) form.

Procedure 22-2 To configure local DHCPv4 server on a routing instance

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance icon by choosing Network→NE→Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the menu. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the Local DHCP Servers tab.

5 On the DHCPv4 tab, perform one of the following:

a Create a new DHCPv4 server by clicking on the Create button. The Local DHCP Server (Create) form opens with the General tab displayed.

b Configure an existing DHCPv4 server by choosing an entry and clicking on the Properties button. The Local DHCP Server (Edit) form opens with the General tab displayed.

6 Configure the parameters:

- Server Name
- Description
- Administrative State
- Use Gateway Interface (GI) Address
- Gateway Interface (GI) Address Scope
- Allow Send Force Renews

7 Configure the client pool parameters:

- Use Pool From Client
- Pool Name Delimiter

8 Click on the Select button and choose a local user database from the Local User Db - Local DHCP Server - Site form.

9 Click on the Failover tab to configure DHCP server failover support. The General tab is displayed.

i Configure the Administrative State parameter.

ii Configure the parameters in the Client Lead Time panel:

- Maximum Time (Hours, Minutes, Seconds)
- Ignore Maximum Client Lead Time

iii Configure the Startup Wait Time Minutes and Seconds parameters in the Startup Wait Time panel.

iv Configure the Partner Down Delay Hours, Minutes, and Seconds parameters in the Partner Down Delay panel.

v Click on the Peer tab to configure a failover DHCP server peer.

vi Click on the Create button. The Failover Peer form opens.

vii Click on the Select button and choose a failover peer MCS site from the Select MC Peer form.

viii Configure the Sync Tag parameter. The Synch Tag setting must be the same on both failover servers.

ix Click on the Node Redundancy button to configure node redundancy for the failover peer, if required. The Manage Node Redundancy form opens, preconfigured for MC peer groups.

x Click on the Search button and configure an existing MC peer group, or click on the Create button and configure a new MC peer group. See Procedure 36-1. The Node Redundancy button allows you to access the MC sync group configuration within the MC peer group in order to add failover peer sync tags.

xi Click on OK in the Failover Peer form.

10 Click on the IP Address Pools tab to create a pool of one or more subnets on the local DHCP server.

i Click on the Create button. The IP Address Pool form opens with the General tab displayed.

ii Configure the following parameters:

- Pool Name
- Description

iii Configure the parameters in the Minimum Lease Time panel:

- Days
- Hours
- Minutes
- Seconds

iv Configure the parameters in the Maximum Lease Time panel:

- Days
- Hours
- Minutes
- Seconds

v Configure the parameters in the Offer Time panel:

- Minutes
- Seconds

vi Configure the parameters in the Pool Notifications (Minimum Free) panel:

- Threshold Type
- Threshold Value
- Notify When Pool Is Depleted

vii Configure parameters in the Subnet Binding panel, if required:

- Key
- Unbind Delay (Hours, Minutes, and Seconds)

To specify Unbind Delay values other than the defaults, disable the Default check box.

11 Click on the Subnets tab to add a subnet to the IP address pool.

12 Click on the Create button. The Subnet form opens with the General tab displayed.

i Configure the parameters:

- IP Address
- Prefix Length
- Maximum Declined Addresses Stored
- Subnet Drain
- Threshold Type
- Threshold Value
- Notify When Subnet Is Depleted

ii Click on the Address Ranges tab.

iii Click on the Create button. The Subnet Address Range form opens.

iv Configure the parameters:

- Action
- Start Address
- End Address
- Failover Control

Note — You must exclude static IP addresses from the subnet address range because static IP addresses are dedicated.

v Click on the OK button. The Subnet Address Range form closes and a dialog box appears.

vi Click on the OK button. The Subnet form reappears.

vii Click on the Options tab.

viii Click on the Create button. The Subnet Option form opens.

ix Configure the parameters:

- Option
- Number
- Type
- Value
- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

The Number parameter is configurable when the Option parameter is set to Custom Option.

The Value parameter is configurable when the Type parameter is set to ASCII String or Hex String.

The IP Address 1, IP Address 2, IP Address 3, and IP Address 4 parameters are configurable when the Type parameter is set to IP Address.

x Click on the OK button. The Subnet Option form closes and a dialog box appears.

xi Click on the OK button. The Subnet form reappears.

xii Click on the OK button. The Subnet form closes and a dialog box appears.

xiii Click on the OK button. The IP Address Pool form reappears.

13 Click on the Options tab.

14 Click on the Create button. The IP Address Pool Option form opens.

15 Configure the Option parameter and do one of the following:

a If you set the Option parameter to Custom Option, configure the following parameters:

- Number
- Type
- Value
- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

The Value parameter is configurable when the Type parameter is set to ASCII String or Hex String.

The IP Address 1, IP Address 2, IP Address 3, and IP Address 4 parameters are configurable when the Type parameter is set to IP Address.

b If you set the Option parameter to DNS Name Servers or Netbios Name Server, configure the following parameters:

- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

c If you set the Option parameter to Domain Name, configure the Value parameter.

d If you set the Option parameter to Lease Time, Lease Renew Time, or Lease Rebind Time, configure the following parameters:

- Days
- Hours
- Minutes
- Seconds

e If you set the Option parameter to Netbios Node Type, configure the Netbios Node Type parameter.

16 Click on the OK button. The IP Address Pool Option form closes and a dialog box appears.

17 Click on the OK button. The IP Address Pool form reappears.

Note 1 — The value in the Free Addresses tab specifies the minimum number of free addresses in the pool. If the actual number of free addresses in the pool falls below this configured minimum, an alarm is generated. The value 0 specifies “No minimum”.

Note 2 — The Declined Addresses tab indicates the number of declined addresses.

18 Click on the OK button. The IP Address Pool form closes and a dialog box appears.

19 Click on the OK button. The Local DHCP Server form reappears.

20 Click on the OK button. The Local DHCP Server form closes and a dialog box appears.

21 Click on the OK button. The Routing Instance form reappears.

22 Click on the OK button to save the configuration. A dialog box appears.

23 Click on the Yes button to verify the action.

24 Close the form.

Procedure 22-3 To configure local DHCPv6 server on a routing instance

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance icon by choosing Network→NE→Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the menu. The Routing Instance form opens with the General tab displayed.

4 Click on the Local DHCP Servers tab.

5 Click on the DHCPv6 sub-tab and do one of the following:

a Create a new DHCPv6 server by clicking on the Create button. The Local DHCPv6 Server (Create) form opens.

b Configure an existing DHCPv6 server by choosing an entry and clicking on the Properties button. The Local DHCPv6 Server (Edit) form opens with the General tab displayed.

6 Configure the parameters:

- Server Name
- Description
- Administrative State
- Use Pool From Client
- User Ident
- User Ident
- Use Link Address
- Link Address Scope
- Ignore Rapid Commit
- Interface ID Mapping

7 Configure the parameters in the Lease Hold Time panel:

- Days
- Hours
- Minutes
- Seconds

8 Configure the parameters in the DHCP Unique Identifier panel:

- Server ID Type
- ID Type
- Value

Note — The ID Type and Value parameters are configurable only if the Server ID Type parameter is set to Enterprise.

9 Click on the Failover tab to configure DHCPv6 server failover support.

i Configure the Administrative State parameter.

ii Configure the parameters in the Client Lead Time panel:

- Maximum Time (Hours, Minutes, Seconds)
- Ignore Maximum Client Lead Time

iii Configure the Startup Wait Time Minutes and Seconds parameters in the Startup Wait Time panel.

iv Configure the Partner Down Delay Hours, Minutes, and Seconds parameters in the Partner Down Delay panel.

v Click on the Peer sub-tab to configure a failover DHCPv6 server peer.

vi Click on the Create button. The Failover Peer form opens.

vii Click on the Select button and choose a failover peer MCS server site from the Select MC Peer form.

viii Configure the Sync Tag parameter. The Synch Tag setting should be the same on both failover servers.

ix Click on the Node Redundancy button to configure node redundancy for the failover peer, if required. The Manage Node Redundancy form opens, preconfigured for MC peer groups.

x Click on the Search button and configure an existing MC peer group, or click on the Create button and configure a new MC peer group. See Procedure 36-1. The Node Redundancy button allows you to access the MC sync group configuration within the MC peer group in order to add failover peer sync tags.

xi Click on OK in the Failover Peer form.

10 Click on the IPv6 Address Pools tab to assign one or more pools to the local DHCPv6 server.

11 Click on the Create button. The IPv6 Address Pool form opens with the General tab displayed.

i Configure the following parameters:

- Pool Name
- Description

ii Click on the Prefixes tab to add prefixes to the DHCPv6 server pool.

iii Click on the Create button. The Prefix form opens with the General tab displayed.

iv Configure the following parameters:

- IPv6 Address
- Prefix Length
- Failover Control
- Prefix Type

v Configure the parameters in the Preferred Life Time panel:

- Days
- Hours
- Minutes
- Seconds

vi Configure the parameters in the Valid Life Time panel:

- Days
- Hours
- Minutes
- Seconds

vii Configure the parameters in the Renew Timer panel:

- Days
- Hours
- Minutes
- Seconds

viii Configure the parameters in the Rebind Timer panel:

- Days
- Hours
- Minutes
- Seconds

ix Click on the Apply button. A dialog box appears.

x Click on the OK button.

xi Click on the Options tab.

xii Click on the Create button. The Prefix Option form opens.

xiii Configure the parameters:

- Option
- Number
- Type
- Value
- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

The Number parameter is configurable when the Option parameter is set to Custom Option.

The Value parameter is configurable when the Type parameter is set to ASCII String, Hex String, or Domain.

The IP Address 1, IP Address 2, IP Address 3, and IP Address 4 parameters are configurable when the Type parameter is set to IP Address.

xiv Click on the OK button. The Prefix Option form closes and a dialog box appears.

xv Click on the OK button. The Prefix form reappears with Options tab displayed.

xvi Click on the OK button. The Prefix form closes and a dialog box appears.

xvii Click on the OK button. The IPv6 Address Pool form reappears with Prefixes tab displayed.

12 Click on the Options tab.

13 Click on the Create button. The IPv6 Address Pool Option form opens.

i Configure the parameters:

- Option
- Number
- Type
- Value
- IP Address 1
- IP Address 2
- IP Address 3
- IP Address 4

The Number parameter is configurable when the Option parameter is set to Custom Option.

The Value parameter is configurable when the Type parameter is set to ASCII String, Hex String, or Domain.

The IP Address 1, IP Address 2, IP Address 3, and IP Address 4 parameters are configurable when the Type parameter is set to IP Address.

ii Click on the OK button. The IPv6 Address Pool Option form closes and a dialog box appears.

iii Click on the OK button. The IPv6 Address Pool form reappears with Options tab displayed.

14 Click on the OK button. The IPv6 Address Pool form closes and a dialog box appears.

15 Click on the OK button. The DHCPv6 Server form reappears with IPv6 Address Pool tab displayed.

16 Click on the OK button. The DHCPv6 Server form closes and a dialog box appears.

17 Click on the OK button. The Routing Instance form reappears.

18 Click on the OK button to save the configuration. A dialog box appears.

19 Click on the Yes button to verify the action.

20 Close the form.

Procedure 22-4 To perform a Force Partner Down action on a local DHCP server failover

The Force Partner Down action attempts to force a transition of the local DHCP server failover facility from a noCommunication state to a partnerDown state.

1 Choose Routing from the navigation tree view selector.

2 Navigate to the routing instance from which you want to perform a Force Partner Down action. Choose Network→NE→Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the menu. The Routing Instance form opens with the General tab displayed.

4 Click on the Local DHCP Servers tab.

5 Click on the DHCPv4 or DHCPv6 sub-tab.

6 Select the DHCP server on which you want to perform a Force Partner Down action and click on the Properties button. The Local DHCP Server form opens.

7 Click on the Failover tab.

8 Click on the Force Partner Down button.

The fields in the Force Partner Down Action panel are updated to reflect the result of the Force Partner Down action.

9 Close the Local DHCP Server form.

10 Close the Routing Instance form.

Procedure 22-5 To configure a routing instance on an OmniSwitch

You can configure interfaces, routing protocols, and static routes on the default routing instances on all OmniSwitch NEs. See Procedure 22-1 to configure VRF instances on supported OmniSwitch NEs.

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance icon by choosing Network→NE→Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the menu. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the Routing tab.

5 Configure the Router ID parameter, if required.

6 Click on the Interfaces tab. See Procedure 22-11 for information about creating additional OmniSwitch L3 interfaces.

7 Click on the Address tab.

8 Configure IP address parameters for L3 interfaces.

i Choose an address in the list.

ii Click on the Properties button. The IP Address (Edit) form opens.

iii Configure the parameters, if required:

- IP Address
- Prefix Length

iv Click on the OK button to save the changes. A dialog box appears.

v Select the check box to indicate that you understand the implications of making the change or click on the No button and go to step ix.

vi Click on the Yes button. A dialog box appears.

vii Click on the Yes button. The Routing Instance (Edit) form reappears.

viii Go to step 9.

ix Close the IP Address (Edit) form.

9 Click on the Static Routes tab to view a list of static routes and to add static routes. See Procedure 22-14 for more information.

10 Click on the OK button to save the configuration. A dialog box appears.

11 Click on the Yes button to verify the action.

12 Close the form.

OmniSwitch DHCP relay and snooping

A DHCP relay agent is a BOOTP relay agent that relays DHCP messages between DHCP clients and DHCP servers on different IP networks. The Omniswitch supports global or per-VLAN BOOTP/DHCP relay service and per-VLAN UDP port relay services.

DHCP Option-82 and DHCP snooping provide security for a DHCP relay service. The DHCP Option-82 switch-level feature allows the relay agent to insert identifying information into client-originated DHCP packets before the packets are forwarded to the DHCP server. DHCP Snooping, at the switch or VLAN level, improves network security by filtering DHCP messages received from devices outside the network and building and maintaining a binding table to track access information for each device. DHCP relay Option-82 and snooping cannot be run on the switch at the same time.

DHCP relay and snooping is configured at the default routing instance level, see Procedure 22-6. In addition, per-VLAN DHCP snooping can be enabled on a VLAN site. See procedures 66-1, 66-2, and 66-3 for more information.

It is necessary to configure ports connected to DHCP servers within the network and/or firewall as trusted ports so that necessary DHCP traffic to/from the server is not blocked. Configuring the port mode as trusted also identifies the device connected to that port as a trusted device within the network. See Procedure 16-23 for more information.

Procedure 22-6 To configure a UDP relay service, DHCP snooping, and DHCP Option 82 on OmniSwitch routing instances

Note — For VRF instances on the OS 6850E, OS6855-U24X, OS 9700E, and OS 9800E NEs, only UDP Relay service is supported.

1 Choose Routing from the navigation tree view selector.

2 Navigate to an OmniSwitch routing instance by choosing Network→OmniSwitch → Routing Instance.

Warning 1 — The routing instance must be the default routing instance.

Warning 2 — UDP Server Statistics/UDP Service Statistics will be lost as part of the parent change from Bridge Instance to Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the menu. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the UDP Relay tab to configure UDP relay. The UDP Relay General Configuration tab is displayed.

5 Configure the following parameters in the UDP BOOTP/DHCP Relay General Configuration panel.

- Forwarding Delay (seconds)
- Maximum Hops
- Forwarding Option

6 If you need to use the DHCP Option-82 functionality, configure the following parameters in the Relay Information Configuration panel.

- Relay Agent Information Mode
- Relay Agent Information Policy

7 If you need support for PXE devices, configure the PXE Support parameter.

Note — For VRF instances on the OS 6850E, OS6855-U24X, OS 9700E, and OS 9800E NEs, the following parameters are read only:

- Forwarding Delay (seconds)
- Maximum Hops
- Relay Agent Information Mode
- Relay Agent Information Policy
- PXE Support

The values of these parameters are updated automatically if the corresponding value is modified under the default VRF instance.

8 Click on the DHCP Snooping tab to configure DHCP snooping.

9 Perform one of the following:

a If working on an OS 6900 or an OS 10K, configure the parameters:

- Option-82 Format Type
- ASCII Field 1 Format
- ASCII Field 2 Format
- ASCII Field 3 Format
- ASCII Field 4 Format
- ASCII Field 5 Format
- ASCII Delimiter
- Option-82 User String
- ASCII Field 1 String Value
- ASCII Field 2 String Value
- ASCII Field 3 String Value
- ASCII Field 4 String Value
- ASCII Field 5 String Value

b If working on a node other than an OS 6900 or an OS 10K, configure the parameters:

- DHCP Snooping Mode
- Bypass Option-82 Check
- Option-82 Format Type
- Option-82 User String
- MAC Address Verification
- Option-82 Data Insertion
- Binding Database Mode
- Synchronization Timeout (seconds)
- Action
- Binding Persistency

10 Configure UDP port relay services, if required. Click on the Relay Services tab.

11 Click on the Create button.

12 Configure the UDP Relay Service parameter.

If you selected the Other option, configure the Relay Service Port and Relay Service Description parameters.

13 Click on the OK button. A dialog box appears.

14 Click on the OK button.

15 Click on the Relay Destinations tab.

16 Click on the Create button. The Create UDP Service Destinations form opens with the Select Relay Service step displayed.

17 Click on the Select button. The Select UDP Service - UDP Relay Service Destination form opens.

18 Choose a UDP relay service. Click on the OK button.

19 If you selected BOOTP/DHCP (67/68) in step 18 and the parameter Forwarding Option is set to Standard, click on the Next button. Otherwise, go to step 22.

20 The Forwarding Address step is displayed.

21 Configure the Forwarding Address parameter, if required.

22 Click on the Next button. The Select VLANs step is displayed.

23 Configure the search filter and click on the Search button. The Select VLANs form displays the VLANs that match the search criteria.

24 Choose one or more VLANs to be used to forward the UDP traffic.

25 Click on the Finish button. The Create UDP Service Destinations form closes and the selected VLANs appear in the relay destinations list.

Procedure 22-7 To configure a RADIUS server on a routing instance

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance by choosing Network→NE→Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the menu. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the RADIUS tab.

5 Click on the Create button. The RADIUS Server (Create) form opens.

6 Configure the parameters:

- Name
- Address
- UDP Authentication Port
- UDP Accounting Port
- Secret
- Description
- Accept CoA
- Pending RADIUS Authentication Requests Limit

7 Click on the OK button. The RADIUS Server (Create) form closes and the Routing Instance (Edit) form reappears with the new RADIUS Server information displayed.

Procedure 22-8 To configure a RADIUS proxy server on a routing instance

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance by choosing Network→NE→Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the menu. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the RADIUS tab.

5 Click on the RADIUS Proxy Servers tab.

6 Click on the Create button. The RADIUS Proxy Server (Create) form opens with the general tab displayed.

7 Configure the parameters:

- Name
- Purpose
- Administrative State
- Description
- Secret
- Send Accounting Response

8 Click on the Select button in the Default RADIUS Server Policies Authentication panel. The Select Authentication - RADIUS Proxy Server form opens with a list of RADIUS server policies displayed.

9 Choose a RADIUS server policy and click on the OK button. The Select Authentication - RADIUS Proxy Server form closes and the RADIUS Proxy Server (Create) form reappears with the RADIUS server policy information displayed.

10 Click on the Select button in the Default RADIUS Server Policies Authorization panel. The Select Authorization - RADIUS Proxy Server form opens with a list of RADIUS server policies displayed.

11 Choose a RADIUS server policy and click on the OK button. The Select Authorization - RADIUS Proxy Server form closes and the RADIUS Proxy Server (Create) form reappears with the RADIUS server policy information displayed.

12 Configure the Key Type parameter.

13 If the Key Type parameter was set to Attributes, configure the parameters:

- Attribute Type 1
- Attribute Type 2
- Attribute Type 3
- Attribute Type 4
- Attribute Type 5
- Vendor ID 1
- Vendor ID 2
- Vendor ID 3
- Vendor ID 4
- Vendor ID 5

14 Click on the Caching tab.

15 Configure the parameters:

- Enable Caching
- Tracked Accounting Packets
- Packet Type

16 If the Packet Type parameter was set to any value other than None, configure the parameters:

- Attribute Type
- Vendor ID

17 Configure the Timeout parameter.

18 Click on the Interfaces tab.

19 Click on the Create button. The RADIUS Proxy Interface form opens.

20 Click on the Select button. The Select Interface - RADIUS Proxy Interface form opens with a list of interfaces displayed.

21 Choose an interface and click on the OK button. The Select Interface - RADIUS Proxy Interface form closes and the RADIUS Proxy Interface form reappears with the interface information displayed.

22 Click on the OK button. The RADIUS Proxy Interface form closes and the RADIUS Proxy Server (Create) form reappears with the interface information displayed.

23 Click on the OK button. The RADIUS Proxy Server (Create) form closes and the Routing Instance (Edit) form reappears with the new RADIUS Proxy Server information displayed.

Procedure 22-9 To create an L3 interface

The interfaces you can configure include the following:

- L3 network interface
- ICMP interface
- system interface
- management interface
- VRRP instance
- IGMP interface
- PIM interface
- MLD interface

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance by choosing Network→NE→Routing Instance.

3 Create an L3 interface by right-clicking on the routing instance icon and choosing Create Interface. The Create Network Interface step form opens.

Note — The steps that appear on the Create Network Interface step form depend on the device type, device version, and the options that are selected during configuration.

4 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- IPv6 Allowed
- MAC Address
- Allow Directed Broadcasts
- Class
- Loopback Enabled
- PIM RP Delayed Up Period
- Cflowd Type
- Trusted
- Admin Link Local Address
- Admin Link Local Address Preferred
- Strip Label
- Enable Ingress FlowSpec IPv4
- Enable Ingress FlowSpec IPv6
- Enable MAC Accounting Stats
- LDP Synchronization Timer
- FlowSpec Validate Enabled
- QoS Route Lookup IPv4
- QoS Route Lookup IPv6

5 Click on the Next button and perform one of the following:

a If you chose Numbered in the Class parameter in step 4, the Configure IP Address form opens. Specify the IP address information for the L3 interface:

i Click on the Create button. The IP Address (Create) form opens.

ii Configure the parameters:

- IP Address
- Prefix Length
- IGP Inhibit
- Broadcast Address Format
- EUI-64
- IP Address Preferred

The Broadcast Address Format parameter only appears if the IP Address parameter is set to an IPv4 address.

The EUI-64 and IP Address Preferred parameters only appear if the IP Address parameter is set to an IPv6 address.

iii Click on the OK button to save the changes. A dialog appears.

iv Click on the OK button. The IP Address (Create) form closes and the Configure IP Address form reappears.

b If you chose Unnumbered for the Class parameter in step 4, the Configure Unnumbered Interface form opens. Configure the parameters:

- Unnumbered Type
- Unnumbered Reference

6 Click on the Next button. The Select Port form opens.

Note — If the Loopback Enabled parameter is selected on the Define General Properties form, The Select Port step does not appear in the step menu for the 7950 XRS, 7450 ESS, 7750 SR, 7705 SAR, and 7710 SR.

7 Associate the L3 interface with a physical port.

i Click on the Select button. The Select Port form opens.

ii Choose a port.

iii Click on the OK button. The port is associated with the L3 interface.

8 Click on the Next button. The Select Network Policy form opens.

9 Click on the Select button in the Network Policy panel to list and choose a network policy for the interface. Network policies are used to determine QoS settings based on the packet DSCP bits on the ingress and egress of the network.

Note — If you select a network policy with a forwarding class mapped to a queue group queue ID, you must ensure that the mapping queue group queue ID is in the selected Queue Group Template Policy.

See Procedure 16-1 for more information about how to configure Ethernet ports. See chapter 42 for more information about queue group template policies.

10 In the Ingress Forwarding Plane Redirect panel:

Note 1 — You must ensure that the port you selected in step 7 has a network egress queue group with the same name as the Queue Group Template policy created on it.

Note 2 — If the Network Policy you selected in step 9 has Port Redirect Groups on its Ingress Forwarding Classes, you must specify both an Ingress Queue Group Template Policy and Instance ID.

Note 3 — If the Network Policy you selected in step 9 has Port Redirect Groups on its Egress Forwarding Classes, these must already be defined within the Egress Queue Group Template Policy you select.

Note 4 — Queue Group Template policies are not applicable to L3 interfaces associated with HSMDA ports.

See Procedure 16-1 for more information about how to configure Ethernet ports. See chapter 42 for more information about queue group template policies.

i Click on the Select button to choose a queue group template policy for the interface's ingress forwarding plane redirection. Only global Ingress Queue Group Template Policies that have already been defined can be chosen. Queue group template policies allow SAP or IP interface forwarding classes to be redirected from the typical queue mapping to a shared queue.

ii Configure the Queue Group Instance ID parameter.

11 In the Egress Port Redirect panel:

Note 1 — If the Network Policy you selected in step 9 has Port Redirect Groups on its Egress Forwarding Classes, you must specify both an Egress Queue Group Template Policy and Instance ID.

Note 2 — If the Network Policy you selected in step 9 has Port Redirect Groups on its Egress Forwarding Classes, these must already be defined within the Egress Queue Group Template Policy you select.

Note 3 — Queue Group Template policies are not applicable to L3 interfaces associated with HSMDA ports.

See Procedure 16-1 for more information about how to configure Ethernet ports. See chapter 42 for more information about queue group template policies.

i Click on the Select button to choose a queue group template policy for the interface's egress port redirection. Only local Egress Queue Group Template Policies which have a Network Egress Queue Group Instance defined on the associated port can be chosen.

ii Configure the Queue Group Instance ID parameter.

12 Click on the Next button. The Select ACL Filters form opens.

13 Click on the Select buttons to list and choose Ingress and Egress IPv4 and IPv6 ACL filters for the interface. ACL filters are used to filter out IP traffic that matches user-defined criteria.

14 Click on the Next button. The Configure ICMP form opens.

Configure the parameters:

- Mask Reply
- Redirects
- Unreachables
- TTL Expired
- Number of Redirects
- Redirects Time (seconds)
- Number of Unreachables
- Unreachables Time (seconds)
- Number of TTL Expired
- TTL Expired Time (seconds)

15 Click on the Next button. If the IPv6 Allowed parameter in step 4 is enabled, the Configure ICMPv6 form opens. Otherwise, go to step 16.

Configure the parameters:

- Redirects
- Unreachables
- Packet Too Big
- Param Problem
- Time Exceeded
- Number of Redirects
- Redirects Time (seconds)
- Number of Unreachables
- Unreachables Time (seconds)
- Number of Packet Too Big
- Packet Too Big Time (seconds)
- Number of Param Problem
- Param Problem Time (seconds)
- Number of Time Exceeded
- Time Exceeded Time (seconds)

16 Click on the Next button. The Configure ARP form opens.

i Configure the Timeout (seconds) parameter.

ii Click on the Create button to statically associate an IP or MAC address to the interface. The Static ARP (Create) form opens.

Configure the parameters:

- IP Address
- Physical Address

iii Click on the OK button. The Static ARP (Create) form closes.

17 Click on the Next button. The Configure Proxy ARP form opens.

Proxy ARP allows a device, such as a router, to answer ARP requests that are intended for another device. This allows a device to reach a remote subnet without configuring routes to the subnet or a default gateway device.

18 Configure the parameters:

- Remote Proxy ARP
- Enable Local Proxy ARP

19 Click on the Next button. The Configure Proxy ARP Policies form opens.

20 Configure the parameters:

- Proxy Arp Policy 1
- Proxy Arp Policy 2
- Proxy Arp Policy 3
- Proxy Arp Policy 4
- Proxy Arp Policy 5

21 Click on the Next button. If the IPv6 Allowed parameter in step 4 is enabled, the Configure Neighbor Discovery form opens. Otherwise, go to step 27.

22 Click on the Create button to configure a neighbor. The Neighbor Discovery (Create) form opens.

23 Configure the parameters:

- IP Address
- Physical Address

24 Click on the OK button. The Neighbor Discovery (Create) form closes and the Configure Neighbor Discovery form reappears.

25 Click on the Next button. The Configure Proxy Neighbor Discovery form opens.

26 Configure the parameters:

- Enable Local Proxy
- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Note — You must not leave an empty policy parameter between two configured policy parameters. For example, do not configure the Policy 1 and Policy 3 parameters and leave the Policy 2 parameter unconfigured. The 5620 SAM reorders the policies and moves the policy entered for the Policy 3 parameter to the Policy 2 parameter.

27 Click on the Next button. The Configure NTP form opens.

28 Configure the Broadcast parameter.

Note — When the Broadcast parameter is enabled, a time protocol such as NTP or SNTP must be enabled and configured on the device, or the device ignores broadcast time packets received on the interface. See chapter 9 for information about configuring NTP or SNTP on a device.

29 Click on the Next button. The Configure DHCP - General form opens.

30 Configure IPv4 DHCP for the interface, if required.

i Configure the parameters:

- Enable DHCP Relay
- Description
- Action
- Circuit ID
- Remote ID
- Remote ID String
- Copy To Option 43

Note — The Remote ID String parameter is configurable when the Remote ID parameter is set to Remote IDString.

ii Click on the Next button. The Configure DHCP - Server form opens.

iii Configure the Server 1 through Server 8 parameters.

31 Click on the Next button. The Configure VRRP form opens.

VRRP instances are members of a virtual router that provides backup if a router fails in a statically configured LAN. VRRP instances are created from network interfaces on a router, either as a master owner through which IP packets are routed before a failover or as a backup non-owner that assumes the packet-forwarding (master) role after a failover. Before you create or add a VRRP instance to a virtual router, ensure that the master and backup interfaces have the same VRID and occupy the same subnet.

32 Perform one of the following:

a If a VRRP instance is not required, click on the Next button until the Unicast RPF form opens in step 41.

b If an IPv4 VRRP instance is required, click on the Create button. The VRRP Instance (Create) form opens with the General tab displayed. See chapter 33 for information about VRRP instances and virtual routers.

c If an IPv6 VRRP instance is required, click on the Next button. The Configure IPv6 VRRP form is displayed. Click on the Create button and the VRRP IPv6 Instance (Create) form opens with the General tab displayed. See chapter 33 for information about VRRP instances and virtual routers.

33 Click on the Next button. The Configure Router Advertisement form opens.

34 Click on the Create button to add a router advertisement entry. The Router Advertisement (Create) form opens with the General tab displayed.

35 Configure the parameters:

- Send Advertisement
- Min Interval (seconds)
- Reachable Time (milliseconds)
- Managed Address Config
- MTU
- Use Virtual MAC Address
- Max Interval (seconds)
- Retransmit Time (milliseconds)
- Other Stateful Config
- Current Hop Limit
- Lifetime (seconds)

If you are configuring the L3 interface for an IPv6 VRRP instance, then the Send Advertisement and Use Virtual MAC Address parameters must both be enabled.

36 Click on the Prefix tab.

37 Click on the Create button. The Router Advertisement Prefix (Create) form opens.

38 Configure the parameters:

- IPv6 Prefix
- Prefix Length
- On-Link Determination
- Autonomous Address Configuration
- Lifetime (seconds)
- No Expiry
- Lifetime (seconds)
- No Expiry

Note — Each Lifetime (seconds) parameter is configurable when the associated No Expiry parameter is disabled.

39 Click on the OK button. A dialog box appears.

40 Click on the OK button. The Router Advertisement Prefix (Create) form closes.

41 Click on the Next button. The Unicast RPF form opens.

42 Configure the parameters:

- URPF Check State IPv4
- URPF Check Mode IPv4
- URPF Check State IPv6
- URPF Check Mode IPv6

The URPF Check State IPv6 and URPF Check Mode IPv6 parameters are only configurable when the IPv6 Allowed parameter is enabled.

43 Click on the Next button. The Configure Network Domain form opens.

44 Configure the parameters. You can Add Network Domain or Remove Network Domain.

45 Click on the Next button. The Configure BFD form opens.

46 Configure Bidirectional Forwarding Detection for the interface, if required.

i Set the Administration Status parameter to Up. The configuration form is refreshed with additional parameters.

ii Configure the parameters:

- Administration Status
- Transmit Interval
- Receive Interval
- Echo Interval
- Multiplier
- Termination Type
- Operational State Transition Interval
- Inherit from Network Element

iii To view local and remote session peers, click on the BFD Session tab. 5620 SAM retrieves information from local and remote nodes and displays a list of BFD current sessions on router interfaces or L3 interfaces.

iv Click on a session. A properties window opens for the session. View the following:

- BFD status
- protocol used
- local address
- remote address
- operational status and statistics

The BFD Status field indicates one of the following:

- “no service”, when BFD is disabled
- “in service”, when BFD is running
- “out of service”, when BFD has failed

v Click on the OK button.

Note — You cannot enable BFD on an interface, if BFD is not configured on the interface. You cannot set the administration status of an interface to disabled, when protocols using the interface have BFD enabled. See chapter 23 for information about enabling and disabling BFD for routing protocols.

47 Click on the Next button. If the IPv6 Allowed parameter in step 4 is enabled, the Configure IPv6 BFD form opens and you can configure IPv6 BFD parameters for the interface as in step 52.

48 Click on the Finish button. The Summary form opens.

49 Enable the View the newly created Network Interface parameter to view the interface configuration after closing the form, if required.

50 Click on the Close button. The Create Network Interface step form closes.

51 If the View the newly created tunnel parameter in step 49 is enabled, the Network Interface (Edit) form opens with the newly created interface configuration displayed. To configure BFD on the network interface, go to step 52.

52 Configure Bidirectional Forwarding Detection for the interface, if required.

i Click on the BFD tab. A configuration form opens.

ii Set the Administration Status parameter to Up. The configuration form is refreshed with additional parameters.

iii Configure the parameters:

- Administration Status
- Transmit Interval
- Receive Interval
- Echo Interval
- Multiplier
- Termination Type
- Inherit from Network Element
- Operational State Transition Interval

iv To view local and remote session peers, click on the BFD Session tab. 5620 SAM retrieves information from local and remote nodes and displays a list of BFD current sessions on router interfaces or L3 interfaces.

v Click on a session. A properties window opens for the session. View the following:

- BFD status
- protocol used
- local address
- remote address
- operational status and statistics

The BFD Status field indicates one of the following:

- “no service”, when BFD is disabled
- “in service”, when BFD is running
- "out of service", when BFD has failed

vi Click on the OK button.

Note — You cannot enable BFD on an interface, if BFD is not configured on the interface. You cannot set the administration status of an interface to disabled, when protocols using the interface have BFD enabled. See chapter 23 for information about enabling and disabling BFD for routing protocols.

Procedure 22-10 To configure an L3 interface

This procedure describes how to configure L3 interface parameters. The interfaces you can modify include the following:

- L3 network interface
- ICMP interface
- system interface
- management interface
- VRRP instance
- IGMP interface
- PIM interface
- MLD interface

1 Choose Routing from the navigation tree view selector.

2 Navigate to a network interface. The path is Routing→NE→Routing Instance→Interface.

3 Choose an interface and choose Properties from the menu. The Network Interface (Edit) form opens.

4 Click on the appropriate tab and configure the parameters, if required. Table 22-4 describes the tabs to choose, as shown when you modify an existing routing interface.

Table 22-4 Description of network interface configuration form tabs

Tab	Description
General	Configure the parameters: • Description • Administrative State • IPv6 Allowed • MAC Address • Allow Directed Broadcasts • Class • Loopback Enabled • PIM RP Delayed Up Period • Cflowd Type • Trusted • LDP Synchronization Timer • Enable Ingress FlowSpec • Enable Ingress FlowSpec IPv6 • PTP HW Assist
Port	To create an association between the L3 interface and a physical port or channel. The system interface is not associated with a port.
Policies	To associate network policies and ingress or egress IP ACL filter policies with the network interface.
Protocols	To view a list of protocols that are enabled on the interface, and to apply protocols. The protocols are: • MPLS • OSPFv2 • OSPFv3 • LDP • IS-IS • RIP
Multicast	To view a list of multicast protocols that are enabled on the interface, and to apply protocols. The protocols are: • PIM • IGMP • MLD
Local DHCP Servers	To assign local DHCP servers. Local DHCP servers are configured on the routing instance and VPRN service. They must be assigned to a network or an L3 interface. To assign local DHCPv6 servers the IPv6 Allowed parameter must be enabled.
DHCP Client	To enable a DHCP Client on a network interface, configure the parameters: • Enable DHCP Client • Client Identifier • Vendor Class ID
Security	To assign a DoS protection policy or DDoS protection policy to a network interface.
RCA Result	To view the results of RCA activities on the network interface
Address	To assign an IP address, subnet and broadcast address format to a network interface. Only one primary IP address can be associated with a network interface.
BFD	To configure BFD parameters

(1 of 2)

Tab	Description
ARP	To configure or view ARP and proxy ARP parameters. Click on the General tab to configure the minimum time, in seconds, that an ARP entry is stored in the ARP table. Click on the Create button to configure static ARP IP and MAC address parameters. Click on the Proxy ARP tab to view parameter information.
ICMP	To configure ICMP parameters
ICMPv6	If IPv6 is enabled on the interface, to configure ICMPv6 parameters
Neighbor Discovery	To configure neighbor discovery and proxy neighbor discovery for static routes. Click on the General tab and Create button to configure neighbor discovery IP and MAC address parameters. Click on the Proxy ND tab to configure proxy neighbor discovery parameters. (1)
VRRP	To add a VRRP instances to an existing virtual router that assumes routing responsibilities from a failed router in a statically configured LAN
MEPs	To add network interface facility MEPs. Each network interface can support one facility MEP. • To perform continuity messaging on the network interface facility MEP, enable the CCM Messages Enabled parameter. • To enable fault propagation on the network interface facility MEP, enable the Facility Fault Notify parameter.
Advertisement	To configure router advertisement
DHCP	To configure DHCP Relay parameters
NTP	To enable SNTP broadcasts on the network interface
Statistics	To view L3 network interface statistics
Faults	To view alarms that are raised against the network interface, or related alarms that affect the network interface

(2 of 2)

Note
(1) The Proxy ND tab is available only on the 7750 SR.

5 Click on the Apply button to save the changes.

6 Close the form.

7 Cable the network ports or channels of the device, with L3 interfaces enabled, to other devices configured the same way.

8 Configure routing protocols, as described in chapter 23.

Procedure 22-11 To create a L3 interface on an OmniSwitch

An L3 interface enables IP routing on a VLAN. Without an L3 interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.

1 Choose Routing from the navigation tree view selector.

2 Navigate to an OmniSwitch routing instance by choosing Network→OmniSwitch →Routing Instance.

3 Right-click on the routing instance icon and choose Create Interface from the menu. The Create Network Interface step form opens with the Define General Properties form displayed.

4 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- Configured Primary Status
- Enable Forwarding

5 Click on the Next button. The Configure IP Address form opens.

6 Click on the Create button. The IP Address (Create) form opens.

7 Configure the parameters:

- IP Address
- Prefix Length

8 Click on the OK button. The IP Address (Create) form closes and a dialog box appears.

9 Click on the OK button.

10 Click on the Next button. The Configure Proxy ARP form opens.

11 Configure the Enable Local Proxy ARP parameter.

12 Click on the Next button. The Select VLAN form opens.

13 Click on the Select button. The Select VLAN - Network Interface form opens.

14 Choose a VLAN to which you need to add the interface.

15 Click on the OK button. The Select VLAN - Network Interface form closes.

16 Click on the Finish button. The Summary form opens.

17 Select the View the newly created Network Interface parameter to view the interface configuration after you close the Summary form, if required.

18 Click on the Close button. The Create Network Interface step form closes.

Procedure 22-12 To configure L3 interfaces on an OmniSwitch

1 Choose Routing from the navigation tree view selector.

2 Navigate to a network interface by choosing Network→ OmniSwitch →Routing Instance→Interface.

3 Choose an interface and choose Properties from the menu. The Network Interface (Edit) form opens.

4 Click on the appropriate tab and modify the parameters, if required. Table 22-5 describes the tabs.

Table 22-5 Description of OmniSwitch network interface configuration form tabs

Tab	Description
General	Configure the parameters: • Description • Administrative State • Configured Primary Status • Enable Forwarding • Encap Type
VLAN	View properties of the VLAN to which the interface is assigned or assign a VLAN to the interface.
Address	Assign an IP address to a network interface or view properties of an assigned address. Only one primary IP address can be associated with a network interface.
ARP	Configure the Enable Local Proxy ARP parameter.
Faults	View alarms that are raised against the network interface, or related alarms that affect the network interface.

5 Click on the Apply button to save the changes.

6 Close the form.

Procedure 22-13 To create a static route

1 Choose Routing from the navigation tree view selector.

2 Navigate to the static routes icon. The navigation path is Routing→NE→Routing Instance→Static Routes.

3 Right-click on the static routes icon and choose Create Static Route from the menu. The Static Route (Create) form opens.

4 Configure the parameters:

- Auto-Assign ID
- Static Route ID
- BFD Enabled
- Forwarding Class Name
- Forwarding Class Priority
- Community
- Description
- Destination
- Prefix Length
- Multicast Capable Peers
- Dynamic BGP
- Type
- IP Address
- Interface Name
- Unnumbered Interface
- Preference
- Metric
- Administrative State
- Tag
- LDP
- Disallow IGP
- Enable CPE Check
- Target IP Address
- Interval (seconds)
- Drop Count
- Log
- Prefix List Name
- Prefix List Flag
- Packet Size

The Dynamic BGP parameter is configurable when the Type parameter is set to Black Hole.

The IP Address parameter is configurable when the Type parameter is set to an option other than Black Hole.

The Target IP Address, Interval (seconds), Drop Count, and Log parameters are displayed only when Enable CPE Check is enabled.

You cannot specify a Prefix List if either BFD Enabled or Enable CPE Check parameters are enabled for the static route.

The Prefix List Flag Prefix List Name parameter is configured.

5 If IPv6 is enabled on the routing instance, click on the Select button beside the Interface Name parameter to choose an IPv6 zone index for the static route. The Select Zone Index - Static Route form opens. Otherwise, go to step 7.

6 Choose a zone index in the list and click on the OK button. The Select Zone Index - Static Route form closes and the zone index is displayed in the Static Route (Create) form.

7 Click on the OK button. The Static Route (Create) form closes.

Procedure 22-14 To configure a static route on an OmniSwitch

1 Choose Routing from the navigation tree view selector.

2 Navigate to the static routes icon by choosing Network→OmniSwitch or→Routing Instance→Static Routes.

3 Right-click on the static routes icon and choose Create Static Route from the menu. The Static Route (Create) form opens.

4 Configure the parameters:

- Auto-Assign ID
- Static Route ID
- Destination
- Prefix Length
- Type
- IP Address
- Metric

Note — If the address entered for the IP Address parameter is unreachable by the node, the static route is not created on the node. Use the 5620 SAM to verify that all configured static routes are created successfully on the node by checking the list of static routes for the OmniSwitch routing instance.

5 Click on the OK button to save the configuration. The Static Route (Create) form closes.

Procedure 22-15 To configure a routing policy statement

See "Routing policies" in section 22.1 for more information about routing policies.

1 Choose Policies→Routing→Statement from the 5620 SAM main menu. A Routing Policy Statement Manager form opens.

2 Click on the Create button.

3 Configure the parameters:

- Policy Statement Name
- Description
- Default Action
- Check Dependencies

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Perform one of the following:

a Click on the Components tab. Choose and right-click on Policy Statement Entry and choose Create Policy Statement Entry. The Policy Statement Entry (Create) form opens with the General tab displayed. Go to step 6.

b Click on the Policy Statement Entries tab.

5 Click on the Create button. The Policy Statement Entry (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Entry ID
- Description
- Action

7 Perform one of the following:

a If you choose Accept, Next Entry, or Next Policy for the Action parameter, go to step 8.

b If you choose None or Reject for the Action parameter, go to step 19.

8 Click on the Action tab. The General sub-tab under the General tab is displayed.

9 Configure the parameters:

- Route Origin
- Route Preference
- BGP Local Preference
- Local Preference Set
- Use Next Hop
- OSPF Route Type
- Advertise Next Hop Self
- Accumulated IGP Metric Value
- Accumulated IGP Metric
- Metric Value
- Metric Action
- Metric Source
- OSPF, RIP, or ISIS Tag (Hex)
- Next Hop Type
- Damping Profile Name
- Interface
- Forwarding Class Name
- Forwarding Class Priority

10 Click on the Path sub-tab.

11 Configure the parameters:

- BGP AS Path Name
- BGP AS Path Action
- BGP AS Prepend number
- Prepend Count

12 Click on the BGP Community sub-tab.

13 Configure the parameters:

- Community Name 1
- Community Action 1
- Community Name 2
- Community Action 2

14 Click on the Community Actions sub-tab.

15 Click on one of the Add, Remove, or Replace sub-tab to perform the specific action that you want to perform.

Note — In the Community Actions context, the Add/Remove and Replace actions are mutually exclusive.

16 Click the Select button. The Select Policy Statement Entry form opens.

17 Click the Search button and select the required entry from the list.

18 Click OK. The Select Policy Statement Entry form closes and your selection appears in the Community Name Action field of the tab you selected in step 15.

19 Click on the From Criteria tab. The General sub-tab displayed.

20 Click on the Select button beside the AS Path Name parameter. The Select Policy Statement Entry - Site form opens.

21 Choose an AS Path from the list and click on the OK button. The AS Path Name is refreshed with the selected AS Path.

22 Click on the Select button beside the AS Path Group Name parameter. The Select Policy Statement Entry - Site form opens.

23 Choose an AS Path Group from the list and click on the OK button. The AS Path Group Name is refreshed with the selected AS Path Group.

24 Click on the Select button beside the Community List Name parameter. The Select Policy Statement Entry - Site from opens.

Note — Selecting a Community List Name in this step is mutually exclusive with creating a Community List Expression in step 39.

25 Choose a community and click on the OK button. The Community List Name is refreshed with the selected community.

26 Configure the parameters.

- Protocol
- Origin
- State
- Interface Name
- Static Route Tag
- No Route Tag
- Family
- Level
- IS-IS External Route
- OSPF Route Type
- OSPF Area
- OSPF Area Set
- Multicast Source IP Address
- Neighbor IP Address

27 Perform the following to add sub-policy calls to group match criteria over multiple policy entries for complex match conditions. Any match conditions that are above the sub-policy are evaluated first. If all of the match conditions are met, the sub-policy is evaluated.

Note — You cannot add policies that have nested sub-policies.

i Click on the Select button beside the Policy Statement Name parameter. The Select Policy Statement Entry form opens. Alternatively, enter a policy name and go to step 28.

ii Choose a policy and click on the OK button. The Policy Statement Name parameter is refreshed with the selected policy.

28 Click on the Select button beside the Multicast Group Prefix List Name parameter. The Select Policy Statement Entry form opens.

29 Choose a policy and click on the OK button. The Multicast Group Prefix List Name parameter is refreshed with the selected policy.

30 Click on the Select button beside the IGMP Host Prefix List Name parameter. The Select Policy Statement Entry form opens.

31 Choose a policy and click on the OK button. The IGMP Host Prefix List Name parameter is refreshed with the selected policy.

32 Click on the Select button beside the Interface Name parameter. The Select Zone Index From Criteria Site form opens.

33 Choose a site and click on the OK button. The Interface Name parameter is refreshed with the selected site.

34 Click on the Select button beside the Neighbor Prefix List Name parameter. The Select Policy Statement Entry form opens.

35 Choose a policy statement and click on the OK button. The Neighbor Prefix List Name parameter is refreshed with the selected policy.

36 Click on the Prefix List tab.

37 Configure the parameters.

- Prefix List 1
- Prefix List 2
- Prefix List 3
- Prefix List 4
- Prefix List 5

38 Click on the Community Expression sub-tab.

39 Create a Community List Expression.

Note — Creating a Community List Expression in this step is mutually exclusive with selecting a Community List Name in step 24.

You enter pre-defined Community lists here which become part of a defined Community List Expression. You then use Boolean operators to define the policy's actions between different lists. Valid expression operators include: AND, OR, and NOT. The Boolean operators can also be used with parentheses and combined into a more complex expression. For example:

```
[comlist1] AND ([comlist3] OR [comlist4])
```

Note — When constructing a Community List Expression, Community Names must be limited to 32 characters maximum, and are enclosed within square parentheses. The entire Community List Expression must be limited to 900 characters maximum.

i Click on the Create button. A Community Expression (Create) form opens

ii Click the Select button. The Select Community form opens.

iii Click the Search button and choose an entry from the list, then click OK.

The Select Community form closes and the entry you selected appears in the Community Name field.

iv Click the Add button to place the entry into the Community List Expression field.

v Construct the Community List Expression string as required by adding other Community Names and connecting them with the appropriate Boolean operators and parentheses. The operators and parentheses are added to the expression by clicking on the required button below the Community List Expression field.

vi If you make an error in the construction of the string, you can use the Clear All button to start again, or just place your cursor in the field and do a manual editing correction.

vii Click on the OK button. A dialog box appears.

viii Click on the OK button. The Community Expression (Create) form closes and the Policy Entry Statement (Create) form is updated with the newly created expression.

ix Repeat steps i to viii to add other Community List Expressions, as required.

40 Click on the To Criteria tab. The Policy Statement Entry (Create) form opens with the General tab displayed.

41 Configure the parameters.

- Protocol
- Instance ID
- All Instances
- Level
- Neighbor IP Address

42 Click on the Select button beside the Neighbor Prefix List Name parameter. The Select Policy Statement Entry form opens.

43 Choose a policy.

44 Click on the OK button. The Neighbor Prefix List parameter is refreshed with the selected policy.

45 Click on the Select button beside the Interface Name parameter. The Select Zone Index To Criteria Site form opens.

46 Choose an interface.

47 Click on the OK button. The Interface Name parameter is refreshed with the selected site.

48 Click on the Prefix Lists tab.

49 Configure the parameters.

- Prefix List 1
- Prefix List 2
- Prefix List 3
- Prefix List 4
- Prefix List 5

50 Click on the OK button. A dialog box appears.

51 Click on the OK button.

Note — A routing policy is discovered as local edit only. To synchronize a routing policy with all NEs, you must change the distribution mode of the routing policy to sync with global. To configure the distribution mode, see Procedure 42-1.

52 Configure the following routing-related policies, if required:

a To configure a prefix list policy, see Procedure 22-16.

b To configure a community policy, see Procedure 22-17.

c To configure a damping policy, see Procedure 22-18.

d To configure an AS Path policy, see Procedure 22-19.

e To configure an AS Path Group policy, see Procedure 22-20.

f To view a routing policy from a CLI session, see Procedure 22-29.

Procedure 22-16 To configure a prefix list policy

See "Routing policies" in section 22.1 for more information about the use and purpose of routing policies.

1 Choose Policies→Routing→Prefix List from the 5620 SAM main menu. A Routing Policy Prefix List Manager form opens.

2 Click on the Create button. The Routing Policy Prefix List (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Prefix List Name
- Description

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Prefix List Members tab.

5 Click on the Create button. The Prefix List Member (Create) form opens.

6 Configure the parameters:

- Prefix
- Mask
- Type
- Begin Length
- Through Length
- Description

The Begin Length and Through Length parameters are configurable when the Type parameter value is set to Range or Through.

7 Click on the OK button. A dialog box appears.

8 Click on the OK button. The Routing Policy Prefix List, Global Policy (Create) form opens with the newly created prefix member.

9 Close the Routing Policy Prefix List, (Create) form.

Note — A routing policy is discovered as local edit only. To synchronize a routing policy with all NEs, you must change the distribution mode of the routing policy to sync with global. To configure the distribution mode, see Procedure 42-1.

10 Configure the following routing-related policies, if required:

a To configure a policy statement, see Procedure 22-15.

b To configure a community policy, see Procedure 22-17.

c To configure a damping policy, see Procedure 22-18.

d To configure an AS Path policy, see Procedure 22-19.

e To configure an AS Path Group policy, see Procedure 22-20.

f To view a routing policy from a CLI session, see Procedure 22-29.

Procedure 22-17 To configure a community policy

See "Routing policies" in section 22.1 for more information about the use and purpose of routing policies.

1 Choose Policies→Routing→Community from the 5620 SAM main menu. A Manage Routing Policy - Community form opens.

2 Click on the Create button. A Routing Policy - Community, Global Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Community Name
- Description

4 Perform one of the following:

a To create a Community Expression, go to step 5.

b To create a Community Member, go to step 9.

5 Click on the Community Expression tab.

6 Click on the Create button. A Community Expression (Create) form opens.

You can enter a string here which becomes a defined Community Expression. You use Boolean operators to define the policy's actions between different values. Valid expression operators include: AND, OR, and NOT. For example, if you enter the following string:

```
target:5:1000 OR target:9:10
```

then the policy matches a route that has either target. Or if you enter:

```
2:2 AND 200:200
```

then the policy only matches a route that has both targets.

The Boolean operators can also be used with parentheses and combined into a more complex expression, such as:

```
(8:8 AND NOT 9:9) OR (7:7)
```

In this case, the policy matches a route which contains the regular expression for target 8:8 with the exception of target 9:9, or just target 7:7 alone.

Any community (including a regular expression), extended community (including a regular expression) or well-known community can be part of the Community Expression. Therefore, valid values for the Community Expression's components include:

- Community Values, such as 100:100
- Extended Community Values, such as target:1:1, origin 1:1, target:1.1.1.1:1, or origin 1.1.1.1:1
- Regular expressions for communities, such as 100|200:100|200
- Regular expressions for extended community values

Note — When constructing a Community Expression, Community IDs must be limited to 75 characters maximum, and regular expressions must be limited to 72 characters maximum. The entire Community Expression must be limited to 900 characters maximum.

Community Expressions are supported on the 7750 SR, 7750 SR-c12, 7750 SR-12E, 7710 SR, and 7450 ESS. IOM3 is required, in chassis mode B, C, or D.

7 Click the OK button. The Community Expression (Create) form closes and the Routing Policy Community (Create) form is updated with the newly created Community Expression.

8 Go to step 14.

9 Click on the Community Members tab.

10 Click on the Create button. A Community Member Site (Create) form opens.

11 Configure the Community Member parameter.

12 Click on the OK button. A dialog box appears.

13 Click on the OK button. The Routing Policy Community (Create) form is updated with the newly created site.

14 Close the Routing Policy - Community, Global Policy (Create) form.

15 Close the Manage Routing Policy - Community form.

Note — A routing policy is discovered as local edit only. To synchronize a routing policy with all NEs, you must change the distribution mode of the routing policy to sync with global. To configure the distribution mode, see Procedure 42-1.

16 Configure the following routing-related policies, if required:

a To configure a policy statement, see Procedure 22-15.

b To configure a prefix list policy, see Procedure 22-16.

c To configure a damping policy, see Procedure 22-18.

d To configure an AS Path policy, see Procedure 22-19.

e To configure an AS Path Group policy, see Procedure 22-20.

f To view a routing policy from a CLI session, see Procedure 22-29.

Procedure 22-18 To configure a damping policy

See "Routing policies" in section 22.1 for more information about the use and purpose of routing policies.

1 Choose Policies→Routing→Damping from the 5620 SAM main menu. A Manage Routing Policy - Damping form opens.

2 Click on the Create button. A Routing Policy - Damping, Global Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Damping Name
- Half Life
- Reuse
- Suppress
- Max Suppression

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the OK button.

5 Close the Routing Policy - Damping, Global Policy (Create) form.

Note — A routing policy is discovered as local edit only. To synchronize a routing policy with all NEs, you must change the distribution mode of the routing policy to sync with global. To configure the distribution mode, see Procedure 42-1.

6 Configure the following routing-related policies, if required:

a To configure a policy statement, see Procedure 22-15.

b To configure a prefix list policy, see Procedure 22-16.

c To configure a community policy, see Procedure 22-17.

d To configure an AS Path policy, see Procedure 22-19.

e To configure an AS Path Group policy, see Procedure 22-20.

f To view a routing policy from a CLI session, see Procedure 22-29.

Procedure 22-19 To configure an AS Path policy

See "Routing policies" in section 22.1 for more information about the use and purpose of routing policies.

1 Choose Policies→Routing→AS Path from the 5620 SAM main menu. A Manage Routing Policy - AS Path form opens.

2 Click on the Create button. An Routing Policy - AS Path, Global Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Path Name
- Description
- Regular Expression

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the OK button.

Note — A routing policy is discovered as local edit only. To synchronize a routing policy with all NEs, you must change the distribution mode of the routing policy to sync with global. To configure the distribution mode, see Procedure 42-1.

5 Configure the following routing-related policies, if required:

a To configure a policy statement, see Procedure 22-15.

b To configure a prefix list policy, see Procedure 22-16.

c To configure a community policy, see Procedure 22-17.

d To configure a damping policy, see Procedure 22-18.

e To configure an AS Path Group policy, see Procedure 22-20.

f To view a routing policy from a CLI session, see Procedure 22-29.

Procedure 22-20 To configure an AS Path Group policy

See "Routing policies" in section 22.1 for more information about the use and purpose of routing policies.

1 Choose Policies→Routing→AS Path Group from the 5620 SAM main menu. The Manage Routing Policy - AS Path Groups form opens.

2 Click on the Create button. The Routing Policy - AS Path Group (Create) form opens with the General tab displayed.

3 Configure the parameters:

- AS Path Group Name
- Description

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the AS Path Group Entries tab.

5 Click on the Create button. The AS Path Group Entry (Create) form opens.

6 Configure the parameters:

- Auto-Assign ID
- Entry ID
- Regular Expression

If the Regular Expression you enter is invalid, then the OK and Apply buttons are disabled.

Note — You must create at least one AS Path Group Entry for this policy.

7 Click on the Apply button.

Note — A routing policy is discovered as local edit only. To synchronize a routing policy with all NEs, you must change the distribution mode of the routing policy to sync with global. To configure the distribution mode, see Procedure 42-1.

Once the policy has been successfully distributed, the local definitions can be viewed by clicking the Local Definitions tab.

8 Configure the following routing-related policies, as required:

a To configure a policy statement, see Procedure 22-15.

b To configure a prefix list policy, see Procedure 22-16.

c To configure a community policy, see Procedure 22-17.

d To configure a damping policy, see Procedure 22-18.

e To configure an AS Path policy, see Procedure 22-19.

f To view a routing policy from a CLI session, see Procedure 22-29.

Procedure 22-21 To configure an MPLS administrative group policy

MPLS administrative group policies define administrative groups that can be assigned to MPLS interfaces, LSPs, and LSP paths. After you configure MPLS administrative groups, the administrative groups can be assigned to MPLS interfaces, LSPs, and LSP paths on their respective properties forms. Multiple administrative groups can be assigned to each of these objects.

When establishing LSP and LSP paths, devices are only consider MPLS interfaces which are associated with the same administrative group as the LSP or LSP path. MPLS interfaces advertise administrative group associations using CSPF. This is done using the 32 bit mask which you configure using the Value parameter on the MPLS administrative group policy form.

An administrative group can also be assigned to be explicitly excluded from LSPs and LSP paths. The device cannot use MPLS interfaces in the administrative group to establish LSPs or LSP paths. Administrative group exclusion takes priority over administrative group inclusion.

CSPF must be enabled on LSPs for administrative groups to be relevant. You can enable and configure CSPF on the LSP properties form. When CSPF is enabled on an LSP, it is automatically enabled on associated LSP paths. LSP paths can be configured on the LSP path properties form to inherit additional CSPF, administrative group, and other parameters from LSPs.

This procedure describes how to create MPLS administrative groups. Table 22-6 describes where to find information about assigning MPLS administrative groups to MPLS interfaces, LSPs, and LSP paths.

Table 22-6 MPLS administrative group assignments

To assign groups to	See Procedure
MPLS interfaces	"To create an MPLS interface" in chapter 25
LSPs	"To create a static LSP" in chapter 25
LSP paths	"To configure an LSP path" in chapter 25

1 Choose Policies→MPLS→MPLS Administrative Group from the 5620 SAM main menu. The Manage MPLS Administration Groups form opens.

2 Click on the Create button. The Admin Group (MPLS) Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Value

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Apply button to save the policy.

The Admin Group (MPLS) Policy (Edit) form is refreshed and the tabs are selectable. Table 22-7 describes the tabs that you can choose to configure the parameters.

Table 22-7 Description of MPLS administrative group form tabs

Tab	Description
Local Definitions	Lists MPLS administrative group policies and allows you to manage administrative group policy distribution.
LSPs	Lists and allows you to manage LSPs to which the administrative group has been assigned.
LSP-Path Bindings	Lists and allows you to manage LSP paths to which the administrative group has been assigned.
Interfaces	Lists and allows you to manage MPLS interfaces to which the administrative group has been assigned.
Faults	List and manage alarms related to the administrative group.

5 Click on the Distribute button to manually distribute the administrative group policy locally to managed devices. If the Distribute button is not visible, click on the More Actions button and choose Distribute. Policies are also automatically distributed to managed devices when they are used by resources on the device.

Procedure 22-22 To configure a Shared Risk Link Group policy

This procedure describes how to create SRLG policies. Table 22-8 describes where to find information about related MPLS and LSP procedures.

Table 22-8 Related MPLS and LSP procedures

To:	See Procedure:
Configure an MPLS instance	"To configure an MPLS instance" in chapter 25
Create an MPLS interface	"To create an MPLS interface" in chapter 25
Configure LSP paths	"To configure an LSP path" in chapter 25

1 Choose Policies→MPLS→Shared Risk Link Group from the 5620 SAM main menu. The Manage Shared Risk Link Group Policies form opens.

2 Click on the Create button.

The Shared Risk Link Group, Global Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Value

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Apply button to save the policy.

The Shared Risk Link Group Policy (Edit) form is refreshed and the tabs are selectable. Table 22-9 describes the tabs that you can choose to configure the parameters.

Table 22-9 Description of Shared Risk Link Group Policy form tabs

Tab	Description
General	Displays information on the policy and allows you to prepare the policy for release and distribution.
Local Definitions	Lists Shared Risk Link Group policies and allows you to manage policy distribution.
Interfaces	Lists and allows you to manage MPLS interfaces to which the SRLG policy has been assigned.
Faults	List and manage alarms related to the SRLG.

5 Click on the Distribute button to manually distribute the SRLG policy locally to managed devices. If the Distribute button is not visible, click on the More Actions button and choose Distribute. Policies are also automatically distributed to managed devices when they are used by resources on the device. See chapter 42 for more information about policies and policy distribution.

Procedure 22-23 To create a static configuration for a SRLG Policy

This procedure describes how to create a static configuration for a SRLG policy. This differs from the standard SRLG policy described in Procedure 22-22 in that it allows you to manually enter into the SRLG database the SRLG membership for links in the entire network. This is typically done at the 7x50 head-end node and is mutually exclusive with the reading of this information from the traffic engineering database.

There are deployments where the 7x50 head-end node interoperates with routers that do not implement the SRLG membership advertisement using IGP SRLG Type-Length Value (TLV) or sub-TLV. In these situations, you can manually enter the link members of SRLG groups for the entire network at any 7x50 node which needs to signal LSP paths, such as a head-end node.

1 Choose Policies→MPLS→Shared Risk Link Group Static Configuration from the 5620 SAM main menu. The Manage Shared Risk Link Group Static Configuration form opens.

2 Click on the Create button.

The Static Configuration for SRLGs Policy (Create) form opens with the General tab displayed.

3 Configure the Displayed Name parameter.

Note — Do not use a colon in the policy name because the 5620 SAM uses colons as separators for the object full name.

4 Click on the Apply button to save the policy.

The Static Configuration for SRLGs Policy (Edit) form is refreshed and the tabs become selectable. Table 22-10 describes the tabs that you can choose to configure parameters or view fault information.

Table 22-10 Description of Static Configuration for SRLG Policy form tabs

Tab	Description
General	Displays information on the policy and allows you to prepare the policy for release and distribution.
Local Definitions	Lists Static Configuration for SRLG policies and allows you to manage policy distribution.
Routers	Lists and allows you to manage existing static configuration entries or add new ones.
Faults	List and manage alarms related to the static configuration for SRLGs.

5 Click on the Routers tab.

6 Click on the Create button. The Router for Static Config for SRLG policy (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Router ID
- Administrative State

8 Click on the OK button, and then click OK in the confirmation box that appears. The router(s) you added appears in the list on the Routers tab.

9 If you need to add other routers, repeat steps 6 and 7, otherwise, go to step 10.

10 Select one of the routers and click on the Properties button. The Router for Static Config for SRLG policy (Create) form opens with the General tab displayed.

11 Configure the Administrative State parameter.

12 Click on the Interfaces tab.

13 Configure the Interface Ip Address parameter. You can enter this manually or use the Select button to choose from a list.

14 Configure the Displayed Name parameter.

Note — You can associate the same Interface Ip Address parameter with more than one SRLG.

15 Click on the Apply button and repeat steps 10 to 14 to add other entries, or click OK to close the Static Configuration for SRLGs policy (Create) form.

16 If you clicked on Apply in the previous step, you can click on the Distribute button to manually distribute the Static Configuration for SRLGs policy locally to managed devices. If the Distribute button is not visible, click on the More Actions button and choose Distribute. Policies are also automatically distributed to managed devices when they are used by resources on the device. See chapter 42 for more information about policies and policy distribution.

Procedure 22-24 To view network resources

This procedure describes how to view current network resources such as IP addresses, duplicate IP addresses, RDs and RTs, and MAC addresses.

1 Choose Network Resources from the Tools menu. The Network resources form opens with the IP Addresses tab displayed.

2 Select the tab for the particular network resource type you need to query. The choices are:

- IP Addresses
- Virtual Router Duplicate IP Addresses
- Route Distinguishers and Route Targets
- MAC Addresses

The form list is refreshed to display the chosen resources.

3 Customize the search as required. Apply a Boolean operator for any of the items in the list header and then do one of the following:

a Choose a specific item type from the adjacent drop down menu (indicated by a downward-pointing arrow).

b Enter a specific string in the adjacent blank text field.

4 Click on the Search button.

The results of your customized search are displayed.

5 Close the Network Resources form.

Procedure 22-25 To view a routing instance or related object

1 Choose Manage→Networking→Routing Instances from the from the 5620 SAM main menu. The Manage Routing Instances form opens.

2 Choose an object from the Select Object Type drop-down menu.

3 Configure the filter criteria, as required, and click on the Search button.

4 Choose an object and click on the Properties button. The appropriate properties form opens with the General tab displayed.

5 Click on the form tabs to view parameters, faults, statistics, and associated objects.

6 Close the properties form.

7 Close the Manage Routing Instances form.

Procedure 22-26 To view routing policy usage

You can use the 5620 SAM to display a list of NEs currently using global or local versions of certain routing policy types. This ability is supported for the following:

- Routing Policy Statements where export and import policies have been associated with sites running these routing protocols: OSPF (v2 and v3), BGP, RIP, ISIS, LDP (export only)
- Routing Policy Statements where VPRN services have associated VRF export and import policies
- Routing Policy Statements where BGP-AD enabled VPLS sites have associated VSI export and import policies
- Prefix Lists
- Communities
- AS Path
- Damping

For Prefix Lists, Communities, AS Path, and Damping policies, the Policy Usage tab lists the policy statements in which the policy is used.

1 Choose Policies→Routing in the 5620 SAM main menu and select the required policy type from the flyout menu. The Routing Policy management form opens.

2 Click the Search button and choose the required policy from the list, then click Properties. The appropriate Routing Policy (Edit) form opens.

3 Click the Policy Usage tab.

4 If you are examining a Routing Policy Statement, click on the required protocol sub-tab. For LDP, RIP, and BGP you must also click on one of the sub-tab options under these, such as Site, Peer, Peer Groups, Group, or Interface, as appropriate.

5 Choose an entry from the list and click on the Properties button. The properties form for the item opens, with the General tab displayed.

6 Close the properties form.

7 Close the Routing Policy management form.

Procedure 22-27 To view DHCPv6 leases

This procedure describes how to view the DHCPv6 prefixes that the server has given out.

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance by choosing Network→NE→Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the menu. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the Local DHCP Servers tab.

5 Click on the Local DHCPv6 tab. The list of associated DHCPv6 servers is displayed.

6 Choose a DHCPv6 server and click on the Properties button. The Local DHCPv6 Server (Edit) form opens with the General tab displayed.

7 Click on the Show Leases button. If the Show Leases button is not visible, click on the More Actions button and choose Show Leases. The Local DHCPv6 Server Show Leases form opens.

8 Perform one of the following:

a To view the entire list of leases that are active on the DHCPv6 server, click OK.

b To view the lease information for a specific prefix, enter the IP address in the Prefix parameter for the particular DHCPv6 server and click OK.

Note — If the prefix does not exist in the list of leases, a message displays.

c To view the detailed lease information for a specific prefix, enter the IP address in the Prefix parameter for the particular DHCPv6 server, select the Detail check box, and click OK. The form displays the CLI details for the specific prefix.

9 Close the Local DHCPv6 Server Show Leases form.

10 Close the Local DHCPv6 Server (Edit) form.

11 Close the Routing Instance (Edit) form.

Procedure 22-28 To view DHCPv6 log events

This procedure describes how to view lease not owner and pool unknown log events for local DHCPv6 servers.

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance by choosing Network→NE→Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the menu. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the Local DHCP Servers tab.

5 Click on the Local DHCPv6 tab. The list of associated DHCPv6 servers is displayed.

6 Choose a DHCPv6 server and click on the Properties button. The Local DHCPv6 Server (Edit) form opens with the General tab displayed.

7 Click on the Logs tab. The Lease Not Owner Log and Pool Unknown Log tabs display.

8 Click on the tab for the type of log that you wish to display. Configure the filter criteria and click on the Search button. A list of NE SHCV event logs appears.

9 Configure the filter criteria and click on the Search button. A list of event logs appears.

10 Choose a log entry and click on the Properties button. The Log form opens.

11 View the log entry.

12 Close the Log form.

13 Close the Local DHCPv6 Server (Edit) form.

14 Close the Routing Instance (Edit) form.

Procedure 22-29 To view a routing policy from a CLI session

To view a routing policy from a CLI session, navigate to the previously distributed local routing policy or view navigate to a routing instance by choosing Network→NE→Routing Instance. See Procedure 22-1 for more information.

1 Perform one of the following depending on which routing policy you need to view from a CLI session.

   a Choose Policies→Routing→Statement from the 5620 SAM main menu. A Routing Policy - Statements form opens.

   b Choose Policies→Routing→Prefix List from the 5620 SAM main menu. A Routing Policy - Prefix Lists form opens.

   c Choose Policies→Routing→Community from the 5620 SAM main menu. A Routing Policy _ Communities form opens.

   d Choose Policies→Routing→Damping from the 5620 SAM main menu. A Routing Policy _ Dampings form opens.

   e Choose Policies→Routing→AS Paths from the 5620 SAM main menu. A Routing Policy - AS Paths form opens.

2 Click on the Search button. A list of policies appears.

3 Choose a policy.

4 Click on the Properties button. A *Policy_type* (Edit) form opens.

5 Click on the Local Definitions tab. A window appears displaying a list of NEs to where the policy was distributed.

6 Choose a site.

7 Click on the Properties button. A *Policy_type* Local Policy (Edit) form opens.

8 Click on the Show Policy button. If the Show Policy button is not visible, click on the More Actions button and choose Show Policy. A Routing Policy Show Policy form opens with the General tab displayed.

9 Click on the OK button. A CLI display is initiated.

10 View the policy.

11 Click on the close button.

12 Close the A *Policy_type* Local Policy (Edit) form.

Procedure 22-30 To list MVPN Extranet objects for a NE

Perform this procedure to display a list of MVPN extranet objects that exchange route information through a given NE. The Show MVPN-Extranet menu command issues a show router mvpn-extranet CLI command to the selected NE, and returns a list of subscriber VRF IP addresses. The command can be issued from a base routing instance, or from a VPRN site.

1 Do one of the following:

- **a** To run the Show MVPN-Extranet command from the navigation tree:
  - **i** Choose Routing from the navigation tree view selector.
  - **ii** Navigate to the Routing Instance icon by choosing Network→<source NE>→Routing Instance.
- **b** To run the Show MVPN-Extranet command from a VPRN site:
  - **i** Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.
  - **ii** Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.
  - **iii** Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens.
  - **iv** In the navigation tree on the left side of the form, navigate to the Routing Instance icon.

2 Right-click on the Routing Instance icon and choose Show MVPN-Extranet from the menu. The Show MVPN-Extranet form opens.

3 In the Parameters field, you can type filter arguments for the show router mvpn-extranet CLI command. For example:

- mvpn-extranet [detail] [srcmvpn <*source_service_id*>] [recvmvpn <*reciever_service_id*>]

where
[detail] provides a detailed route table in the command output.
[srcmvpn <*source_service_id*>] filters the output route table to a source VRF, based on the service ID of the source VRF. The variable range is 0 to 4294967295.
[recvmvpn <*reciever_service_id*>] filters the output route table to a destination VRF, based on the service ID of the destination VRF. The variable range is 0 to 4294967295.

4 Click on the OK button. The Show MVPN-Extranet form displays table of MVPN extranet objects.

Procedure 22-31 To display IOM/IMM Label FIB information

Perform this procedure to display FP tunnel table information for a routing instance.

1 Choose Routing from the navigation tree view selector.

2 Navigate to the Routing Instance icon by choosing Network→<source NE>→Routing Instance.

3 Right-click on the Routing Instance icon and choose Show FP Tunnel Table from the menu. The FP RTR Show FP Tunnel Table form appears.

4 Configure the parameters:

- Slot Number
- IP Prefix
- IP Prefix Length

5 Click on the OK button. The FP RTR Show FP Tunnel Table form displays information about BGP, LDP, and RSVP tunnels on the interface.

Procedure 22-32 To display ECMP/LAG hashing of Epipe services

Perform this procedure to monitor the distribution of Epipe service traffic over a LAG and/or ECMP paths into the network. The Show Service Hashing menu command issues a CLI tools dump command to an NE. The CLI command can be issued from a specific LAG on an NE, or from an Epipe service site.

When you issue this command from a LAG, then only the actual number of Epipe services currently using the physical port of the LAG will be displayed.

Alternatively, you can issue this command from an Epipe site that uses a port associated with a LAG. When you specify a range of Epipe Service IDs, the procedure will display information on all the Epipe services within that range that are using the same LAG as their egress port.

This procedure is only applicable to 7750 SR NEs and is not supported for PBB Epipe services.

1 Perform one of the following:

a To run the Show Service Hashing command from a LAG:

i Choose Equipment from the navigation tree view selector.

ii Navigate to the LAG icon by choosing Network→<required NE>→Logical Groups→LAGs→<required LAG>.

iii Right-click on the required LAG icon and choose Show Service Hashing from the menu.

The Epipe LAG Show Service Hashing form opens and displays the total number of Epipe services currently using the physical port of the LAG.

If an error is detected (for example, an invalid login), then error debugging information will be provided.

b To run the Show Service Hashing command from an Epipe site that uses a LAG:

i Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

ii Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

iii Select the required Epipe service and click on the Properties button. The Epipe Service (Edit) form opens.

iv In the navigation tree on the left side of the form, navigate to the required Epipe site.

v Right-click on the site icon and choose Show Service Hashing from the menu. The Epipe Service Show Service Hashing form opens.

vi Enter the desired value in the End Service Id field. This is the highest Service ID in a range of up to 1024 service IDs that will be examined. It can have a value of 0 to 2147483650. The Epipe service from which you issued this command has the lowest Service ID in the range of services that will be examined. So if, for example, the Epipe has a Service ID of 100, then Service IDs up to 1124 will be examined.

Entering a value of 0 in the End Service Id field indicates that the Service ID will not be considered. In this case, only the total number of Epipe services currently using the same physical port as the site's LAG will be displayed.

vii Click the OK button.

The Epipe Service Show Service Hashing form opens and displays specific information on all Epipe services currently using the same physical port as the site's LAG.

If an error is detected (for example, an invalid login), then error debugging information will be provided.

2 Click on the Close button. The Show Service Hashing form closes.

22.6 Network domain configuration procedures

Perform these procedures to configure a network domain.

Procedure 22-33 To create a network domain

1 Choose Routing from the navigation tree view selector.

2 Navigate to the network domains icon by choosing Network→NE→Routing Instance→Network Domains.

3 Right-click on the network domains icon and choose Create Network Domain from the menu. The Network Domain (Create) form opens.

4 Enter:

- Domain Name
- Description

5 Click on the OK button. The Domain Network (Create) form closes and a network domain is created in the navigation tree.

Procedure 22-34 To associate a network interface with a network domain

1 Choose Routing from the navigation tree view selector.

2 Choose Network→NE→Routing Instance→Network Domains→domain-userdomain.

3 Click on the Network Interfaces tab and click on Add Network Interface. The Add Network Interface form opens.

4 Click on Search to display all the Network Interfaces. Choose a Network Interface and click on the OK button. The selected Network Interface is displayed on the Network Domain form.

Procedure 22-35 To remove a network interface from a network domain

1 Choose Routing from the navigation tree view selector.

2 Choose Network→NE→Routing Instance→Network Domains→domain-userdomain.

3 Click on the Network Interfaces tab and select the Network Interface that has to be removed from the domain.

4 Click on Remove Network Interface.

5 A Confirm dialog box opens.

Perform one of the following:

a Click on the No button to avoid removing the network interface. The Confirm dialog box closes.

b Click on the Yes button. The network interface is removed from the network domain.

Procedure 22-36 To associate a service tunnel with a network domain

1 Choose Routing from the navigation tree view selector.

2 Choose Network→NE→Routing Instance→Network Domains→domain-userdomain.

3 Click on the Service Tunnels tab and click on Add Tunnel. The Add Tunnel form opens.

4 Click on Search to display all the service tunnels. Choose a service tunnel and click on the OK button. The selected service tunnel is displayed on the Network Domain form.

Procedure 22-37 To remove a service tunnel from a network domain

1 Choose Routing from the navigation tree view selector.

2 Choose Network→NE→Routing Instance→Network Domains→domain-userdomain.

3 Click on the Service Tunnels tab and select the service tunnel that has to be removed from the domain.

4 Click on Remove Tunnel.

5 A Confirm dialog box opens.

Perform one of the following:

a Click on the No button to avoid removing the service tunnel. The Confirm dialog box closes.

b Click on the Yes button. The service tunnel is removed from the network domain.

Procedure 22-38 To delete a network domain

1 Choose Routing from the navigation tree view selector.

2 Navigate to the network domains icon by choosing Network→NE→Routing Instance→Network Domains.

3 Right-click on the network domains icon and choose Delete from the menu. A Confirm dialog box opens.

Caution 1 — The default network domain cannot be deleted.

Caution 2 — The network domain related to the Interface and SDP cannot be deleted.

4 Perform one of the following:

a Click on the No button to avoid deleting the network domain. The Confirm dialog box closes.

b Click on the Yes button. The network domain is deleted from the navigation tree.

23.1 Protocol configuration overview

The 5620 SAM allows you to configure routing protocols and navigate to the device parameters. One device can support multiple routing protocols.

You use the network, IS-IS, and OSPF views in the 5620 SAM GUI navigation tree to view and configure parameters that set and manage the device routing protocol support. The routing protocols are enabled on the devices when you configure the devices. You configure the Layer 3 interfaces when you configure the routing instance on the device. You can then configure the routing protocols for specific Layer 3 interfaces.

Supported routing protocols include:

- IPv6
- BGP
- MP-BGP
- RIP
- LDP
- IS-IS
- OSPF
- RSVP
- L2TP
- PIM
- IGMP
- MSDP
- MLD
- Bridging
- WPP

Routing protocols can be configured to import or export routes from other routing protocols using routing policies. See "Routing policies" in section 22.1 for more information.

In addition to routing protocols, the 5620 SAM supports the following router configurations:

- multicast protocols
  - PIM; see section 23.23 for more information
  - IGMP; see section 23.24 for more information
  - MSDP; see section 23.25 for more information
  - MLD; see section 23.26 for more information
- bridging on OmniSwitch devices; see section 23.27 for more information

For more information about managing routing objects and protocols in the 5620 SAM, see section 22.1.

IPv6 support

The 5620 SAM supports IPv6 for control-plane addressing on IPv6-enabled devices.

Although the implementation of IPv6 is driven by the diminishing IPv4 address space, it is increasingly necessary to use a protocol that is designed to handle more complex network applications, such as broadband voice and video transmission, IP transit, Internet exchange peering, and other large enterprise applications.

Transition from IPv4 to IPv6

The transition from IPv4 to IPv6 is occurring in stages as network providers, service providers, and end users migrate existing applications and equipment to the new version. Control-plane forwarding of IPv6 packets is an important part of this transition; it allows isolated IPv6 hosts and smaller IPv6 networks to peer across an IPv4 network, using a mechanism such as 6over4 tunneling.

With 6over4 tunneling, a host encapsulates IPv6 packets in IPv4 packets for transport across an IPv4 network. Routers that identify 6over4 encapsulation remove the IPv4 encapsulation before they forward the packets to other native IPv6 hosts. The 6over4 mechanism uses the IPv4 multicast infrastructure for neighbor discovery.

IPv6 benefits

The general benefits of IPv6 include:

- **simplified header format and fixed header length**
  An IPv6 header contains fewer fields than an IPv4 header. IPv6 excludes obsolete IPv4 header fields and processes option fields only when they contain values. IPv6 also standardizes the size of the packet header to 40 bytes to streamline packet processing. These features reduce packet-processing overhead and make routing more efficient.
- **addressing enhancements**
  IPv6 increases the IP address size from 32 bits to 128 bits to support a greater number of NEs and to provide a more versatile addressing hierarchy. IPv6 also supports address autoconfiguration.
  The scalability of multicast routing is improved by the presence of a Scope field. IPv6 introduces anycast addressing, which designates a group of disparate NEs as the recipient of a specific data stream.
- **improved scalability and extensibility**
  Built-in traffic optimization makes IPv6 highly scalable, and IPv6 supports future routing technology enhancements using protocol extensions.
- **flow-labeling capability**
  IPv6 features packet prioritization which allows the labeling of packets that require special handling, such as real-time service for VoIP conferences.
- **improved privacy and security**
  Authentication, encryption, and data integrity features are mandatory components for which IPv6 supports standardized extensions.

The 5620 SAM and IPv6

The 5620 SAM entities that support IPv6 configuration include the following:

- BGP for base routing instances and VPRN services
- IS-IS adjacencies
- multicast routing
- static routes
- ICMP
- routing policies
- access ingress and egress policies
- CPM filter policies
- PPP
- IES and VPRN SAPs
- IES and VPRN bidirectional forwarding detection
- VLL Ipipe
- PIM-SSM

A 5620 SAM operator enables IPv6 on an interface during interface creation.

The benefits of the 5620 SAM IPv6 implementation include:

- integration with existing IPv4 configurations on many property and configuration forms
- automatic validation of IP addresses on the client GUI, regardless of the IP version
- support of compressed IPv6 addresses when repeated address octets are present
- support for IPv6 statistics
- simultaneous IPv4 and IPv6 support by routing protocols
- separate IPv4 and IPv6 administrative and operational states on an interface

Accepted IPv6 address formats

The 5620 SAM accepts IPv6 addresses in the following formats:

- colon-hexadecimal, or *x:x:x:x:x:x:x:x*
  where *x* is a 16-bit hexadecimal number from 0 to FFFF
- a combination of colon-hexadecimal and dotted-decimal, or *x:x:x:x:x:x:d.d.d.d*
  where
  x is a 16-bit hexadecimal number from 0 to FFFF
  d is an 8-bit decimal number from 0 to 255

Using a combination of colon-hexadecimal and dotted-decimal formats may be convenient in an environment that supports the use of IPv4 and IPv6 addresses.

The 5620 SAM allows IPv6 address compression for an address that contains repeated zero values. You can use two adjacent colons to represent any group of repeated zero values in an IPv6 address. For example:

2001:DB8::

expands to

2001:0DB8:0000:0000:0000:0000:0000:0000

It is not necessary to supply the leading zeros for a number in an IPv6 address. For example, 2001:DB8::3C:5 is a valid IPv6 address.

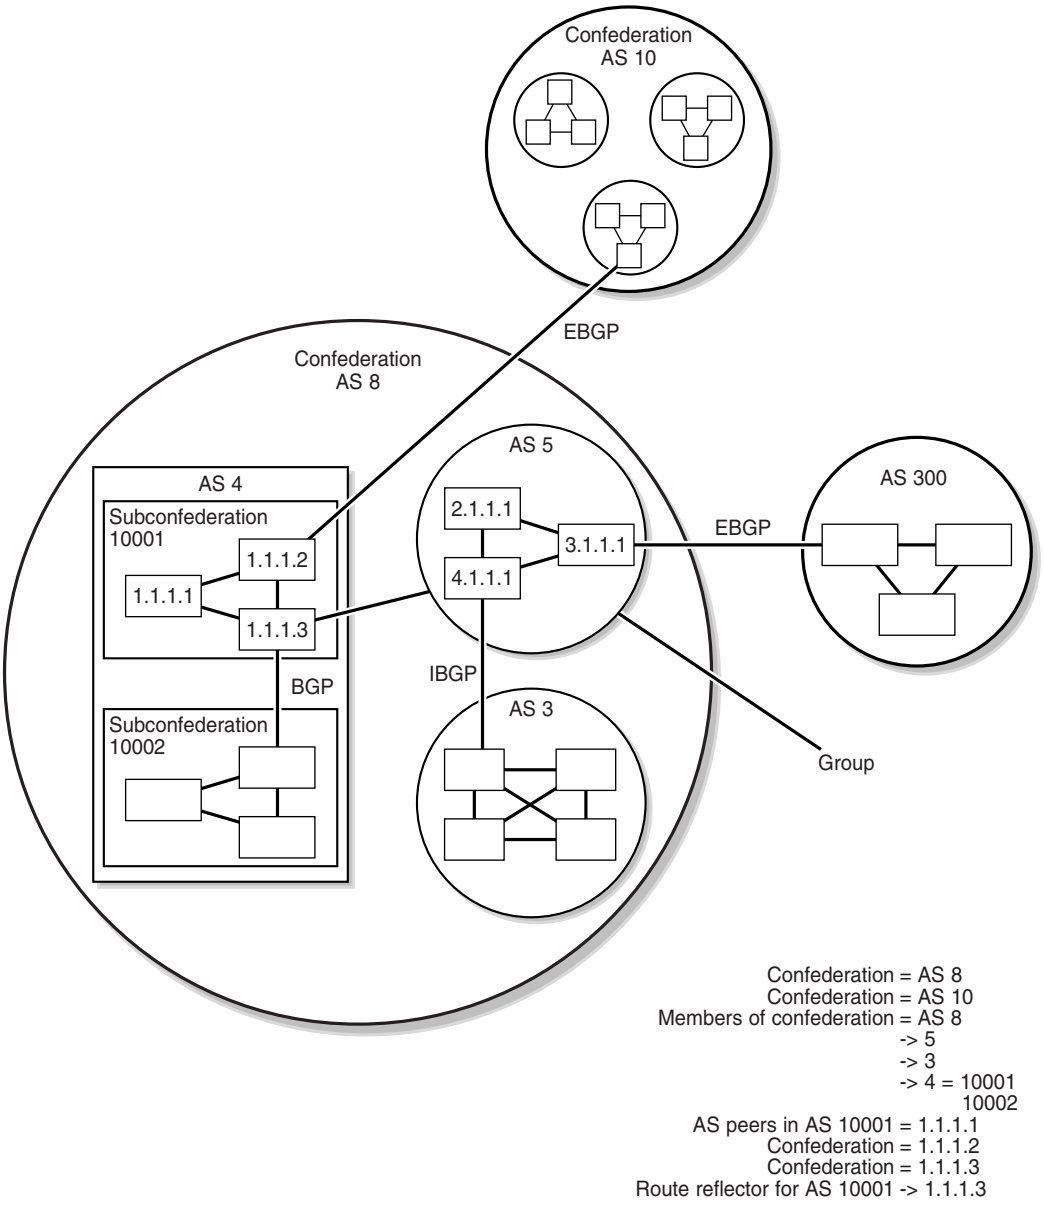
BGP

BGP is an inter-AS routing protocol. An AS is a network or a group of devices logically organized and controlled by a common network administration. BGP enables devices to exchange network reachability information. AS paths are the routes to each destination. There are two types of BGP: IBGP and EBGP.

- IBGP is used to communicate with peer devices in the same AS. Routes received from a device in the same AS are not advertised to other devices in the same AS but can be advertised to an EBGP peer.
- EBGP is used to communicate with peers in different ASs. Routes received from a device in a different AS can be advertised to both EBGP and IBGP peers.

See "Inter-AS connections" in section 71.1 for more information about connecting ASs in a VPRN.

You can use the 5620 SAM to enable BGP on the device and perform the following functions:



- set the AS values for the routing instance
- create confederations of group-managed devices
- create BGP peer groups
- create neighbors (peers) within the BGP peer groups

The 5620 SAM supports the configuration of IPv6 addresses for BGP peering on the base routing instance of the 7950 XRS, the 7750 SR (chassis modes C and D, and chassis modes A and B with mixed mode enabled), and the 7450 ESS in mixed mode.

A device can only belong to one AS. After the neighbor relationship is established between devices, they exchange BGP open messages, which contain information such as AS numbers, BGP versions, router IDs, hold-time values, and keepalive messages. This information determines the status of the BGP session. Peer relationships are defined by configuring the IP addresses of the devices that are peers of the local BGP system.

Figure 23-1 shows a simple BGP example using groups, subconfederations, and confederations.

Figure 23-1 BGP example

In a standard BGP configuration, all BGP-enabled devices within an AS have a full mesh of BGP peerings to ensure all externally learned routes are redistributed through the entire AS. This is needed because IBGP does not re-advertise routes learned from one IBGP peer to another IBGP peer. However, as more devices are added, scaling the IBGP mesh can become an issue. To solve this scaling issue, you can use:

- confederations
- subconfederations

Confederations are a way to subdivide a large AS into smaller ASs. Subconfederations further subdivide ASs. Within each smaller AS, or confederation, IBGP is still used, however EBGP is used between subconfederations. This means less meshing between peers is required.

Another method of subdividing an AS is route reflection. For route reflection, an AS is divided into groups called clusters. Each cluster contains at least one route reflector. The route reflector redistributes routing updates to all devices in its cluster. Because the route reflector provides all the routing updates, the other devices in the cluster do not maintain a BGP mesh.

By default, BGP routers will advertise only the best path to other BGP peers. When the best path fails or a better path is discovered, the old routing information is overwritten. If BGP Add-Path is enabled, peers will advertise multiple paths for the same destination, all of which will be retained in their routing tables. In the event of a failure or path withdrawal message, the router is able to update its forwarding entry for that destination without having to receive new path advertisements. This results in faster convergence after path failure.

MP-BGP

BGP distributes IP routing information between networks. The distribution of IP routing information between VPRNs requires MP-BGP. MP-BGP addressing uses an 8-byte RD with a 4-byte or 16-byte IP address, depending on whether IPv4 or IPv6 is used. The requirements for MP-BGP configuration are the following.

- MP-BGP must be enabled on the participating PE devices.
- All PE devices must be configured as BGP peers.

When PE devices learn routing information from the CE devices in a VPRN configuration, the routing information is shared using MP-BGP. The RD is used to associate the new routing information with a VPRN instance.

The PE devices distribute the route information to the other CE devices in the VPRN. Each learned route is assigned an MPLS label that is distributed to the devices.

When customer packets arrive at a PE device, the packets are encapsulated with the MPLS label that corresponds to the learned route for the packet destination.

The MP-BGP multicast extension can be applied to build separate routing tables for multicast paths. IGPs such as OSPF and IS-IS can import multicast and unicast routing information to the multicast and unicast routing tables. The multicast routing information can subsequently be used by PIM to perform RPF lookups.

RIP

RIP is an IGP that uses a distance-vector algorithm to determine the best route to a destination, using hop count as the deciding factor. In order for the protocol to provide complete information about routing, every device in the domain must participate in the protocol. RIP, a UDP-based protocol, updates its neighbors, and the neighbors update their neighbors.

Unlike OSPF and other link-state protocols, RIP directly advertises reachability information to its neighbors. RIP advertises reachability information by sending prefix, mask, and either hop count or cost metric data. Each device running the RIP protocol advertises all RIP devices periodically by sending RIP update PDUs. The route with the lowest metric is advertised as the best route.

The 5620 SAM supports the configuration of RIPv1 and RIPv2 on network and access interfaces.

The 5620 SAM supports the configuration of IPv6 addresses for RIP on the base routing instance of the 7750 SR (chassis modes C and D, and chassis modes A and B with mixed mode enabled).

LDP

LDP is used to distribute labels in non-traffic-engineered MPLS applications. Routers can establish LSPs across a network by mapping network-layer routing information directly to the data link layer switched paths. After the LDP distributes the labels to the LSR, the LSR assigns the label to a FEC, and then informs all other LSRs in the path about the label and how the label switches data accordingly.

A FEC is a collection of common actions associated with a class of packets. LDP helps establish the LSP by providing a set of procedures that LSRs can use to distribute labels.

When a service tunnel is configured on managed routers using LDP signaling in an MPLS environment, LDP sessions are set up based on the configured hello and other PDU values. If another service tunnel is created to the same destination, the LDP session is reused.

The LDP sessions between LSRs:

- find and establish LDP peers in the managed network
- exchange label mappings for each LSR
- exchange label bindings

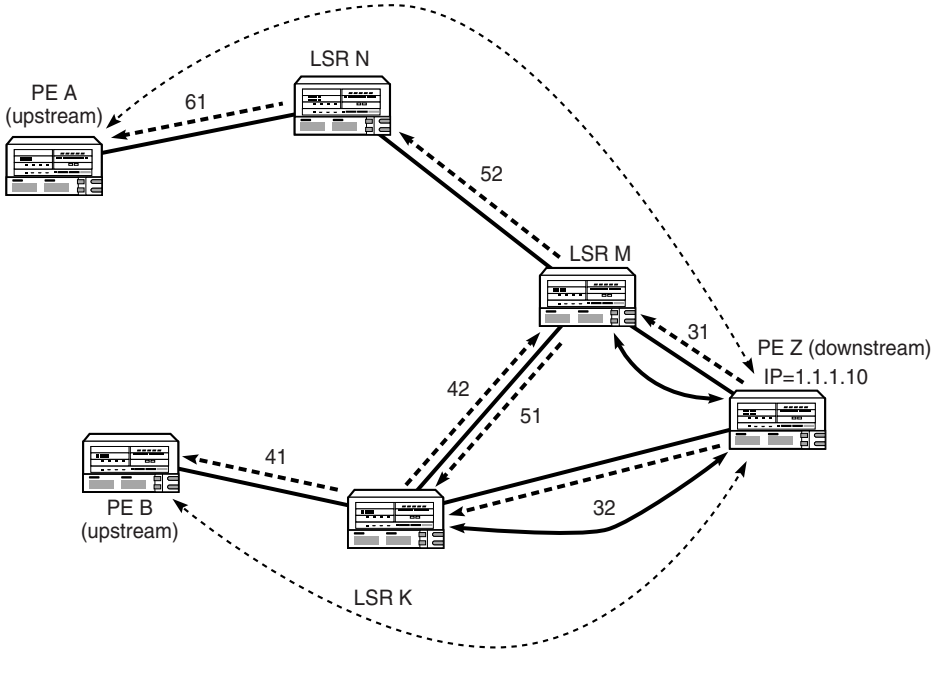
After all the LSRs are LDP-aware and the LSP is created, forwarding can occur as follows:

1 A FEC is associated with the LSP.

2 The FEC maps the packets to the LSP.

3 The next LSR that is part of the LSP splices incoming FEC labels to the outgoing FEC label of the next hop.

There are two types of LDP:



- T-LDP
- DU-LDP

T-LDP is used to distribute labels for VLL and VPLS. T-LDP allows the targeting of remote devices that are not directly connected as targeted peers.

DU-LDP can be used to create tunnels between PEs for IP-VPN services.

Figure 23-2 shows an example of LDPs that are used in a simple Layer 2 and Layer 3 service provider network.

Figure 23-2 LDP sample network

- The solid straight lines between the devices indicate IP connectivity. These are directly connected peers.
- The dotted bidirectional curved lines indicate T-LDP sessions. These are targeted peers that are not directly connected.
- The solid bidirectional curved lines indicate DU-LDP sessions. This example only shows two instances, between M and Z, and Z and K. If there is IP connectivity between all the devices, then all of the devices have DU-LDP sessions.

Provider edge router Z advertises the labels for its address 1.1.1.10 to adjacent link state devices M and K. Routers M and K distribute the labels for that address to the rest of the network.

If provider edge router A wants to send a VPN-labeled packet to router Z, it uses label 61 as the outer label. When the packet reaches router N, outer label 61 is swapped for outer label 52 and the packet continues downstream to router M. Router M then swaps out label 52 for either outer label 31 or 42, depending on the router M label selection algorithm. If outer label 31 is selected, the packet reaches router Z directly, which then continues to route the packet to the customer site based on the VPN label.

If a router receives more than one request for an IP address, and the router does not support ECMP, it selects the first label it receives. If the router supports ECMP, it selects the label with the lowest cost path, or selects both labels if the cost paths are identical.

When a router supports ECMP protocol, LSRs can have multiple equal cost paths to an IP address. ECMP LDP retains all labels it receives from multiple next hop peers. The forwarding plane contains multiple next hops for a FEC and as a result, provides load balancing for LDP-based LSPs.

When a router supports ECMP LDP and a device configured as the next hop is no longer valid, for example a session between peers is lost or the peer withdraws its label, a new valid LDP next hop peer is selected and the forwarding plane is updated.

Load balancing across LSPs for LDP over RSVP is also supported. When ECMP is enabled, all equal cost LSP endpoints are installed in the routing table by the IGP for consideration by LDP. LDP selects the LSP with the lowest LSP metric to determine the next hop. If multiple LSPs are available with equal cost, then ECMP is utilized until the ECMP count is exhausted. An LDP tree is created by sending LSP Trace messages along an ECMP path to downstream LSR NEs.

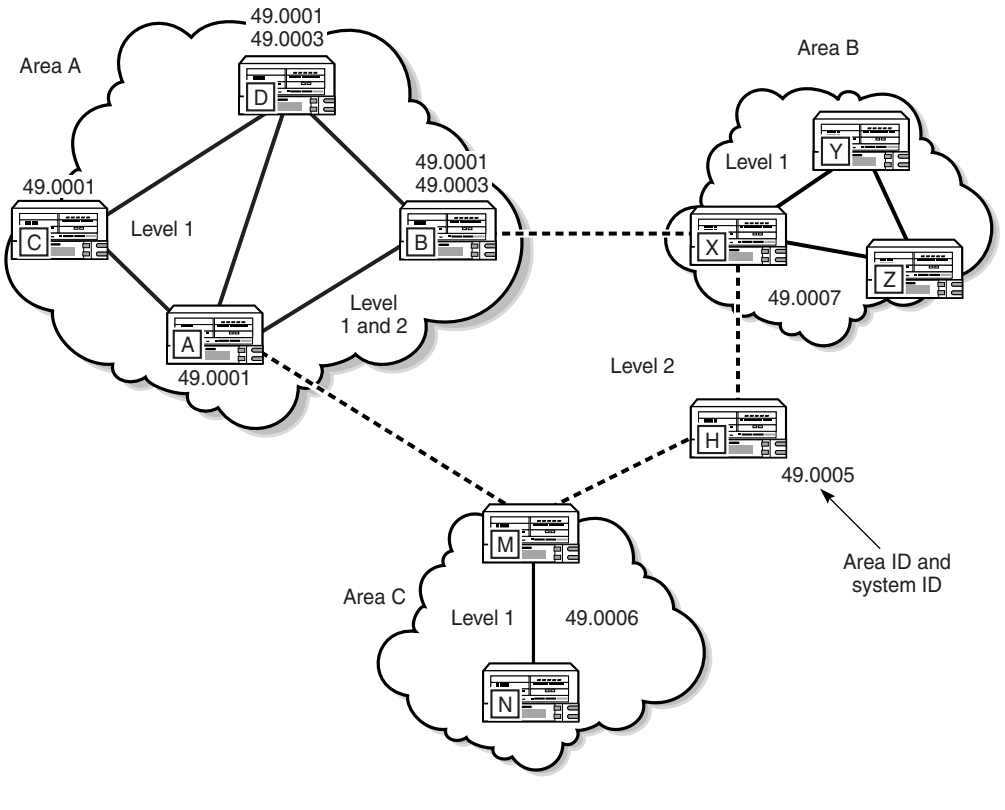
LDP for P2MP

LDP support for P2MP can be enabled on an LDP interface. You can configure an LDP interface for multicast traffic forwarding towards a downstream NE. LDP configuration allows an exchange of P2MP FEC via an established session to a peer, and the use of next hops over an interface.

LDP configuration is supported on a tunnel interface under a base routing instance and under protocols such as PIM and IGMP. A P2MP ID is used as an index for LDP-based tunneling instead of an LSP ID.

Note — BFD and source redundancy are only supported on an RSVP tunnel interface.

IS-IS



IS-IS is a link-state interior gateway protocol that uses the shortest path first algorithm to determine a route. Routing decisions are made using the link-state information. IS-IS entities include:

- networks, which are autonomous system routing domains
- intermediate systems, which are routers
- end systems, which are network devices that send and receive PDUs

End systems and intermediate system protocols allow devices and NEs to identify each other. The IS-IS protocol sends link state updates periodically through the network, so each device can maintain current network topology information.

Large networks, or autonomous systems, are supported by IS-IS using a two-level hierarchy. This divides a large area into more manageable, smaller areas. The first level (level 1) of routing is performed within an area. The second level (level 2) of routing is performed between areas, as shown in Figure 23-3.

Figure 23-3 IS-IS routing domains example

Level 2 areas are also called backbones, similar to an OSPF backbone area. All traffic traversing different areas must traverse the backbone. A device can be configured as level 1, level 2, or both level 1 and 2. In this example, routers A, B, M, H, and X form the level 2 IS-IS backbone. The connection between routers A and B carries both level 1 and level 2 link-state PDUs (LSPs). However, level 1 devices are only aware of their own area's topology, and must forward traffic to a level 1/2 device to forward the data to another area.

Two devices are in the same level 1 area when they have level 1 adjacency. Level 1 adjacency occurs when the area IDs are common and there is a level 1 connection between the devices. Level 2 adjacency occurs when it has at least one level 1 and 2, or one level 2 interface configured.

The 5620 SAM supports the configuration of IPv6 addresses for IS-IS adjacencies.

Note — If two neighboring devices in the same level 1 area run both level 1 and 2, they establish both a level 1 and a level 2 adjacency.

When LDP over RSVP is enabled for IS-IS, LSPs can be used by the IGP to calculate its SPF tree. The IGP then provides LDP with all of the ECMP IDP next-hops and tunnel endpoints that the IGP identifies as the lowest cost path to the destination. If an IGP calculation and an LDP over RSVP have the same cost, LDP chooses an LDP over RSVP tunnel over an IGP route and ECMP between the two types is not considered. The type and number of tunnels that are to be considered by LDP depend on the IGP costs, where the lowest cost between the tunnel endpoint and the target is selected.

After IS-IS is configured, routing occurs as follows:

1 Hello PDUs are sent to IS-IS-enabled interfaces to discover neighbors and establish adjacencies.

2 IS-IS neighbor relationships are formed.

3 Link-state PDUs (LSPs) are created based on local interfaces and prefixes that are learned from adjacent devices.

4 The devices flood LSPs to adjacent neighbors, and build a link-state database.

5 A shortest path tree is calculated by the IS-IS and the routing table is built.

OSPF

OSPF is a hierarchical link-state interior gateway protocol that operates within ASs and is used in IP networks. OSPF packets are routed based on the destination IP address of the IP packets. Each OSPF router collects link-state information to build a network topology based on OSPF areas. This topology is used to apply the Dijkstra algorithm to calculate the shortest path to each destination in the network. See the appropriate device documentation for more information about OSPF.

When LDP over RSVP is enabled for OSPF, LSP can be used by the IGP to calculate its SPF tree. The IGP then provides LDP with all of the ECMP IDP next-hops and tunnel endpoints that the IGP identifies as the lowest cost path to the destination. If an IGP calculation and an LDP over RSVP have the same cost, LDP chooses an LDP over RSVP tunnel over an IGP route and ECMP between the two types is not considered. The type and number of tunnels that are to be considered by LDP depend on the IGP costs, where the lowest cost between the tunnel endpoint and the target is selected.

OSPF areas

The hierarchical design of OSPF allows a collection of networks to be grouped into a logical OSPF area. The topology of the area is hidden from the rest of the AS, which significantly reduces OSPF protocol traffic. Routing in the AS takes place on two levels, depending on whether the source and destination of a packet reside in the same area (intra-area routing) or different areas (inter-area routing). In intra-area routing, the packet is routed solely on information obtained within the area; routing information obtained from outside the area is not used. Routers that belong to more than one area called an ABR. An ABR maintains a separate topological database for each area it is connected to. Every router that belongs to the same area has an identical topological database for that area.

OSPF neighbor

Routers in the same broadcast domain or at each end of a point-to-point telecommunications link form adjacencies when they detect each other. The detection occurs when a router identifies itself in a hello OSPF protocol packet. This is called a two-way state and is the most basic relationship. The routers in an Ethernet or frame relay network select a designated router and a backup designated router which act as a hub to reduce traffic between routers. OSPF uses both unicast and multicast to send hello packets and link state updates.

The OSPF protocol establishes and maintains neighbor relationships in order to exchange routing updates with other routers. The neighbor relationship table is called an adjacency database in OSPF. Provided that OSPF is configured correctly, OSPF forms neighbor relationships only with the routers directly connected to it. In order to form a neighbor relationship between two routers, the interfaces used to form the relationship must be in the same area. An interface can only belong to a single area.

OSPF super-backbone

The OSPF super-backbone provides an additional layer of hierarchy in OSPF. The OSPF super-backbone functions include:

- loop prevention
- handling LSAs received from the CE
- managing VPN IPv4 routes received by BGP

The PE routers that connect OSPF areas to the super-backbone function as ABRs in the OSPF areas to which they are attached. To achieve full compatibility, the PE routers can also serve as ASBRs in non-stub areas.

PE routers insert inter-area routes from other areas into the area in which the CE router is present. The CE routers are not involved at any level and are not aware of the super-backbone or other OSPF areas that exist outside of the super-backbone.

When you configure the super-backbone, all destinations that are learned by PEs with matching domain IDs become inter-area routes.

See the appropriate device documentation for more information about the OSPF super-backbone.

RSVP

RSVP is a network control protocol that hosts use to request specific qualities of service from the network for specific data streams. RSVP is also used to deliver QoS requests to all devices in a data path and to establish and maintain the state information required to provide the requested service quality.

RSVP is not a routing protocol. RSVP operates using unicast and multicast routing protocols. RSVP consults local routing tables to relay RSVP messages. By default, RSVP is enabled on all devices that support it.

RSVP requests typically result in the reservation of resources on each device in the data path. MPLS uses this RSVP mechanism to set up traffic-engineered LSPs. RSVP requests resources for unidirectional flows only. RSVP treats a sender as logically distinct from a receiver, although the same application process may act as both a sender and a receiver.

The RSVP hello protocol detects the loss of a neighbor NE or the reset of a neighbor RSVP state information. In standard RSVP, neighbor monitoring occurs as part of the RSVP soft-state model. The reservation state is maintained as cached information that is first installed and then periodically refreshed by the ingress and egress LSRs.

If the state is not refreshed within a specified time interval, the LSR discards the state because it assumes that either the neighbor NE has been lost or its RSVP state information has been reset.

Diff-Serv Traffic Engineering support

The 5620 SAM supports Diff-Serv Traffic Engineering, or TE, extensions for RSVP. Diff-Serv TE extensions provide the ability to manage bandwidth in an MPLS network on a per-TE-class basis. With Diff-Serv TE, an LER can perform this on a per-class basis. Therefore, you can set different limits for admission control of LSPs in each TE class over each link in the network.

You do this by setting a bandwidth constraint, which configures the percentage of the RSVP interface bandwidth that each CT shares. The absolute value of the CT share of the interface bandwidth is derived as the percentage of the bandwidth advertised by IGP in the Maximum Reservable link bandwidth TE parameter, that is, the link bandwidth multiplied by the RSVP interface subscription parameter.

This configuration also exists at the RSVP interface level and the value specifically configured for the interface overrides the globally-configured value. The bandwidth constraint value can be changed on the fly. You are also allowed to specify the bandwidth constraint for a CT which is not used in any of the TE class definitions and which is not used by any LSP originating or transiting this NE.

To enable this feature, in summary, you must:

- configure Diff-Serv Classes on the router RSVP Routing Instances
- configure protocol properties to allow Diff-Serv Classes on the required router RSVP Interfaces
- configure traffic engineering and specify the Class Type that the required dynamic LSPs belongs to
- configure the Diff-Serv Class Type that the required LSP Paths belongs to. This overrides the value set at the LSP level.
- configure Diff-Serv to LSP FC mappings on the required service tunnels (SDPs). User-entered mappings of FC to LSP name are validated automatically (to avoid configuration conflicts) by checking with the RSVP module.

L2TP

L2TP is a session-layer protocol that extends the PPP model by allowing L2 and PPP endpoints to reside on different devices that are interconnected by a PSN. L2TP extends the PPP sessions between the CPE and PPP/L2TP termination point on the L2TP network server (LNS), via an intermediate L2TP access concentrator (LAC). The LAC is the initiator of session-generated L2TP tunnels; the LNS is the server that waits for new tunnels. Manually configured and initiated L2TP tunnels can be initiated and stopped from either the LNS or LAC.

After an L2TP tunnel is established, the network traffic between the peers is bidirectional. If a tunnel carrying a session fails, another tunnel from the same tunnel group re-establishes the session. Within each L2TP tunnel, one or more L2TP sessions can exist. Each L2TP session transports PPP packets.

The 5620 SAM supports the configuration and management of the following:

- ISA-LNS groups
- L2TP sites
- L2TP tunnel group profiles
- L2TP tunnel profiles

ISA-LNS groups

The 5620 SAM supports the creation and configuration of ISA-LNS groups on the 7750 SR. ISA-LNS groups provide LNS PPP session termination. An ISA-LNS group is associated with specific L2TP inbound peers and groups. Session traffic is automatically balanced across the available active ISA broadband application MDAs in the group.

The following operations can be performed on an ISA-LNS group member:

- drain MDA—prevents new sessions from being accepted
- stop drain—allows new sessions to be established
- stop MDA sessions—terminates the active sessions

See Procedure 14-6 for information about creating and configuring an ISA-LNS group.

L2TP sites

By default, L2TP is enabled on a base routing instance, and an L2TP site is created. An L2TP icon appears in the routing view of the navigation tree. An L2TP site does not exist by default on the base routing instance of a 7450 ESS in non-mixed mode.

Certain LAC parameter values can be configured on an L2TP site which can, in turn, be inherited by any child L2TP tunnel group profiles of the site. The Tunnel Session Limit parameter value can only be inherited by an L2TP tunnel group profile.

A tunnel selection blacklist function provides a means to temporarily suspend (or blacklist) tunnels that return one or more specified return codes, indicating that the tunnel is inoperative. The user can specify the manner in which blacklisted tunnels are handled:

- how many tunnels can be blacklisted at any given time
- how long a tunnel can remain blacklisted
- action taken on a blacklisted tunnel when the maximum blacklist period expires

See Procedure 23-34 for information about managing L2TP sites.

L2TP is not enabled by default on a VPRN site. To enable L2TP on a VPRN site, see Procedure 71-3.

L2TP tunnel group profiles

An L2TP tunnel group profile represents the configuration for a group of L2TP tunnels. L2TP tunnel group profiles must be configured on the LNS NE. If a local user database is used on the LAC for session authentication, an L2TP tunnel group profile must be configured on the LAC. When you create an L2TP tunnel group profile, you can configure certain LAC parameter values to be inherited from the parent L2TP site. In turn, the profile can be used by its child L2TP tunnel profile to inherit certain parameter values. The inherited parameter values are used as the default values during L2TP tunnel profile configuration.

The following operations can be performed on an L2TP tunnel group profile that has a configured L2TP tunnel profile:

- drain—prevents new sessions from being accepted
- stop drain—allows new sessions to be established
- stop—closes tunnel instances and terminates the active sessions

See Procedure 23-34 for information about managing L2TP tunnel group profiles.

L2TP tunnel profiles

You can create and manage L2TP tunnel profiles from the Tunnel Group Profile properties form. When you create an L2TP tunnel profile, you can configure certain LAC parameter values to be inherited from the parent L2TP tunnel group profile and L2TP site.

The following operations can be performed on an L2TP tunnel profile:

- start instance—attempts to create new tunnels
- stop instance—attempts to close the tunnels
- drain—prevents new sessions from being accepted
- stop drain—accepts new sessions

See Procedure 23-34 for information about managing L2TP tunnel profiles.

L2TP tunnel instance endpoints

The endpoints of an operational L2TP tunnel are represented by tunnel instance endpoints. You can view tunnel instance endpoints from the Tunnel Instance Endpoints tab on the L2TP Site (Edit) form, and from the Tunnel Group Profile or Tunnel Profile properties form if the endpoint is created using the profile configuration.

An L2TP tunnel instance endpoint is automatically created when:

- a start operation is performed on an L2TP tunnel profile
- an incoming L2TP session is established using group and tunnel profiles
- RADIUS authentication returns a configuration for the tunnel when an incoming L2TP session is authenticated and PPP session authentication determines that L2TP is used, at which point an L2TP session is established.

The following operations can be performed on an L2TP tunnel instance endpoint:

- drain—prevents new sessions from being accepted
- stop drain—allows new sessions to be established
- stop—closes the tunnel instances and terminates the active sessions

See Procedure 23-36 for information about viewing L2TP tunnel instance endpoints.

L2TP peers

An L2TP site can have none or multiple L2TP peers. L2TP peer information is available on the Peers tab of the L2TP Site form. Information about L2TP tunnels for a specific L2TP peer is available on the Tunnels tab of the L2TP Peer properties form.

The following operations can be performed on an L2TP peer:

- drain—prevents new sessions from being accepted
- stop drain—accepts new sessions

L2TP tunnels and tunnel endpoints

You can view information about L2TP tunnels and tunnel endpoints from the L2TP Tunnel - Endpoint A - Endpoint B form. See Procedure 23-35 for information about viewing L2TP tunnels and tunnel endpoints.

L2TP sessions

You can view information about L2TP sessions from the L2TP Session (View) form. You can access the form from the following places in the GUI:

- Manage Residential Subscribers form
- Sessions tab on the L2TP Site (Edit) form
- Sessions tab on the L2TP Tunnel Instance Endpoint (View) form
- L2TP panel on the PPPoE Session form (LAC only)
- L2TP Session button on the Subscriber Host form (LAC only)

See Procedure 23-37 for information about viewing L2TP sessions from the Manage Residential Subscribers form.

PPP sessions

You can view information about PPP sessions from the PPP Session, PPPoE Session, and PPPoA Session forms. You can access the forms from the following places in the GUI:

- Manage Residential Subscribers form
- LNS PPP panel in the L2TP Session (View) form (LNS only)
- PPP Session button in the Subscriber Host form

See Procedure 23-38 for information about viewing PPP sessions.

PIM

PIM is a component of multicast routing that defines the one-to-many or many-to-many transmission of information. You can use the following variations for PIM configurations:

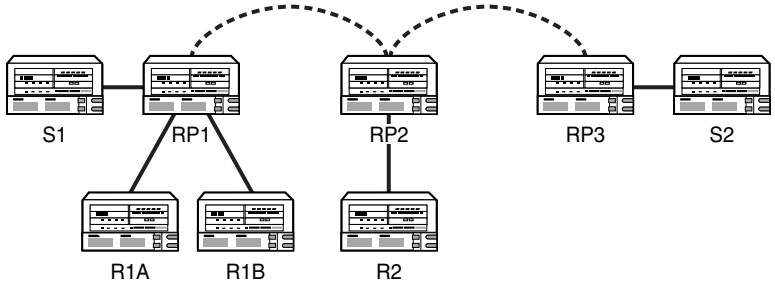
- sparse mode
- dense mode
- source-specific multicast
- bidirectional

Sparse mode is the most common PIM configuration. Sparse mode is used for data transmission to NEs in multiple Internet domains that contain a small ratio of NEs that subscribe to the multicast traffic. Dense mode is used when a large ratio of the potential NEs subscribe to the multicast traffic. In source-specific multicast, paths originate at a single, defined source. Bidirectional PIM is not source-specific.

Anycast RP

Anycast RP for PIM-SM enables fast convergence when a PIM RP router fails. The receivers and sources rendezvous at the closest RP after the router failure. Anycast RP allows an arbitrary number of RPs for each group in a single, shared-tree PIM-SM domain. Triple play configurations that distribute multicast traffic using PIM-SM realize the benefits of fast RP convergence, which helps to avoid the loss of multicast data streams or IPTV delivery to the end user.

Anycast RP for PIM-SM environments is supported in the base routing PIM-SM instance of the service router. The 7950 XRS, 7750 SR, 7710 SR, and the 7450 ESS in mixed mode support Anycast RP in VPRN instances that are configured with PIM.



Anycast RP for PIM requires the completion of the following configuration information:

- An IP address specified as the RP address. This address is statically configured, or distributed using a dynamic protocol, to all PIM routers in the domain.
- A set of routers in the domain designated as RPs for the RP address. These routers form an anycast RP.

- Each of these routers is configured with a loopback interface that uses the RP address. The RP address, or a prefix that includes the RP address, is injected into the unicast routing system inside the domain.
- Each router in the anycast RP also needs a separate IP address, to be used for communication between the RPs.
- Each router in the anycast RP is configured with the addresses of all other routers in the anycast RP. The addresses must be consistently configured in all RPs in the set.

Figure 23-4 shows a sample implementation of anycast RP for PIM-SM.

Figure 23-4 Sample implementation of anycast RP for PIM-SM

R1A, R1B, and R2 are receivers for an AnyCast RP group
S1 and S2 send traffic to the AnyCast RP group
RP1, RP2, and RP3 use the same Anycast RP IP address

18605

Table 23-1 summarizes the sequence of events for the Anycast RP implementation shown in Figure 23-4.

Table 23-1 Sequence of events for Anycast RP fast convergence

Sequence	Event description
1	S1 sends a multicast packet.
2	The router connected to S1 forms a PIM registration message to send to the Anycast RP address. The unicast routing system delivers the PIM registration message to the nearest RP, in this case RP1.
3	RP1 receives the PIM registration message, decapsulates the message, and sends the packet down the shared tree to the R1A and R1B receivers.
4	RP1 is configured with the IP address for RP2 and RP3. Since the registration message did not come from one of the RPs in the anycast RP set, RP1 assumes that the packet came from a designated router.
5	RP1 sends a copy of the registration message from the S1 designated router to RP2 and RP3. RP1 uses its IP address as the source address for the PIM registration message.
6	RP1 can join the source tree by sending a join message to S1. However, RP1 must create a source-specific state.
7	RP2 receives the registration message from RP1, decapsulates the message, and send the packet down the share tree to the R2 receiver.

(1 of 2)

Sequence	Event description
8	RP2 sends a registration-stop message back to RP1. RP2 can wait to send the registration-stop message if it decides to join the source tree. RP2 should wait until it receives data from the source tree before it sends the registration-stop message. If RP2 does wait for the data, the registration-stop message is sent to RP1 when it receives the next registration message. If RP2 does not wait for the data, the registration-stop message is immediately sent to RP1.
9	RP2 can join the source tree by sending a join message to S1. However, RP2 must create a source-specific state.
10	RP3 receives the registration message from RP1 and decapsulates the message. No receivers joined for the group, so RP3 discards the packet.
11	RP3 sends a registration-stop message back to RP1.
12	RP3 creates a source-specific state, so when a receiver joins after S1 starts sending traffic, RP3 can quickly join the source tree for S1.
13	RP1 processes the registration-stop message from RP2 and RP3. RP1 can cache the receipt of registration-stop messages from the RPs in the anycast RP set. (The cache of messages is completed on a per-RP or per-source-specific basis.) The cache of messages increases the reliability of the delivery of registration messages to each RP. Subsequent registration messages received by RP1 are sent only to the RPs in the anycast RP set that have not previously sent registration-stop messages from the source-specific entry.
14	RP1 sends a registration-stop message to the DR under the following conditions: • after receiving a registration message from the DR • if all RPs in the anycast RP set have returned registration-stop messages for a specific source-specific route

(2 of 2)

SPT switchover thresholds

SPT switchover thresholds allow you to configure the switchover threshold, in Kbps, for the group prefixes. The threshold value determines when the router switches from the shared tree to the source-specific tree. The switchover is attempted only if the traffic rate on the shared tree for the group exceeds the configured threshold.

L3 Multicast Load Balancing for ECMP

The 5620 SAM distributes multicast traffic by balancing the load based on the total available multicast bandwidth on all ECMP paths. You can configure ECMP rebalancing on the VPRN and base PIM Routing Instance configuration forms.

5620 SAM ECMP rebalancing has the following important characteristics:

- Multicast load balancing over ECMP links is enabled, by default.
- The rebalancing timer is set to 30 minutes, by default.
- Distribution of the multicast groups over the available links is processed based on the bandwidth configured for the specified group address. If the bandwidth is not configured for the multicast stream, then the configured default value is used.
- If a link failure occurs, the load on the failed channel is distributed to the remaining channels. The bandwidth required to accommodate the load from the failed link is evenly distributed over the remaining links.
- If an additional link becomes available for a specific multicast channel, it is then treated in an equivalent manner to the other links of the interface.

- A manual (operator-initiated) rebalance command is typically used to re-evaluate the current balance, with regard to bandwidth utilization. If necessary, multicast streams can subsequently be moved to different links to achieve a balance.
- In an automatic timed rebalance, the system rebalances multicast streams over the available links, based on the configured bandwidth and interval. If no links have been added or removed, or it is determined that no multicast streams will benefit from a rebalance, then it is not be implemented.
- When multicast load rebalancing is not enabled, any ECMP changes are not optimized. However, whenever a link is added, an attempt is made to balance the number of multicast streams on all the available ECMP links. This may however, not result in balanced bandwidth utilization of all the ECMP links.
- Only a single rebalance command can be executed at any specific time. If a rebalance is in progress and a manual rebalance command is entered, it is rejected and a message is displayed informing the user who a rebalance is already in progress.

IGMP

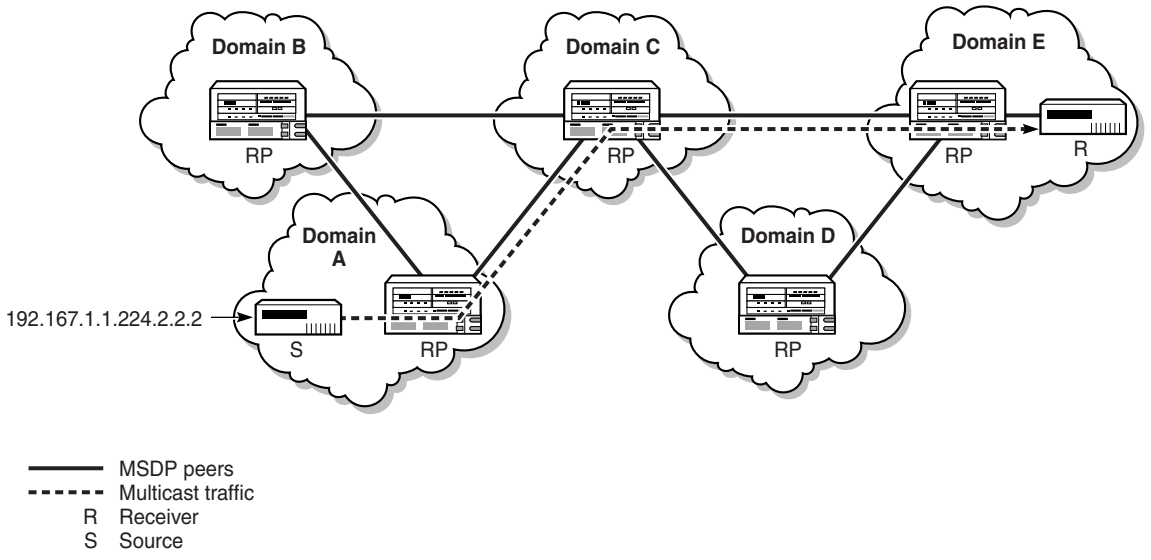
IGMP is a multicast protocol which service providers can use to establish multicast group memberships on a LAN. Within the LAN, end users use IGMP to communicate with a local multicast router, which then uses PIM to distribute the IGMP messages to other local and remote multicast routers. Multicast routers send regular membership queries to IGMP hosts which respond with membership reports. Multicast routers can use these reports to determine which hosts are interested in receiving particular multicast messages.

Configuring a group interface query source IP address on the IGMP site allows a VPLS IGMP snooping instance to register the port facing an ESM port as a multicast router port.

IGMP operates above the network layer on IPv4 networks.

MSDP

MSDP is a protocol that enables multiple PIM-SM domains to communicate with each other using their own RPs. MSDP also enables multiple RPs in a single PIM-SM domain to establish MSDP mesh-groups and to synchronize information between anycast RPs about the active sources being served by each anycast RP peer. The 7950 XRS, 7750 SR, 7710 SR, and the 7450 ESS in mixed mode support MSDP.



Each PIM-SM domain has its own RPs and MSDP enables these RPs to inform each other about active sources. When an active source is detected, the RPs send PIM-SM explicit join messages to the active source. When RPs in remote domains know about active sources, they can pass on this information to their local receivers and multicast data can be forwarded between the domains.

The RP learns about a new multicast source within its domain through the PIM register mechanism and encapsulates the first data packet in a source active message. After an RPF check, the MSDP source active message is flooded by each peer to its MSDP peers until it reaches every MSDP router in the interconnected networks. If the receiving MSDP peer is an RP, and the RP has a (*,G) entry for the group in the source active message, the message is accepted. The RP creates an (S,G) state for the source and join to the shortest path tree for the state of the source.

The encapsulated data is forwarded down the RP shared tree. When the packet is received by a receiver's last hop router, the last-hop may also join the shortest path tree to the source.

Figure 23-5 shows a sample of how data flows from a source in Domain A to a receiver in Domain E in an MSDP implementation for PIM-SM.

Figure 23-5 Sample implementation of MSDP for PIM-SM

MLD

MLD is an asymmetric protocol used by IPv6 routers to discover the presence of multicast listeners, that is, NEs that wish to receive multicast packets. MLD specifies separate behaviors for multicast address listeners and multicast routers.

The purpose of MLD is to enable each multicast router to discover, for each of its directly attached links, which multicast addresses and which sources have interested listeners on that link. The information gathered by MLD is provided to whichever multicast routing protocol is used by the router, such as PIM, to ensure that multicast packets are delivered to all links where there are listeners interested in such packets.

MLD is supported on the 7950 XRS, in chassis mode C or D, and on the 7750 SR in chassis mode A or B with mixed mode enabled. MLD is supported on all variants of the 7705 SAR.

Bridging

Bridging is used between an OmniSwitch device and a 7450 ESS to create a fast ring. The fast ring bridges the end-user devices, such as BTV set-top boxes, and Layer 2 services, such as VPLS, that distribute multicast traffic. If required, you can configure the devices with MSTP or another STP.

STP is active by default on an OmniSwitch. The default mode of operation is 1x1 mode using RSTP. A loop-free network topology is automatically calculated based on default STP switch, bridge, and port parameter values.

Additional OmniSwitch configuration such as enabling and configuring OmniSwitch learned port security parameters for VLAN ports, DHCP relay, and DHCP snooping can be done while configuring other bridge parameters.

You can configure MVRP as part of the bridging configuration on the OmniSwitch. MVRP provides a mechanism to maintain the contents of dynamic VLAN registration entries for each VLAN, and to propagate that information to other bridges.

In the 5620 SAM, a bridge is represented in the network view below a device, similar to the routing instance of a device.

WPP

WPP (Web Portal Protocol) runs between a BNG and a Web portal server. It is used for Web portal authentication of WLAN users (DHCP hosts). WPP can be enabled on base routing instances or VPRN routing instances.

23.2 Workflow to configure protocols

This workflow assumes the following:

- You know the 32-bit unique router ID prior to configuring OSPF or BGP.
- An AS number is assigned to the device prior to configuring BGP.

1 Enable the routing protocols to be supported on the devices. See the appropriate device documentation for more information. The options are:

- LDP
- IS-IS
- MPLS
- RSVP (enabled by default)
- BGP
- RIP
- L2TP (enabled by default)
- OSPFv2
- OSPFv3
- PIM
- IGMP
- MSDP
- MLD

Note — L2TP is enabled by default on a base routing instance, but not on a VPRN routing instance.

2 Ensure the parameters to implement routing protocols on the Layer 3 interfaces are configured. See chapter 22 for more information.

3 As required on the selected routing protocol, configure routing policies. See chapter 22 for more information.

4 Review the appropriate workflow to configure a routing protocol:

- **a** BGP; see section 23.3 for more information
- **b** RIP; see section 23.4 for more information
- **c** LDP; see section 23.5 for more information
- **d** IS-IS; see section 23.6 for more information
- **e** OSPFv2 or OSPFv3; see section 23.7 for more information
- **f** RSVP; see section 23.8 for more information
- **g** L2TP; see section 23.9 for more information
- **h** PIM; see section 23.10 for more information
- **i** IGMP; see section 23.11 for more information
- **j** MSDP; see section 23.12 for more information
- **k** MLD; see section 23.13 for more information
- **l** bridging; see section 23.14 for more information
- **m** WPP; see section 23.15 for more information

5 As required, configure the protocol for the remote device.

23.3 Workflow to configure BGP

1 Enable BGP on the routing instance. See Procedure 23-1 for more information.

2 Determine whether BGP confederations are necessary. If BGP confederations are necessary:

- **a** Configure the Confederation Autonomous System number on the Routing tab of the Routing Instance configuration form.
- **b** Configure BGP confederation members from the BGP Confederations tab of the Routing Instance configuration form. See Procedure 23-3 for more information.

3 If you are configuring MP-BGP, perform the following on the base routing instance of each NE that is to participate in a VPRN:

- **a** As required, enable VPN IPv4 and VPN IPv6.
- **b** As required, enable multicast IPv4 to apply the multicast extension. See Procedure 23-2 and chapter 71 for more information.

4 Create at least one BGP peer group. See Procedure 23-4 for more information.

5 As required, create BGP neighbors with which to peer. See Procedure 23-5 for more information.

6 As required, enable or disable BGP peering. See Procedure 23-6 for more information.

23.4 Workflow to configure RIP

1 Enable RIP on the routing instance. See Procedure 23-8 for more information.

2 Configure global-level RIP. See Procedure 23-9 for more information.

3 Configure group-level RIP. See Procedure 23-10 for more information.

4 Configure neighbor-level (also known as interface) RIP. See Procedure 23-11 for more information.

23.5 Workflow to configure LDP

1 Enable LDP on the routing instance. See Procedure 23-12 for more information.

2 Configure global-level LDP. See Procedure 23-13 for more information.

3 Configure one of the following options.

a If two LDP peers are adjacent devices, create an LDP interface. See Procedure 23-14 for more information.

b If two LDP peers are non-adjacent devices, create an LDP targeted peer. See Procedure 23-16 for more information.

4 Create an LDP keychain. See Procedure 23-15 for more information.

5 As required, configure ECMP on an LDP routing interface. See Procedure 23-17 for more information.

23.6 Workflow to configure IS-IS

1 Enable IS-IS on the routing instance. See Procedure 23-19 for more information.

2 Configure global-level IS-IS. See Procedure 23-20 for more information.

3 Configure at least one NET address. See Procedure 23-22 for more information.

4 Configure at least one IS-IS interface. See Procedure 23-23 for more information.

5 As required, if LDP over RSVP is enabled for IS-IS, configure an operational LSP between routers. See chapter 25 for more information.

23.7 Workflow to configure OSPFv2 and OSPFv3

1. Enable OSPF on the routing instance. See Procedure 23-24 for more information.
2. Create at least one OSPFv2 or OSPFv3 area. See Procedure 23-25 for more information.
3. As required, create an OSPF neighbor on an OmniSwitch. See Procedure 23-26 for more information.
4. Assign Layer 3 interfaces to the routers in the OSPFv2 or OSPFv3 area. See Procedure 23-27 for more information.
5. As required, create an OSPF area range. See Procedure 23-28 for more information.
6. As required, create a virtual link between the backbone OSPF area and a remote OSPF area that does not advertise the OSPF topology. See Procedure 23-29 for more information.
7. Configure OSPF on the routing instance. See Procedure 23-30 for more information.
8. Assign routers to the OSPFv2 or OSPFv3 area. See Procedure 23-31 for more information.

23.8 Workflow to configure RSVP

1. As required, configure MPLS, LSP, MPLS path, and LSP path parameters. See chapter 25 for more information.
2. Configure the RSVP on the routing interface. See Procedure 23-32 for more information.
3. Configure the RSVP interface. See Procedure 23-33 for more information.
4. As required, enable LDP. See Procedure 23-12 for more information.

23.9 Workflow to configure L2TP

1. Configure L2TP on a routing instance. See Procedure 23-34 for more information.
2. Create and configure an LNS group and group member for an LNS site. If the site is an LAC, this configuration is not required. See Procedure 14-6 for more information.
3. As required, configure the ESM profiles for LNS L2TP termination:
   a. VPRN; see Procedure 71-60 for more information
   b. IES; see Procedure 70-12 for more information

4 As required, configure L2TP on each local user database PPPoE host to be forwarded to the LNS (applicable for the LAC and the LNS, where RADIUS is not used). See Procedure 65-5 for more information.

5 As required, view L2TP tunnels and endpoints. See Procedure 23-35 for more information.

6 As required, view L2TP tunnel instance endpoints associated with a subscriber host. See Procedure 23-36 for more information.

7 As required, view L2TP sessions. See Procedure 23-37 for more information.

8 As required, view PPP sessions on an LAC or LNS. See Procedure 23-38 for more information.

23.10 Workflow to configure PIM

1 Enable PIM on a routing instance. See Procedure 23-39 for more information.

2 Configure PIM on a routing instance. See Procedure 23-40 for more information. To configure PIM on a VPRN routing instance, see Procedure 23-41.

3 As required, configure Anycast RP for PIM on a router. See Procedure 23-42 for more information.

4 Configure a PIM interface. See Procedure 23-43 for more information.

23.11 Workflow to configure IGMP

1 Enable IGMP on the routing interface. See Procedure 23-45 for more information.

2 Configure IGMP on the routing instance.See Procedure 23-46 for more information.

3 As required, configure IGMP on an OmniSwitch. See Procedure 23-47 for more information.

4 Configure an IGMP interface. See Procedure 23-48 for more information.

5 As required, turn up or shut down an IGMP interface. See Procedure 23-49 for more information.

6 As required, view IGMP statistics, as follows:

a IGMP multicast reporting statistics; see Procedure 23-50 for more information

b IGMP source statistics; see Procedure 23-51 for more information

23.12 Workflow to configure MSDP

1. Enable MSDP on the routing instance. See Procedure 23-52 for more information.
2. Configure global MSDP on the routing instance. See Procedure 23-53 for more information.
3. Create at least one MSDP peer or group-peer.
   a. As required, configure group-level MSDP. See Procedure 23-54 for more information.
   b. As required, configure peer-level MSDP. See Procedure 23-56 for more information.
4. As required, configure group-peer-level MSDP. See Procedure 23-57 for more information.
5. As required, configure an MSDP source. See Procedure 23-55 for more information.
6. As required, enable or disable MSDP peering. See Procedure 23-58 for more information.

23.13 Workflow to configure MLD

1. Enable MLD on the routing instance. See Procedure 23-59 for more information.
2. Configure MLD on the routing instance or VPRN routing instance. See Procedure 23-60 for more information.
3. Create an MLD interface on the routing instance or VPRN routing instance. See Procedure 23-61 for more information.
4. Create an MLD interface on an IES L3 access interface. See Procedure 23-62.

23.14 Workflow to configure bridging on an OmniSwitch device

1. As required, configure bridging on an OmniSwitch. See Procedure 23-63 for more information.
2. Release a violated OmniSwitch LSP port if required. See Procedure 23-64 for more information.

23.15 Workflow to configure WPP

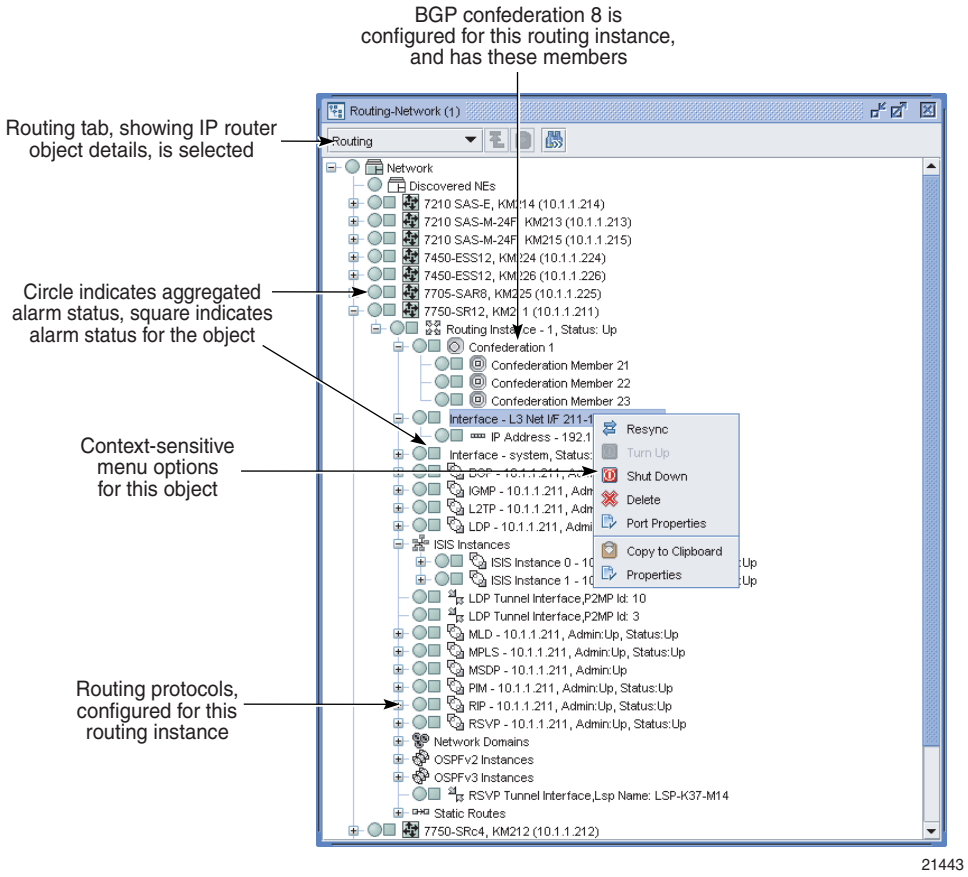
1. As required, enable WPP on the following routing instances:
   a. Base routing instance. See Procedure 22-1 for more information.
   b. VPRN routing instance. See Procedure 71-6 for more information.

2 Create a Web portal. See Procedure 23-65 for more information.

3 Bind a web portal to a group interface:

a IES group interface. See Procedure 70-12 for more information.

b VPRN group interface. See Procedure 71-60 for more information.



23.16 BGP configuration procedures

The BGP command hierarchy consists of three levels:

- global
- peer group
- peer (also known as neighbor)

Figure 23-6 shows the network view open to show Confederations and BGP settings.

Figure 23-6 BGP in the navigation tree network view

BGP parameters are initially applied at the global level. The parameters are inherited by the group and peer levels. Parameters can be modified and overridden on a level-specific basis.

Many of the hierarchical BGP commands can be modified at different levels. BGP group-level parameters take precedence over BGP global-level parameters. BGP peer-level parameters take precedence over group- and global-level parameters.

The following procedures describe how to configure BGP.

Procedure 23-1 To enable BGP on a routing instance

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.

3 Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) form opens with the General tab displayed.

4 Enable BGP.

i Click on the Protocols tab.

ii Choose the BGP Enabled parameter.

Note 1 — You must configure an AS number before enabling BGP. Configure the Autonomous System parameter on the Routing tab of the Routing Instance (Edit) form.

Note 2 — If a confederation is required, configure the Confederation Autonomous System parameter on the Routing tab on the Routing Instance (Edit) form.

5 Click on the OK button. The Routing Instance (Edit) form closes, a BGP entry appears in the list of enabled protocols, and a BGP icon appears in the network view of the navigation tree.

Procedure 23-2 To configure global-level BGP

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the BGP icon. The path is Routing→Router→Routing Instance→BGP.

3 Right-click on the BGP icon and choose Properties. The BGP Site (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Description
- Router ID
- Administrative State
- Cluster ID
- Keep MP-BGP Routes

5 Assign a TCP key chain, if required.

Note — You can assign a TCP key chain to a BGP site, group, or peer on a 7950 XRS, 7750 SR, or on a 7450 ESS in mixed mode.

i Click on the Select button in the KeyChain panel. The Select BGP Site Keychain - BGP form opens.

ii Choose a key chain in the list and click on the OK button. The Select BGP Site Keychain - BGP form closes. The 5620 SAM assigns the key chain to the BGP instance.

6 Configure the parameters in the Graceful Restart panel:

- Graceful Restart
- Stale Routes Time (seconds)
- Restart Time (seconds)
- Enable Notification

The graceful restart parameters are configurable when you enable the Graceful Restart parameter.

7 Configure the parameters in the MED panel:

- MED Source
- MED Value

The parameters are used to find a way to leave the AS when there are multiple methods of leaving the AS.

8 Configure the parameters in the IGP Shortcut panel:

- IGP Shortcut
- Disallow IGP

The Disallow IGP parameter is only displayed if you enable one of the IGP Shortcut parameter options.

9 Configure the parameters in the MultiPath panel:

- Multi Path
- IBGP MultiPath
- EIBGP LoadBalance

Set the Multi Path parameter to 1 to disable. When the parameter is set from 2 to 16, multipath is enabled and BGP load shares traffic across the number of links specified. If the equal cost routes available are greater than the configured value, routes with the lowest next hop IP address are chosen.

10 Configure the Backup Path parameter in the Backup Path panel.

11 Configure the parameters in the Best Path Selection panel:

- Ignore Next Hop Metric
- Ignore Router Id
- MED Compare
- Deterministic MED
- Strict

When you set the MED Compare parameter to off, the Strict parameter is set to true and is not configurable. When you set the MED Compare parameter to on, the Strict parameter is set to false and is not configurable.

12 Configure the parameters in the OLC panel.

- Current OLC State
- Revert OLC State

13 Click on the Behavior tab.

14 Configure the parameters:

- Preference
- Local Preference
- Multi Hop
- Loop Detect
- Aggregator ID Zero
- Damping
- Disable Client Reflect
- Min. Route Advertisement
- Disable Standard Communities
- Disable Extended Communities
- Disable Fast External Failover
- Advertise Inactive Routes
- Enable Inter AS VPRN
- Enable Rapid Withdrawal
- Enable Peer Tracking
- BFD Enabled
- FlowSpec Validate Enabled
- Connect Retry Time (seconds)
- Keep Alive (seconds)
- Purge Time (minutes)
- Transport Tunnel
- Path MTU Discovery Enabled
- Disable Route Table Install
- Enable Route Reflector VPN Forwarding
- Peer Tracking Policy
- Split Horizon
- IANA MVPN VRF Import Subtype

The Enable Inter AS VPRN parameter is not configurable on a VPRN routing instance.

15 Configure the parameters in the Next-Hop Resolution panel:

- Use BGP Routes
- Policy

16 Configure the parameters in the Hold Time panel:

- Hold Time (seconds)
- Minimum Hold Time (seconds)

17 Configure the parameters in the Add-Path panel:

- Enable Add-Path Send
- Add-Path Receive
- IPv4 Add-Path Limit
- VPN IPv4 Add-Path Limit
- IPv6 Add-Path Limit
- VPN IPv6 Add-Path Limit

18 Configure the Fault Tolerance parameter in the Error Handling panel. The Fault Tolerance parameter allows BGP routers to be more tolerant of some UPDATE message errors, use less disruptive error recovery mechanisms, and provide better operational and diagnostics information.

19 Configure the parameters in the Damp Peer Oscillations panel:

- Enable Damp Peer Oscillation
- Initial Wait Time (minutes)
- Second Wait Time (minutes)
- Maximum Wait Time (minutes)
- Error Interval (minutes)

20 Click on the AS Properties tab.

21 Configure the parameters:

- Min AS Origination (seconds)
- Disable 4Byte ASN

22 Configure the parameters in the Local AS panel:

- Local AS
- Private
- No Prepend Global AS

The No Prepend Global AS is configurable only if you set the Local AS parameter to a value other than 0.

The Local AS parameters are used to configure a virtual AS. A virtual AS is used when a router (RTA) is moved from one AS (AS1) to another AS (AS2). However, the customer router (CR1) is configured to belong to the AS1. To avoid reconfiguring CR1 to belong to AS2, CR1 can continue to belong to AS1, but RTA has its local AS value set to AS1. RTA can advertise AS1 for routes advertised to CR1.

23 Configure the parameters in the Remove Private AS panel:

- Remove Private AS
- Limited

24 Click on the VPN tab.

25 Configure the parameters in the VPN panel:

- Family
- Apply Import Route Policies
- Apply Export Route Policies
- AS Override

If you are configuring global-level BGP for BGP AD in VPLS or for BGP VPLS, you must enable the L2 VPN option for the Family parameter.

The Apply Import Route Policies and Apply Export Route Policies parameters are not configurable on a VPRN routing instance.

The Apply Import Route Policies and Apply Export Route Policies parameters specify whether to apply the existing import and export route policies configured on the Import Policies and Export Policies tabs.

26 Configure the parameters in the AS Path Ignore panel:

- AS Path Ignore
- AS Path Ignore Family

The AS Path Ignore Family parameter is configurable when the AS Path Ignore parameter is set to true.

27 Configure the Address Family parameter in the Rapid Update panel.

28 Configure the Address Family parameter in the Advertise External panel.

29 Add a peer group, if required.

i Click on the Group tab.

ii Click on the Create button.The Peer Group (Create) form opens.

iii Perform steps 4 to 29 of Procedure 23-4.

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Peer Group (Create) form closes.

30 Add a peer, if required.

i Click on the Peer tab.

ii Click on the Create button. The Peer (Create) form opens.

iii Perform steps 4 to 30 of Procedure 23-5.

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Peer (Create) form closes.

31 Click on the Import Policies tab.

32 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Policy 6
- Policy 7
- Policy 8
- Policy 9
- Policy 10
- Policy 11
- Policy 12
- Policy 13
- Policy 14
- Policy 15

Configure the import route policies to determine which routes are accepted from peers. The policies should match the policies you configure using the Routing Policy Manager, as described in chapter 22. There is no validation performed by the router to ensure the policies match.

33 Click on the Export Policies tab.

34 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Policy 6
- Policy 7
- Policy 8
- Policy 9
- Policy 10
- Policy 11
- Policy 12
- Policy 13
- Policy 14
- Policy 15

Configure the export route policies to determine which routes are advertised to peers. The policies should match the policies you configure using the Routing Policy Manager, as described in chapter 22. A router performs no validation to ensure the policies match.

35 Click on the Authentication tab.

36 Configure the parameters:

- Type
- Key

37 Click on the following tabs to view information:

- Statistics
- Faults

38 Click on the OK button. The BGP (Edit) form closes.

Procedure 23-3 To configure a BGP confederation

For BGP confederations, the following rules apply:

- A device can only belong to one confederation.
- Multiple devices can belong to one BGP confederation.

You must configure BGP on the device and configure global-level BGP parameters before you configure BGP confederations, as described in Procedures 23-1 and 23-2.

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.

3 Right-click on the Routing Instance icon and choose Properties. The Routing Instance (Edit) form opens.

4 Click on the Routing tab.

5 Enter the confederation number for the Confederation Autonomous System parameter and click on the Apply button.

6 Click on the BGP Confederations tab.

7 Click on the Create button to add a BGP confederation, or choose a BGP confederation from the list and click on the Properties button to configure an existing BGP confederation. The Confederation (Edit) form opens with the General tab displayed.

Note — You can only have one BGP confederation per device.

8 To add a new member to the confederation:

i Click on the Members tab.

ii Click on the Create button. The Confederation Member (Create) form opens.

iii Configure the Member AS parameter as the number of ASs for the confederation. The member AS number represents the BGP instance of the device.

iv Click on the OK button. The Confederation Member (Create) form closes, and an entry for the new confederation member AS appears in the Confederation (Edit) form.

9 Click on the OK button. The Confederation (Edit) form closes and the Routing Instance (Edit) reappears. A Confederation icon appears in the Navigation Tree below the Routing Instance icon.

You can verify the confederation membership by opening the Confederation icon to view icons that represent the members of the confederation as specified in step 8.

10 Close the Routing Instance (Edit) form.

Procedure 23-4 To configure peer-group-level BGP

Note 1 — For most parameters in this procedure, you can specify that the parameter value is inherited from the parent BGP configuration using the Inherit Value parameter.

If you disable value inheritance for a parameter, the available options are restricted, based on the parent parameter value and the protocol functionality. For example, if a parameter in the global-level BGP configuration is set to True, the only available option for the same parameter in the peer-group-level BGP configuration is False, unless a value of False violates a protocol rule, in which case the only available option is True.

Note 2 — The parameters that you configure for a BGP peer group take precedence over the parameters that are configured for global-level BGP.

1 Choose Routing from the navigation tree view selector from the 5620 SAM GUI.

2 Choose Routing→Router→Routing Instance→BGP.

3 Right-click on the BGP icon and choose Create Group. The Peer Group (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Name
- Description
- Administrative State
- Cluster ID
- Local Address
- Inherit Value
- Dynamic Peer

5 Assign a TCP key chain, if required.

Note — You can assign a TCP key chain to a BGP site, group, or peer on a 7950 XRS, 7750 SR, or on a 7450 ESS in mixed mode.

i Click on the Select button in the KeyChain panel. The Select BGP Group Keychain - Peer Group form opens.

ii Choose a key chain in the list and click on the OK button. The Select BGP Group Keychain - Peer Group form closes. The 5620 SAM assigns the key chain to the BGP peer group.

6 Configure the parameters in the Graceful Restart panel:

- Graceful Restart
- Stale Routes Time (seconds)
- Restart Time (seconds)
- Enable Notification
- Inherit Value

The graceful restart parameters are configurable when the Graceful Restart parameter is enabled.

The Graceful Restart parameter is not configurable on 7210 SAS-M and 7210 SAS-X devices.

7 Configure the parameters in the MED panel:

- MED Source
- MED Value
- Inherit Value

The parameters are used to find a way to leave the AS when there are multiple methods of leaving the AS.

8 Click on the Apply button.

9 Configure the parameters in the OLC panel:

- Current OLC State
- Revert OLC State

10 Click on the Behavior tab.

11 Configure the parameters:

- Preference
- Local Preference
- Multi Hop
- Loop Detect
- Aggregator ID Zero
- Damping
- Disable Client Reflect
- Min. Route Advertisement
- Disable Standard Communities
- Disable Extended Communities
- Disable Fast External Failover
- Advertise Inactive Routes
- Enable Peer Tracking
- BFD Enabled
- FlowSpec Validate Enabled
- Connect Retry Time (seconds)
- Keep Alive (seconds)
- Peer Type
- Passive
- Next Hop Self
- Minimum TTL Value
- Path MTU Discovery Enabled
- Default Route Target
- Accumulated IGP
- Split Horizon
- Next Hop Unchanged

12 Configure the parameters in the Hold Time panel:

- Hold Time (seconds)
- Minimum Hold Time (seconds)

13 Configure the parameters in the Prefix Limit panel:

- Prefix Limit
- Log Only
- Threshold
- Idle Timeout
- Never Timeout

The Idle Timeout parameter is configurable when the Never Timeout parameter is disabled.

14 Configure the parameters in the Add Path panel:

- Enable Add-Path Send
- Add-Path Receive
- IPv4 Add-Path Limit
- VPN IPv4 Add-Path Limit
- IPv6 Add-Path Limit
- VPN IPv6 Add-Path Limit
- Inherit Value

15 Configure the parameters in the Error Handling panel. The Fault Tolerance parameter allows BGP routers to be more tolerant of certain UPDATE message errors, use less disruptive error recovery mechanisms, and provide better operational and diagnostics information.

- Fault Tolerance
- Inherit Value

16 Configure the parameters in the Damp Peer Oscillations panel:

- Enable Damp Peer Oscillation
- Initial Wait Time (minutes)
- Second Wait Time (minutes)
- Maximum Wait Time (minutes)
- Error Interval (minutes)
- Inherit Value

17 Click on the AS Properties tab.

18 Configure the parameters:

- Peer AS
- Min AS Origination (seconds)
- Disable 4Byte ASN
- AS Override
- Inherit Value

The Peer AS parameter specifies the peer AS for this specific group, and the behavior, internal or external. Multipath configurations are not supported at the BGP peer level.

19 Configure the parameters in the Local AS panel:

- Local AS
- Private
- No Prepend Global AS
- Inherit Value

The No Prepend Global AS is configurable only if you set the Local AS parameter to a value other than 0.

The Local AS parameters are used to configure a virtual AS. A virtual AS is used when a router (RTA) is moved from one AS (AS1) to another AS (AS2). However, the customer router (CR1) is configured to belong to the AS1. To avoid reconfiguring CR1 to belong to AS2, CR1 can continue to belong to AS1, but RTA has its local AS value set to AS1. RTA can advertise AS1 for routes advertised to CR1.

20 Configure the parameters in the Remove Private AS panel:

- Remove Private AS
- Limited
- Inherit Value

21 Click on the VPN tab.

22 Configure the parameters in the VPN panel:

- Family
- Apply Import Route Policies
- Apply Export Route Policies
- Inherit Value

Note 1 — The Advertise Label, Apply Import Route Policies, and Apply Export Route Policies parameters are not configurable for a VPRN routing instance.

Note 2 — The Apply Import Route Policies and Apply Export Route Policies parameters specify whether to apply the existing import and export route policies configured on the Import Policies and Export Policies tabs.

23 Add a peer, if required.

i Click on the Peer tab.

ii Click on the Create button. The Peer (Create) form opens.

iii Perform steps 4 to 30 of Procedure 23-5.

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Peer (Create) form closes.

24 Click on the Import Policies tab.

25 Configure the parameters:

- Inherit Value
- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Policy 6
- Policy 7
- Policy 8
- Policy 9
- Policy 10
- Policy 11
- Policy 12
- Policy 13
- Policy 14
- Policy 15

Configure the import route policies to determine which routes are accepted from peers. The policies should match the policies you configure using the Routing Policy Manager, as described in chapter 22. There is no validation performed by the router to ensure the policies match.

26 Click on the Export Policies tab.

27 Configure the parameters:

- Inherit Value
- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Policy 6
- Policy 7
- Policy 8
- Policy 9
- Policy 10
- Policy 11
- Policy 12
- Policy 13
- Policy 14
- Policy 15

Note — Configure the export route policies to determine which routes are advertised to peers. The policies should match the policies you configure using the Routing Policy Manager, as described in chapter 22. A router performs no validation to ensure the policies match.

28 Click on the Authentication tab.

29 Configure the parameters:

- Type
- Key
- Inherit Value

30 Click on the following tabs to view information.

- Statistics
- Faults

31 Click on the OK button. The Peer Group (Create) form closes, and the 5620 SAM displays an icon for the new peer group under the BGP icon in the navigation tree.

Procedure 23-5 To configure peer-level BGP

Note 1 — For most parameters in this procedure, you can specify that the parameter value is inherited from the parent BGP configuration using the Inherit Value parameter.

If you disable value inheritance for a parameter, the available options are restricted, based on the parent parameter value and the protocol functionality. For example, if a parameter in the peer-group-level BGP configuration is set to True, the only available option for the same parameter in the peer-level BGP configuration is False, unless a value of False violates a protocol rule, in which case the only available option is True.

Note 2 — The parameters that you configure for a BGP peer take precedence over the parameters that are configured for group-level BGP.

1 Choose Routing from the navigation tree view selector from the 5620 SAM GUI.

2 Choose Routing→Router→Routing Instance→BGP→Peer Group.

3 Right-click on the peer group icon and choose Create Peer. The Peer (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Description
- Peer Address
- Administrative State
- Cluster ID
- Local Address
- Inherit Value

5 Configure the parameters in the Graceful Restart panel:

- Graceful Restart
- Stale Routes Time (seconds)
- Restart Time (seconds)
- Enable Notification
- Inherit Value

The graceful restart parameters are configurable when the Graceful Restart parameter is enabled.

6 Configure the parameters in the MED panel:

- MED Source
- MED Value
- Inherit Value

The parameters are used to find a way to leave the AS when there are multiple methods of leaving the AS.

7 Click on the Apply button.

8 Configure the parameters in the OLC panel.

- Current OLC State
- Revert OLC State

9 Click on the Behavior tab.

10 Configure the parameters:

- Preference
- Local Preference
- Multi Hop
- Loop Detect
- Aggregator ID Zero
- Damping
- Disable Client Reflect
- Min. Route Advertisement
- Disable Standard Communities
- Disable Extended Communities
- Disable Fast External Failover
- Advertise Inactive Routes
- Enable Peer Tracking
- BFD Enabled
- Connect Retry Time (seconds)
- Keep Alive (seconds)
- Peer Type
- Passive
- Next Hop Self
- Minimum TTL Value
- Path MTU Discovery Enabled
- Default Route Target
- Accumulated IGP
- Inherit Value
- FlowSpec Validate Enabled
- Split Horizon

11 Configure the parameters in the Hold Time panel:

- Hold Time (seconds)
- Minimum Hold Time (seconds)
- Inherit Value

12 Configure the parameters in the Prefix Limit panel:

- Prefix Limit
- Log Only
- Threshold
- Idle Timeout
- Inherit Value

13 Configure the parameters in the Add-Path panel:

- Enable Add-Path Send
- Add-Path Receive
- IPv4 Add-Path Limit
- VPN IPv4 Add-Path Limit
- IPv6 Add-Path Limit
- VPN IPv6 Add-Path Limit
- Inherit Value

14 Configure the parameters in the Error Handling panel. The Fault Tolerance parameter allows BGP routers to be more tolerant of certain UPDATE message errors, use less disruptive error recovery mechanisms, and provide better operational and diagnostics information.

- Fault Tolerance
- Inherit Value

15 Configure the parameters in the Damp Peer Oscillations panel:

- Enable Damp Peer Oscillation
- Initial Wait Time (minutes)
- Second Wait Time (minutes)
- Maximum Wait Time (minutes)
- Error Interval (minutes)
- Inherit Value

16 Click on the AS Properties tab.

17 Configure the parameters:

- Peer AS
- Min AS Origination (seconds)
- Disable 4Byte ASN
- Inherit Value

The Peer AS parameter specifies the peer AS for the group to which the peer belongs, and the behavior, internal or external. Multipath configurations are not supported at the BGP peer level.

18 Configure the parameters in the Local AS panel:

- Local AS
- Private
- No Prepend Global AS
- Inherit Value

The No Prepend Global AS parameter is configurable when you set the Local AS parameter to a value other than 0.

19 Configure the parameters in the Remove Private AS panel:

- Remove Private AS
- Limited
- Inherit Value

20 Click on the VPN tab.

21 Configure the parameters:

- Family
- Advertise Label
- Advertise LDP Prefix
- Apply Import Route Policies
- Apply Export Route Policies
- Inherit Value

The Advertise LDP Prefix is only displayed when the Advertise Label parameter is enabled for IPv4 routes.

The Apply Import Route Policies and Apply Export Route Policies parameters specify whether to apply the existing import and export route policies configured on the Import Policies and Export Policies tabs.

22 Click on the Graceful Restart tab.

23 Configure the parameters:

- Graceful Restart
- Stale Routes Time (seconds)
- Inherit Value

24 Assign a TCP key chain, if required.

Note — You can assign a TCP key chain to a BGP site, group, or peer on a 7950 XRS, 7750 SR, or on a 7450 ESS in mixed mode.

i Click on the KeyChain tab.

ii Click on the Select button. The Select BGP Peer Keychain - Peer form opens.

iii Choose a key chain in the list and click on the OK button. The Select BGP Peer Keychain - Peer form closes and the 5620 SAM assigns the key chain to the BGP peer.

25 Click on the Import Policies tab.

26 Configure the parameters:

- Inherit Value
- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Policy 6
- Policy 7
- Policy 8
- Policy 9
- Policy 10
- Policy 11
- Policy 12
- Policy 13
- Policy 14
- Policy 15

Configure the import route policies to determine which routes are accepted from peers. The policies should match the policies you configure using the Routing Policy Manager, as described in chapter 22. There is no validation performed by the router to ensure the policies match.

27 Click on the Export Policies tab.

28 Configure the parameters:

- Inherit Value
- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Policy 6
- Policy 7
- Policy 8
- Policy 9
- Policy 10
- Policy 11
- Policy 12
- Policy 13
- Policy 14
- Policy 15

Configure the export route policies to determine which routes are advertised to peers. The policies should match the policies you configure using the Routing Policy Manager, as described in chapter 22. A router performs no validation to ensure the policies match.

29 Click on the Authentication tab.

30 Configure the parameters:

- Type
- Key
- Inherit Value

31 Click on the OK button. The Peer (Create) form closes and a Peer icon appears below the Peer Group icon in the Navigation Tree of the network view.

32 Configure the protocol for the far-end device, if applicable. Use CLI for devices that are managed outside the scope of the 5620 SAM.

Procedure 23-6 To enable or disable BGP peering

1 Choose Routing from the navigation tree view selector from the 5620 SAM GUI.

2 Choose Routing→Router→Routing Instance→BGP→Peer Group.

3 Click on the Peer Group icon to display the peers in the peer group.

4 Right-click on a peer and choose one of the following menu items:

a Turn Up to activate a peer

b Shut Down to deactivate a peer

5 A dialog box appears. Click on the Yes button. The state information beside the Peer icon changes accordingly.

Procedure 23-7 To perform a routing policy test

Perform the following procedure to verify BGP routes against a routing policy. The output of the test returns the prefixes that are accepted and rejected by the policy. This test allows you to evaluate an existing routing policy against the RIB to identify the prefixes that are matched or not matched by the policy, before attaching the prefix to a routing neighbor or instance.

1 Perform one of the following:

   a Perform a routing policy test on a base router instance BGP site.

      i From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

      ii Navigate to the BGP icon. The path is Routing→NE→Routing Instance→BGP.

      iii Right-click on the BGP and choose Routing Policy Test. The rtr BGP Routing Policy Test form opens.

   b Perform a routing policy test on a VPRN instance BGP site.

      i Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

      ii Configure the filter criteria. A list of services appears.

      iii Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens.

      iv Navigate to the BGP Site icon in the service navigation tree. The path is Sites→Routing Instance - NE System ID→Routing Instance→Protocol s→BGP Site.

      v Right-click on the BGP Site icon and choose Routing Policy Test. The VPRN BGP Routing Policy Test form opens.

2 Configure the parameters:

- Policy Name
- Family
- RD
- Prefix
- Longer Prefix Match
- Neighbor
- Display Rejects
- Output Format

   You must enter the name of an existing and distributed routing policy for the Policy Name parameter.

3 Click on the Execute button and view the results.

4 Click on the Close button.

23.17 RIP configuration procedures

The RIP command hierarchy consists of three levels:

- global
- group
- interface (also known as neighbor)

For RIP configuration, you must define at least one group and one interface. The parameters that are configured on the global level are inherited by the group and interface levels. Parameters can be modified and overridden on a level-specific basis.

Many of the hierarchical RIP commands can be modified on different levels. RIP group-level parameters take precedence over BGP global-level parameters. RIP interface-level parameters take precedence over peer-group and global-level parameters.

When configuring RIP on the 7705 SAR, a RIP routing site is created under the routing instance which can be seen in the routing network tree. Using this RIP routing site, RIP groups and RIP interfaces can be configured.

The following procedures describe how to configure RIP.

Procedure 23-8 To enable RIP on a routing instance

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.

3 Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) form opens.

4 Enable RIP.

  i Click on the Protocols tab.

  ii Select the RIP Enabled parameter.

5 Click on the OK button to save the changes. A dialog box appears.

6 Click on the Yes button. The Routing Instance (Edit) form closes, and a RIP icon appears under the routing instance in the navigation tree.

Procedure 23-9 To configure global-level RIP

1 Choose Routing from the navigation tree view selector from the 5620 SAM GUI.

2 Choose Routing→Router→Routing Instance→RIP.

3 Right-click on the RIP icon and choose Properties. The RIP Site (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Description
- Administrative State

5 Click on the Behavior tab.

6 Configure the parameters:

- Check Zero
- Message Size
- Metric In
- Metric Out
- Preference
- Receive
- Send
- Split Horizon
- Propagate RIP Metric
- Flush
- Timeout
- Update

The Send parameter specifies the type of messages received based on the RIP version, and the variation of RIPv2 messages sent, broadcast or multicast.

The Propagate RIP Metric parameter is configurable only when configuring RIP on a VPRN routing instance.

7 Click on the Authentication tab.

8 Configure the parameters:

- Type
- Key

9 Click on the Import Policies tab.

10 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Specify routing policies that determine the routes that RIP interfaces import. You can specify up to five routing policies. The routing policies are enforced in order, from one to five.

11 Click on the Export Policies tab.

12 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Specify routing policies that determine the routes that RIP interfaces export. You can specify up to five routing policies. The routing policies are enforced in order, from one to five.

13 To create a RIP group, click on the Group tab.

i Click on the Create button. The RIP Group (Create) form opens.

ii Configure the parameters. See Procedure 23-10 for more information.

14 Click on the Interface tab. To configure interface-level (also known as neighbor) RIP parameters:

i Click on the Create button. The RIP Interface (Create) form opens.

ii Configure the parameters. See Procedure 23-11 for more information.

15 Click on the following tabs to view statistics and alarm information.

- Statistics
- Faults

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The RIP Site (Edit) form closes.

Procedure 23-10 To configure group-level RIP

Note 1 — You can choose to inherit values from the global-level RIP configuration by selecting the Inherit Value parameter. If you choose not to inherit a parameter value from the global-level RIP configuration, only the parameter options that are not set in the parent configuration are available. For example, if the Check Zero parameter is set to false in the global-level RIP configuration, you can only set the parameter to true in the group-level RIP configuration.

Note 2 — The parameters that you configure for a RIP group take precedence over the parameters that are configured for the global-level RIP configuration.

1 Choose Routing from the navigation tree view selector.

2 Navigate to the RIP icon. The path is Routing→Router→Routing Instance→RIP.

3 Right-click on the RIP icon and choose Create Group. The RIP Site Group (Create) form opens with the General tab displayed.

4 Configure the Name parameter.

5 Perform steps 4 to 12 of Procedure 23-9.

6 Click on the OK button. The RIP Group (Create) form closes, and the 5620 SAM displays an icon for the new RIP group in the navigation tree below the RIP icon.

Procedure 23-11 To configure interface-level RIP

Note 1 — You can choose to inherit values from the global-level RIP configuration by selecting the Inherit Value parameter. If you choose not to inherit a parameter value from the global-level RIP configuration, only the parameter options that are not set in the parent configuration are available. For example, if the Check Zero parameter is set to false in the global-level RIP configuration, you can only set the parameter to true in the interface-level RIP configuration.

Note 2 — The parameters that you configure for a RIP interface, also known as a RIP neighbor, take precedence over the parameters that are configured for the group- and global-level RIP configuration.

1 Choose Routing from the navigation tree view selector.

2 Navigate to a RIP group. The path is Routing→Router→Routing Instance→RIP→RIP Group.

3 Right-click on the RIP group icon and choose Create Interface. The RIP Interface (Create) form opens with the General tab displayed.

4 Perform steps 4 to 12 of Procedure 23-9.

5 Click on the OK button. The RIP Interface (Create) form closes, and the 5620 SAM displays an icon for the new RIP interface below the RIP group icon in the navigation tree.

23.18 LDP configuration procedures

An LDP instance in the 5620 SAM network navigation tree has the following child objects:

- Interfaces–The interfaces object contains the configured LDP interfaces for directly connected peers. The 7210 SAS-M does not support configuration of LDP interfaces.
- Targeted Peers–The targeted peers object contains the indirectly connected peers.

T-LDP is supported on the 7950 XRS, 7750 SR, 7710 SR, 7450 ESS, 7210 SAS-M, 7210 SAS-X, and 7705 SAR. DU-LDP is supported on the 7750 SR and 7705 SAR.

The following procedures describe how to configure LDP.

Procedure 23-12 To enable LDP on a routing instance

1 Choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.

3 Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) form opens.

4 Enable LDP.

i Click on the Protocols tab.

ii Select the LDP Enabled parameter.

5 Click on the OK button to save the changes. A dialog box appears.

6 Click on the Yes button. The Routing Instance (Edit) form closes, and an LDP icon appears under the routing instance in the navigation tree.

Procedure 23-13 To configure global-level LDP

1 Enable LDP on the router, as described in Procedure 23-12.

2 Choose Routing from the navigation tree view selector.

3 Navigate to the LDP instance icon. The path is Routing→Router→Routing Instance→LDP.

4 Right-click on the LDP icon and choose Properties. The LDP - Routing Instance (Edit) form appears, with the General tab displayed.

5 Configure the Administrative State parameter.

6 Click on the Common tab.

7 Configure the parameters:

- Targeted Sessions Allowed
- Prefer Tunnel-in-Tunnel
- Tunnel Down Damp Time (seconds)
- Enable Implicit Null Label
- Enforce Graceful Restart
- Multi Path Make Before Break Time (seconds)
- Neighbor Liveness Time (seconds)
- Maximum Recovery Time (seconds)
- Forward State Holding Time (seconds)
- Reconnect Time (seconds)
- Shortcut Local TTL Propagate
- Shortcut Transit TTL Propagate
- Fast Re-route

Configure the Targeted Sessions Allowed parameter to true to configure the router for T-LDP. Targeted sessions are LDP sessions that distribute labels between indirectly connected peers.

The Neighbor Liveness Time (seconds) and Maximum Recovery Time (seconds) parameters are configurable when the Enforce Graceful Restart parameter is enabled.

8 Click on the Interface Properties tab.

9 Configure the parameters:

- Address Type
  - Choose system to have the system IP address set up LDP sessions.
  - Choose interface to have the IP interface address set up LDP sessions only if there are not multiple interfaces between the two neighbors.
- Keep-Alive Factor
- Keep-Alive Timeout (seconds)
- Hello Factor
- Hello Timeout (seconds)

By default, these parameter values are inherited by all LDP interfaces.

10 Click on the Targeted Peer Properties tab.

i Configure the parameters:

- Keep-Alive Factor
- Keep-Alive Timeout (seconds)
- Hello Factor
- Hello Timeout (seconds)
- Enable Hello Reduction
- Hello Reduction Factor

By default, these parameter values are inherited by all LDP targeted peers.

Note — If the Enable Hello Reduction parameter is disabled while the targeted LDP session to the peer is operationally up, the change in the hold time will take effect only when the targeted LDP session is re-established.

ii Click on the Route Import Policy tab.

iii Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

iv Click on the Route Export Policy tab.

v Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

11 Click on the Ecmp OAM tab. The General tab displayed. See Procedure 23-17 for more information about configuring ECMP for LDP interfaces.

12 Click on the Interfaces tab. A list of interfaces you can view or configure opens. See Procedure 23-14 for more information about configuring LDP interfaces.

13 Click on the Peers tab. A list of peers you can view or configure opens. See Procedure 23-17 for more information about creating peers.

14 Click on the Targeted Peers tab. A list of targeted peers you can view or configure opens. See Procedure 23-16 for more information about creating and configuring targeted peers.

15 Click on the Import Policies tab.

16 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

17 Click on the Export Policies tab.

18 Configure the parameters on the General tab:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

19 Click on the Tunnel Table tab.

20 Configure the parameters on the Tunnel Table tab:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

The tunnel table policies are used to allow LDP-capable PE devices to offer services to PE routers in areas or domains where BGP-labeled routes are not supported. They are used to determine which routes are advertised to LDP. Only policy entries supporting the LDP protocol are considered; all other policies are ignored. See also Procedure 23-5 for information on enabling the advertisement of LDP prefixes to BGP peers.

21 Click on the Static Prefix FECs tab.

i Click on the Create button. The StaticFec (Create) form opens.

ii Configure the parameters:

- IP Prefix
- Probe Interval (Minutes)
- Advertised Label
- Next Hop Type
- Next Hop
- Swap Label

Next Hop Address and Swap Label parameters appear when IP Address is selected for the Next Hop Address value.

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The static FEC form closes and the static FEC entry appears in the list.

22 Click on the Aggregate Prefix Match tab.

23 Configure the parameters:

- Aggregate Prefix Match Enabled
- Administrative State

When the Aggregate Prefix Match Enabled parameter is enabled, the LDP installs a prefix binding in the LDP FIB by performing a longest match against an aggregate prefix in the routing table, as opposed to requiring an exact match of the prefix. The LDP prefix binding continues to be advertised on a per individual /32 prefix basis.

The Administrative State parameter can only be configured if the Aggregate Prefix Match Enabled parameter is enabled.

24 Configure the following parameters in the Prefix Exclude Policies panel:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

The Prefix Exclude Policies can only be configured if the Aggregate Prefix Match Enabled parameter is enabled.

When routing policy statements are specified in the Prefix Exclude Policies panel, any prefixes defined in the routing policies are excluded from the aggregate prefix matching procedure. In this case, when LDP receives a FEC-label binding for this prefix, it performs an exact match of a specific FEC element prefix, as opposed to a longest match of one or more LDP FEC element prefixes.

25 Click on the Accounting tab.

26 Click on the Create button. The AccountingFecPrefix (Create) form opens.

27 Configure the FEC Prefix parameter.

28 Configure the parameters in the Egress Accounting Statistics panel:

- Click on the Select button. The Select Accounting Policy - AccountingFecPrefix form opens. Choose the required accounting policy and click on the OK button. Only accounting policies with the CombinedLdpLspEgressStats stats type are available for selection.
- Collect Accounting Statistics
- Administrative State

See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

29 Click on the following tabs to view LDP statistics and alarm information.

- Statistics
- Faults

30 Click on the OK button. The LDP (Edit) form closes.

Procedure 23-14 To configure an LDP interface

Note — You can choose to inherit values from the global-level LDP configuration by selecting the Inherit Value parameter.

1 Choose Routing from the navigation tree view selector.

2 Navigate to an LDP instance. The path is Routing→Router→Routing Instance→LDP.

3 Right-click on the LDP instance and choose Create Interface. The LDP Interface configuration form opens with the General tab displayed.

4 Click on the Select button to choose a Layer 3 interface. The Select Interface - LDP Interface form opens.

5 Configure the filter criteria. A list of the available interfaces appears.

6 Choose an interface in the list and click on the OK button.

7 Configure the parameters:

- Description
- Administrative State

8 Click on the Protocol Properties tab.

9 Configure the parameters:

- Keep-Alive Factor
- Keep-Alive Timeout (seconds)
- Hello Factor
- Hello Timeout (seconds)
- Address Type
- Local LSR ID
- Enable BFD Tracking
- Multicast Forwarding

By default, these parameter values are inherited by all LDP interfaces.

For the Address Type parameter:

- Choose system to have the system IP address set up LDP sessions.
- Choose interface to have the IP interface address set up LDP sessions only if there are not multiple interfaces between the two neighbors.

10 If you set the Local LSR ID parameter to Interface in step 9, perform the following to specify a routing interface:

i Click on the Select button in the Interface panel. The Select Interface form opens.

ii Configure the filter criteria, as required, and click on the Search button.

iii Select a routing interface in the list and click on the OK button. The Select Interface form closes.

11 Click on the OK button. The LPD Interface (Create) form closes, and an icon for the new LDP interface appears in the navigation tree list of interfaces below the LDP icon.

12 Click on the OK button. An icon for the new LDP interface appears in the navigation tree below the LDP icon.

13 Configure the protocol for the far-end device, if applicable. Use CLI for devices that are managed outside the scope of the 5620 SAM.

Procedure 23-15 To configure an LDP peer

1 Choose Routing from the navigation tree view selector.

2 Navigate to an LDP interface. The path is Routing→Router→Routing Instance→LDP.

3 Right-click on the LDP icon and choose Properties. The LDP (Edit) form opens.

4 Click on the Peers tab.

5 Click on the Create button. The Peer (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Peer Address
- Minimum TTL Value
- DoD Label Distribution
- Path MTU Discovery Enabled
- FEC 129 CISCO Interop
- Distribute Local Addresses Only
- PE ID MAC Flush Interop

7 Assign a TCP key chain to the LDP peer, if required.

i Click on the KeyChain tab.

ii Click on the Select button. The Select LDP Peer Keychain - Peer form opens with a list of local key chains displayed.

iii Choose a key chain in the list and click on the OK button. The Select LDP Peer Keychain - Peer form closes. The 5620 SAM assigns the key chain to the LDP peer.

8 Click on the Authentication tab.

9 Configure the parameters:

- Type
- Key

10 Click on the Import Policies tab.

The FEC prefix Import Policy provides a mean of controlling which FEC prefixes received from other LDP and T-LDP peers should be re-distributed to this LDP peer. If no policy name is specified, the NE will import all FEC prefixes it learns from other LDP and T-LDP peers to this LDP peer.

11 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

12 Click on the Export Policies tab.

The FEC prefix Export Policy provides a mean of controlling which FEC prefixes from this peer should be re-distributed to all other LDP and T-LDP peers. If no policy name is specified, the NE will export all FEC prefixes it learns from this LDP peer to all other LDP and T-LDP peers.

13 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

14 Click on the OK button. A dialog box appears.

15 Click on the Yes button. The new peer appears in the list.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The LDP (Edit) form closes.

Procedure 23-16 To configure an LDP targeted peer

Note 1 — You can choose to inherit values from the global-level LDP configuration by selecting the Inherit Value parameter.

Note 2 — The parameters that you configure for a targeted peer take precedence over the parameters that are configured for the global-level LDP configuration.

1 Choose Routing from the navigation tree view selector.

2 Navigate to an LDP interface. The path is Routing→*NE*→Routing Instance→LDP.

3 Perform one of the following.

a Right-click on the LDP icon and choose Create Targeted Peer to create an LDP targeted peer. The Targeted Peer (Create) configuration form opens with the General tab displayed.

b Expand the LDP and Targeted Peers icons and right-click on a targeted peer. Choose Properties from the contextual menu. The Targeted Peer (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Peer Address
- Description
- Administrative State

The Peer Address parameter is not configurable if you are modifying an existing targeted peer.

5 Click on the Protocol Properties tab.

i Configure the parameters:

- Tunneling Enabled
- BFD Enabled
- Keep-Alive Factor
- Keep-Alive Timeout (seconds)
- Hello Factor
- Hello Timeout (seconds)
- Enable Hello Reduction
- Hello Reduction Factor

By default, these parameter values are inherited from the global-level LDP instance.

Note 1 — If the Enable Hello Reduction parameter is disabled while the targeted LDP session to the peer is operationally up, the change in the hold time will take effect only when the targeted LDP session is re-established.

Note 2 — The parameters are not configurable if you are modifying an auto-created LDP targeted peer that was created using a CLI template. You can determine whether a targeted peer was automatically created on the NE using a template by verifying the Creator indicator.

ii Click on the Select button to configure the Local LSR ID. The Select Local LSR ID form opens.

iii Choose a Local LSR ID from the list and click the OK button. The Select Local LSR ID form closes and the name of the Local LSR ID you chose appears in the Name field.

6 If you are creating an LDP targeted peer, click on the LSPs tab. Otherwise, go to step 7. View, add, or configure associated LSPs, as required.

See chapter 25 for information on creating and configuring LSPs.

7 Click on the OK button. The Targeted Peer (Create|Edit) form closes, and an icon for the new LDP targeted peer appears in the navigation tree list of targeted peers below the LDP icon.

8 Configure the protocol for the far-end device, if applicable. Use CLI for devices that are managed outside the scope of the 5620 SAM.

Procedure 23-17 To configure ECMP for LDP routing

Note — 5620 SAM supports LDP ECMP when LDP routing is configured on the 7950 XRS, 7750 SR, 7450 ESS, 7710 SR and 7705 SAR.

1 Choose Routing from the navigation tree view selector.

2 Navigate to an LDP interface. The path is Routing→Router→Routing Instance→LDP.

3 Right-click on the LDP icon and choose Properties. The LDP Routing Instance (Edit) form opens.

4 Click on the ECMP OAM tab.

5 Perform one of the following steps:

a If the Tree Trace parameter is not configured, go to step 6.

b If the Tree Trace parameter is configured, go to step 7.

6 Select Configured from the Tree Trace drop-down menu. The LDP Routing Instance (Edit) form re-opens with all parameters displayed.

7 Configure the tree discovery configuration parameters:

- Tree Trace
- Administrative State
- Discovery Interval (Minutes)
- Discovery Timeout (Seconds)
- Retry Count
- Maximum Paths
- Forwarding Class
- Profile
- Maximum TTL
- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Probe Interval (Minutes)
- Probe Timeout (Minutes)
- Retry Count

8 Click on the Discovered FECs tab. A list of discovered FECs appears.

9 Choose a FEC from the list and click on the Properties button. An Autodiscovered FEC (Edit) form opens with the General tab displayed.

10 Perform one of the following:

a Click on the Create LDP Tree Trace button to configure and execute an LSP trace test. If the Create LDP Tree Trace button is not visible, click on the More Actions button and choose Create LDP Tree Trace. See chapter 32 for information about how to configure this test.

b Click on the Create LSP Ping button to configure and execute a LSP ping test. If the Create LSP Ping button is not visible, click on the More Actions button and choose Create LSP Ping. See chapter 32 for information about how to configure this test.

c Click on the Create LSP Trace button to configure and execute a LDP tree trace. If the Create LSP Trace button is not visible, click on the More Actions button and choose Create LSP Trace. See chapter 32 for information about how to configure this test.

11 Click on the Discovered ECMP tab. A list of ECMP paths associated with the FEC appears.

12 Choose an ECMP path from the list.

13 Click on the Properties button. An Autodiscovered Path (Edit) form opens.

14 Click on the Create LSP button. If the Create LSP button is not visible, click on the More Actions button and choose Create LSP. See chapter 32 for information about how to configure and execute an LSP trace test.

15 Click on the Create LSP Ping button. If the Create LSP Ping button is not visible, click on the More Actions button and choose Create LSP Ping. See chapter 32 for more information about how to configure and execute an LSP ping test.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The Autodiscovered FEC (Edit) form closes.

Procedure 23-18 To view the LDP session information

Perform this procedure to check the status of and view the information about a LDP session.

1 Choose Routing from the navigation tree view selector.

2 Navigate to an LDP instance. The path is Routing→NE→Routing Instance→LDP.

3 Right-click on the LDP icon and choose Properties. The LDP - Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the Sessions tab. A list of the active LDP sessions is displayed.

5 View the information.

6 To view the information for a specific session, choose the session entry and click on the Properties button. The Session (View) form opens with the General tab displayed.

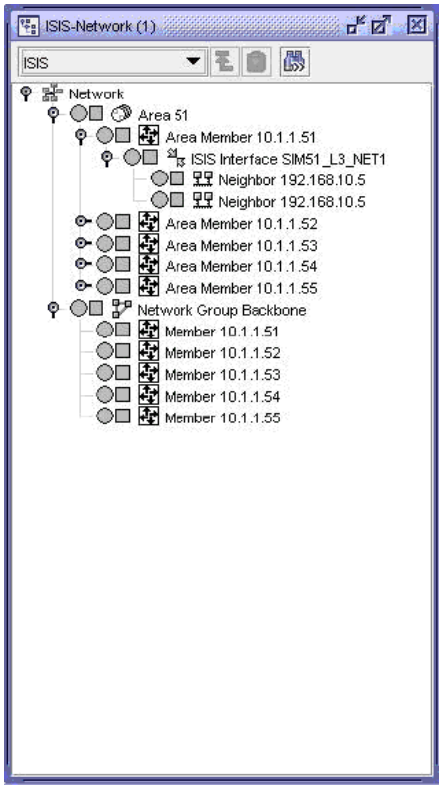
7 Click on the Session tab to view specific session and connection information.

8 View information about the addresses exchanged in LDP peer sessions.

i Click on the Addresses tab. A list of the addresses received from peers is displayed on the Received tab.

ii To view the information about a received address, choose the address entry and click on the Properties button. The Received Addresses (View) form opens with the General tab displayed.

iii To view the information about the addresses sent to peers, click on the Sent tab. A list of the sent addresses is displayed.



iv To view the information about a sent address, choose the address entry and click on the Properties button. The Sent Addresses (View) form opens with the General tab displayed.

9 Close the open forms, as required.

23.19 IS-IS configuration procedures

Configuration planning is essential to organize devices in level 1, level 2 and level 1 and 2 areas. IS-IS provides defaults for basic protocol operability. Use the 5620 SAM to configure the IS-IS parameters. Figure 23-7 shows the IS-IS view in the navigation tree

Figure 23-7 IS-IS view

The IS-IS information that is displayed includes:

- backbone area and backbone-area devices
- a list of areas and the participating routers in each area
- a list of devices and associated interfaces that shows the IP address and the configured level (1, 2, or 1 and 2) of each interface
- the IS-IS adjacencies for each interface

The following procedures describe how to configure IS-IS.

Procedure 23-19 To enable IS-IS on a routing instance

1 Choose Routing from the navigation tree view selector. The Routing view is displayed.

2 Expand the device object. The Routing Instance object is displayed.

3 Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) form opens.

4 Enable the IS-IS protocol.

  i Click on the Protocols tab.

  ii Select the IS-IS Enabled parameter.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. IS-IS is displayed in the list of enabled protocols.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The Routing Instance (Edit) form closes, and an ISIS Instance object is displayed in the navigation tree.

Procedure 23-20 To configure IS-IS on a routing instance

Routing instance IS-IS parameter values can differ from the IS-IS interface parameter values that are configured in Procedure 23-23. Interface capabilities are compared to the router-wide capabilities to determine the type of level 1, level 2, and level 1 and 2 adjacencies that are set up between routers to exchange IS-IS routing information.

1 Enable the IS-IS protocol on a routing instance, as described in Procedure 23-19.

2 Choose Routing from the navigation tree view selector. The Routing view is displayed.

3 Perform one of the following:

a Choose *NE*→Routing Instance→ISIS Instances to navigate to the ISIS Instances object (except 7705 SAR NEs).

b For 7705 SAR NEs, which display only one ISIS instance, navigate to the ISIS object and go to step 4 b ii.

4 Perform one of the following:

a Create an IS-IS instance.

i Right-click on the ISIS Instances object and choose Create ISIS Instance. The ISIS, Routing Instance, ISIS Instance (Create) form opens with the General tab displayed.

ii Configure the Instance ID parameter.

b Modify an IS-IS instance.

i Expand the ISIS Instances object.

ii Right-click on an ISIS Instance object and choose Properties from the contextual menu. The ISIS, Routing Instance, ISIS Instance (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Administrative State
- Level Capability

A level 1 adjacency can be established when there is at least one area ID shared by this router and a neighboring router. A level 2 adjacency is established when another router is configured as a level 2 or a level 1 and 2 router with interfaces configured as level 2 or level 1 and 2. A level 1 and 2 adjacency is created when the neighboring router is also configured as a level 1 and 2 router and the routers have at least one area ID in common.

Note — The available parameters vary, depending on the NE type.

6 Click on the Behavior tab.

7 Configure the parameters in the General panel:

- Traffic Engineering
- Unicast Import IPv4
- Unicast Import IPv6
- Multicast Import IPv4
- Multicast Import IPv6
- Hello Authentication
- CSNP Authentication
- PSNP Authentication
- Multi-Topology
- IPv6 Unicast Multi-Topology
- Enable LDP Synchronization
- LDP over RSVP Include
- Default Route Tag
- Suppress Default Routes
- Advertise Only Passive Interfaces
- RSVP Shortcut Enabled
- Advertise Tunnel Links Enabled
- Export Limit
- IID TLV
- Loop-free Alternate

You can only configure the IPv6 Unicast Multi-Topology parameter when the Multi-Topology parameter is set to true.

Note — If you plan to enable IPv6 on the IS-IS instance (see step 15), you must set the Multi-Topology and IPv6 Unicast Multi-Topology parameters to true.

8 Configure the Reference Bandwidth (Kb/s) parameter.

9 Configure the parameters in the Overload panel:

- Overload On Boot
- Overload On Boot Timeout (seconds)
- Overload
- Overload Timeout (seconds)

10 Configure the parameters in the Link State PDU panel:

- LSP Lifetime (seconds)
- LSP Max Wait (seconds)
- LSP Initial Wait (seconds)
- LSP Second Wait (seconds)
- LSP MTU Size

11 Configure the parameters in the Shortest Path First panel:

- SPF Max Wait (seconds)
- SPF Initial Wait (milliseconds)
- SPF Second Wait (milliseconds)

12 Click on the Graceful Restart tab.

13 Configure the parameters:

- Graceful Restart
- Helper Mode

14 Depending on the device type and configuration, the IP Versions tab is configurable. Click on the IP Versions tab to specify the allowed IP versions for the IS-IS instance.

15 Configure the parameters:

- Enable IPv6
- IPv6 Routing TLV type
- Enable IPv4
- Strict Adjacency Check

16 Click on the Authentication tab.

17 Configure the parameters:

- Enable Authentication
- Type
- Key

18 Click on the Level 1 tab.

19 Configure the parameters on the General sub-tab:

- External
- Internal
- Wide Metrics Only
- Hello Authentication
- CSNP Authentication
- PSNP Authentication
- Loop-free Alternate Exclude
- Default Metric
- IPv6 Default Metric

20 Click on the Authentication sub-tab.

21 Configure the parameters:

- Type
- Key

22 Click on the Level 2 tab.

23 Repeat steps 19 to 21.

24 Click on the Export Policies tab.

25 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

You can specify multiple routing policies, in order of preference, to determine the routes that are exported from the routing table to IS-IS. When multiple policies are specified, the policies are evaluated in numerical order.

26 Click on the NET addresses tab.

27 Click on the Create button.

28 Configure the Area ID parameter.

29 Click on the OK button. A dialog box appears.

30 Click on the OK button. The new NET address is displayed on the NET Addresses tab.

31 Click on the Route Summarizations tab. IS-IS route summaries allow users to create aggregate IPv4 or IPv6 addresses that include multiple groups of IPv4 or IPv6 addresses for a specific IS-IS summary level. This can help reduce the size of the link state database and the routing table.

32 Click on the Create button. The Route Summarization (Create) form opens.

33 Configure the parameters:

- Network
- Mask
- Summary Level
- Summary Route Tag

34 Click on the OK button. A dialog box appears.

35 Click on the OK button. The new route summary is displayed on the form.

36 Click on the Interfaces tab to add an IS-IS interface, if required.

i Click on the Create button. The ISIS Interface (Create) form opens, with the General tab displayed.

ii Click on the Select button. The Select Interface - IS-IS Interface form opens.

iii Configure the filter criteria, if required, and click on the Search button. A list of the available interfaces appears.

iv Choose an interface in the list and click on the OK button. The Select Interface - ISIS Interface form closes, and the interface information appears on the ISIS Interface (Create) form.

v Perform steps 5 to 15 of Procedure 23-23.

vi Click on the OK button. A dialog box appears.

vii Click on the OK button. The new interface is listed on the form.

37 Click on the OK button. A dialog box appears.

38 Click on the Yes button. The IS-IS (Edit) form closes.

Procedure 23-21 To configure an IS-IS link group on a routing instance

You can create an IS-IS link group to bundle multiple member interfaces that are treated as a single virtual link for ECMP. See Procedures 23-20 and 23-23 for more information about how to create and configure IS-IS interfaces.

1 Choose Routing from the navigation tree view selector. The Routing view is displayed.

2 Perform one of the following:

a Choose *NE*→Routing Instance→ISIS Instances to navigate to the ISIS Instances object (except 7705 SAR NEs).

b For the 7705 SAR, which displays only one ISIS instance, navigate to the ISIS object and go to step 3.

3 Expand the ISIS Instances object.

4 Right-click on an ISIS Instance object and choose Properties from the contextual menu. The ISIS Routing Instance, ISIS Instance (Edit) form opens with the General tab displayed.

5 Click on the Link Group tab.

6 Click on the Create button. The Link Group Config (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Group Name
- Description

8 Click on the OK button. A dialog box appears.

9 Click on the OK button. The Link Group Config (Create) form closes.

10 Click on the Apply button. A dialog box appears.

11 Click on the Yes button.

12 Choose the link group that you created and click on the Properties button. The Link Group Config (Edit) form opens with the General tab displayed.

13 Click on the Level 1 tab. The General tab is displayed.

14 Configure the parameters:

- Operational Members
- Revert Members
- IPv4 Unicast Metric Threshold
- IPv4 Multicast Metric Threshold
- IPv6 Unicast Metric Threshold
- IPv6 Multicast Metric Threshold

15 Click on the Members tab.

16 Click on the Add button. The Select... form opens.

17 Click on the Search button. A list of interfaces appears.

18 Choose an interface and click on the OK button. The Select... form closes.

19 Click on the Level 2 tab. The General tab is displayed.

20 Configure the parameters:

- Operational Members
- Revert Members
- IPv4 Unicast Metric Threshold
- IPv4 Multicast Metric Threshold
- IPv6 Unicast Metric Threshold
- IPv6 Multicast Metric Threshold

21 Click on the Members tab.

22 Click on the Add button. The Select... form opens.

23 Click on the Search button. A list of interfaces appears.

24 Choose an interface and click on the OK button. The Select... form closes.

25 Click on the OK button. A dialog box appears.

26 Click on the Yes button. The Link Group Config (Edit) form closes.

27 Close the ISIS Routing Instance, ISIS Instance (Edit)

Procedure 23-22 To configure an IS-IS NET address

1 Enable the IS-IS protocol on a device, as described in Procedure 23-19.

2 Choose Routing from the navigation tree view selector. The Routing view is displayed.

3 Perform one of the following:

a Choose *NE*→Routing Instance→ISIS Instances→ISIS Instance to navigate to the ISIS Instance object (except 7705 SAR NEs).

b For 7705 SAR NEs, which display only one IS-IS instance, navigate to the ISIS object.

4 Right-click on the ISIS Instance object and choose Add NET Address. The Area ID (Create) form opens.

5 Configure the Area ID parameter.

Note — The Area ID forms part of the NET address. NET addresses are built from some non-configurable elements, including the device system ID and the network selector ID.The NET address is exchanged in hello and link-state PDUs. Level 1 interfaces must have at least one area ID in common. Level 2 interfaces can have different area IDs. If all of the interfaces have different area IDs, they are considered level 2 interfaces only.

6 Click on the OK button. The Area ID (Create) form closes, and an icon for the new area appears in the navigation tree below the ISIS object.

Procedure 23-23 To configure an IS-IS interface

The IS-IS interface parameters can differ from the IS-IS routing instance parameters configured in Procedure 23-20. Interface parameters specify the interface routing levels. Interface level capabilities are compared to the router-wide level capabilities to determine the type of level 1, level 2, and level 1 and 2 adjacencies that are created between devices.

1 Enable the IS-IS protocol on a routing instance, as described in Procedure 23-19.

2 Choose Routing from the navigation tree view selector. The Routing view is displayed.

3 Perform one of the following:

- **a** Choose *NE*→Routing Instance→ISIS Instances →ISIS Instance to navigate to the ISIS Instance object (except 7705 SAR NEs). If no IS-IS instance exists, you must create one by performing Procedure 23-20.
- **b** For 7705 SAR NEs, which display only one IS-IS instance, navigate to the ISIS object.

4 Perform one of the following:

- **a** Create an IS-IS interface.
  - **i** Right-click on the ISIS Instance object and choose Create Interface. The ISIS Interface (Create) form opens with the General tab displayed.
  - **ii** Click on the Select button to choose a network interface. The Select Interface - IS-IS Interface form opens.

iii Configure the filter criteria, if required, and click on the Search button. A list of the available interfaces appears.

iv Choose an interface and click on the OK button. The Select Interface - ISIS Interface form closes, and the interface information appears on the ISIS Interface (Create) form.

b Modify an IS-IS interface.

i Expand the ISIS Instance object.

ii Right-click on an ISIS Interface object and choose Properties from the contextual menu. The ISIS Interface (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Administrative State
- Type
- Level Capability
- IPv4 BFD Enabled
- IPv6 BFD Enabled

6 Click on the Behavior tab.

7 Configure the parameters:

- CSNP Interval (seconds)
- LSP Pacing Interval (seconds)
- Retransmit Interval (seconds)
- Mesh Group Status
- Mesh Group
- Passive
- IPv6 Unicast Enabled
- Route Tag
- Loop-free Alternate Exclude

To create a mesh group, set the Mesh Group Status parameter to Enabled and specify the same mesh group value for all interfaces. The mesh group parameters specify the assigned mesh group for the interface. Mesh groups limit the amount of flooding that occurs when a new or changed LSP is advertised in an area.

The TE Metric parameter is a read-only field that displays the TE metric used for LSP path computation by CSPF.

8 Click on the Authentication tab.

9 Configure the parameters:

- Enable Authentication
- Type
- Key

10 Click on the Level 1 tab.

11 Configure the parameters on the General sub-tab:

- Hello Interval (seconds)
- Hello Multiplier
- Metric
- IPv6 Unicast Metric
- Passive
- Priority
- Signal Degrade Threshold
- Signal Fail Threshold

12 Click on the Authentication sub-tab.

13 Configure the parameters:

- Type
- Key

14 Click on the Level 2 tab.

15 Repeat steps 11 to 13.

16 Click on the OK button. The IS-IS Interface (Create) form closes, and the new interface is displayed in the navigation tree below the ISIS Instance icon.

23.20 OSPF configuration procedures

The 5620 SAM supports the configuration of OSPFv2 and OSPFv3.

Note 1 — The following devices support OSPFv3:

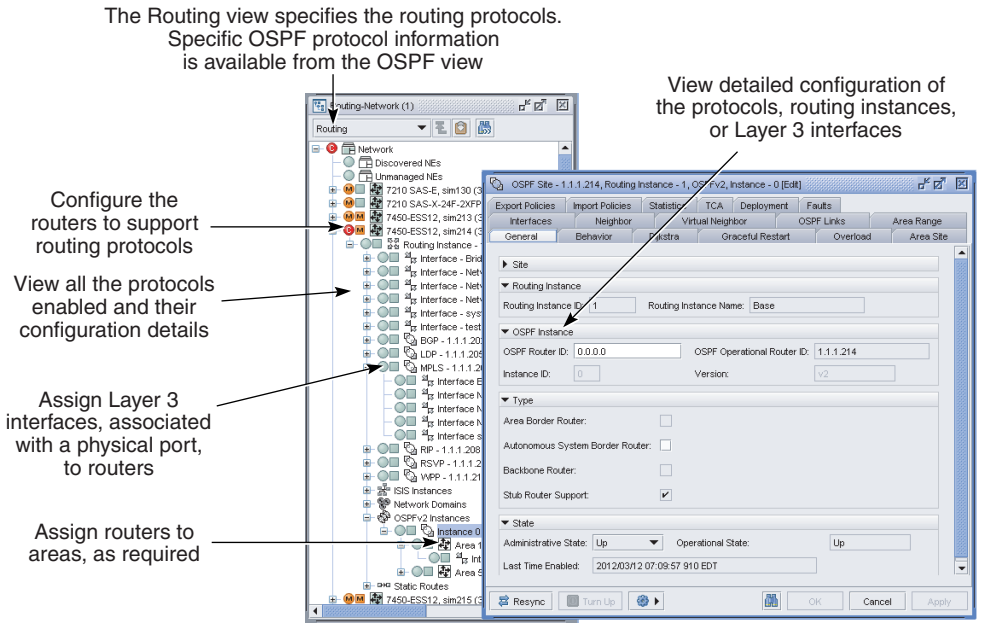
- 7450 ESS, in mixed mode
- 7710 SR
- 7750 SR, in chassis mode C or D
- 7750 SR, in chassis mode A or B, with mixed mode enabled
- 7950 XRS

Note 2 — The 7450 ESS, 7710 SR, 7750 SR, and 7950 XRS support multiple OSPFv2 and OSPFv3 instances on the base routing instance and on VPRN routing instances.

Note 3 — The following devices support only one OSPF instance on a VRF instance:

- OS 10K
- OS 6850E
- OS 6850E-U24X
- OS 6900
- OS 9700E
- OS 9800E

Note 4 — The 7450 ESS in mixed mode, the 7710 SR, the 7750 SR in chassis mode C or D, and the 7950 XRS support multiple OSPF instances in VPRN services.



Note 5 — The 7210 SAS-M supports only one OSPF instance.

Configuration planning is essential to organize OSPF areas, interfaces, and virtual links. OSPF provides defaults for basic protocol operability. OSPF configuration requires, as a minimum, that:

- you create a single OSPF backbone area that contains the area border routers.
- for larger networks, you create several areas that contain the other routers.
- for smaller networks, you place all routers in the OSPF backbone area.

Use the 5620 SAM navigation tree to configure the OSPF parameters. Figure 23-8 shows the OSPF view in the navigation tree.

Figure 23-8 OSPF view

The OSPF parameters that are required for OSPF deployment are:

- Router ID — Each device that runs OSPF must be configured with a unique router ID. The router ID is used by the OSPF and BGP routing protocols in the routing table manager. When you configure a new router ID, protocols are not automatically restarted with the new router ID. You must shut down and restart the protocol to initialize the new router ID.
- An area — At least one OSPF area must be created. An interface must be assigned to each OSPF area. The types of OSPF areas include a backbone area, stub area, and NSSA.
- Layer 3 interfaces — A Layer 3 interface is the logical IP connection between a router and one of its attached networks. A physical interface is associated with the Layer 3 interface to provide the cabled connected to another device. A Layer 3 interface has state information from the underlying lower-level protocols and the routing protocol. A network interface has an associated IP address and mask that combine to create an IP prefix, unless the interface is in an unnumbered, point-to-point network.

The following procedures describe how to configure OSPF.

Procedure 23-24 To enable OSPF on a routing instance

1 Choose Routing from the navigation tree view selector from the 5620 SAM GUI.

2 Choose Routing→Router→Routing Instance.

3 Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) form opens.

4 Click on the Protocols tab.

5 Select the OSPFv2 Enabled parameter to enable OSPFv2, if required.

6 Select the OSPFv3 Enabled parameter to enable OSPFv3, if required.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The Routing Instance (Edit) form closes, and an icon for each newly enabled protocol appears under the routing instance in the navigation tree.

Procedure 23-25 To create an OSPF area

1 In the 5620 SAM navigation tree, choose OSPF from the view selector.

2 Right-click on the Network icon and choose Create Area from the contextual menu. The Area (Create) form opens.

3 Configure the parameters:

- Version
- Area ID
- Name
- Type
- Description

4 Click on the Apply button. The form refreshes with additional tabs.

5 Click on the Area Site tab.

6 Click on the Create button to add a routing instance to the area. The Area Site (Create) form opens with the General tab displayed.

7 Click on the Select button to choose a routing instance. The Select OSPF Instance - Area Site form opens.

8 Choose an OSPF instance and click on the OK button. The Select OSPF Instance form closes, and the OSPF instance appears in the Routing Instance panel.

9 Configure the parameters:

- Type
- Blackhole Range
- Loop-free Alternate Exclude

Configure the area as a blackhole range to avoid routing loops.

The Type parameter is not configurable for a backbone-area routing instance.

10 Click on the Apply button. Additional configurable tabs appear, and an icon for the new area appears in the navigation tree.

11 Depending on the Type parameter value, the Stub/NSSA tab is configurable. Configure stub or NSSA functionality, if required.

The Default Cost parameter is configurable only when the Type parameter value from step 9 is Stub (No Type 5 External) or Totally Stub (No Summaries).

i Click on the Stub/NSSA tab.

ii Configure the parameters:

- Default Cost
- Redistribute External Routes
- Originate Default Route
- Adjacency Check

The Redistribute External Routes, Originate Default Route, and Adjacency Check parameters are configurable only when the Type parameter value from step 9 is NSSA (No Type 5 External) or NSSA (No Summaries).

The Adjacency Check parameter is configurable only when the Originate Default Route is set to Originate Type 3 or Originate Type 7. Enable the Adjacency Check parameter to enforce an ABR to have an adjacency in area 0 before the default route or routes can be advertised into the NSSA.

12 If the area is a backbone area that requires links to remote areas that do not advertise OSPF topology, configure a virtual link.

i Click on the Virtual Link tab.

ii Perform steps 4 to 8 of Procedure 23-29.

iii Click on the OK button. The new virtual link entry appears in the list.

13 Create an area range, if required.

i Click on the Area Range tab.

ii Click on the Create button. The Area Range (Create) form opens.

iii Perform steps 5 and 6 of Procedure 23-28.

iv Click on the OK button. The new area range entry appears in the list.

14 Click on the OK button. The Area Site (Create) form closes, and a dialog box appears.

15 Click on the Yes button to confirm the action.

Procedure 23-26 To create an OSPF neighbor on an OmniSwitch

1 In the 5620 SAM navigation tree, choose Routing from the view selector.

2 Choose Routing→Router→Routing Instance→OSPFv2.

3 Right-click on the OSPFv2 Instance icon and choose Create Neighbor from the contextual menu. The OspfNeighbor (Create) form opens.

4 Configure the parameters:

- Neighbor IP Address
- Priority/Eligibility

5 Click on the OK button. The OspfNeighbor (Create) form closes.

Procedure 23-27 To add a Layer 3 interface to an OSPF router

Perform this procedure to allow an OSPF-enabled router to participate in area discovery and share routing information with other area members.

Note — This action assigns an existing Layer 3 interface to the router in the OSPF area rather than creating a new Layer 3 interface.

1 In the 5620 SAM navigation tree, choose OSPF from the view selector.

2 Click on an Area icon to display the area routers.

3 Right-click on a router instance icon and choose Create Interface. The OSPF Interface (Create) configuration form opens with the General tab displayed.

4 Configure the parameters:

- Description
- Administrative State
- Configured MTU (bytes)

5 Click on the Select button beside the Interface Name parameter to choose an interface. The Select Interface - OSPF Interface form opens.

6 Configure the filter criteria. A list of available Layer 3 interfaces appears.

7 Choose a Layer 3 interface and click on the OK button. The Select Interface - OSPF Interface form closes, and the interface entry appears in the Interface panel.

8 Click on the Protocol Properties tab.

9 Configure the parameters:

- Type
- Priority
- Metric
- Advertise Subnet
- BFD Enabled
- Loop-free Alternate Exclude
- LSA Filter Out
- Passive
- Hello Interval (seconds)
- Router Dead Interval (seconds)
- Retransmission Interval (seconds)
- Transit Delay (seconds)

The Advertise Subnet parameter is configurable for OSPFv2 only.

The TE Metric check box is a read-only field that indicates whether the TE Metric parameter is being configured in the interface for LSP path computation by CSPF.

10 Perform one of the following steps to configure authentication for the interface, if required. Otherwise, go to step 13.

a Click on the Authentication tab, and go to step 11.

b For OSPFv3 interfaces, click on the IPsec Static SA tab, and go to step 12.

11 Configure the Authentication Type parameter.

a Choose MD5-based Authentication.

i Click on the Create button to create an MD5 authentication key. The Md5Key (Create) form opens.

ii Configure the parameters:

- Key Index
- Key
- Re-enter Key

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The Md5Key (Create) form closes, and the new authentication key appears in the list.

b Choose Simple Password.

i Click on the Change Password button to enter a password. The Password (Create) form opens.

ii Configure the parameters:

- Password
- Re-enter Password

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The Password (Create) form closes.

12 Configure the parameters:

- IPsec Security Association Name
- IPsec In Static Security Association
- IPsec Out Static Security Association

13 Click on the OK button to close the OSPF Interface (Create) form. The 5620 SAM displays an icon for the new OSPF interface in the navigation tree below the area router.

Procedure 23-28 To create an OSPF area range

An area range summarizes a range of IP addresses in an LSA to minimize the number of flooded advertisements in the LSA.

1 In the 5620 SAM navigation tree, choose OSPF from the view selector.

2 Click on an Area icon in the navigation tree to display the area routers.

3 Expand the Router Instance icon.

4 Right-click on an Instance icon and choose Create Area Range. The Area Range (Create) form opens.

5 Configure the parameters:

- Network
- Prefix Length
- Link State DB Type
- Effect
- Metric

6 Click on the OK button. The Area Range (Create) form closes, and an icon for the new area range appears in the navigation tree below the OSPF area.

Procedure 23-29 To create a virtual link

Perform this procedure to create a virtual link between a backbone OSPF area and a remote OSPF area that does not advertise the OSPF topology. When you create a virtual link, a virtual neighbor is automatically created.

1 In the 5620 SAM navigation tree, choose OSPF from the view selector.

2 Click on the backbone area icon in the navigation tree to display the area routers. The backbone area ID is 0.0.0.0.

3 Right-click on a backbone-area router instance icon and choose Create Virtual Link. The Virtual Link (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Virtual Neighbor Router (Site) ID
- Transit Area

5 Click on the Protocol Properties tab.

6 Configure the parameters:

- Hello Interval (seconds)
- Router Dead Interval (seconds)
- Retransmission Interval (seconds)
- Transit Delay (seconds)

7 Perform one of the following steps to configure authentication for the virtual link, if required. Otherwise, go to step 10.

a Click on the Authentication tab, and go to step 8.

b For OSPFv3 interfaces, click on the IPsec Static SA tab, and go to step 9.

8 Configure the Authentication Type parameter.

a Choose MD5-based Authentication.

i Click on the Create button to create an MD5 authentication key. The Md5Key (Create) form opens.

ii Configure the parameters:

- Key Index
- Key
- Re-enter Key

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The Md5Key (Create) form closes, and the new authentication key appears in the list.

v Go to step 10.

b Choose Simple Password.

i Click on the Change Password button to enter a password. The Password (Create) form opens.

ii Configure the parameters:

- Password
- Re-enter Password

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The Password (Create) form closes.

v Go to step 10.

9 Configure the parameters:

- IPsec Security Association Name
- IPsec In Static Security Association
- IPsec Out Static Security Association

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The VirtualLink (Create) form closes, and the 5620 SAM displays two new icons: one for the virtual link and one for the virtual neighbor.

12 As required, review the properties of the virtual link or virtual neighbor, by clicking on the appropriate icon and selecting Properties from the contextual menu.

Note — You can delete a virtual link by selecting the virtual link icon and select delete from the contextual menu. To delete a virtual neighbor, you must select the virtual link icon and select delete from the contextual menu.

Procedure 23-30 To configure OSPF on a default routing instance or a VRF routing instance

1 In the 5620 SAM navigation tree, choose Routing from the view sector.

2 Perform one of the following:

- **a** For 7950 XRS, 7750 SR, 7450 ESS, and 7710 SR NEs, choose Network→Router→Routing Instance→OSPFv*N* Instances, where *N* is the OSPF version number; for example, 2 or 3.
- **b** For all other supported devices, choose Routing→Router→Routing Instance→OSPFv*N*, where *N* is the OSPF version number; for example, 2 or 3.

3 Perform one of the following:

- **a** For the 7950 XRS, 7750 SR, 7450 ESS, or 7710 SR, right-click on the appropriate OSPFv*N* Instances icon and choose Create OSPFv*N* Instance. The OSPF Site (Create) form opens with the General tab displayed. Go to step 4.
- **b** For all other supported devices, right-click on the appropriate OSPFv2 Instances icon and choose Properties. The OSPF Site, Routing instance, OSPFv2 instance (Edit) form appears. Go to step 4.

4 Configure the parameters:

- OSPF Router ID
- Instance ID
- Autonomous System Border Router
- Domain ID
- Administrative State

5 Click on the Behavior tab.

6 Configure the parameters:

- Traffic Engineering Support
- Interface Base Reference Cost (kbps)
- Overload Stubs
- Unicast Import
- Multicast Import
- Enable LDP Synchronization
- Ignore DN Bit
- Suppress DN Bit
- RFC1583 Compatible
- Loop-free Alternate
- LDP over RSVP Include
- Advertise Tunnel Links Enabled
- Exit Overflow Interval
- External LSA Limit
- Internal
- External

The Traffic Engineering Support, RFC1583 Compatible, LDP over RSVP Include, Multicast Import, and Unicast Import parameters are configurable for OSPFv2 only.

7 Click on the Dijkstra tab.

8 Configure the following parameters:

For SPF:

- SPF Max Wait (milliseconds)
- Redistribute Delay (milliseconds)
- Initial Wait (milliseconds)
- Second Wait (milliseconds)
- Incremental SPF Wait (milliseconds)

For LSA:

- LSA Generate Max Wait (milliseconds)
- LSA Arrival Wait (milliseconds)
- Initial Wait (milliseconds)
- Second Wait (milliseconds)
- LSA Accumulate (milliseconds)

9 Configure graceful restart, if required.

i Click on the Graceful Restart tab.

ii Configure the parameters:

- Graceful Restart
- Helper Mode

The Helper Mode parameter is configurable when the Graceful Restart parameter is set to true.

10 Depending on the OSPF version, the Overload tab is configurable. Configure overload, if required.

i Click on the Overload tab.

ii Configure the parameters:

- Overload Enabled
- Boot Overload Enabled
- Overload Interval (seconds)
- Boot Overload Interval (seconds)

The Overload Interval (seconds) parameter is configurable when the Overload Enabled parameter is selected.

The Boot Overload Interval (seconds) parameter is configurable when the Boot Overload Enabled parameter is enabled.

11 If the OSPF version is OSPFv2, the OSPF Super-Backbone tab is configurable. Configure the OSPF super-backbone, if required.

i Click on the OSPF Super-Backbone tab.

ii Configure the parameters:

Note — These parameters apply only to VPRN instances of OSPF.

- VPN Domain Type
- VPN Domain ID (hex)
- VPN Tag
- Super-Backbone

12 Click on the Export Policies tab to specify the export routing policies that determine the routes that are advertised to peers. Export policies are created as routing policy statements. See Procedure 22-15 for more information.

13 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

14 Click on the Import Policies tab to specify the import routing policies that determine the routes that are advertised to peers. Import policies are created as routing policy statements. See Procedure 22-15 for more information.

15 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

16 Click on the following tabs to add optional OSPF configuration items. Click on the Search button to list previously configured items or click on the Create button to create the item, if supported.

- Area Sites; see Procedure 23-25
- Interfaces (Layer 3 interfaces); see Procedure 23-27
- Area Range; see Procedure 23-28
- Virtual Neighbor; see Procedure 23-29
- OSPF Links (configurable only in a backbone area); see Procedure 23-29

Click on the remaining tab view additional OSPF configuration information, if required.

17 Click on the OK button. A dialog box appears.

18 Click on the Yes button to close the OSPF Site (Edit) form.

Procedure 23-31 To add a router to an OSPF area

1 In the 5620 SAM navigation tree, choose OSPF from the view selector.

2 Navigate to the OSPF area to which you want to add a router. The path is Routing→OSPF Area.

3 Right-click on the area icon and choose Add OSPF Instance. The Area Site (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Type
- Blackhole Range
- Loop-free Alternate Exclude

Configure the area as a blackhole range to avoid routing loops.

5 Click on the Select button below the Routing Instance panel to choose a routing instance. The Select OSPF Instance - Area Site form opens.

6 Choose a routing instance and click on the OK button. The routing instance appears in the Routing Instance panel.

7 Depending on the Type parameter value from step 4, the Stub/NSSA tab is configurable. Configure stub or NSSA functionality, if required.

i Click on the Stub/NSSA tab.

ii Configure the parameters:

- Default Cost
- Redistribute External Routes
- Originate Default Route
- Adjacency Type

The Default Cost parameter is configurable only when the Type parameter value from step 4 is Stub (No Type 5 External) or Totally Stub (No Summaries).

The Redistribute External Routes, Originate Default Route, and Adjacency Check parameters are configurable only when the Type parameter value from step 4 is NSSA (No Type 5 External) or NSSA (No Summaries).

The Adjacency Check parameter is configurable only when the Originate Default Route is set to Originate Type 3 or Originate Type 7. Enable the Adjacency Check parameter to enforce an ABR to have an adjacency in area 0 before the default route or routes can be advertised into the NSSA.

8 Click on the OK button. The Area Site (Create) form closes, and an icon for the router appears in the navigation tree under the OSPF Area icon.

23.21 RSVP configuration procedures

The following procedures describe how to configure RSVP.

Procedure 23-32 To configure RSVP on a routing instance

1 Navigate to an RSVP icon. The path is Routing→Router→Routing Instance→RSVP.

2 Right-click on the RSVP icon and choose Properties. The RSVP form opens with the General tab displayed.

3 Configure the parameters:

- Administrative State
- Keep Multiplier
- Refresh Time
- Message Pacing
- Enable Graceful Shutdown
- Enable Implicit Null Label
- Max Burst
- Period (milliseconds)
- Rapid Retransmit Time (hundred-milliseconds)
- Rapid Retry Limit
- Enable Refresh Bypass
- Soft Preemption Timer (seconds)

4 If you are going to configure Diff-Serv TE, then MPLS must be shutdown first. Otherwise, go to step 18.

5 Configure the parameters:

Note 1 — Enabling a Diff Serv Model only takes effect if you have already enabled traffic engineering at one or both of the following routing protocol levels:

- IS-IS, as described in Procedure 23-20
- OSPF, as described in Procedure 23-30

A dialog box appears if IS-IS and/or OSPF TE is not enabled, but you can save your configuration if IS-IS and/or OSPF TE is not enabled.

Note 2 — The Class Type BW Percent parameters are configured globally and the parameters are applied to all RSVP interfaces in the system. After the parameters are configured, the parameters can only be changed after you shut down the MPLS protocol. The total bandwidth specified for the eight classes should not exceed 100%.

- Diff Serv Model
- TE Threshold Update Enabled
- Class Type 0 BW Percent
- Class Type 1 BW Percent
- Class Type 2 BW Percent
- Class Type 3 BW Percent
- Class Type 4 BW Percent
- Class Type 5 BW Percent
- Class Type 6 BW Percent
- Class Type 7 BW Percent
- Update On CAC Failure Enabled
- Update Timer (seconds)

6 Configure the Include Node in RRO parameter.

7 Configure the parameters in the Merge Point Abort Timer panel:

- P2P Merge Point Abort Timer
- P2MP Merge Point Abort Timer

8 Configure the restart parameters in the GR Helper Time panel.

- Max Recovery Time (seconds)
- Max Restart Time (seconds)

9 Click on the TE Classes tab.

10 Select one of the TE classes in the table and click on the Properties button. The TE Class (Create) form opens.

Note — The TE Class Definition is used to map all TE Classes (up to a maximum of 8) to Class Type and LSP setup priority. There is no default TE Class after Diff-Serv is enabled. You must explicitly define each TE Class. If Diff-Serv is disabled, the default CT (CT0) and eight pre-emption priorities are used internally.

11 Configure the parameters:

- Priority
- TE Class Type

12 Click on the ForwardingClassMaps tab.

13 Click on the Create button. The Forwarding Class Map (Create) form opens.

14 Configure the parameters:

- FC Name
- TE Class Type

15 Repeat steps 10 to 14 for the remaining TE classes, as required.

16 Click on the TE Thresholds tab.

17 Configure the parameters:

- Up Threshold (%) (1 through 16)
- Down Threshold (%) (1 through 16)

You can also click the Reset TE Up/Down Thresholds to Default buttons to set the Up or Down Thresholds to their default values, respectively.

18 Click on the following tabs to view information.

- Interfaces
- Sessions
- Neighbors
- Statistics
- Faults

19 Click on the OK button. A dialog box appears.

20 Click on the Yes button. The RSVP form closes.

Procedure 23-33 To configure an RSVP interface

1 Navigate to an RSVP interface icon. The path is Routing→Router→Routing Instance→RSVP→Interfaces→Interface.

2 Right-click on the RSVP interface and choose Properties. The RSVP Interface (Edit) form opens with the General tab displayed.

3 Configure the parameters:

- Description
- Administrative State

4 Click on the Protocol Properties tab.

5 Configure the parameters:

- Enable Refresh Reduction
- Enable Reliable Delivery
- Enable Graceful Shutdown
- Enable Implicit Null Label
- Hello Interval (milliseconds)
- Subscription Ratio
- BFD Enabled
- Graceful Restart Helper Mode
- Inherit SAM Class Type BW
- Class Type 0 BW Percent
- Class Type 1 BW Percent
- Class Type 2 BW Percent
- Class Type 3 BW Percent
- Class Type 4 BW Percent
- Class Type 5 BW Percent
- Class Type 6 BW Percent
- Class Type 7 BW Percent

The Class Type BW Percent parameters can only be configured if the Inherit SAM Class Type BW parameter is disabled. If you enter values at the RSVP interface level, they override the global values configured in Procedure 23-32 for the RSVP routing instance on the NE.

6 Click on the Authentication tab.

7 Configure the Key parameter.

8 Click on the TE Thresholds tab.

9 Configure the parameters:

- Inherit TE Up Thresholds
- Inherit TE Down Thresholds
- Up Threshold (%) (1 through 16)
- Down Threshold (%) (1 through 16)

You can only configure the Up Threshold (%) and Down Threshold (%) parameters if the Inherit TE Up Thresholds and Inherit TE Down Thresholds parameters are disabled, respectively.

10 Click on the following tabs to view information.

- Neighbors
- Statistics
- Faults

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The RSVP Interface (Edit) form closes.

23.22 L2TP configuration procedures

The 5620 SAM supports the configuration and management of L2TP sites, tunnel group profiles, and tunnel profiles.

A typical L2TP configuration is applied to two NEs; one NE performs the LAC role and the other NE performs the LNS role. An NE can perform both LAC and LNS roles. At least one ISA-LNS group must be configured for the LNS NE. See section 14.5 for information about ISA-LNS groups. See Procedure 14-6 for information about creating and configuring an ISA-LNS group member.

Note 1 — An NE must be in chassis mode B or higher to support L2TP.

Note 2 — You can also enable L2TP on a VPRN site. See chapter 71 for more information.

The following procedures describe how to configure L2TP.

Procedure 23-34 To configure L2TP on a routing instance

Note 1 — For most parameters in this procedure, you can specify that the parameter value is inherited from the parent L2TP configuration using the Inherit Value parameter.

If you disable value inheritance for a parameter, the available options are restricted, based on the parent parameter value and the protocol functionality. For example, if a parameter in the global-level L2TP configuration is set to True, the only available option for the same parameter in the tunnel group profile-level L2TP configuration is False, unless a value of False violates a protocol rule, in which case the only available option is True.

Note 2 — The parameters that you configure for a L2TP tunnel group profile take precedence over the parameters that are configured for global-level L2TP.

1 Navigate to an L2TP icon. The path is Routing→Router→Routing Instance→L2TP.

2 Right-click on the L2TP icon and choose Properties. The L2TP Site (Edit) form opens with the General tab displayed.

3 Configure the parameters:

- Administrative State
- AVP Hiding
- Calling Number Format
- Challenge
- Cisco NAS-Port Ethernet
- Cisco NAS-Port ATM
- Destruct Timeout
- Excluded AVPs
- Group Session Limit
- Hello Interval
- Idle Timeout
- Local IP Address
- Local Name
- Max Retries Established
- Max Retries Not Established
- Next Attempt
- Password
- Peer Address Change Policy
- Receive Window Size
- Replace Result Code
- Session Assign Method
- Session Limit
- Tunnel Session Limit

4 Click on the Select button next to the RADIUS Accounting Policy field. The Select L2TP Accounting Policy form opens.

5 Choose an L2TP Accounting Policy from the list and click on the OK button. The Select L2TP Accounting Policy form closes and the RADIUS Accounting Policy field shows the displayed name of the selected accounting policy. Refer to Procedure 49-3 for information on creating an L2TP RADIUS Accounting Policy.

6 If required, click on the Tunnel Selection Blacklist tab and configure the parameters:

- Add Tunnel on
- Max List Length
- Max Time
- Timeout Action

7 Click on the Tunnel Group Profiles tab.

i Click on the Create button. The L2TP Tunnel Group Profile (Create) form opens with the General tab displayed.

ii Configure the parameters:

- Group Name
- Description
- Administrative State
- Local IP Address
- Local Name
- Password
- Challenge
- AVP Hiding
- Session Limit
- Session Assign Method
- Max Retries Established
- Max Retries Not Established
- Receive Window Size
- Hello Interval (seconds)
- Idle Timeout (seconds)
- Destruct Timeout (seconds)
- Load Balance Method

Note — To generate operational L2TP tunnels, a start operation must be performed on the L2TP tunnel on the LAC NE. You can also perform a start operation from a tunnel profile on the LNS.

8 Click on the Select button in the LNS Group ID panel and choose an LNS group from the Select LNS Group ID form.

Note — You must choose an LNS group for the tunnel group profile or tunnel profile of the site that acts as the LNS.

9 Click on the Select button in the L2TP Radius Accounting Policy panel and choose a RADIUS accounting policy from the Select L2TP RADIUS Accounting Policy form.

10 Configure PPP on the L2TP tunnel group profile, as required.

Note — PPP is required only for LNS L2TP tunnel group profiles and L2TP tunnel profiles.

i Click on the PPP tab.

ii Configure the parameters:

- Authentication Protocol
- Proxy LCP
- Proxy Authentication
- MTU (bytes)
- Keep-Alive Interval
- Keep-Alive Multiplier
- IPCP Subnet Negotiation
- LCP Ignore Magic Number

iii Configure the CHAP challenge length parameters, as required:

- Min
- Max

iv Configure an authentication policy, as required.

Click on the Select button in the Authentication Policy panel and choose an authentication policy from the Select Authentication Policy (PPPGroupProfile) form.

v If you did not choose an authentication policy in step iv, select a user database.

Click on the Select button in the User Database panel and choose a user database from the Select User Database (PPPGroupProfile) form.

vi Click on the Select button in the Default Service ID panel and choose a default service ID from the Select Default Service ID (PPPGroupProfile) form.

vii Click on the Select button in the Default Group Interface panel and choose a default group interface from the Select Default Group Interface (PPPGroupProfile) form.

11 Click on the Tunnel Profiles tab.

i Click on the Create button. The L2TP Tunnel Profile (Create) form opens with the General tab displayed.

ii Configure the parameters:

- Tunnel Name
- Description
- Administrative State
- Local IP Address
- Local Name
- Peer IP Address
- Remote Name
- Password
- Auto Established
- Preference
- Challenge
- AVP Hiding
- Session Limit
- Max Retries Established
- Max Retries Not Established
- Receive Window Size
- Hello Interval (seconds)
- Idle Timeout (seconds)
- Destruct Timeout (seconds)
- Load Balance Method

Note — When you configure parameters with the same name in a tunnel group profile and a tunnel profile, a non-default value in the tunnel group profile overrides the value specified for the L2TP site. Also, a non-default value in a tunnel profile overrides the value defined in the associated tunnel group profile and L2TP site.

iii As required, click on the Select button in the LNS Group ID panel and choose an LNS group from the Select LNS Group ID form.

Note — You must choose an LNS group for the tunnel group profile or tunnel profile of the site that acts as the LNS.

iv Click on the Select button in the L2TP Radius Accounting Policy panel and choose a RADIUS accounting policy from the Select L2TP RADIUS Accounting Policy form.

v Click on the PPP tab and repeat step 10 to configure PPP on the L2TP tunnel profile, as required.

Note 1 — You only configure PPP for LNS L2TP tunnel group profiles and L2TP tunnel profiles.

Note 2 — The values for the MTU, Keep-Alive Interval, Keep-Alive Multiplier, and CHAP Challenge Length Min and Max parameters can be inherited from the parent tunnel group profile.

vi Click on the MLPPP tab.

vii Configure the parameters:

Note — When Inherit from Tunnel Group Profile beside a parameter is enabled, the parameter value from the tunnel group profile is used. You must disable Inherit from Tunnel Group Profile beside a parameter before you can configure the parameter.

- Endpoint ID
- IPv4 Address
- MAC Address
- Interleave
- Max Fragment Delay
- Max MLPPP Links
- Reassembly Timeout
- Send Short Sequence Numbers
- Administrative State

viii Click on the OK button. A dialog box appears.

ix Click on the Yes button. The L2TP Tunnel Profile (Create) form closes.

12 Click on the MLPPP tab.

13 Configure the parameters:

Note — When Inherit from Tunnel Group Profile beside a parameter is enabled, the parameter value from the tunnel group profile is used. You must disable Inherit from Tunnel Group Profile beside a parameter before you can configure the parameter.

- Endpoint ID
- IPv4 Address
- MAC Address
- Interleave
- Max Fragment Delay
- Max MLPPP Links
- Reassembly Timeout
- Send Short Sequence Numbers
- Administrative State

14 Click on the OK button. A dialog box appears.

15 Click on the OK button. The L2TP Tunnel Group Profile (Create) form closes.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The L2TP Site (Edit) form closes.

Procedure 23-35 To view L2TP tunnels and tunnel endpoints

1 Choose Manage→ISA Functions→ISA-L2TP from the 5620 SAM main menu. The Manage ISA-L2TP form opens.

2 Choose L2TP tunnel (L2TP) from the object drop-down menu.

3 Click on the Search button. A list of L2TP tunnels is displayed.

4 Choose an entry in the list and click on the Properties button. The L2TP Tunnel - Endpoint A - Endpoint B form opens with the General tab displayed.

5 View the information for Tunnel Endpoint A and Tunnel Endpoint B.

6 Click on the L2TP Tunnel Endpoints tab. The two L2TP tunnel endpoints are displayed.

7 Choose an entry in the list and click on the Properties button. The L2TP Tunnel Endpoint (View) form opens.

8 View the information. You can also click on the Properties button to view additional information for the following:

- Site ID
- Tunnel Instance Endpoint
- Tunnel Profile
- Tunnel Group Profile
- Peer

9 Close the L2TP Tunnel Endpoint (View) form.

10 Close the L2TP Tunnel - Endpoint A - Endpoint B form.

Procedure 23-36 To view L2TP tunnel instance endpoints on a subscriber instance

Perform this procedure to view L2TP tunnel instance endpoints associated with a specific subscriber instance.

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Choose Residential Subscriber Instance (Residential Subscriber) from the object drop-down menu.

3 Configure the filter criteria, as required, and click on the Search button.

4 Choose a residential subscriber instance in the list and click on the Properties button. The Residential Subscriber Instance (Edit) form opens with the General tab displayed.

5 Click on the L2TP Tunnel Instance Endpoints tab.

6 Configure the filter criteria, as required, and click on the Search button. A dialog box opens.

7 Click on the Yes button.

8 Choose an L2TP tunnel instance endpoint in the list and click on the Properties button. The L2TP Tunnel Instance Endpoint (View) form opens with the General tab displayed.

9 View the information, as required. You can also click on the Sessions tab to view session information, as required.

10 Close the L2TP Tunnel Instance Endpoint (View) form.

11 Close the Residential Subscriber Instance (Edit) form.

12 Close the Manage Residential Subscribers form.

Procedure 23-37 To view L2TP sessions

Perform this procedure to view L2TP sessions on an L2TP site.

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Choose L2TP Session (L2TP) from the object drop-down menu.

3 Click on the Select button for the Site ID to choose a site.

4 Click on the Select button for the Routing Instance ID to choose a routing instance.

5 Configure the filter criteria, as required, and click on the Search button.

6 Choose a session in the list and click on the Properties button. The L2TP Session (View) form opens.

7 View the information in the following panels:

- Session
- Tunnel
- Operational Information
- LNS PPP

Note — The LNS PPP panel is applicable only for an LNS.

8 Close the L2TP Session (View) form.

9 Close the Manage Residential Subscribers form.

Procedure 23-38 To view PPP sessions

Perform this procedure to view PPP sessions.

1 Choose Manage→Residential Subscribers from the 5620 SAM main menu. The Manage Residential Subscribers form opens.

2 Choose PPP Session (PPP Policy and Session) from the object drop-down menu.

3 Click on the Select button for the Site ID to choose a site.

4 Click on the Select button for the Service ID to choose a service.

5 Configure the filter criteria, as required, and click on the Search button.

6 Choose a session in the list and click on the Properties button. The PPP Session form opens with the General tab displayed.

7 View the information in the following panels:

- PPP General
- Residential Subscriber
- Business Subscriber
- DHCP

8 Click on the following tabs to view the information, as required:

- Authentication Protocols
- DNS and NBNS IP Addresses
- QoS Overrides
- Deployment

9 Close the PPP Session form.

10 Close the Manage Residential Subscribers form.

23.23 PIM configuration procedures

The following procedures describe how to configure PIM.

Procedure 23-39 To enable PIM on a routing instance

1 Choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.

3 Right-click on the routing instance object and choose Properties. The Routing Instance (Edit) form opens with the General tab displayed.

4 Enable PIM:

i Click on the Multicast tab.

ii Select the PIM Enabled parameter.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Routing Instance (Edit) form closes, and a PIM icon appears in the navigation tree below the routing instance.

Procedure 23-40 To configure PIM on a routing instance

Note — If you are creating a PIM site on a VPRN routing instance, perform Procedure 23-41. See Procedure 71-50 for more information about configuring PIM on a VPRN routing instance.

1 Choose Routing from the navigation tree view selector.

2 Navigate to a PIM icon. The path is Routing→Router→Routing Instance→PIM.

3 Right-click on the PIM icon and choose Properties. The PIM Site (Edit) form opens with the General tab displayed.

4 Configure the Administrative State parameter in the States panel.

5 Configure the parameters in the PIM General Configurations panel:

- Apply To
- Non DR Attract Traffic
- RPF Vectors
- SSM Assert Compatible Mode
- Multicast Fast-failover

6 Configure the following parameters in the ECMP Balancing panel:

- ECMP Balancing Enabled
- Hold Time (minutes)
- ECMP Hashing Enabled

7 In the Lag Usage panel, configure the Lag Usage Optimization parameter.

8 Click on the RP Behavior tab. The IPv4 tab is displayed

9 If you are configuring for IPv4, click on the IPv4 tab and go to step 10. Otherwise click on the IPv6 tab and go to step 15.

10 Configure the IPv4 Administrative State parameter in the States panel.

11 Configure the following parameters in the PIM General Configurations panel:

- IPv4 RPF Lookup Sequence
- Auto RP Discovery Enabled

12 Configure the following parameters in the Candidate Bootstrap Router panel:

- CBSR Admin State
- CBSR Address
- CBSR Priority
- CBSR Hash Mask Length

13 Configure the following parameters in the Candidate Rendezvous Point panel:

- Administrative State
- C-RP Address
- C-RP Priority
- C-RP Hold Time (seconds)

14 Go to step 20.

15 Configure the IPv6 Administrative State parameter in the States panel.

16 Configure the IPv6 RPF Lookup Sequence parameter in the PIM General Configurations panel.

17 Configure the following parameters in the Candidate Bootstrap Router panel:

- CBSR Admin State
- CBSR Address
- CBSR Priority
- CBSR Hash Mask Length

18 Configure the following parameters in the Candidate Rendezvous Point panel:

- Administrative State
- C-RP Address
- C-RP Priority
- C-RP Hold Time (seconds)

19 Configure the following parameters in the Embedded-RP panel:

- Enable Embedded-RP
- Embedded-RP Administrative State

20 Add one or more C-RP groups, if required.

i Click on the Candidate-RP Groups tab.

ii Click on the Create button to add a new entry, if required. The C-RP Group Prefix (Create) form opens.

iii Configure the parameters:

- Group IP Address
- Mask

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The C-RP Group Prefix (Create) form closes and the new Candidate-RP entry appears in the table.

21 Add one or more embedded RP groups, if required.

Note — The Embedded-RP Groups tab is only selectable if you enabled the Enable Embedded-RP parameter in step 19.

i Click on the Embedded-RP Groups tab.

ii Click on the Create button to add a new entry, if required. The E-RP Group Range (Create) form opens.

iii Configure the parameters:

- Group IP Address
- Prefix

iv Click on the OK button. The E-RP Group Range (Create) form closes and the new Embedded-RP entry appears in the table.

22 Click on the Group To RP tab. The Static RP tab is displayed.

23 In the Static RP tab, click on the Create button to add a new entry, if required. The Static RP (Create) form opens.

24 Configure the parameters:

- Static RP IP Address
- RP Override

25 Click on the Static Group-To-RP tab.

26 Click on the Create button to add a new entry, if required. The Static Group To RP (Create) form opens.

27 Configure the parameters:

- Static Group IP Address
- Static Group Mask

28 Click on the OK button. A dialog box appears.

29 Click on the OK button. The new Static Group-To-RP entry appears on the form.

30 Click on the OK button. A dialog box appears.

31 Click on the OK button. The new Static RP entry appears on the form.

32 Click on the Import Policies tab.

33 Click on the BootStrap Import Policies tab.

34 Configure the parameters to filter bootstrap messages and to control the flow of bootstrap messages to the routing instance.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

35 Click on the Join/Prune Import Policies tab.

36 Configure the parameters to filter join/prune messages.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

37 Click on the Register Import Policies tab.

38 Configure the parameters to filter PIM register messages.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

39 Click on the Export Policies tab.

40 Click on the BootStrap Export Policies tab.

41 Configure the parameters to filter PIM-related export messages.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

42 Depending on the device release, the Anycast RP tab is configurable. Click on the Anycast RP tab to configure Anycast RP, if required.

Note — You can use the PIM configuration form to add peers to an anycast RP. The complete configuration of anycast RP for PIM requires additional supporting components, such as the configuration of loopback interfaces and static RPs. Due to the complex configuration dependencies, Alcatel-Lucent recommends that you use the Virtual Anycast manager. The Virtual Anycast manager automatically configures many of the supporting requirements for the protocol, which reduces operator configuration errors and assists in troubleshooting activities. See Procedure 23-42 for more information about using the Virtual Anycast manager.

43 Click on the General tab.

44 Configure the RP IP Address parameter.

45 Click on the Anycast Peer tab.

46 Click on the Create button to create a new entry, if required. The Anycast Peer (Create) form opens.

47 Configure the Peer IP Address parameter.

48 Click on the OK button. A dialog box appears.

49 Click on the OK button. The new anycast peer entry appears on the form.

50 Click on the OK button. A dialog box appears.

51 Click on the OK button. The new anycast RP entry appears on the form.

52 Click on the SSM Groups tab.

53 Click on the Create button to create a new entry, if required.

54 Configure the parameters:

- SSM Group IP Address
- SSM Group Mask

  The parameters are applicable to both IPv4 and IPv6.

55 Click on the OK button. A dialog box appears.

56 Click on the OK button. The new SSM group entry appears on the form.

57 Click on the Interfaces tab to create an interface, if required.

i Click on the Create button to add a new entry.

ii Perform steps 2 to 8 of Procedure 23-43.

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The new interface entry appears on the form.

58 Click on the SPT Switch Threshold tab to configure SPT switchover, if required.

59 Click on the Create button to create a new entry, if required. The Spt Switch Over Threshold (Create) form opens.

60 Configure the parameters:

- Group IP Address
- Group Prefix Length
- Infinity For Threshold
- Threshold (kbps)

61 Click on the OK button. A dialog box appears.

62 Click on the OK button. The new SPT switch threshold entry appears on the form.

63 Click on the following tabs to view and edit information.

- Groups
- Neighbor
- Statistics
- Faults

The Statistics and Faults tabs are unavailable for PIM in VPRN.

64 Click on the OK button. A dialog box appears.

65 Click on the Yes button. The PIM (Edit) form closes.

Procedure 23-41 To create a PIM site on a VPRN routing instance

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service.

4 Click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

5 On the navigation tree, expand the Sites icon.

6 Expand the Routing Instance - NE System ID icon of the site to which you need to add the routing instance.

7 Expand the Routing Instance icon.

8 Right-click on the Protocols icon and choose Create PIM Site from the contextual menu. The PIM Site (Create) form opens with the General tab displayed.

9 Configure the Administrative State parameter in the States panel.

10 Configure the parameters in the PIM General Configurations panel:

- Apply To
- Non DR Attract Traffic
- SSM Assert Compatible Mode

11 Configure the following parameters in the ECMP Balancing panel:

- ECMP Balancing Enabled
- Hold Time (minutes)
- ECMP Hashing Enabled

12 Click on the RP Behavior tab. The IPv4 tab is displayed

13 If you are configuring for IPv4, click on the IPv4 tab and go to step 24. Otherwise click on the IPv6 tab and go to step 19.

14 Configure the IPv4 Administrative State parameter in the States panel.

15 Configure the following parameters in the PIM General Configurations panel:

- IPv4 RPF Lookup Sequence
- IPv4 SSM Default Range Disabled

16 Configure the following parameters in the Candidate Bootstrap Router panel:

- CBSR Admin State
- CBSR Address
- CBSR Priority
- CBSR Hash Mask Length

17 Configure the following parameters in the Candidate Rendezvous Point panel:

- Administrative State
- C-RP Address
- C-RP Priority
- C-RP Hold Time (seconds)

18 Go to step 24.

19 Configure the IPv6 Administrative State parameter in the States panel.

20 Configure the IPv6 RPF Lookup Sequence parameter in the PIM General Configurations panel.

21 Configure the following parameters in the Candidate Bootstrap Router panel:

- CBSR Admin State
- CBSR Address
- CBSR Priority
- CBSR Hash Mask Length

22 Configure the following parameters in the Candidate Rendezvous Point panel:

- Administrative State
- C-RP Address
- C-RP Priority
- C-RP Hold Time (seconds)

23 Configure the following parameters in the Embedded-RP panel:

- Enable Embedded-RP
- Embedded-RP Administrative State

24 Click on the MVPN tab. The General tab is displayed.

25 Configure the parameters:

- Auto-Discovery
- MCast Signaling
- Inclusive Tunnel Type
- Selective Tunnel Type
- US Multicast Hop Selection
- Inter-Site Shared
- MDT Type

Note — You must set the Inclusive Tunnel Type parameter to PIM, RSVP, or MLDP if you are creating an inclusive tunnel.

26 Click on the UMH PE Backup tab to configure primary and standby UMH addresses, if required.

i Click on the Create button. The MVPN UMH PE Backup (Create) form opens.

ii Configure the parameters:

- UMH Primary PE Address
- UMH Standby PE Address

iii Click on the OK button. The MVPN UMH PE Backup (Create) form closes and the new entry appears in the list.

27 Click on the MVPN Inclusive Tunnel tab.

Note 1 — The MVPN Inclusive Tunnel tab appears only if you set the Inclusive Tunnel Type parameter to an option other than None in step 25.

Note 2 — The tab that appears on the MVPN Inclusive Tunnel tab depends on the Inclusive Tunnel Type parameter option that you configured in step 25.

28 Perform one of the following:

a Create a PIM inclusive tunnel.

i Click on the PIM tab.

ii Configure the parameters:

- Provider Tunnel Inclusive PIM Mode
- Group Address

  The Group Address parameter is configurable if the Provider Tunnel Inclusive PIM Mode parameter is set to ASM or SSM.

iii Go to step 29.

b Create an RSVP inclusive tunnel.

i Click on the RSVP tab.

ii Configure the P2MP Administrative State parameter. You cannot set the P2MP Administrative State parameter to Up until you choose an MVPN LSP template. To create an MVPN LSP template, see Procedure 25-23.

iii Click on the Select button. The Select MVPN Lsp Template - RSVP MVPN Provider Tunnel form opens.

iv Choose an MVPN LSP template from the list and click on the OK button. The MVPN LSP template is displayed.

v Configure the parameters:

- Tunnel Root Enable BFD
- Tunnel Root BFD Transmit Interval
- Tunnel Root BFD Multiplier
- Tunnel Leaf Enable BFD

The Tunnel Root BFD Transmit Interval and Tunnel Root BFD Multiplier parameters are configurable when you enable the Tunnel Root Enable BFD parameter.

c Create an MLDP inclusive tunnel.

i Click on the MLDP tab.

ii Configure the P2MP Administrative State parameter.

iii Go to step 29.

29 Click on the MVPN Selective Tunnel tab. The General tab is displayed.

30 Configure the Delay Interval (seconds) parameter in the Data MDT panel.

31 Perform one of the following:

a Choose an existing data MVPN threshold entry.

i Click on the Search button in the Data MVPN Threshold tab.

ii Choose a Data MVPN Threshold entry from the list.

iii Click on the Apply button.

iv Go to step 32.

b Create and choose a data MVPN threshold entry.

i Click on the Create button in the Data MVPN Threshold tab. The Data MVPN Threshold (Create) form is displayed.

ii Configure the parameters:

- Group IP Address
- Group Prefix Length
- Threshold (kbps)

iii Click on the OK button. The Data MVPN Threshold (Create) form closes and the entry is displayed in the list.

iv Choose the Data MVPN Threshold entry that you created.

v Click on the Apply button.

32 Perform one of the following, if required:

Note — A data Multicast Tunnel (MT) is a connector between a set of PE routers forming a multicast domain. In the context of a VPN-specific PIM instance, a multicast tunnel is a single multi-access interface. The data MT Interface can be created or selected when the PIM address is configured with a value other than null (0.0.0.0).

a Choose an existing data MT interface entry.

i Click on the Search button in the Data MT Interface tab.

ii Choose a Data MT Interface entry from the list.

iii Click on the Apply button.

iv Go to step 33.

b Create and choose a data MT interface.

i Click on the Add button in the Data MT Interface tab. The Data MT Interface (Create) form is displayed.

ii Configure the parameters:

- Administrative State
- Hello Interval (seconds)
- Hello Multiplier
- Improved assert
- Three Way Hello
- Tracking Support

iii Click on the OK button. The Data MT Interface (Create) form closes and the entry is displayed in the list.

iv Choose the data MT interface that you created.

v Click on the Apply button.

33 Click on the PIM tab and configure the parameters:

- PIM Prefix
- PIM Prefix Length
- PIM Group Address Mode
- Pack Data Join TLV
- Auto-Discovery
- Enable ASM Data MDT

34 Click on the RSVP tab and configure the parameters:

- P2MP Maximum Spmsi
- P2MP Administrative State

The P2MP Maximum Spmsi parameter can be disabled by selecting the associated Disabled checkbox.

35 Click on the Select button in the RSVP panel to choose an MVPN Lsp Template. The Select MVPN Lsp Template form is displayed.

36 Perform one of the following:

a Choose an existing LSP template for MVPN.

i Click the Search button. All of the available MVPN p2mp LSP templates for the local NE (the NE contains this VPRN/PIM) are displayed.

ii Choose the required template and click on the OK button.

iii Go to step 37.

b Create an LSP template for MVPN.

i Click the Create button and perform Procedure 25-23.

ii Choose the newly-created template from the list in the Select MVPN Lsp Template form and click on the OK button.

37 The Select MVPN Lsp Template form closes and the RSVP tab is refreshed.

38 Click on the MLDP tab and configure the parameters:

- P2MP Maximum Spmsi
- P2MP Administrative State

The P2MP Maximum Spmsi parameter can be disabled by selecting the associated Disabled checkbox.

39 Click on the Import Policies tab.

40 Click on the BootStrap Import Policies tab.

41 Configure the parameters to filter bootstrap messages and to control the flow of bootstrap messages to the routing instance.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

42 Click on the Join/Prune Import Policies tab.

43 Configure the parameters to filter join/prune messages.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

44 Click on the Register Import Policies tab.

45 Configure the parameters to filter PIM register messages.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

46 Click on the Export Policies tab.

47 Click on the BootStrap Export Policies tab.

48 Configure the parameters to filter PIM-related export messages.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

49 Click on the Interfaces tab to create an interface, if required.

i Click on the Create button to add a new entry.

ii Perform steps 2 to 8 of Procedure 23-43.

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The new interface entry appears on the form.

50 Add one or more C-RP groups, if required.

i Click on the Candidate-RP Groups tab.

ii Click on the Create button to add a new entry, if required. The C-RP Group Prefix (Create) form opens.

iii Configure the parameters:

- Group IP Address
- Mask

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The C-RP Group Prefix (Create) form closes and the new Candidate-RP entry appears in the table.

51 Click on the Group To RP tab. The Static RP tab is displayed.

52 In the Static RP tab, click on the Create button to add a new entry, if required. The Static RP (Create) form opens.

53 Configure the parameters:

- Static RP IP Address
- RP Override

54 Click on the Static Group-To-RP tab.

55 Click on the Create button to add a new entry, if required. The Static Group To RP (Create) form opens.

56 Configure the parameters:

- Static Group IP Address
- Static Group Mask

57 Click on the OK button. A dialog box appears.

58 Click on the OK button. The new Static Group-To-RP entry appears on the form.

59 Click on the OK button. A dialog box appears.

60 Click on the OK button. The new Static RP entry appears on the form.

61 Click on the SSM Groups tab.

62 Click on the Create button to create a new entry, if required.

63 Configure the parameters:

- SSM Group IP Address
- SSM Group Mask

  The parameters are applicable to both IPv4 and IPv6.

64 Click on the OK button. A dialog box appears.

65 Click on the OK button. The new SSM group entry appears on the form.

66 Click on the SPT Switch Threshold tab to configure SPT switchover, if required.

67 Click on the Create button to create a new entry, if required. The Spt Switch Over Threshold (Create) form opens.

68 Configure the parameters:

- Group IP Address
- Group Prefix Length
- Infinity For Threshold
- Threshold (kbps)

69 Click on the OK button. A dialog box appears.

70 Click on the OK button. The new SPT switch threshold entry appears on the form.

71 Depending on the device release, the Anycast RP tab is configurable. Click on the Anycast RP tab to configure Anycast RP, if required.

Note — You can use the PIM configuration form to add peers to an anycast RP. The complete configuration of anycast RP for PIM requires additional supporting components, such as the configuration of loopback interfaces and static RPs. Due to the complex configuration dependencies, Alcatel-Lucent recommends that you use the Virtual Anycast manager. The Virtual Anycast manager automatically configures many of the supporting requirements for the protocol, which reduces operator configuration errors and assists in troubleshooting activities. See Procedure 23-42 for more information about using the Virtual Anycast manager.

72 Click on the General tab.

73 Configure the RP IP Address parameter.

74 Click on the Anycast Peer tab.

75 Click on the Create button to create a new entry, if required. The Anycast Peer (Create) form opens.

76 Configure the Peer IP Address parameter.

77 Click on the OK button. A dialog box appears.

78 Click on the OK button. The new anycast peer entry appears on the form.

79 Click on the OK button. A dialog box appears.

80 Click on the OK button. The new anycast RP entry appears on the form.

81 Click on the following tabs to view and edit information.

- Groups
- Neighbor
- Statistics
- Faults

The Statistics and Faults tabs are unavailable for PIM in VPRN.

82 Click on the OK button. A dialog box appears.

83 Click on the Yes button. The PIM (Edit) form closes.

Procedure 23-42 To configure Anycast PIM on a router

This procedure describes how to use the Virtual Anycast Manager to configure anycast PIM on a router. The Virtual Anycast Manager automatically configures many of the supporting requirements for the protocol, which reduces operator configuration errors and assists in troubleshooting activities.

Note — The 5620 SAM does not automatically delete the supporting requirements for the protocol when you delete an anycast RP member.

You can also manually add peers to an anycast RP by navigating to the Anycast RP tab of the PIM configuration form. Ensure that PIM is enabled on the router. See Procedure 23-40 for more information.

The 5620 SAM raises an alarm when VRFs from different VPRNs are added to a single anycast RP set. You can only mismatch VRFs using methods that are not associated with the Virtual Anycast Manager; for example, by using the CLI or the PIM configuration form.

1 Choose Manage→Networking→Virtual Anycast RP from the 5620 SAM main menu. The Manage Virtual Anycast RP form opens.

2 Click on the Create button. The Virtual Anycast RP form opens with the General tab displayed.

3 Configure the parameters:

- Anycast RP Type
- Anycast RP Address
- Name
- Description
- Auto Created Interface Name

4 If the Anycast RP Type parameter value is VPRN, choose a VPRN service for the anycast RP.

i Click on the Select button. The Select Service form opens.

ii Choose a VPRN service in the list and click on the OK button. The Select Service form closes, and the service is displayed in the Service panel.

5 Click on the Apply button. The Status panel appears. The Status panel is used in step 9 of this procedure to identify configuration problems.

6 Click on the Components tab.

7 Add virtual Anycast RP members to the PIM configuration.

i Right-click on the Virtual Anycast RP Members icon and choose Add Anycast RP Member. The Enter Interface Name form opens.

ii Enter the interface name for the loopback interface. The Auto Created Interface Name parameter value appears, if configured.

iii Click on the OK button. The Enter Interface Name form closes, and the Select Local Address form opens.

iv Configure the filter criteria.

v Choose the local IP address that is used to communicate with the other RP members in the virtual anycast set and click on the OK button. The new local address entry appears on the Components tab under the Virtual Anycast RP Members icon. The new local address entry also appears under the Static RP icon.

Note — The local address is typically the system address.

The 5620 SAM automatically performs the following virtual anycast RP required configuration tasks.

- It creates a PIM-enabled loopback interface, if not present, with the RP address.
- It adds a local address to the anycast RP peer set.
- It updates the peer sets that participate in the anycast RP so that all peer sets contain the same members.
- It enables PIM on the interface that contains the local IP address.
- It creates a static RP that uses the anycast RP address. Groups must be manually created using the Components tab.

vi Repeat steps 7 i to v for each member in the virtual anycast RP.

8 Add a static group-to-RP mapping for the anycast configuration.

i Right-click on a member in the Static RP list and choose Create Static RP. The Static RP (Create) form opens.

ii Configure the parameters:

- Static Group IP Address
- Static Group Mask

iii Click on the OK button. The Static Group To RP (Create) form closes.

iv Repeat steps 8 i to iii for each static group-to-RP mapping that you want to add to the virtual anycast RP configuration. Each member needs a static RP and at least one static group-to-RP mapping. The mappings typically use the same configuration values for each member in the group.

9 Verify the status of the anycast RP for PIM configuration.

i Click on the General tab. The Status panel displays the status of the anycast RP configuration. The 5620 SAM updates the status when you add a member to or delete a member from the virtual anycast RP. You can also use the Update Status button to manually update the Status panel.

Table 23-2 lists the status check boxes that identify potential configuration problems.

Table 23-2 Anycast RP status fields

Check box	Description
Missing Group Range(s) Configurations	At least one anycast RP member does not have a group range for the anycast RP address.
Inconsistent Peer Sets	Peer sets of all the anycast RP members are not equal.
PIM not enabled on loopback interface(s)	PIM is not enabled on all loopback interfaces that are configured in the virtual anycast RP.
Only one peer configured	Only one peer is configured for anycast RP. The configuration requires two or more peers for correct functionality.
Loopback interface(s) not properly configured	At least one anycast RP member does not have a loopback interface configured with the anycast RP address.
Missing Static RP configuration(s)	A member of the virtual anycast RP does not have a static RP. Each member requires a static RP.

ii Click on the OK button. The Manage Virtual Anycast RP form reappears, and the new virtual anycast RP entry appears on the form.

iii Close the Manage Virtual Anycast RP form.

Procedure 23-43 To create a PIM interface on a base routing instance or VPRN routing instance

1 Perform one of the following:

   a Create a PIM interface on a base routing instance.

      i Choose Routing from the navigation tree view selector.

      ii Navigate to a PIM icon. The path is Routing→Router→Routing Instance→PIM.

      iii Right-click on the PIM icon and choose Create Interface. The PIM Interface (Create) form opens with the General tab displayed.

   b Create a PIM interface on a VPRN routing instance.

      i Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

      ii Configure the filter criteria. A list of services appears.

      iii Choose a VPRN service.

      iv Click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

      v On the navigation tree, click on the site to which you need to add the routing instance.

      vi Expand the Routing Instance - NE System ID icon.

      vii Expand the Routing Instance icon.

      viii Expand the Protocols icon.

      ix Expand the PIM icon.

      x Right-click on the PIM instance and choose Create PIM Interface. The PIM Interface, Routing Instance (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a Layer 3 interface. The Select Interface - PIM Interface form opens.

3 Configure the filter criteria.

4 Choose an interface in the list and click on the OK button. The Select Interface - PIM Interface form closes, and the interface name appears in the Interface panel.

5 Configure the parameters:

- Description
- Administrative State
- BFD Enabled
- IPv6 BFD Enabled

Note — If you are configuring IPv6 BFD on a VPRN routing instance, you must enable the IPv6 Allowed parameter on the associated L3 access interface and set the BFD IPv6 Admin State parameter to Up on the BFD tab. See Procedure 71-38.

6 Click on the Behavior tab.

7 Click on the General sub-tab.

8 Configure the parameters:

- Hello Interval (seconds)
- Hello Multiplier
- Tracking Support
- Multicast Senders
- BSM Check Router Alert
- Improved assert
- Assert Period
- Max Groups
- Three Way Hello
- Sticky DR
- DR Priority
- Sticky DR Priority
- P2MP to LDP Tree Join Enabled

The Sticky DR Priority parameter is configurable when the Sticky DR parameter is enabled.

9 Click on the Neighbor tab, if configurable, to view and edit information. The Neighbor tab is configurable only when a neighbor PIM interface exists.

10 Click on the IPv4 or IPv6 sub-tab, as required.

11 Configure the IPv4 Administrative State or IPv6 Administrative State parameter in the States panel, as required.

12 Click on the Multicast CAC tab to add a multicast CAC policy, if required.

i Click on the Select button to choose a multicast CAC policy. The Select Multicast CAC Policy - PIM Interface form opens.

ii Choose a multicast CAC policy from the list and click on the OK button. The Multicast CAC Policy - PIM Interface form closes, and the multicast CAC policy name appears in the Multicast CAC Policy panel.

iii Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)

iv Click on the Levels tab.

v Click on the Create button. The PIM Interface Multicast CAC level form opens.

vi Configure the parameters:

- Level ID
- Bandwidth (kbps)

vii Click on the LAG Port Down tab.

viii Click on the Create button. The PIM Interface Multicast CAC LAG Port Down form opens.

ix Configure the parameters:

- Number of Ports Down
- Level

13 Click on the OK button. The PIM Interface (Create) form closes, and an icon for the new PIM interface appears in the navigation tree below the PIM icon.

Procedure 23-44 To view an mVPN P2MP LSP object

Perform this procedure to navigate to an mVPN P2MP LSP object.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service.

4 Click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

5 On the navigation tree, click on the site on which you want to view the mVPN P2MP LSP object.

6 Expand the Routing Instance - NE System ID icon.

7 Expand the Routing Instance icon.

8 Expand the Protocols icon.

9 Click on the PIM icon. The PIM Site (Edit) form opens with the General tab displayed.

10 Click on the MVPN Inclusive Tunnel tab.

11 Click on the RSVP tab.

12 Choose an interface from the Inclusive Provider Tunnel PMSIs panel and click on the Properties button. The Inclusive RSVP PMSI Interface (Edit) form opens with the General tab displayed.

13 Click on the Properties button next to the P2MP LSP ID parameter. The P2MP LSP (View) form opens with the General tab displayed.

14 Click on the tabs to view information about the P2MP LSP object.

15 Close the P2MP LSP (View) form.

16 Close the VPRN Service (Edit) form.

17 Close the Manage Services form.

23.24 IGMP configuration procedures

The 5620 SAM supports IGMP configuration for core router functionality and IP services.

The following procedures describe how to configure IGMP.

Procedure 23-45 To enable IGMP on a router

1 Choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.

3 Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) configuration form opens.

4 Enable IGMP.

- i Click on the Multicast tab.
- ii Select the IGMP Enabled parameter.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Routing Instance (Edit) form closes, and an IGMP icon appears in the navigation tree below the routing instance icon.

Procedure 23-46 To configure an IGMP site on a router

Before you can configure an IGMP site on a router, you must enable IGMP on the routing instance. See Procedure 23-45 for more information.

1 Choose Routing from the navigation tree view selector.

2 Navigate to the IGMP icon. The path is Routing→Router→Routing Instance→IGMP.

3 Right-click on the IGMP icon and choose Properties. The IGMP Site (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Administrative State
- Query Interval (seconds)
- Last Member Query Interval (seconds)
- Query Response Interval (seconds)
- Robust Count
- Group Interface Query Source IP

5 Click on the SSM Translation tab to configure SSM, if required.

i Click on the Create button to create a new entry. The SSM Translation (Create) form opens.

ii Configure the parameters:

- Start Mcast Address
- End Mcast Address
- Configured Source

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The new SSM entry appears on the form.

6 Click on the Interfaces tab to add an interface, if required.

i Click on the Create button.

ii Perform steps 4 to 14 of Procedure 23-48.

iii Click on the OK button. The new interface entry appears on the form.

7 Click on the Group Interfaces tab to view IES group interfaces added to IGMP, if required.

8 Click on the LDP Tunnel Interfaces tab to create an LDP tunnel interface entry, if required.

i Click on the Create button. The LDP IGMP Tunnel Interface (Create) form opens with the General tab displayed.

ii Click on the Select button beside the P2MP ID parameter. The Select - LDP IGMP Tunnel Interface form opens.

iii Choose an LDP tunnel interface and click on the OK button. The LDP IGMP Tunnel Interface form reappears with the information displayed.

iv Click on the Static Group/Source tab to create a static multicast entry, if required.

v Click on the Create button. The StaticGrpSrc (Create) form opens.

vi Configure the parameters:

- Static Multicast Group
- Static Source

vii Click on the OK button. A dialog box appears.

viii Click on the OK button. The new static multicast entry appears on the LDP IGMP Tunnel Interface (Create) form.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The LDP IGMP Tunnel Interface (Create) form closes.

9 Click on the RSVP Tunnel Interfaces tab to create an RSVP tunnel interface entry, if required.

i Click on the Create button. The RSVP IGMP Tunnel Interface (Create) form opens with the General tab displayed.

ii Click on the Select button beside the Lsp Name parameter. The Select - RSVP IGMP Tunnel Interface form opens.

iii Choose an RSVP IGMP tunnel interface and click on the OK button. The Select - RSVP IGMP Tunnel Interface form closes and the RSVP IGMP Tunnel Interface (Create) form reappears with the information displayed.

iv Click on the Static Group/Source tab to create a static multicast entry, if required.

v Click on the Create button. The StaticGrpSrc (Create) form opens.

vi Configure the parameters:

- Static Multicast Group
- Static Source

vii Click on the OK button. A dialog box appears.

viii Click on the OK button. The new static multicast entry appears on the form.

ix Click on the OK button. A dialog box appears. The RSVP IGMP Tunnel Interface (Create) form closes and the new tunnel entry is displayed.

x Click on the OK button. The RSVP IGMP Tunnel Interface (Create) form closes.

10 Click on the following tabs to view and edit information.

- Multicast Group/Source
- Statistics
- Faults

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The Routing Instance (Edit) form closes.

Procedure 23-47 To configure IGMP on an OmniSwitch

Note — IGMP parameters can be configured globally or for each VLAN site. The VLAN site IGMP configuration overrides the routing instance IGMP settings. You can only configure VLAN site IGMP parameters after you create the VLAN. See Procedure 66-9 for information about configuring IGMP on an OmniSwitch VLAN site.

1 Choose Routing from the navigation tree view selector.

2 Navigate to the IGMP icon. The path is Routing→ Routing Instance→IGMP.

3 Right-click on the IGMP icon and choose Properties. The IGMP (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- Administrative State
- Querying
- Spoofing
- Proxying
- Querier Forwarding
- Zapping
- Max Group Action
- Query Interval (seconds)
- Last Member Query Interval (tenths of seconds)
- Query Response Interval (tenths of seconds)
- Robust Count
- Max Group
- Protocol Version
- Router Timeout (seconds)
- Source Timeout (seconds)
- Unsolicited Report Interval (seconds)

Note — When the Administrative State parameter is set to Up, IP multicast switching is enabled on the OmniSwitch.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The Routing Instance (Edit) form closes.

Procedure 23-48 To create an IGMP interface

Note — IGMP IPv6 interfaces are supported on the 7950 XRS, on the 7750 SR in chassis mode A or B with mixed mode enabled, and on the 7750 SR in chassis mode C or D.

1 Choose Routing from the navigation tree view selector.

2 Navigate to the IGMP icon. The path is Routing→Router→Routing Instance→IGMP.

3 Right-click on the IGMP icon and choose Create Interface. The IGMP Interface (Create) form opens with the General tab displayed.

4 Click on the Select button to choose a Layer 3 interface. The Select Interface - IGMP Interface form opens.

5 Configure the filter criteria, if applicable.

6 Choose an interface in the list and click on the OK button. The Select Interface - IGMP Interface form closes, and the interface name appears in the Interface panel.

7 Configure the parameters:

- Description
- Administrative State
- Administrative Version

8 Click on the Behavior tab.

9 Configure the parameters, if applicable:

- Import Policy
- Group Count
- Maximum Number of Groups
- Maximum Number of Sources
- Maximum Number of Group Sources
- Subnet Check
- Disable Router Alert Check

10 Click on the Multicast CAC tab to add a multicast CAC policy, if required.

i Click on the Select button to choose a multicast CAC policy. The Select Multicast CAC Policy - IGMP Interface form opens.

ii Choose a multicast CAC policy from the list and click on the OK button. The Multicast CAC Policy - IGMP Interface form closes, and the multicast CAC policy name appears in the Multicast CAC Policy panel.

iii Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)
- Constraint Admin State

11 Click on the SSM Translation tab, if required.

i Click on the Create button.

ii Configure the parameters:

- Start Mcast Address
- End Mcast Address
- Configured Source
- Start Mcast Address Type
- End Mcast Address Type
- Configured Source Type

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The new SSM translation entry appears on the form.

12 Click on the Static Group/Source tab to create a static multicast entry, if required.

   i Click on the Create button.

   ii Configure the parameters:

   - Static Multicast Group
   - Static Source

   iii Click on the OK button. A dialog box appears.

   iv Click on the OK button. The new static multicast entry appears on the form.

13 Click on the following tabs to view and edit information.

   - Multicast Group
   - Multicast Group/Source

14 Click on the OK button. A dialog box appears.

15 Click on the Yes button. The IGMP Interface (Create) form closes, and an icon for the new interface appears in the navigation tree below the IGMP icon.

Procedure 23-49 To turn up or shut down an IGMP interface

1 Choose Routing from the navigation tree view selector.

2 Navigate to the IGMP icon. The path is Routing→Router→Routing Instance→IGMP.

3 Right-click on the interface icon and choose Properties. The IGMP Site (Edit) form opens.

4 Click on the Interfaces tab.

5 Turn up or shut down the IGMP interface.

   a Click on the Turn Up button to activate the interface. A dialog box appears.

   b Click on the Shut Down button to deactivate the interface. A dialog box appears.

6 Click on the Yes button to confirm the action and close the dialog box.

7 Close the IGMP Site (Edit) form.

Procedure 23-50 To view IGMP multicast reporting statistics for an IGMP site

See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

1 Choose Manage→Networking→Routing Instances from the 5620 SAM main menu. The Manage Routing Instances form opens.

2 Choose IGMP Site (IGMP) from the Select Object Type drop-down menu.

3 Click on the Search button. A list of IGMP sites appears.

4 Choose a site from the list and click on the Properties button. The IGMP Site form opens with the General tab displayed.

5 Click on the Show IGMP Multicast Reporting Statistics button. If the Show IGMP Multicast Reporting Statistics button is not visible, click on the More Actions button and choose Show IGMP Multicast Reporting Statistics. The IGMP IGMP Stats Show IGMP Multicast Reporting Statistics form opens.

6 Configure the IP address, if required.

7 Click on the OK button. The contents of the IGMP multicast report are displayed.

8 Close the IGMP IGMP Stats Show IGMP Multicast Reporting Statistics form.

Procedure 23-51 To view IGMP source statistics

See the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Click on the Search button to display a list of services.

3 Choose a service from the list and click on the Properties button. The Service (Edit) form opens with the General tab displayed.

4 Click on the Sites tab to display a list of sites.

5 Choose a site from the list and click on the Properties button. The Site (Edit) form opens with the General tab displayed.

6 Click on the Multicast tab.

7 Click on the Group Interfaces tab to display a list of group interfaces.

8 Choose a group interface from the list and click on the Properties button. The IGMP Group Interface (Edit) form opens with the General tab displayed.

9 Click on the Group Interface SAP tab.

10 Choose a group interface SAP from the list and click on the Properties button. The Group Interface SAP (Edit) form opens with the General tab displayed.

11 Click on the Group tab.

12 Click on the Search button to display a list of groups.

13 Choose a group from the list and click on the Properties button. The Group Interface SAP Group (View) form opens with the General tab displayed.

14 Click on the Source tab.

15 Click on the Search button to display a list of sources.

16 Close the Group Interface SAP Group (View) form.

17 Click on the Statistics tab.

18 Click on the Collect button to collect additional statistics.

19 Choose a statistics record from the list and click on the Properties button. The Statistics Record - Group Interface SAP Stats form opens.

20 Review the statistics and close the Statistics Record - Group Interface SAP Stats form.

21 Close the IGMP Group Interface SAP (Edit) form.

22 Close the IGMP Group Interface (Edit) form.

23 Close the Site (Edit) form.

24 Close the Service (Edit) form.

25 Close the Manage Services form.

23.25 MSDP configuration procedures

The MSDP command hierarchy consists of three levels:

- global level
- peer level and group level
- group peer level

MSDP parameters are initially applied at the global level. The parameters are inherited by the group and peer levels. Parameters can be modified and overridden on a level-specific basis.

The following procedures describe how to configure MSDP.

Procedure 23-52 To enable MSDP on a router

1 Choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance.

3 Right-click on the routing instance icon and choose Properties. The Routing Instance (Edit) form opens.

4 Enable MSDP by performing the following steps.

i Click on the Multicast tab.

ii Select the MSDP Enabled parameter.

5 Click on the OK button. A dialog box appears.

6 Confirm the action. The Routing Instance (Edit) form closes, and an MSDP icon appears in the navigation tree below the routing instance icon.

Procedure 23-53 To configure global-level MSDP

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the MSDP icon. The path is Routing→Router→Routing Instance→MSDP.

3 Right-click on the MSDP icon and choose Properties. The MSDP (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- SA Limit
- Data Encapsulation
- Local IP Address
- RPF Lookup Sequence
- SA Cache Lifetime (seconds)
- Receive Message Rate
- Receive Message Interval (seconds)
- Receive Message Threshold
- Administrative State

5 Click on the Group tab to add a group, if required. See Procedure 23-54 for more information about how to configure a group-level MSDP.

6 Click on the Peer tab to add a peer, if required. See Procedure 23-56 for more information about how to configure a peer-level MSDP.

7 Click on the Source tab to add a source, if required. See Procedure 23-55 for more information about how to configure an MSDP source.

8 Click on the Import Policies tab.

9 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the import route policy to determine which routes are accepted from peers. The policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 22. There is no validation performed by the router to ensure the policies match.

10 Click on the Export Policies tab.

11 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the export route policy to determine which routes are advertised to peers. The policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 22. A router performs no validation to ensure the policies match.

12 Click on the following tabs to view information.

- Data Source Active
- Data Source Active Rejected
- Statistics
- Faults

13 Click on the OK button. A dialog box appears.

14 Confirm the action. The MSDP (Edit) form closes.

Procedure 23-54 To configure group-level MSDP

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the routing instance icon. The path is Routing→Router→Routing Instance→MSDP.

3 Right-click on the MSDP icon and choose Create Group. The MSDP Peer Group (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Name
- Mode
- SA Limit
- Local IP Address
- Receive Message Rate
- Receive Message Interval (seconds)
- Receive Message Threshold
- Administrative State

5 Click on the Peer tab to add a peer, if required.

6 Click on the Create button. The MSDP Peer Group (Create) form opens.

7 Configure the parameters:

- Peer Address
- SA Limit
- Local IP Address
- Default Peer
- Receive Message Rate
- Receive Message Interval (seconds)
- Receive Message Threshold
- Administrative State

8 Configure the import and export policies for the MSDP peer by performing the following steps.

i Click on the Import Policies tab.

ii Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the import route policy to determine which routes are accepted from peers. The policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 22. There is no validation performed by the router to ensure the policies match.

iii Click on the Export Policies tab.

iv Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the export route policy to determine which routes are advertised to peers. The policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 22. There is no validation performed by the router to ensure the policies match.

9 Click on the Authentication tab.

10 Configure the parameters:

- Type
- Key

11 Click on the OK button. The MSDP Peer Group (Create) form closes and a dialog box appears.

12 Confirm the action. The peer is listed on the MSDP Peer Group (Create) form.

13 Configure the import and export policies for the MSDP group by performing the following steps.

i Click on the Import Policies tab.

ii Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the import route policy to determine which routes are accepted from peers. The policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 22. There is no validation performed by the router to ensure the policies match.

iii Click on the Export Policies tab.

iv Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the export route policy to determine which routes are advertised to peers. The policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 22. There is no validation performed by the router to ensure the policies match.

14 Click on the OK button. The MSDP Peer Group (Create) form closes, and an MSDP Peer Group icon appears in the navigation tree below the MSDP Routing Instance icon.

Procedure 23-55 To configure an MSDP source

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the MSDP icon. The path is Routing→Router→Routing Instance→MSDP.

3 Right-click on the MSDP icon and choose Properties. The MSDP (Edit) form opens with the General tab displayed.

4 Click on the Source tab.

5 Click on the Create button. The MSDP Source (Create) form opens.

6 Configure the parameters:

- IP Prefix
- Mask
- SA Limit

7 Click on the OK button. The MSDP Source (Create) form closes and a dialog box appears.

8 Confirm the action. The source is listed on the MSDP (Edit) form.

9 Click on the OK button. A dialog box appears.

10 Confirm the action. The MSDP (Edit) form closes.

Procedure 23-56 To configure peer-level MSDP

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Navigate to the MSDP icon. The path is Routing→Router→Routing Instance→MSDP.

3 Right-click on the MSDP icon and choose Create Peer. The MSDP Peer (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Peer Address
- SA Limit
- Local IP Address
- Default Peer
- Receive Message Rate
- Receive Message Interval (seconds)
- Receive Message Threshold
- Administrative State

5 Configure the import and export policies by performing the following steps.

i Click on the Import Policies tab.

ii Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the import route policy to determine which routes are accepted from peers. The policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 22. There is no validation performed by the router to ensure the policies match.

iii Click on the Export Policies tab.

iv Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the export route policy to determine which routes are advertised to peers. The policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 22. There is no validation performed by the router to ensure the policies match.

6 Click on the Authentication tab.

7 Configure the parameters.

- Type
- Key

8 Click on the OK button. The MSDP Peer (Create) form closes, and an MSDP Peer icon appears in the navigation tree below the MSDP Routing instance icon.

Procedure 23-57 To configure group-peer-level MSDP

Note — The parameters that you configure for a MSDP peer take precedence over the parameters that are configured for the MSDP peer group.

1 From the 5620 SAM, choose Routing from the navigation tree view selector.

2 Navigate to a peer group. The path is Routing→Router→Routing Instance→MSDP→MSDP Peer Group.

3 Right-click on the peer group icon and choose Create Peer. The MSDP Group Peer, MSDP Peer Group (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Peer Address
- SA Limit
- Local IP Address
- Default Peer
- Receive Message Rate
- Receive Message Interval (seconds)
- Receive Message Threshold
- Administrative State

5 Configure the import and export policies by performing the following steps.

i Click on the Import Policies tab.

ii Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the import route policy to determine which routes are accepted from peers. The policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 22. There is no validation performed by the router to ensure the policies match.

iii Click on the Export Policies tab.

iv Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Configure the export route policy to determine which routes are advertised to peers. The policies should match the policies you set when configuring the Routing Policy Manager, as described in chapter 22. There is no validation performed by the router to ensure the policies match.

6 Click on the Authentication tab.

7 Configure the parameters:

- Type
- Key

8 Click on the OK button. The MSDP Group Peer, MSDP Peer Group (Create) form closes, and an MSDP Group Peer icon appears in the Navigation Tree below the MSDP Peer Group icon.

Procedure 23-58 To enable or disable MSDP peering

1 From the 5620 SAM, choose Routing from the navigation tree view selector.

2 Perform one of the following:

a Enable or disable MSDP peering in a peer group.

i Navigate to an MSDP peer group. The path is Routing→Router→Routing Instance→MSDP→MSDP Peer Group.

ii Right-click on an MSDP Peer Group icon.

b Enable or disable MSDP peering in a group peer.

i Navigate to an MSDP peer group. The path is Routing→Router→Routing Instance→MSDP→MSDP Peer Group→MSDP Group Peer.

ii Right-click on an MSDP Group Peer icon.

3 Choose one of the following menu items:

a Turn Up to activate

b Shut Down to deactivate

A dialog box appears.

4 Click on the Yes button. The state information beside the appropriate MSDP icon changes accordingly.

23.26 MLD configuration procedures

MLD is supported on the 7950 XRS, on a chassis mode C or D, and on the 7750 SR in chassis mode A or B with mixed mode enabled.

The following procedures describe how to configure MLD.

Procedure 23-59 To enable MLD on a routing instance

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Choose Network→Router→Routing Instance.

3 Right-click on the Routing Instance and choose Properties. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the Multicast tab and enable the MLD Enabled check box.

5 Click on the OK button. The Routing Instance (Edit) form closes, and an MLD icon appears in the navigation tree below the routing instance.

Procedure 23-60 To configure MLD on a routing instance or VPRN routing instance

Perform this procedure to configure MLD on a base routing instance or on a VPRN routing instance.

Note 1 — You must first enable MLD on the base routing instance of the VPRN site. See Procedure 23-59.

Note 2 — You must ensure that the VPRN routing instance has an associated L3 access interface, and that the IPv6 Allowed parameter on the interface is enabled. You must add an IPv6 address to the L3 access interface. See Procedures 71-22 and 71-34.

1 Perform one of the following:

- **a** Configure MLD on a base routing instance.
  - **i** From the 5620 SAM GUI, choose Routing from the navigation tree view selector.
  - **ii** Choose Network→Router→Routing Instance→MLD.
  - **iii** Right-click on the MLD icon and choose Properties. The MLD, Routing Instance (Edit) form opens with the General tab displayed.
- **b** Configure MLD on a VPRN routing instance.
  - **i** Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.
  - **ii** Configure the filter criteria. A list of services appears.
  - **iii** Choose a VPRN service.
  - **iv** Click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.
  - **v** On the navigation tree, click on the site to which you need to configure MLD.

vi Expand the Routing Instance - NE System ID icon.

vii Expand the Routing Instance icon.

viii Expand the Protocols icon.

ix Right-click on the Protocols icon and choose Create MLD Site. The MLD Site (Create) form opens with the General tab displayed.

2 Configure the parameters:

- Administrative State
- Query Interval (seconds)
- Last Member Query Interval (seconds)
- Query Response Interval (seconds)
- Robust Count

3 Click on the Apply button to save the changes.

4 Click on the SSM Translation tab, and click on the Create button. The SSM Translation, Routing Instance (Create) form opens.

5 Configure the parameters:

- Start Multicast Address
- End Multicast Address
- Configured Source

6 Click on the OK button. The SSM Translation, Routing Instance (Create) form closes.

7 Click on the OK button. The MLD, Routing Instance (Edit) form closes.

Procedure 23-61 To create an MLD interface on a base routing instance or VPRN routing instance

1 Perform one of the following:

a Create an MLD interface on a base routing instance.

i From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

ii Choose Network→Router→Routing Instance→MLD.

iii Right-click on the MLD icon and choose Create Interface. The MLD Interface, Routing Instance (Create) form opens with the General tab displayed.

b Create an MLD interface on a VPRN routing instance.

i Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

ii Configure the filter criteria. A list of services appears.

iii Choose a VPRN service.

iv Click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

v On the navigation tree, click on the site to which you need to add the routing instance.

vi Expand the Routing Instance - NE System ID icon.

vii Expand the Routing Instance icon.

viii Expand the Protocols icon.

ix Expand the MLD icon.

x Right-click on the MLD instance and choose Create MLD Interface. The MLD Interface, Routing Instance (Create) form opens with the General tab displayed.

2 Configure the Description parameter.

3 Click on the Select button in the Interface panel. The Select Interface - MLD Interface - Routing Instance form opens.

4 Choose a network interface that has IPv6 enabled and click on the OK button. The Select Interface - MLD Interface - Routing Instance form closes.

5 Configure the parameters in the States panel:

- Administrative State
- MLD Version

6 Click on the Behavior tab and configure the parameters:

- Disable Router Alert Check
- Maximum Number of Groups
- Query Interval (seconds)
- Maximum Response Time between Group Messages (seconds)
- Maximum Response Time For MLDv2 (seconds)

7 Click on the Import Policy tab.

8 Click on the Select button to choose an import policy.

9 Click on the Static/Group Source tab and click on the Create button. The MLD Interface Group Source Static (Create) form opens.

10 Configure the parameters:

- Group Address
- Group Source Address

11 Click on the OK button.The MLD Interface Group Source Static (Create) form closes.

12 Click on the SSM Translation tab and click on the Create button. The MLD Interface Source Specific Multicast (Create) form opens.

13 Configure the parameters:

- Start Multicast Address
- End Multicast Address
- Group Source Address

14 Click on the OK button. The MLD Interface, Routing Instance (Create) form closes.

Procedure 23-62 To configure an MLD interface on an IES L3 access interface

Perform this procedure to create an MLD interface on an IES L3 access interface. You must ensure that MLD is enabled on the site NE. See Procedure 23-59.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Ensure that the IPv6 Allowed parameter is enabled.

8 Click on the Addresses tab and perform the following.

i Click on the Create button. The IP Address (Create) form opens.

ii Configure the Address ID parameter with a value greater than 1.

iii Enter an IPv6 address for the IP Address parameter.

iv Configure the Prefix Length parameter.

v Configure the parameters in the IPv6 panel:

- EUI-64
- IP Address Preferred

vi Click on the OK button. A dialog box appears.

vii Click on the OK button.

9 Click on the Multicast tab and perform the following.

i Click on the Add button. The Create Interface form opens.

ii Choose MLD from the drop-down menu and click on the OK button. The Create Interface form closes and the MLD Interface (Create) form opens with the General tab displayed.

iii Configure the Description parameter.

iv Click on the Select button in the Interface panel. The Select Interface - MLD Interface - Routing Instance form opens.

v Choose a network interface that has IPv6 enabled and click on the OK button. The Select Interface - MLD Interface - Routing Instance form closes.

vi Configure the parameters in the States panel:

- Administrative State
- MLD Version

10 Click on the Behavior tab and configure the parameters:

- Disable Router Alert Check
- Maximum Number of Groups
- Query Interval (seconds)
- Maximum Response Time between Group Messages (seconds)
- Maximum Response Time For MLDv2 (seconds)

11 Click on the Import Policy tab and perform the following.

12 Click on the Select button to choose an import policy.

13 Click on the Static/Group Source tab and perform the following.

i Click on the Create button. The MLD Interface Group Source Static (Create) form opens.

ii Configure the parameters:

- Group Address
- Group Source Address

iii Click on the OK button.The MLD Interface Group Source Static (Create) form closes.

14 Click on the SSM Translation tab and click on the Create button. The MLD Interface Source Specific Multicast (Create) form opens.

15 Configure the parameters:

- Start Multicast Address
- End Multicast Address
- Group Source Address

16 Click on the OK button. The MLD Interface Source Specific Multicast (Create) form closes.

17 Close the IES L3 Access Interface (Edit) form.

18 Close the IES Service (Edit) form.

19 Close the Manage Services form.

23.27 Bridging configuration procedures

The following procedures describe how to configure bridging.

Procedure 23-63 To configure bridging on an OmniSwitch

Caution — Changing bridge parameter values may affect the spanning tree calculations and trigger a topology change in the network.

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Locate and expand an object that represents an OmniSwitch. A Bridge Instance object appears below the OmniSwitch object.

3 Right-click on the Bridge Instance object and choose Properties. The Bridge (Edit) form opens with the General tab displayed.

4 Configure the parameters:

- STP Mode
- Path Cost

Configure the Auto VLAN Containment parameter if you the chose the flat STP mode.

5 Configure LPS, if required.

i Click on the Learned Port Security tab. The Learned Port Security General tab is displayed.

ii Configure the parameters:

- Learning Time Window (minutes)
- Status
- Learning Time Window No Aging
- Learning Time Window Bootup Status

Note 1 — The Status parameter does not appear on the form and the Restart Timer option is dimmed until you enter a non-zero value for the Learning Time Window (minutes) parameter.

Note 2 — The Learning Time Window Expiry Status parameter is read-only and appears for OS 6400, OS 6850, OS 6850E, OS 6855, OS 9700E, and OS 9800E NEs.

Note 3 — The Learning Time Window Time Remaining (seconds) parameter is read-only and appears for OS 6900 and OS 10K NEs.

Note 4 — Click on the Restart Timer button to restart the MAC source learning timer if you need to restart dynamic MAC address learning on a port. If the Restart Timer button is not visible, click on the More Actions button and choose Restart Timer.

iii Click on the Ports tab.

iv Click on the Create button to select ports on which you want to enable learned port security. The Select Port - Bridge form opens.

v Choose one or more ports and click on the OK button. The Select Port - Bridge form closes and the selected ports appear in the Ports form.

vi Click on the Apply button to enable learned port security on the selected ports. A dialog box appears.

vii Click on the Yes button.

viii If you need to apply the same LPS properties to multiple ports but do not need to configure static MAC addresses on the ports, go to step 5xxiv.

Note — Static MAC addresses can only be added to LPS-enabled ports individually.

ix Choose a port and click on the Properties button. The Learned Port Security (Edit) form opens.

x Click on the Properties button. The Physical Port (Edit) form opens on the General tab.

xi Click on the LPS Learned MAC Entries tab.

xii Click on the Create button to add static MAC entries. The MAC Entries (Create) form opens.

Note — A port must be LPS-enabled and belong to a VLAN before you can add static MAC addresses.

xiii Click on the Select button. The Select VLAN Site - MAC Entries form opens.

xiv Configure the filter criteria. A list of VLANs appears at the bottom of the Select VLAN Site - MAC Entries form.

xv Choose a VLAN from the list.

xvi Click on the OK button. The Select VLAN Site - MAC Entries form closes.

xvii Configure the MAC Address parameter.

xviii Click on the Apply button to save the configuration.

xix Repeat steps 5xvii to 5xviii if you need to add another static MAC address to the port.

xx Click on the OK button. A dialog box appears.

xxi Click on the Yes button to close the dialog box.

xxii Click on the OK button to close the Physical Port (Edit) form. A dialog box appears.

xxiii Click on the Yes button. Go to step 5xxv.

xxiv Choose multiple ports and click on the Properties button. The Learned Port Security (Edit) form opens.

xxv Configure the parameters:

- Violation
- Administrative State
- Low MAC Range
- High MAC Range
- Max. MAC Addresses to Learn
- Max. Filtered MACs to Learn
- Trap Threshold

xxvi Click on the OK button to save the configuration and close the Learned Port Security (Edit) form.

xxvii If you need to stop the aging out of dynamic MAC addresses on the LPS port, convert the dynamic MAC addresses to static MAC addresses. Choose the port and click on the Convert to Static button. If the Convert to Static button is not visible, click on the More Actions button and choose Convert to Static.

Note — If traffic containing MAC addresses outside of the allowable MAC address range attempts to access an LPS port, the switch either restricts access to the port for that traffic or shuts the port down to all traffic. When this happens, the port is in an operationally violated state and an alarm is raised.

See Procedure 23-64 for information about how to release a violated LPS port.

6 Perform one of the following actions:

a Configure the STP Flat Mode.

b Configure the STP 1x1 Mode; go to step 25.

7 Click on the Spanning Tree tab. The STP Flat Mode CIST General tab is displayed.

8 Configure the parameters:

Caution — Changing the Protocol parameter to MSTP resets the flat bridge priority and path.

- Protocol
- Forwarding Delay (seconds)
- Max Age (seconds)
- Instance BPDU Switching
- Priority
- Hello Time (seconds)
- TX Hold Count

9 Click on the Port tab.

10 Choose one or more ports from the list.

11 Click on the Properties button. The CIST Instance Ports (Edit) form opens.

12 Configure the parameters:

- Priority
- Mode
- Admin Edge
- Restricted Role
- Path Cost
- Connection Type
- Auto Edge
- Restricted TCN

13 Click on the OK button. The CIST Instance Ports (Edit) form closes.

14 Click on the MSTI tab if you need to configure MSTI, otherwise go to step 34.

Note — In order to configure MSTI, the Protocol parameter must be set to MSTP.

15 Click on the Create button. The MST Instance (Create) form opens.

16 Configure the parameters:

- Instance Index
- Priority
- Instance Name
- Auto VLAN Containment

17 Click on the VLAN tab.

18 Click on the Create button to assign a VLAN to the MSTI. The Select VLAN Sites - MST Instance form opens.

19 Choose one or more VLANs from the list and click on the OK button. The VLANs appear on the MST Instance VLAN form.

20 Click on the OK button. A dialog box appears.

21 Click on the Yes button.

22 Click on the MST Region tab.

23 Configure the parameters:

- Region Name
- Region Revision
- Bridge Max Hops

24 Go to step 34.

25 Click on the Spanning Tree tab.

Caution — Changing the STP 1x1 Mode configuration may affect the STP calculations for this instance of the VLAN and trigger a topology change in the network.

26 Click on the STP 1x1 Mode tab.

27 Choose a 1x1 instance from the list and click on the Properties button. The VLAN STP Instance (Edit) form opens with the General tab displayed.

28 Configure the parameters:

- Protocol
- Forwarding Delay (seconds)
- Max Age (seconds)
- Instance BPDU Switching
- Priority
- Hello Time (seconds)
- TX Hold Count

29 Click on the Port tab.

30 Choose one or more ports from the list of ports that have been assigned to VLANs and click on the Properties button. The VLAN STP Instance Ports (Edit) form opens.

31 Configure the parameters:

- Priority
- Mode
- Auto Edge
- Restricted Role
- Path Cost
- Connection Type
- Auto Edge
- Restricted TCN

32 Click on the OK button. The VLAN STP Instance Ports (Edit) form closes.

33 Click on the OK button. The VLAN STP Instance form closes.

34 Click on the TLS tab.

35 Configure the TLS Mode parameter.

36 Click on the QoS tab.

37 Configure the parameters:

- QoS Status
- Trust Ports
- Default Servicing Mode
- Default Bridged Disposition
- Default Routed Disposition
- Default IGMP Disposition

Note — The Default Servicing Mode, Default Bridged Disposition, Default Routed Disposition, and Default IGMP Disposition parameters do not apply to the OS 6900 and OS 10K.

38 Click on the Apply button. A dialog box appears.

39 Click on the Yes button. The applied values for the Default Bridged Disposition, Default Routed Disposition, and Default IGMP Disposition parameters should be the same as the configured values.

40 Click on the IGMP Port Group Limit tab.

41 Configure the filter criteria. A list of ports appears.

Note — Only ports that are active (administratively Up) appear in the list.

42 Choose one or more ports from the list and click on the Properties button.

43 The IGMP Port Group Limit (Edit) or IGMP Port Group Limit - (Multiple Instances) (Edit) form opens.

44 Configure the parameters:

- Port Max Group
- Port Action

45 Click on the OK button.

Note — Click on the Multicast VLAN Port tab in the multicast VLAN IGMP site properties to view the Port Max Group and Port Action parameter information for a multicast VLAN port. You can also view the number of IGMP groups dynamically learned by the port. See Procedure 66-13 for more information.

46 If you need to configure the IGMP port group limit parameters for an inactive (administratively Down) port, click on the Create button. Otherwise, go to step 57.

47 The Select Port form opens.

48 Configure the filter criteria. A list of ports appears.

49 Choose one or more ports from the list and click on the OK button. The Select Port form closes and the selected ports appear in the list of ports.

50 Choose an inactive port from the list and click on the Properties button.

51 Configure the parameters:

- Port Max Group
- Port Action

52 Repeat steps 50 and 51 for each inactive port that you need to configure.

53 Click on the Apply button. A dialog box appears.

54 Click on the Yes button to save your configuration.

Note 1 — The inactive ports do not appear in the list of ports. Only active ports are displayed in the list. You can view the configuration of the inactive ports using the OmniSwitch CLI.

Note 2 — Click on the Multicast VLAN Port tab in the multicast VLAN IGMP site properties to view the Port Max Group and Port Action parameter information for a multicast VLAN port. You can also view the number of IGMP groups dynamically learned by the port. See Procedure 66-13 for more information.

55 Click on the MVRP tab to configure MVRP (if required).

56 Configure the parameters:

- VLAN Registration Protocol Type
- Status
- Transparent Switching Status
- Max VLAN

57 Click on the OK button. A dialog box appears.

58 Click on the Yes button. The Bridge (Edit) form closes.

Procedure 23-64 To release a violated OmniSwitch LPS port

Perform the following procedure to release a violated LPS port.

1 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

2 Locate and expand an object that represents an OmniSwitch. A Bridge Instance object appears below the OmniSwitch object.

3 Right-click on the Bridge Instance object and choose Properties. The Bridge (Edit) form opens with the General tab displayed.

4 Click on the Learned Port Security tab. The Learned Port Security General tab is displayed.

5 Click on the Port tab.

6 Select one or more violated LPS ports. Violated LPS ports are highlighted in orange. When you select one or more violated ports the Release Violated Port option is enabled.

7 Click on the Release Violated Port button to release the selected ports. If the Release Violated Port button is not visible, click on the More Actions button and choose Release Violated Port. Releasing a violated port restores the port to the same operational state it was in before the violation. When a violated port is released, all MAC addresses known to the port are flushed from the switch MAC address table.

8 Close the Bridge (Edit) form.

23.28 WPP configuration procedure

The following procedure describes how to configure WPP.

Procedure 23-65 To create a web portal

1 Enable WPP on a routing instance as described in Procedure 22-1.

2 From the 5620 SAM GUI, choose Routing from the navigation tree view selector.

3 Navigate to the WPP instance icon. The path is Routing→Router→Routing Instance→WPP.

4 Right-click on the WPP icon and choose Create Web Portal. The Web Portal - Routing Instance (Create) form appears with the General tab displayed.

5 Configure the parameters:

- Name
- IP Address
- Administrative State

6 Click on the OK button. A dialog box appears.

7 Click on the OK button. The Web Portal - Routing Instance (Create) form closes.

24 — NAT

24.1 NAT overview *24-2*

24.2 Workflow to configure NAT *24-6*

24.3 NAT configuration procedures *24-6*

24.1 NAT overview

Network Address Translation, or NAT, rewrites address information in IP packets that travel between private and public networks. NAT effectively extends the public IPv4 address space; multiple end users can share one IP address. NAT provides security by preventing an internal IP address, such as an end-user address, from entering a public network.

NAT translates internal, or private, host IP address and TCP port values to external, or public, values. When NAT receives a packet from an internal host, it replaces the source address information in the packet with public address information, and forwards the packet to the destination. NAT assigns private IP addresses and ports dynamically using values from an allocated pool, but can also use values that are statically assigned to internal hosts, depending on the type of NAT deployment.

The 5620 SAM NAT support includes:

- policy-based management
- subscriber-specific implementation
- configurable port usage limits per subscriber, address range, or policy
- reserved port ranges for specified forwarding classes that are exempt from port usage limits
- configurable protocol timeout periods for efficient resource management

The NAT configuration on a routing instance includes:

- one or more NAT address pools that are associated with local ISA-NAT groups
- a NAT policy that specifies port ranges and operational parameters
- host address match criteria
- one or more NAT destinations

A 5620 SAM operator assigns port ranges in an address pool configuration. Port ranges specify the number of ports that are allocated to a subscriber for mapping to host sessions. If all ports for a subscriber are in use, additional port assignments cannot occur and host sessions are rejected. This function helps to prevent the flooding of NAT by a virus attack or multiple peer-to-peer file transfers. You can override a port range limit by configuring a range of reserved ports that are assigned based on the traffic forwarding class.

Note — You cannot use ports 0 to 1023, which are called the well-known ports or privileged ports, in a NAT configuration.

To provide equitable and timely NAT resource allocation to hosts, you can specify timeout values in a NAT policy for protocols such as ICMP, TCP, and UDP. NAT ends a host session after the timeout period, for example, when a TCP handshake takes an excessive amount of time.

The NAT drain function is a mechanism that is used to gracefully remove the host sessions associated with an address range in a NAT address pool. When an address range is in the draining state, NAT drops new session requests for the address range. After an existing session associated with a draining address range closes, a new session for the same host is created using a different address range. The drain

function removes an address range only when there are no sessions associated with the address range. See Procedure 24-10 for information about using the NAT drain function.

You can view general NAT statistics, for example, address pool allocation and session counts for different protocols on the Statistics tab of an ISA-NAT group member properties form.

Note — The 5620 SAM does not record detailed NAT session information such as session duration or packet counts. You can obtain this information from a request to a participating NE.

The 5620 SAM supports the following NAT deployment types:

- L2-aware—Hosts of the same subscriber can share a private address, and are assigned public addresses from a pool in a base routing instance.
- large-scale—Each host can have a unique static or dynamic private address, and is assigned a public address from a pool in a VPRN routing instance.

L2-aware NAT

In L2-aware NAT, a NAT policy is associated with a subscriber profile that is applied to an IES SAP. The policy specifies an address pool on the base routing instance. When DHCP assigns a private IP address that is in an L2-aware NAT address range, NAT assigns a public IP address to the host packets. See chapter 70 for information about configuring NAT in an IES.

Note 1 — A NAT configuration on a base routing instance applies to each IES site on the NE.

Note 2 — A NAT policy that is specified in a subscriber profile redirects the IPv4 traffic for the subscriber to NAT.

Large-scale NAT

Large-scale NAT, or LSN, is required when each host in a customer VPRN service has a unique private IP address and requires a unique public IP address, for example, in mobile network deployments. Large-scale NAT is used between routing instances. A customer VPRN routing instance provides host access and forwards packets through NAT to a VPRN or through an IES to an NE routing instance, which provides public network access.

A VPRN routing instance requires an ACL IP filter or static route to transmit host traffic through the NAT function, and uses an address pool in the VPRN routing instance. You can configure large-scale NAT to statically and dynamically assign private addresses. See chapter 71 for information about configuring NAT in a VPRN service. See "Static port forwarding" in this section for more information about configuring NAT to use static private addresses.

You can use the 5620 SAM Statistics Plotter to plot real-time LSN subscriber host statistics on a base or VPRN routing instance. See Procedure 24-9 for information.

Static port forwarding

In a large-scale NAT deployment, you can configure NAT to assign static private addresses to subscriber hosts using static port forwarding. Static port forwarding ensures that an internal host uses the same private IP address and port each time they connect to the network. You can use the 5620 SAM to configure static port forwarding for TCP and UDP independently.

A standby routing instance can be specified to create static port forwards for pools in a redundant configuration. The 5620 SAM identifies the active pool from the two specified NEs and creates a static port forward on the active pool. In the event of a wildcard static port forward request, if there is a switch-over of the active pool, the 5620 SAM attempts to create the static port forward on the other pool. If there is a second pool switch-over, the static port forward is not created.

See chapter 71 for information about configuring static port forwarding in a VPRN service. See chapter 65 for information about configuring L2Aware static port forwarding on a residential subscriber instance.

Dynamic block reservation

To prevent starvation of dynamic port blocks for subscribers that use static port forwarding, dynamic port blocks can be reserved for the lifetime of the static port forward. Dynamic port blocks are associated with the same inside IP addresses that are associated with the static port forward. A log entry is not generated until the dynamic port block is used.

At the time of static port forward creation:

- If the corresponding dynamic port block mapping (same inside IP address) does not exist, dynamic port block(s) are reserved and associated with the same inside IP addresses used in the static port forward. No log entries are generated for the reserved dynamic port blocks.
- If corresponding dynamic mappings (relative to the inside IP address) exist, the existing port block is reserved (or kept) after the last mapping within it has expired. The reserved dynamic port block(s) continue to be associated with the same inside IP address until the static port forward is deleted. A log entry is generated when the last mapping in the dynamic port block expires (even if the dynamic port block continues to be reserved).

NAT pools

A NAT pool is a range of public IP addresses that are translated to inside private IP addresses in a Large Scale or L2 Aware NAT configuration. A NAT pool is required in order to configure a NAT policy, as well as static port forwarding, DS Lite, and NAT 64.

NAT policies

A NAT policy defines general NAT properties and associates a NAT address pool with an ISA-NAT group on the same NE. A NAT policy is associated with a subscriber profile for L2-aware NAT in an IES or VPRN service, or for large-scale NAT in a VPRN service.

A NAT pool must be assigned to the local NAT policy before the NAT policy can be associated with the NAT configuration. A NAT policy is required in order to configure DS Lite, NAT 64, and NAT subscriber identification.

ISA-NAT groups

An ISA-NAT group provides a redundant NAT function for routing instances using ISA Broadband Applications MDAs. The group can contain up to six MDAs in a warm redundancy configuration. For an ISA-NAT group to be operational, at least one member MDA must be in the active role. See the NE documentation for more information about NAT deployment.

Note 1 — You can install an ISA-NAT Broadband Applications MDA in an IOM3-XP.

Note 2 — The same ISA Broadband Applications MDA can belong to an ISA-NAT group and an ISA-LNS group.

NAT Destinations

A NAT destination prefix applies NAT to all traffic that matches a given route. A NAT Destination cannot be configured in conjunction with a NAT policy that points to a NAT pool that resides in the same service. Such a configuration would result in a routing loop.

NAT 64

NAT 64 allows IPv6 hosts to connect to IPv4-only servers, mapping their inside IPv6 addresses to outside IPv4 addresses. NAT 64 configuration requires support for IPv6 (chassis mixed mode) on the NE. You must assign a NAT policy to the NAT configuration before enabling NAT 64. IP fragmentation can be configured to allow IPv6 packet fragmentation before transmission.

DS Lite

DS Lite is intended for network operators that have an IPv6-only access network, but IPv4-only CPEs. The inside IPv4 host information is encapsulated into a 4to6 tunnel that runs over the IPv6 network. At the other end, the IPv4 address is de-encapsulated and translated to an outside IPv4 address via CGN. You must assign a NAT policy to the NAT configuration before enabling DS Lite. IP fragmentation can be configured to allow IPv6 packet fragmentation before transmission if the packets are larger than the tunnel MTU for a given DS Lite address.

Deterministic NAT

Deterministic NAT is a mode of operation in which the inside IP address and source ports are deterministically mapped to the outside IP address and port range at the time of configuration. Each inside IP address is permanently mapped to an outside IP address and a dedicated port block. The dedicated port block is referred to as the deterministic port block. Deterministic mapping can be automatically extended by a dynamic port block in cases where a deterministic port range runs out of ports. Because a simple formula is used to determine the inside IP address based on the outside IP address and port, there is no need for NAT logging.

The NAT deterministic script generates an offline calculation of the deterministic NAT map entries. You can save the script results to a folder on a remote server by specifying a URL for the server in the local NE properties.

In the 5620 SAM, inside IP addresses are configured in the form of prefixes. Any inside prefix on any routing instance can be mapped to any deterministic pool on any routing instance, including the deterministic pool in which the inside prefix is defined. The mapping between the inside prefix and the deterministic pool is achieved through a NAT policy that is referenced for each individual prefix. IP addresses from the prefixes on the inside are distributed over the IP addresses defined in the outside pool referenced by the NAT policy.

A port block is a collection of ports that is assigned to a subscriber. A deterministic LSN subscriber can have only one deterministic port block that can be extended by multiple dynamic port blocks. All port blocks for an LSN subscriber must be allocated from a single outside IP address.

A port range is a collection of ports that can spawn multiple port blocks of the same type. For example, a deterministic port range includes all ports that are reserved for deterministic consumption. A dynamic port range is a total collection of ports that can be allocated in the form of dynamic port blocks.

24.2 Workflow to configure NAT

1. Provision an ISA-NAT group on an ISA MDA. See Procedure 24-1.
2. Configure a NAT policy. See Procedure 24-2.
3. Associate a NAT policy with a subscriber profile. See Procedure 54-18.
4. Configure NAT on a routing instance. See Procedure 24-3.

24.3 NAT configuration procedures

The following procedures describe how to configure NAT.

Procedure 24-1 To configure an ISA-NAT group

Perform this procedure to create and configure an ISA-NAT group.

1. Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.
2. Expand an NE object in the equipment navigation tree.
3. Expand the Logical Groups object in the equipment navigation tree.

4 Perform one of the following:

a To create an ISA-NAT group, right-click on the ISA-NAT Groups object and choose Create ISA-NAT Groups. The ISA-NAT Group (Create) form opens with the General tab displayed. Configure the Group Number parameter.

b To configure an ISA-NAT group, expand the ISA-NAT Groups object, right-click on the ISA-NAT group that you want to configure and choose Properties from the contextual menu. The ISA-NAT Groups (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Description
- Active MDA Limit
- Reservation Count
- Session Watermark High
- Session Watermark Low
- Current OLC State
- Revert OLC State

The Current OLC State and Revert OLC State parameters are configurable when you click on the Apply button on the ISA-NAT Group form.

6 Click on the Select button beside the RADIUS Accounting Policy parameter. The Select Policy - ISA-NAT Group form opens with a list of available NAT RADIUS accounting policies.

7 Select a NAT RADIUS accounting policy from the list and click on the OK button. The Select Policy - ISA-NAT Group form closes and the ISA-NAT Group form reappears with the RADIUS accounting policy information displayed.

8 Click on the Apply button. The ISA-NAT Group form refreshes with additional tabs.

9 Click on the ISA-NAT MDA tab.

10 Click on the Create button. The ISA-NAT Group MDA (Create) form opens.

Note — You can configure up to six ISA-NAT group members. Each group member must be an ISA Broadband Applications MDA.

11 Click on the Select button. The Select Daughter Card form opens.

12 Choose an MDA in the list and click the OK button. The Select Daughter Card form closes, and the ISA-NAT Group MDA (Create) form displays the MDA identifier in the Slot Name field.

13 Click on the OK button. The ISA-NAT Group MDA (Create) form closes and a dialog box appears.

14 Click on the OK button. The ISA-NAT Group form lists the MDA.

15 Repeat steps 10 to 14 to configure another ISA-NAT Group MDA, if required.

16 Click on the General tab.

17 Configure the Administrative State parameter.

Note — You can set the Administrative State parameter to Up only when the ISA-NAT group contains at least one MDA and when the Active MDA Limit parameter is set to a value greater than 0.

18 Click on the OK button. A dialog box appears.

19 Click on the Yes button. The ISA-NAT Group form closes.

Procedure 24-2 To configure a NAT policy

Perform this procedure to configure a NAT policy for a large-scale or L2-aware NAT implementation.

1 Choose Policies→ISA Policies→NAT from the 5620 SAM main menu. The NAT Policies form opens.

a Create a new NAT policy by clicking on the Create button. The NAT Policy (Create) form appears with the General tab displayed.

b Configure an existing NAT policy by clicking on an item in the list and clicking on the Properties button. The NAT Policy (Edit) form appears with the General tab displayed.

2 Configure the parameters:

- Displayed Name
- Description
- Filtering
- ALG Protocols
- UDP Inbound Refresh
- TCP Maximum Segment Size
- Port Reservation Count
- High Watermark (%)
- Low Watermark (%)
- Max Port Blocks
- Max Port Forwarding Entries
- Session Limit
- Reservation Count
- Session High Watermark (%)
- Session Low Watermark (%)
- Priority Session Forwarding Class Set
- TCP Established
- TCP Transitory
- TCP Syn
- TCP Time Wait
- ICMP Query
- SIP
- UDP
- UDP Initial
- UDP DNS

3 Click on the Select button in the IPFIX Export Policy panel and choose an IPFIX export policy from the Select IPFIX Export Policy form.

4 Click on the Distribute button to manually distribute the policy locally to devices. If the Distribute button is not visible, click on the More Actions button and choose Distribute. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button, or the Distribute option under the More Actions button, is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 42 for more information.

5 Assign a NAT pool to a local definition of the policy, as required.

Note — The policy must be distributed to the NE on which the NAT pool is configured before the local definition of the policy can be configured.

i Click on the Local Definitions tab.

ii Click on the Search button. A list of NEs to which the policy has been distributed appears.

iii Click on an item in the list and click on the Properties button. The NAT Policy, Local Policy form appears.

iv Ensure that the Distribution Mode field of the local policy is set to Local Edit Only. Click on the Switch Mode button to change the distribution mode.

v Click on the Select button next to the Router Name field and choose a NAT pool from the Select NAT Pool dialog box.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The NAT Policy form closes.

8 Close the NAT Policies manager.

Procedure 24-3 To configure NAT on a routing instance

Perform this procedure to configure NAT on a base routing instance, or on a VPRN routing instance.

1 Choose Routing from the navigation tree view selector.

2 Navigate to a routing instance by choosing Network→NE→Routing Instance.

3 Right-click on the Routing Instance icon and choose Properties from the contextual menu. The Routing Instance (Edit) form opens with the General tab displayed.

4 Click on the NAT tab.

5 On the NAT Configuration sub-tab, do one of the following:

a Create a new NAT configuration by clicking on the Create button. The NAT Configuration (Create) form appears with the Outside tab displayed.

b Configure an existing NAT configuration by clicking on an item in the list and clicking on the Properties button. The NAT Configuration (Edit) form appears with the Outside tab displayed.

Click on the Hints button at the bottom of the form to display information about the various components and options available to a NAT configuration.

6 Configure the MTU parameter.

7 Use the Select button to choose an ACL filter from the Select Upstream IP Filter form, if required.

8 Configure NAT pools, as required.

i Click on the Create button to create a new NAT pool, or select an existing NAT pool in the list and click on the Properties button. The NAT Pool form appears with the General tab displayed.

ii Configure the parameters, as required:

- Displayed Name
- Description
- Subscriber Limit
- Deterministic NAT Port Reservation
- Port Forwarding Dynamic Block Reservation
- Exported Address Prefix
- Prefix Length
- Monitored Address Prefix
- Prefix Length
- NAT Pool Type
- Administrative State
- Pool Mode
- Port Reservation Type
- Port Reservation Value
- Port Forward Range End
- High Watermark (%)
- Low Watermark (%)

Note — The Deterministic NAT Port Reservation and Port Forwarding Dynamic Block Reservation parameters are mutually exclusive. If one is configured, the other is disabled. The Port Forwarding Dynamic Block Reservation parameter applies only to large scale NAT pools.

iii Click on the Select button and choose an ISA-NAT group from t Select ISA-NAT group form.

iv Click on the NAT Pool Ranges tab.

v Click on the Create button. The Pool Range form opens.

vi Configure the parameters:

- Description
- Range Start
- Range End

vii Click on the OK button. A dialog box appears.

viii Click on the OK button. The Pool Range form closes, and the NAT Pool form lists the pool range.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The NAT Pool form closes, and the NAT Configuration form lists the NAT pool.

xi Repeat steps i to x to add another pool, if required.

9 Click on the Inside tab. The General sub-tab is displayed.

i Configure Deterministic NAT parameters, if required.

- Classic LSN Maximum Subscriber Limit
- DS Lite Maximum Subscriber Limit

ii Click on the Select button and choose a NAT policy from the Select NAT policy form.

Note — The NAT policy you choose must be distributed to the local NE, and the local definition of the NAT policy must be configured with a NAT pool. See Procedure 24-2.

iii Click on the Apply button. A dialog box appears. Click on the Yes button.

iv Configure the parameters, if required.

- NAT 64 Enabled

Redundancy panel:

- Peer Address
- Steering Route Address Prefix
- Prefix Length

DS Lite panel:

- Administrative State
- Subscriber Prefix Length

NAT Subscriber Identification panel:

- Description
- Administrative State
- Drop Unidentified Traffic

v In the RADIUS Proxy Server panel, click on the Select button next to the Routing Instance field and choose a routing instance from the Select Routing Instance form.

vi Click on the Select button next to the RADIUS Proxy Server Name field and choose a RADIUS proxy server from the RADIUS Proxy Server form.

Note — The selection of the RADIUS Proxy Server Name is dependent on the selected routing instance. You can select only servers enabled for accounting.

vii In the RADIUS Vendor Information panel, click on the Select button next to the Attribute Type field and choose an attribute type from the Select RADIUS Attribute form. The attribute type information is displayed in the fields of the RADIUS Vendor Information panel.

10 Perform the following steps to add an IP address for L2-aware NAT forwarding, as required.

i Click on the L2 Aware IP Addresses sub-tab.

ii Click on the Create button. The L2 Aware IP form opens.

iii Configure the parameters:

- IP Address
- Prefix Length

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The L2 Aware IP form closes, and the NAT Configuration form lists the IP address.

vi Repeat steps ii to v to add another IP address, if required.

11 Perform the following steps to add a DS Lite address, as required.

i Click on the DS Lite Address sub-tab.

ii Click on the Create button. The Dual Stack Lite Address form opens.

iii Configure the and parameters.

- AFTR IP Address
- Tunnel MTU
- Address IP Fragmentation

Note — If address IP fragmentation is enabled, the Tunnel MTU parameter value must be equal to or greater than 1232 bytes.

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Dual Stack Lite Address from closes and the NAT Configuration form lists the DS Lite address.

12 Perform the following steps to configure NAT 64, as required.

Note — In order to configure NAT 64, you must have configured the NAT 64 Enabled parameter in step 9.

i Click on the NAT 64 sub-tab.

ii Configure the Administrative State and Subscriber Prefix Length parameters.

iii If the Administrative State parameter was set to Out Of Service in step ii, configure the following parameters:

- Nat Destination Prefix
- Nat Destination Prefix Length
- IPv6 MTU
- Drop UDP With Zero Checksum
- Ignore IPv6 TC and Set IPv4 ToS
- Ignore IPv4 ToS and Set IPv6 TC
- Insert IPv6 Fragment Header
- IP Fragmentation

Note — If IP fragmentation is enabled, the IPv6 MTU parameter value must be equal to or greater than 1280 bytes.

13 Perform the following steps to add an inside NAT destination address, as required.

i Click on the Destination Prefixes sub-tab.

ii Click on the Create button. The Destination Prefix form opens.

iii Configure the parameters:

- IP Address
- Prefix Length

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Destination Prefix form closes, and the NAT Configuration form lists the destination address.

vi Repeat steps ii to v to add another destination address, if required.

14 Perform the following steps to add an inside NAT deterministic prefix, as required.

Note — In order to configure a NAT deterministic prefix, you must have configured one of the Deterministic NAT parameters in step 9.

i Click on the Deterministic Prefixes sub-tab.

ii Click on the Create button. The Deterministic NAT Prefix form opens.

iii Configure the parameters:

- Subscriber Type
- Prefix Address
- Prefix Length
- Administrative State
- Map Creation Disabled

iv Click on the Select button next to the NAT Policy field and choose a NAT policy from the Select NAT Policy form.

v In the Deterministic Map panel, click on the Create button. The Deterministic NAT Map form opens.

vi Configure the parameters:

- Start Address
- End Address
- To Address

vii Click on the OK button. The Deterministic NAT Prefix form is updated with the new deterministic map.

viii Repeat steps v to vii to add another deterministic map, if required.

ix Click on the OK button in the Deterministic NAT Prefix form. The form closes, and the NAT Configuration form lists the deterministic prefix.

x Repeat steps ii to ix to add another deterministic prefix, if required.

15 Perform the following steps to configure NAT port forwarding, if required.

i Click on the NAT Port Forwarding tab.

ii Click on the Static sub-tab.

iii Click on the Create button. The NAT Static Port Forwarding form opens.

iv Configure the parameters:

- Type
- Inside IP Address
- Outside IP Address
- Inside Port
- Protocol
- Outside Port
- Lifetime (seconds)
- B4 Address
- AFTR Address

Note — You cannot specify the same set of Inside Port and Protocol values in more than one static port mapping to an Inside IP Address.

You can specify the same Outside Port value in multiple mappings to an Inside IP Address.

The B4 Address and AFTR Address parameters apply only to DS Lite LSN configurations.

v If a redundant pool configuration is in use, click on the Select button next to the Routing Instance field and choose the site of the standby pool from the Select Routing Instance form.

vi Click on the OK button. The NAT Static Port Forwarding form closes, and the NAT Configuration form lists the new entry.

vii Repeat steps iii to vi to assign large scale NAT static port forwards, if required.

16 Synchronize NAT static port forwards, if required.

i Click on the Static sub-tab.

ii Configure the Resync Static and Dynamic parameter, if required. If this parameter is enabled, both static and dynamic forwarders are retrieved from the NE.

Static port forwards are persisted in the 5620 SAM database. Dynamic port forwards are retrieved from the NE, and are retained in the 5620 SAM GUI only for the duration of the current session.

iii Click on the Resync NAT Port Forward button. A confirmation dialog box appears.

iv Click on the Yes button.

17 Click on the OK button. A dialog box appears.

18 Click on the Yes button. The NAT Configuration form closes, and the NAT configuration is listed on the Routing Instance form.

Procedure 24-4 To configure a NAT deterministic script on a remote server

1 Choose Equipment from the navigation tree view selector.

2 Right-click on the NE on which you want to configure a NAT deterministic script and choose Properties. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab.

4 Click on the Subscriber Management tab.

5 Configure the Remote URL parameter using the following syntax:

[{ftp://|tftp://}<*login*>:<*password*>@<*remote_address*>/]
[<*path_file*>]

where...

<*login*> is the login name of the remote server.

<*password*> is the login password of the remote server.

<*remote_address*> is the IP address of the remote server.

<*path_filename*> is the path to the folder on the remote server where the mappings are stored.

6 Click on the Apply button and then confirm the change.

7 Click on the Save Script button to save the current deterministic NAT mappings to a file on the specified remote server.

8 If required, click on the Resync button to update the read-only information in the Save Needed, Last Saved Result, and Last Saved Time fields.

If a change occurs on the local NE that affects the deterministic NAT mappings, the Save Needed parameter changes to Yes, indicating that you must click on the Save Script button to update the mappings.

9 Click on the OK button. A dialog box opens.

10 Click on the Yes button. The Network Element (Edit) form closes.

Procedure 24-5 To create an IPFIX export policy

Use this procedure to create an IPFIX export policy for use with an NAT policy.

1 Choose Policies→IPFIX Export Policy from the 5620 SAM main menu. The IPFIX Export Policy form opens.

2 Click on the Create button. The IPFIX Export Policy (Create) form appears.

3 In the General tab, configure the following parameters:

- Displayed Name
- Description

4 Click on the IPFIX Collectors tab.

5 Click on the Create button to create a new collector definition. The IpfixCollector form opens.

6 Configure the following parameters:

- Displayed Name
- Administrative State
- Router Instance Type
- IPFIX Collector Address
- IPFIX Collector Source Address
- Default
- MTU
- Refresh Timeout

7 If you specified a Router Instance Type of VPRN, perform the following:

   i Click on the Select button. The Select vprnPointer form opens.

   ii Configure the filters and click on the Search button. A list of VPRN pointers appears.

   iii Select a VPRN pointer and click on the OK button.

8 Click on the OK button. The IpfixCollector form closes.

9 Click on the Apply button. The policy is saved and is ready to be distributed.

Procedure 24-6 To view reserved IP address and reserved block information on an ISA-NAT group

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the ISA-NAT group object where you want to view reserved IP address and reserved block information. The path is Network→*NE*→Logical Groups→ISA-NAT Groups→ISA-NAT Group *n*.

3 Right-click on an ISA-NAT Group *n* icon and choose Properties. The ISA-NAT Group (Edit) form opens with the General tab displayed.

4 Click on the ISA-NAT Members tab.

5 Click on the Search button. A list of ISA-NAT members is displayed.

6 Select an ISA-NAT member from the list and click on the Properties button. The ISA-NAT Member form opens with the General tab displayed.

7 Reserved IP address and reserved block information is viewable under the following read-only parameters:

- IP Addresses Reserved
- Blocks Reserved

   Click on the Resync button to update the IP Address Reserved and Blocks Reserved values to the most recent information available on the MDA.

8 Click on the Close button. The ISA-NAT Member form closes.

9 Close the ISA-NAT Group (Edit) form.

Procedure 24-7 To view ISA-NAT object information

Use this procedure to perform an on-demand retrieval of large-scale NAT entries, based on a routing instance ID. Search results can be further constrained by specifying an inside address (for a classic LSN host, DS Lite subscriber, or NAT64 subscriber) or an outside address and start port number (for an LSN block allocation).

1 Click Manage→ISA Functions→ISA-NAT. The Manage ISA-NAT form appears.

2 Select an object type from the drop-down list:

- Classic LSN Host
- DS Lite Subscriber
- ISA-NAT Group
- LSN Block Allocation
- NAT64 Subscriber

3 Depending on the object type you selected in step 2, configure the following parameters, as required:

- Site ID
- Routing Instance
- Inside Address
- Outside Address
- Start Port #

4 Click on the Search button. A list of ISA-NAT object entries is displayed.

5 Select an entry in the list and click on the Properties button. A read-only object properties form appears.

6 Review the information and click on the Cancel button to close the form.

7 Click on the Close button. The Statistics Record form closes.

8 Close the Manage ISA-NAT form.

Procedure 24-8 To configure statistics on an ISA-NAT group

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the ISA-NAT group object where you want to configure statistics. The path is Network→*NE*→Logical Groups→ISA-NAT Groups→ISA-NAT Group *n*.

3 Right-click on the ISA-NAT Group *n* icon where you want to configure statistics and choose Properties. The ISA-NAT Group (Edit) form opens with the General tab displayed.

4 To configure ISA Member statistics, ISA Member Usage statistics, or Policy statistics, click on the ISA-NAT MDA tab.

Note — You can also collect ISA NAT Member statistics or ISA NAT Member Usage statistics (but not NAT Policy statistics) from the ISA-NAT Members tab. The procedure for collecting statistics is the same as is outlined below.

5 Click on the Search button. A list of ISA-NAT MDAs is displayed.

6 Select an ISA-NAT MDA from the list and click on the Properties button. The ISA-NAT Group MDA (Edit) form opens.

7 Click on the Statistics tab.

8 In the Select Object Type area, choose one of the following from the contextual menu:

- ISA NAT Member Stats
- ISA NAT Member Usage Stats
- NAT Policy Stats

9 Click on the Collect button.

10 A statistics record appears on the ISA-NAT Group MDA (Edit) form. Select the record.

11 Click on the Properties button. The Statistics Record form opens.

12 View the read-only statistics parameter values for the ISA-NAT group MDA.

13 Click on the Close button. The Statistics Record form closes.

14 Close the ISA-NAT Group MDA (Edit) form.

15 Close the ISA-NAT Group (Edit) form.

Procedure 24-9 To plot LSN subscriber host statistics

Perform this procedure to view LSN subscriber host statistics data in graphical form.

Note — You can plot only real-time statistics data for a subscriber host. The 5620 SAM does not retain historical subscriber host information.

1 Perform one of the following.

   a Plot the statistics data from a base routing instance. Perform the following steps.

      i Choose Routing from the navigation tree view selector.

      ii Navigate to a routing instance. The path is Network→NE→Routing Instance.

      iii Right-click on the Routing Instance icon and choose Properties from the contextual menu. The Routing Instance (Edit) form opens with the General tab displayed.

   b Plot the statistics data from a VPRN routing instance. Perform the following steps.

      i Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

      ii Configure the filter criteria, as required, and click on the Search button. A list of services is displayed.

      iii Select a VPRN service in the list and click on the Properties button. The VPRN Service (Edit) form opens.

      iv Expand the Sites object in the service navigation tree.

      v Select a routing instance in the service navigation tree. The Site (Edit) form opens.

2 Click on the NAT tab.

3 Perform one of the following.

   a To plot host statistics for a DS Lite subscriber, click on the NAT DS Lite Subscribers tab.

   b To plot host statistics for a NAT 64 subscriber, click on the NAT64 Subscribers tab.

   c To plot statistics for classic LSN hosts, click on the Classic LSN Hosts tab.

4 Click on the Search button. A list of subscriber hosts is displayed.

5 Select a subscriber host in the list and click on the Properties button. The subscriber host properties form opens.

6 Click on the More Actions button and choose Plotter→New Plot. The Statistics Plotter window opens.

See "Graphing statistics" in the *5620 SAM Statistics Management Guide* for information about using the 5620 SAM Statistics Plotter.

7 View the plotted statistics data.

Save the tabular data or plot graph, as required.

8 Close the open forms.

Procedure 24-10 To start or stop a NAT address-pool drain operation

Perform this procedure to control the removal, or draining, of the host sessions associated with a NAT pool address range.

1 Choose Routing from the navigation tree view selector. The navigation tree displays the routing view.

2 Navigate to a routing instance that has one or more configured NAT pools. The path is Network→*NE*→Routing Instance.

3 Right-click on the routing instance icon and choose Properties from the contextual menu. The Routing Instance (Edit) form opens.

4 Click on the NAT Configuration tab.

5 Click on the Search button. A list of NAT configurations is displayed.

6 Choose the required NAT configuration in the list and click on the Properties button. The NAT Configuration (Edit) form opens with the General tab displayed.

7 Click on the NAT Pools tab.

8 Click on the Search button. A list of address pools is displayed.

9 Choose the required address pool in the list and click on the Properties button. The NAT Pool (Edit) form opens.

Note — You can also select multiple address pools and use the Drain or Stop Drain buttons to control the draining for the selected address pools, as described in subsequent procedure steps.

10 To start a drain operation on the address pool, click on the Drain button. The number of host sessions that are associated with the address range decreases as sessions close.

11 To stop an active drain operation on the address pool, click on the Stop Drain button. New host sessions can use the address range.

12 Close the open forms, as required.

25 — MPLS

25.1 MPLS overview *25-2*

25.2 Sample MPLS configuration *25-11*

25.3 Workflow to configure MPLS *25-12*

25.4 MPLS procedures *25-13*

25.1 MPLS overview

The 5620 SAM supports the configuration and provisioning of MPLS paths and LSPs.

MPLS is a data-carrying mechanism that emulates some properties of a circuit-switched network over a packet-switched network. MPLS prepends a packet with an MPLS header that is comprised of labels in a stack. As an NE forwards a packet through an MPLS network, it examines the top label for routing instructions and pops it off the stack; the contents below the label stack are not examined. The label stack is not removed until it reaches the egress NE.

MPLS uses one or more IGPs, such as IS-IS, OSPF, or RIP, to forward packets. Regardless of the IGP chosen, the MPLS configuration is the same. An advantage of MPLS is that if more than one IGP is enabled, it continues to work when another protocol fails. See chapter 23 for more information on IS-IS, OSPF, and RIP.

MPLS can be used as the underlying transport mechanism for service tunnels. For MPLS to be used as such, an MPLS mesh and an LSP mesh must be created before the tunnel is created. Since LSPs and service tunnels are unidirectional, they must be created in both directions. See chapter 27 for more information about service tunnels.

When MPLS is enabled on a 5620 SAM-managed NE routing instance, the 5620 SAM displays an MPLS instance below the routing instance in the network view of the navigation tree. Using this view, you can perform various functions on the MPLS instance, for example, assign an L3 interface to an MPLS instance.

If a link, NE, or path fails, MPLS can determine a redundant path by using fast reroute. Fast reroute uses an alternative NE to complete the failed LSP. Fast reroute provides the following types of route protection.

- Many-to-one—one backup route is maintained for multiple protected LSPs on an NE.
- One-to-one—a separate backup route is maintained for each protected LSP on an NE algorithm.

You can list and view MPLS objects such as MPLS and RSVP instances and interfaces, static and dynamic LSPs, cross connections, and MPLS paths using the 5620 SAM Manage MPLS Objects form.

LSPs

An LSP is a path through an MPLS network that is set up based on criteria in a forwarding equivalency class, or FEC. A FEC is a set of characteristics that define how NEs in an MPLS network forward packets that are bound to an MPLS label. A FEC includes specifications such as the destination IP address and QoS parameters. A FEC is associated with a specific LSP, but an LSP may be used for multiple FECs.

An LSP begins at a PE device called an LER, which is the ingress NE that prepends a label to a packet based on a FEC and sends the packets to the next transit NE in the path. The transit NE swaps the packet label for a new one, and sends the packet to the next NE. The LER that acts as the egress PE NE removes the label and forwards the packet according to the header of the next layer, for example, IP.

LSPs are unidirectional; they enable the label switching of a packet through an MPLS network from one endpoint to another. Bidirectional communication through an MPLS network requires the configuration of an LSP in the opposite direction.

The types of LSPs are the following.

- Static LSPs specify a static path through an MPLS network. All transit NEs require manual configuration with LSP labels and require no signaling protocol, such as LDP or RSVP.
- Bypass-only LSPs are LSPs with manually configured bypass tunnels on Point-of-Local-Repair (PLR) NEs. Such LSPs are used exclusively for the purpose of bypass protection.
- Dynamic, or signaled LSPs, use a protocol such as LDP or RSVP. The signaling protocol allows an ingress NE to dynamically assign labels to an egress NE. You must configure the ingress NE, but not the transit NEs in an LSP. LDP LSPs are not explicitly defined. The downstream unsolicited (DU) method configures them automatically through the network.
- Point-to-Multipoint LSPs allow the source of multicast traffic to forward packets to one or many multicast receivers over a network without requiring a multicast protocol, such as PIM, to be configured in the network.

You can apply a metric value to a dynamic LSP or a Point-to-Multipoint LSP that determines which LSP the 5620 SAM uses when multiple LSPs lead to the same destination. The metric value for a static route is set to 1 and cannot be configured.

You can list and view detailed information on LSPs, templates, cross connections, service tunnels, and detour and bypass information on the LSP (Edit) forms.

Dynamic LSPs

A dynamic LSP uses a signaling protocol such as LDP or RSVP-TE and an MPLS path between two NEs. You can then create an LSP between the two NEs and bind it to an MPLS path. An LSP-MPLS path binding is called an LSP path. You can configure the LSP path after the MPLS path and the LSP are bound.

Dynamic LSPs are categorized as follows:

- Explicit-path LSPs resemble static LSPs when all hops are strict; each hop in the LSP requires explicit configuration. MPLS uses RSVP-TE to set up an explicit-path LSP. Transit NE hops can be strict, and use a direct path between NEs, or loose, and include other NEs in the path between NEs.
- Constrained-path LSPs have dynamically assigned intermediate NE hops that rely on CSPF to find a path that satisfies the LSP constraints. CSPF is a routing algorithm that takes different LSP constraints, such as the available bandwidth and MPLS administrative groups, into account to balance the network load. When the CSPF path is found, RSVP uses the path to request the LSP setup. If Fast Reroute is enabled, the ingress NE signals the downstream NEs to set up a detour configuration for the LSP.

When an LSP is established, the reserved bandwidth is controlled by the bandwidth parameter at the primary path level, regardless of whether the LSP has auto-bandwidth enabled. When auto-bandwidth is enabled and a trigger occurs, the NE attempts to change the bandwidth of the LSP to a value between the minimum and maximum bandwidth, which are configurable at the LSP level. Automatic bandwidth allocation is supported on RSVP LSPs that have both CSPF and MBB enabled. If an RSVP LSP is configured for auto-bandwidth, the ingress LER determines, at every adjust interval, whether to attempt an auto-bandwidth adjustment. You can change the minimum bandwidth, maximum bandwidth, or threshold parameters on an operational LSP, however, the changes do not take effect until the next auto-bandwidth trigger, for example, an adjust interval expiry. If the bandwidth adjustment fails, for example, the CSPF cannot find a path, the existing LSP is maintained with its existing bandwidth reservation. See Procedure 25-8 for more information.

The 5620 SAM provides OAM tools for troubleshooting service and network transport issues. You can run an OAM validation test for the dynamic LSP by clicking on the One Time Validation button. If a check mark appears beside the OAM Validation Failed state cause indicator, the test has failed. The One Time Validation Result tab on the Tests tab displays detailed information about the OAM test result. See Procedure 77-9 for information on how to use the One Time Validation function.

Static LSPs

A static LSP uses an IGP instead of a signaling protocol, such as LDP or RSVP-TE. The 5620 SAM attempts to derive the hop configurations based on the hop labels in the path. You must use an ingress label that is unique within an NE when you create a new static hop; otherwise, the 5620 SAM rejects the new hop.

You can assign static label mappings for LSP cross-connections on an MPLS interface during interface creation or modification. A static label map is used only for intervening unmanaged NEs. The 5620 SAM attempts to derive the interface and label values from the swap egress label of the previous hop. The Static Label Maps form lists the static label maps for an interface whether they are created using the 5620 SAM client GUI, an OSS client, or CLI.

The 5620 SAM does not raise an alarm against an unmanaged NE.

The 5620 SAM raises an alarm against a static LSP under the following conditions when the LSP destination is managed by the 5620 SAM:

- No hops are configured for the static LSP.
- The last hop does not match the LSP destination.
- The label action specified for the last hop is not a pop action.

Point-to-Multipoint LSPs

A Point-to-Multipoint (P2MP) MPLS LSP allows the source of multicast traffic to forward packets to one or many multicast receivers over a network without requiring a multicast protocol, such as PIM, to be configured in the network. A P2MP LSP tree is established in the control plane for which the path consists of a head-end NE, one or many branch NEs, and multiple leaf NEs. Packets that are injected by the head-end NE are replicated in the data plane at the branching NEs before they are delivered to the leaf NEs.

The P2MP LSP has a source IP address but does not a have a destination address. Instead, you must create S2L leaf NEs for each destination in the P2MP LSP tree. The P2MP LSPs are not supported in SDP bindings.

Each P2MP LSP object has one P2MP LSP instance object. This is the primary instance, and can contain multiple child S2L path objects. Just as the P2MP LSP can appear as a tree, each S2L path object represents a root-to-leaf (S2L) sub-LSP path for the primary instance. The S2L paths can be empty paths or can specify a list of explicit hops. The same path can be used by more than one S2L of the instance. However the destination IP address must have a unique argument per S2L, because it corresponds to the address of the egress LER NE.

PIM tunnel interfaces are associated with a P2MP LSP. The tunnel interfaces are needed at both the ingress LER and the egress LER NEs. You must also associate static multicast groups with the tunnel interfaces that are associated with the P2MP LSPs.

On the ingress side, you can create one or more tunnel interfaces in PIM and associate each with a different RSVP P2MP LSP. The tunnel interface is associated with the P2MP LSP name. You can then assign static multicast group joins to each tunnel interface using an IGMP configuration. A specific <*,G> or <S,G> can only be associated with a single tunnel interface. A multicast packet which is received on an interface and matches the <*,G> or <S,G> specified in the IGMP join for the tunnel interface is replicated and forwarded to all branches of the P2MP LSP.

On the egress side, the PIM tunnel interface is associated with both the P2MP LSP name and the system address of the ingress LER. You must define a multicast info policy to associate specific multicast groups, or a specific <S,G>, to the primary tunnel interface on each egress LER leaf NE. The multicast info policy must then be applied to the router. A multicast packet synced from a tunnel interface associated with a P2MP LSP on the egress leaf NE can then be forwarded over a PIM or IGMP interface, which can be an access interface or a network interface, including a spoke SDP-based IES interface. You may create multiple tunnel interfaces per NE, where each interface is associated with a different P2MP LSP. The P2MP LSP association to a multicast group can be applied at the bundle, channel, and/or source channel level in the policy.

You can create a P2MP LSP using the LSP template for MVPN from the Policies→MPLS→LSP Template MVPN menu option. You can configure the scope as either local or global. The global template can be modified and multiple local versions can exist on the NEs. You must assign a default MPLS path to the template on the local definition before the template is turned up. If you modify the template, you must shut down the local policy first. When you turn up the local policy, all previously created P2MP LSP parameters are synchronized with the new template. See Procedure 25-23 for more information.

Bypass LSPs and manual bypass tunnels

You can create manual bypass tunnels and dynamic (or automatic) bypass tunnels on the SR/ESS, 7705 SAR, and 7210 SAS. You can manually configure an LSP to be bypass-only on a PLR NE. The LSP is then used exclusively for the purpose of bypass protection.

You can use manual bypass alone or with dynamic bypass. When used with the dynamic bypass, the manual bypass has precedence over the dynamic bypass for the path selection.

Dynamic bypass tunnels can be disabled on a per-NE basis. They are enabled by default. If dynamic bypass is disabled on a network element while dynamic bypass tunnels are active, traffic loss occurs. Furthermore, if no suitable manual bypass LSPs are found, the protected LSP remains without protection.

A bypass-only LSP does not have all the configurable attributes of a regular dynamic LSP. The main differences include:

- Manual bypass LSPs only support primary path. Secondary or standby paths cannot be created.
- Manual bypass LSPs do not support bandwidth or fast-reroute.
- Path monitoring is not available for manual bypass LSPs.
- Manual bypass LSPs cannot be assigned to a service tunnel, or be added to an LDP targeted peer as the LDP tunnelling LSP.
- There is no rule-based topology support available for manual bypass LSPs.
- There is no network-wide LSP view (the physical map LSP view) support available for manual bypass LSPs,
- You cannot create a static LSP using a tunnel template.

The following additional characteristics also apply to a manual bypass:

- The default protection level for a bypass tunnel is “node-protect”.
- CSPF is supported for the manual bypass tunnel. When CSPF is enabled, loose path and hop-less path are allowed on a manual bypass tunnel. The CSPF calculation is performed when the manual bypass tunnel is first set up.

Administrative groups with facility bypass backup LSPs

Administrative group constraints configured on an LSP primary path are used for signaling of bypass LSPs. The 5620 SAM supports P2P LSP and P2MP S2L path bypass LSPs. Administrative groups with one-to-one detour LSPs are not supported.

You can enable the use of administrative group constraints in the association of a manual or dynamic bypass LSP with the primary LSP path on the MPLS instance of the NE. When constraints are enabled, each PLR NE reads the constraints in the FAST_REROUTE object in the path message of the primary path LSP. If the FAST_REROUTE object is not included in the path message, the PLR NE reads the constraints from the session attribute object in the path message. The PLR NE uses the administrative group constraints and other constraints, such as the hop limit and SRLG, to choose a manual or dynamic bypass LSP from the LSPs that are in use.

You can enable the use of the administrative group constraints on FRR backup LSP on the P2P and the P2MP LSP configuration forms, and in the LSP template MVPN policy. The constraints apply only to new attempts to find a valid bypass.

Automatic ABR selection and dynamic ABR bypass protection

The ABR selection for the inter-area RSVP P2P LSP path computation by CSPF is automatic at the ingress LER. You do not need to include the ABR as a loose-hop in the LSP path definition. On the LSP path binding configuration form, you can view whether:

- the operational path is inter-area or intra-area
- the current CSPF hop is an ABR (on the CSPF Path tab)

Dynamic bypass LSP for ABR NE protection

The 5620 SAM provides dynamic bypass computation, signaling, and association with the primary path of an inter-area P2P LSP to provide ABR NE protection. For a PLR NE within the local area of the ingress LER to provide ABR NE protection, the NE must dynamically signal a bypass LSP and associate it with the primary path of the inter-area LSP. You can view the address of the NE that must be bypassed along the path in the RSVP session tab on the dynamic LSP properties form.

Tunnel Templates

Tunnel templates allow users to configure dynamic LSP, LSP path, and SDP templates to define common characteristics for a tunnel or templatable tunnel object. Configure tunnel templates to reduce configuration time. See "XML API template administration" in the *5620 SAM Scripts and Templates Developer Guide* for information about creating tunnel XML API templates.

To simplify creating tunnel templates, the 5620 SAM provides examples of common tunnel templates that can be copied and customized. You can also create a tunnel template from an existing templatable object.

After a template is configured, dynamic LSPs, LSP paths and SDPs can be configured by choosing a create from template button during configuration. Users can configure multiple LSP paths for a dynamic LSP. For example, you can configure one primary, one standby, and many secondary LSP paths.

When the 5620 SAM auto-tunnel creation is used to create LSP paths, the LSP paths must use a hopless path. If the paths belong to the same LSP, they must use different MPLS paths, even when the MPLS paths are hopless. For a RSVP LSP policy, one LSP template can be specified. When an LSP template with multiple LSP paths is specified, many LSP paths are created.

LSP Path Optimization Policy

The 5620 SAM allows you to resignal LSP Paths to take advantage of new paths that are less congested, fewer hops, have a lower metric and meet least-fill criteria. NEs periodically check the network to determine whether a more efficient path is available and notify the 5620 SAM when another path is eligible for re-signalling. 5620 SAM maintains a list of LSP Paths that are eligible for re-signaling. When a LSP Path is eligible for optimization, the LSP Path can be routed to a different path. When a LSP Path not eligible for optimization, the LSP Path cannot use newly available network resources.

A LSP Path optimization policy allows the operator to filter the LSP Path candidates and set the execution rules to determine the candidacy and priority of an LSP Path for re signalling. The 5620 SAM operator can define LSPs Paths that are eligible for re-signaling and if a path is selected, the LSP Path is added to a candidate list. Execution rules determine the sequence in which the LSP Paths can re-signal and the number of seconds between re-signalling. Execution rules apply to the entire candidate list. Each time that optimization starts, the candidate list is filtered according to the candidate definition values and then re sequenced according to the sequencing target and order values.

To ensure that NEs are not overloaded by LSP re-signaling, an LSP Path optimization schedule can be created to identify when re-signaling can be evaluated and executed. You can also manually execute LSP Path optimization schedules. To avoid network congestion and maintain QoS standards, one policy should be executed at a time. Repetitive re-signaling requests are ignored, including manual or scheduled re-signaling requests. However, a re-signaling request that is initiated from the LSP Path binding properties form executes regardless of whether another LSP optimization policy is in progress.

The NEs notify the 5620 SAM about the current state and outcome of LSP Path re-signaling. You can access the LSP Path property form to view information about the state of LSP Path optimization. The following parameters are displayed:

- The Resignal Eligible parameter indicates whether a LSP Path is eligible for optimization. When the parameter value is true, the LSP Path can be optimized. When the parameter value is false, the LSP Path is not eligible for optimization.
- The Last Performed Type parameter indicates how resignaling was performed. Typically the value is Manual Resignal. However, if a schedule was set, the value is Timer Based Resignal.
- The Last Performed parameter indicates the last time the LSP Path was chosen to be re-signaled.
- The Last Performed State parameter indicates the re-signal state of a specific LSP Path.

LDP-over-RSVP tunnels

In networks that contain dozens of NEs spanning multiple routing areas, many RSVP service tunnels may be required. To reduce the number of RSVP tunnels required for service deployment in large networks, you can use the 5620 SAM to create LSPs using LDP-over-RSVP, sometimes called tunnel-in-tunnel encapsulation. An SDP can ride on multiple LDP-over-RSVP tunnels.

The 5620 SAM supports automatic, rule-based service-tunnel creation using NEs that are grouped according to their role in the 5620 SAM-managed network. This functionality greatly reduces the time and effort required to provision a mesh of service tunnels. See chapter 27 for more information about rule-based automatic service-tunnel creation.

The 5620 SAM can use tunnel rules and groups to create new RSVP LSP bindings between a PE device that is added to the network and the existing ABRs. It can also create a new LDP-over-RSVP tunnel between a new NE and an existing PE NE. See chapter 27 for more information about tunnel creation using rules and groups.

Service traffic that is transported by an LDP-over-RSVP tunnel requires a VC label, an LDP label, and an RSVP label. Unlike T-LDP sessions that use IGP SPF algorithms, RSVP LSPs are not advertised to an IGP instance. When the same FEC applies to the destination of an LDP-over-RSVP LSP tunnel and an IGP-based LDP tunnel, the 5620 SAM uses the LDP tunnel by default to minimize network overhead.

Using tunnel-in-tunnel encapsulation, a pair of LSP tunnels and a T-LDP session between two NEs are equivalent to two adjacent LDP NEs with a non-tunneled LDP session between them. In other words, the LDP tunnel uses the RSVP LSP as one hop between LSRs in the network.

During the configuration of LDP-over-RSVP, you can specify an explicit list of dynamic and static LSPs, or use the 5620 SAM to find eligible LSPs. After an LSP is explicitly configured for LDP tunnelling, the 5620 SAM associates the LDP targeted peer with the LSP.

You can configure LDP-over-RSVP to enable an OSPF area router to be a stitching point. You can specify which NEs to use as the stitching points in each area. When there are many NEs in an area, this function helps to reduce the number of LSPs required, because a full mesh is not required.

For an LSP to be eligible for LDP-over-RSVP, the following conditions apply:

- The LSP must be an RSVP-owned LSP (strict or loose)
- The LSP must start and terminate either on:
  - The router ID (system IP address)
  - The router ID (loopback address when used in multi-instance OSPF
- The OSPF system/loopback address must be advertised
- A T-LDP session must exist between the originating and terminating routers using the addresses cited above
- LDP-over-RSVP availability must be enabled in the LSP configuration. This indicates that the LSP is eligible for LDP-over-RSVP, and RSVP signals to the IGP that the LSP should be included in the SPF run.

Shared Risk Link Groups

Shared Risk Link Groups, or SRLGs, are constructs which allow you to perform two operations that enhance overall system reliability. Firstly, you can establish a FRR LSP path. In addition, you can also use SRLGs to establish a secondary LSP path which is disjointed from the primary LSP path.

Configured SRLGs are associated with MPLS interfaces. The SRLGs are used by the CSPF when computing a FRR detour/bypass path, or a secondary LSP path. Links which are members of the same SRLG represent resources which are assumed to share the same risk. These links are therefore avoided when computing and setting up an alternate LSP path.

- FRR backup

  The SRLG constraint can be enabled system-wide on a PLR NE, in the computation of a FRR detour or bypass to be associated with a primary LSP path. CSPF includes the SRLG constraint in the computation of a FRR detour or bypass. CSPF then prunes all links with interfaces which belong to the same SRLGs as the egress interface being protected (or the immediate downstream NE, depending on the protection level). If a path is found, the bypass or detour is set up. If not, and you included the Enable SRLG for FRR - Strict option, then the bypass or detour is not set up. If the Enable SRLG for FRR - Strict option is not specified, and a path exists that meets other TE constraints (other than the SRLG constraint), then the bypass or detour is still set up.
- Secondary LSP backup

  The SRLG constraint can also be enabled per LSP path on a head-end LER in the computation of an LSP secondary path that includes the standby path. The SRLG constraint is additional to the admin group constraint on the same secondary LSP path. CSPF includes the SRLG constraint in the computation of the secondary LSP path, which requires that the primary LSP path is configured and active.

CSPF prunes links with interfaces that belong to the same SRLGs as the interfaces included in the primary path. If a path is found, the secondary LSP path is set up. Otherwise, CSPF keeps trying to set up the secondary LSP path.

You can enable only the SRLG constraint for the FRR backup operation. However, you can enable both the SRLG constraint and the admin-group include/exclude constraint for the secondary LSP backup path operation. In either case, you can still apply the admin-group constraint for the primary path.

The following conditions also apply to SRLGs:

- An SRLG is modeled as a policy object. It therefore follows the normal policy behavior for creation, listing, updating, deletion, distribution and resynchronization
- SRLGs are defined node-wide
- Configured SRLGs are associated with MPLS interfaces. A specific MPLS interface can belong to multiple SRLGs. Up to 64 SRLGs can be associated with a specific MLPLS interface

Bandwidth-based equal cost RSVP LSP path selection

When multiple equal-cost paths satisfy the constraints of a specific RSVP LSP path, CSPF in the 7x50 head-end NE uses a random number generator to choose a path and return it to MPLS. While this method actually balances the number of LSP paths over the links in the network, it does not necessarily balance the bandwidth utilization across those links.

In order to achieve load balancing of the bandwidth amongst the available LSP paths, CSPF must include the link utilization as a criterion in the path selection. One algorithm that considers this is referred to as the “least-fill” path selection. This algorithm identifies the single link in each of the equal-cost paths that has the least available bandwidth in proportion to its maximum reservable bandwidth. CSPF then selects the path containing the link with the largest such available bandwidth to maximum reservable bandwidth percentage. The net effect of using this algorithm is that over time, LSP paths become spread over the network links in such a way that the percentage of link utilization is balanced.

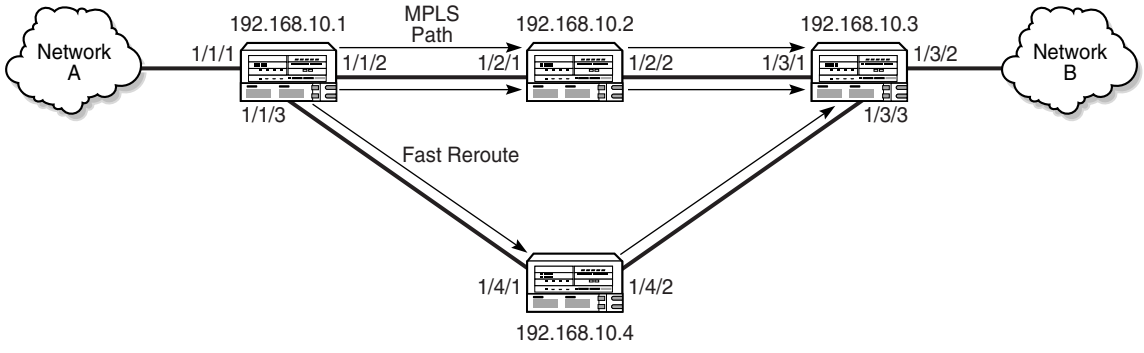
When comparing the percentages of least available link bandwidth across the sorted paths, if two percentages differ by less than a value you configure as a minimum threshold, CSPF considers them equal. It then applies a random number generator to choose amongst these paths. You can also specify a reoptimization threshold, which allows you include a path cost consideration into the decision of when to alter the paths used by the LSP.

LSP on-demand resynchronization

LSP on-demand resynchronization is supported on the 7750 SR, 7710 SR, and 7950 XRS. On-demand resynchronization does not affect the existing manual full NE resynchronization functionality. However, when LSP on-demand resynchronization is enabled, any scheduled resynchronization is blocked for the following LSP objects:

- RSVP session
- cross-connect
- in-segment
- out-segment
- actual hop
- CSPF hop

Therefore, these LSP objects are not resynchronized as a result of a relevant trap. The exception is that for 5650 CPAM path monitored LSPs, the actual hop trap (a generic trap) is still processed.



By default, the LSP on-demand resynchronization functionality is disabled. See "To enable LSP on-demand resynchronization" in the *5620 SAM System Administrator Guide* for more information. After you enable LSP on-demand resynchronization, click on the Resync button on the LSP configure form to start the manual LSP on-demand resynchronization. The following objects are resynchronized, depending on the type of LSP:

- for a dynamic LSP: the LSP, LSP path, CSPF and actual paths, bypass or detour path, cross-connects, in-segments, out-segments, and RSVP sessions
- for a manual bypass LSP: the LSP, LSP path, CSPF and actual paths, cross-connects, in-segments, out-segments, and RSVP sessions
- for a static LSP: the head-end LSP, the static hops, static label maps, cross-connects, in-segments, and out-segments. You must manually resynchronize all of the planned hop sites in a static LSP before creating a static LSP.

25.2 Sample MPLS configuration

Figure 25-1 shows an example of an MPLS service configuration. The actual configuration depends on the specific network requirements.

Figure 25-1 Sample MPLS configuration

The high-level tasks that are required to configure the MPLS service example in Figure 25-1 follow.

Preconfiguration

1 Before you begin, verify that the following preconfigurations have been made.

- An IGP is enabled on all participating NEs and includes the system interface in the IS-IS or OSPF area.
- Any additional Layer 3 interfaces that you wish to use are configured.

Configuration

2 Create an MPLS path as follows:

i Specify 192.168.10.1 as the source network element.

ii Specify 192.168.10.2 and 192.168.10.4 as hops.

iii Specify interface 1/3/2 on 192.168.10.3 as the destination site. This is the final hop in the MPLS path.

3 Create a dynamic LSP as follows:

i Specify interface 1/1/1 on 192.168.10.1 as the source IP address.

ii Specify 192.168.10.3 as the destination IP address.

4 Bind the dynamic LSP created in step 3 to the MPLS path created step 2.

25.3 Workflow to configure MPLS

1 Enable and configure one or more IGPs such as IS-IS, RIP, and OSPF to include the system interface on all NEs that are to participate in the MPLS network. See the appropriate device documentation for more information.

2 Enable MPLS on the routing instances of all NEs that are to participate in the MPLS network. See Procedure 25-1.

3 Create or configure an MPLS instance. Assign Layer 3 interfaces, including the system management interface, to the MPLS instance. See Procedure 25-2 or 25-3.

4 Create a mesh of MPLS paths. See Procedure 25-4.

5 As required, create a mesh of LSPs.

a Create a static LSP. See Procedure 25-6.

b Create a dynamic LSP. See Procedure 25-8. See Procedure 25-10 for more information about how to create a dynamic LSP from a tunnel template.

c Create a Point-to-Multipoint LSP. See Procedure 25-13.

d Create a Manual Bypass LSP. See Procedure 25-14.

6 If your mesh includes dynamic LSPs or bypass-only LSPs, configure an LSP path. See Procedure 25-16 or 25-17.

7 Create an LSP Path optimization policy, if required. See Procedure 25-18.

Note 1 — Only static LSPs and static FRR LSPs are supported on the OS 9700E and OS 9800E NEs.

Note 2 — RSVP is not supported on the OS 9700E and OS 9800E NEs.

Note 3 — Label actions cannot be modified on NEs after the labels are created by the 5620 SAM.

25.4 MPLS procedures

Use the following 5620 SAM procedures to manage MPLS.

Procedure 25-1 To enable MPLS on a routing instance

1 Choose Routing from the 5620 SAM navigation tree view selector.

2 Navigate to a routing instance. The path is Routing→NE→Routing Instance.

3 Right-click on the routing instance and choose Properties from the contextual menu. The Routing Instance (Edit) form opens.

4 Click on the Protocols tab.

5 Enable the MPLS Enabled parameter. RSVP is enabled by default and cannot be disabled using the 5620 SAM.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Routing Instance (Edit) form closes. The 5620 SAM creates an MPLS instance and displays the instance below the routing instance in the navigation tree.

Procedure 25-2 To configure an MPLS instance

Note — The following tabs are supported on the OS 9700E and OS 9800E NEs for MPLS configuration at the site level:

- General
- Interfaces
- In Segments
- Cross Connects
- Out Segments
- Static Label Maps
- Faults

1 Enable MPLS on an NE, as described in Procedure 25-1.

2 Choose Routing from the 5620 SAM navigation tree view selector.

3 Navigate to an MPLS instance. The path is Routing→NE→Routing Instance→MPLS.

4 Right-click on the MPLS icon in the navigation tree, and choose Properties from the contextual menu. The MPLS (Edit) form opens with the General tab displayed.

5 Configure the Administrative State parameter in the States panel.

6 Configure the parameters in the Configuration panel:

- Fast Reroute Signaling
- Dynamic Bypass
- Exponential Backoff Retry
- Logger Event Bundling
- Enable Administrative Group for FRR Path Computation
- Static LSPs Fast Retry Timer (seconds)
- Secondary Fast Retry Timer (seconds)
- Static LSPs Fast Retry Timer (seconds)
- Maximum Bypass Associations
- Maximum Number of Static LSP Labels
- Maximum Number of Static SVC Labels

7 Configure the parameters in the LSP Resignal panel:

- Enable
- Resignal Timer (min)
- Active Path Fast Retry Timer (seconds)

8 Configure the parameters in the P2MP LSP Resignal panel:

- Enable
- Resignal Timer (min)
- S2L Active Path Fast Retry Timer (seconds)

9 Configure the Hold Timer (seconds) parameter in the Hold Timer panel.

10 Configure the parameters in the Shared Risk Link Group panel:

- Enable SRLG for FRR
- Strict
- Use SRLG Static Configuration

11 Configure the parameters in the Least-Fill panel:

- Least Minimum Threshold
- Least Reoptimization Threshold

12 Configure the parameters in the TTL Propagate panel:

- Shortcut Local TTL Propagate
- Shortcut Transit TTL Propagate

13 Configure the parameters in the Auto Bandwidth Multipliers panel:

- Sample Multiplier
- Adjust Multiplier

14 Configure the CSPF On Loose Hop parameter in the Inter Area/Level Traffic Engineering panel.

15 If you need to configure OAM diagnostics for the MPLS instance, click on the Tests tab. See chapter 32 for more information about how to configure OAM diagnostics.

16 To configure MPLS interfaces on the MPLS instance, click on the Interfaces tab. See Procedure 25-3 for more information about how to configure MPLS interfaces.

17 To configure the collection of ingress accounting statistics for the MPLS instance, click on the Accounting tab.

18 Click on the Create button. The IngStatsPolicy, Routing Instance (Create) form opens.

19 Configure the parameters in the LSP Information panel:

- LSP Name
- Sender Address

20 Configure the parameters in the Ingress Accounting Statistics panel:

- Click on the Select button. The Select Accounting Policy - IngStatsPolicy - Routing Instance form opens. Choose the required accounting policy and click on OK. Only accounting policies with the CombinedMplsLspIngressStats stats type are available for selection.
- Collect Accounting Statistics
- Administrative State

Note — The collection of egress accounting statistics is configured in Procedure 25-8.

See “Statistics collection overview” in the *5620 SAM Statistics Management Guide* for more information on the collection of statistics.

21 Click on the following tabs to view information about the MPLS instance, as required.

- In Segments to view the MPLS ingress segment information, such as label assignments
- Cross Connects to vie w the LSP cross-connection information
- Out Segments to view the MPLS egress segment information, such as label assignments
- Static Label Maps to view static hop mapping information
- Statistics to view MPLS site and interface statistics
- Faults to view alarm information for the MPLS instance

22 Click on the View RSVP Site button to view the associated RSVP instance on the NE. If the View RSVP Site button is not visible, click on the More Actions button and choose View RSVP Site.

23 Click on the OK button. A dialog box appears.

24 Click on the Yes button. The MPLS (Edit) form closes.

Procedure 25-3 To create an MPLS interface

Perform this procedure to create an MPLS interface by assigning a network interface to an MPLS instance.

This procedure requires the existence of a numbered or unnumbered L3 network interface on the NE that hosts the MPLS instance. See section 22.1 for more information about how to configure network interfaces.

Note — The following tabs are supported on the OS 9700E and OS 9800E NEs for MPLS configuration at the interface level:

- General
- In Segments
- Static Label Maps
- Cross Connects
- Out Segments
- Faults

1 Choose Routing from the 5620 SAM navigation tree view selector.

2 Navigate to an MPLS instance icon. The path is Routing→NE→Routing Instance→MPLS.

3 Right-click on the MPLS icon and choose Create Interface from the contextual menu. The MPLS Interface (Create) form opens with the General tab displayed.

4 Assign a numbered or unnumbered L3 network interface as the MPLS interface.

i Click on the Select button. The Select Interface form opens.

ii Choose an interface from the list and click on the OK button.The interface is displayed in the Interface panel on the MPLS Interface (Create) form.

5 Configure the parameters:

- Description
- Administrative State

6 In the TE Metric panel, configure the parameters:

- TE Metric Enabled
- TE Metric

7 Click on the Apply button. The form displays additional tabs, and the 5620 SAM creates the MPLS interface and displays it below the MPLS and RSVP instances in the navigation tree.

8 Configure a Shared Risk Link Group, if required.

i Click on the Shared Risk Link Groups tab. The Shared Risk Link Group list page opens.

ii Click on the Create button. The SharedRiskLinkGroup (Path/Routing Management: MPLS) Select form opens.

iii Click on the Search button. The available SRLGs are displayed.

iv Select the required SRLGs and click OK. Up to 64 SRLGs can be associated with a specific MPLS interface. The SharedRiskLinkGroup (Path/Routing Management: MPLS) Select form closes and the selected SRLG is displayed in the Shared Risk Link Group list page.

9 Configure a static label map, if required. A static label map is required when there are intervening unmanaged NEs between the managed NEs in an MPLS path.

Note — Alcatel-Lucent recommends that you use a static label mapping only to specify unmanaged NEs.

i Click on the Static Label Maps tab.

ii Click on the Create button. The Static Label Map (Create) form opens. Alternatively, you can choose a Static Label Map from the list and click on the Properties button to edit the Static Label Map properties.

iii Configure the Label Action parameter. When you change the Label Action parameter from unspecified to Pop or Swap, the Static Label Map (Create) form changes to include other parameters. Configure the other parameters as required:

- Ingress Label
- Egress Label
- Egress Label
- Enable Implicit Null Label
- Next Hop
- Next Hop
- Administrative State

The Egress Label, Next Hop and Enable Implicit Null Label parameters are only configurable when the Label Action parameter value is set to Swap.

The Egress Label and Next Hop parameters are configurable only when the Label Action parameter value is set to Swap/Protect-Swap.

The 5620 SAM sets the Label Action parameter value to Pop when the hop destination matches the destination LSP.

iv Click on the OK button. A dialog box appears.

v Click on the OK button.

10 Click on the Administrative Groups tab to assign MPLS administrative groups to the interface, as required. After you assign administrative groups to an MPLS interface, the total value of the groups is displayed in a bit mask format by the Groups Included (bitmask) indicator on the General tab.

11 Click on the following tabs to view information about the MPLS interface, as required.

- In Segments to view the MPLS ingress segment information, such as label assignments
- Cross Connects to vie w the LSP cross-connection information
- Out Segments to view the MPLS egress segment information, such as label assignments
- Statistics to view the MPLS site and interface statistics
- Faults to view alarm information for the MPLS interface

12 Click on the OK button. A dialog box appears.

13 Click on the Yes button. The MPLS Interface properties form closes.

Procedure 25-4 To create an MPLS path

1 Choose Manage→MPLS→MPLS Paths from the 5620 SAM main menu. The Manage MPLS Paths form opens.

2 Click on the Create button. The Create MPLS Path form opens with the Name the MPLS Path step displayed.

3 Configure the parameters:

- Name
- Description

4 Click on the Next button. The Define Source Site step displayed.

5 Perform one of the following actions to specify a 5620 SAM-managed NE for the Starting Network Element parameter value.

a Choose an NE from a list.

i Click on the Select button. The Select a Network Element - Select Source Site form opens.

ii Choose an NE and click on the OK button. The management IP address of the NE is displayed as the source site of the MPLS path.

b Enter the management IP address of the port.

6 Click on the Next button. The Define the provisioned Path step is displayed.

7 Click on the Insert Hop button to insert an MPLS path hop. The Hop for New MPLS Path (Create) form opens.

8 Configure the Specify Site parameter. Perform one of the following actions.

a Specify the IP address of an unmanaged NE.

i Choose Manually.

ii Configure the IP Address parameter.

b Choose a managed NE.

i Choose By Selection.

ii Click on the Select button. The Select a Network Element - New MPLS Path form opens.

iii Choose an NE and click on the OK button. The management IP address of the NE is displayed as the IP Address value.

iv Specify an alternative or loopback (only for Dynamic P2P RSVP LSPs) interface on the NE to be used as the hop point, if required. Otherwise, go to step 9.

v Click on the IP Address parameter Select button. The Select a Virtual Router Interface form opens with a list of the available interfaces.

vi Choose an interface and click on the OK button. The Select a Virtual Router Interface form closes and the Hop for New MPLS Path (Create) form displays the IP Address of the selected loopback interface.

9 Configure the Hop Type parameter.

10 Click on the Apply button.

11 Insert an additional hop, if required, by repeating steps 8 to 10.

12 Click on the OK button. The Create MPLS Path form reappears.

13 To change the hop sequence, choose a hop and click the Move Up or Move Down button. The first hop in the list is the first hop, and the last hop becomes the destination site when the form changes are saved.

14 Click on the Next button. The Set Initial State step is displayed.

15 Configure the Administrative parameter.

16 Click on the Finish Button to save the configuration. You are prompted to view the MPLS path.

17 Enable the View the newly created MPLS path parameter to view the MPLS path configuration after closing the form, if required.

18 Click on the Close button. The Create MPLS Path form closes.

19 If the View the newly created MPLS path parameter in step 16 is enabled, the MPLS Path (Edit) form opens with the newly created MPLS path configuration displayed.

i View the configuration, if required.

ii Close the MPLS Path (Edit) form.

20 Close the Manage MPLS Paths form.

Procedure 25-5 To view an MPLS path

1 Choose Manage→MPLS→MPLS Paths from the 5620 SAM main menu. The Manage MPLS Paths form opens.

2 Configure the filter criteria. A list of MPLS paths is displayed.

3 View the MPLS path information as required. The information includes the following:

- name and description
- ID
- source and destination sites
- administrative and operational states

Procedure 25-6 To create a static LSP

Note — When LSP on-demand resynchronization is enabled, manually resynchronize all of the planned hops in the static LSP before you create a static LSP. This is to ensure that validations on the static LSP can be run properly. See "To enable LSP on-demand resynchronization" in the *5620 SAM System Administrator Guide* for more information.

1 Choose Manage→MPLS→Static LSPs from the 5620 SAM main menu. The Manage Static LSPs form opens.

2 Click on the Create button. The Static LSP (Create) form opens.

3 Configure the parameters:

- Name
- Description
- ID
- Auto-Assign ID
- Source Site ID
- Egress Label
- Enable Implicit Null Label
- Next Hop
- Administrative
- Destination Site ID

Note 1 — If a range policy is applied to a service tunnel, a grey text box appears beside the Service ID parameter to indicate that a range policy is in effect.

If a format policy is applied to a service tunnel, a combo box appears beside the object field during object creation, to indicate that a format policy is enforced. When there is only one matching policy, the combo box is dimmed. When there are multiple matching policies, the combo box is used to choose a policy. The items in the combo box are ordered by the policy's Priority parameter.

Note 2 — The Administrative parameter applies to the source NE only, not to the entire static LSP

4 Click on the Static Hops tab.

5 Click on the Create button. The Static Hop (Create) form opens.

6 Configure the Hop Index parameter.

7 Click on the Select button in the Site panel to configure the Site ID parameter. The Select Site - Static Hop form opens with a list of the available hop sites.

8 Choose a site and click on the OK button. The Select Site - Static Hop form closes and the Static Hop (Create) form displays the site information.

9 Click on the Select button in the Interface panel to configure the Interface Name parameter. The Select Interface - Static Hop form opens with a list of the available interfaces on the hop site.

10 Choose an interface and click on the OK button. The Select Interface - Static Hop form closes and the Static Hop (Create) form displays the interface name.

11 Configure the parameters:

- Label Action
- Ingress Label
- Egress Label
- Egress Label
- Enable Implicit Null Label
- Next Hop
- Next Hop
- Administrative State

The Egress Label, Enable Implicit Null Label and Next Hop parameters are configurable when the Label Action parameter value is set to Swap.

The Egress Label and Next Hop parameters are configurable only when the Label Action parameter value is set to Swap/Protect-Swap.

12 Click on the OK button. The Static Hop (Create) form closes and a dialog box appears.

13 Click on the OK button. Static LSP (Create) form reappears.

14 Insert an additional hop, if required, by repeating steps 5 and 13.

15 Click on the OK button. The Static LSP (Create) form closes and a dialog box appears.

16 Click on the Yes button. The Static LSP (Create) form closes and the Manage Static LSPs form reappears.

17 Close the Manage Static LSPs form.

Procedure 25-7 To view and configure a static LSP

The following procedure applies only to the 7210 SAS-M24F, 7210 SAS-M24F2XFP, 7210 SAS-M24F2XFP [ETR], 7450 ESS, 7750 SR, 7710 SR, and 7950 XRS.

1 Choose Manage→MPLS→Static LSPs from the 5620 SAM main menu. The Manage Static LSPs form opens.

2 Configure the filter criteria and click on the Search button. A list of static LSPs is displayed.

3 Choose an LSP and click on the Properties button. The Static LSP (Edit) form opens.

4 Click on the following tabs to view information about the static LSP, as required.

- Static Hops to view and configure LSP hops
- Service Tunnels to view a list of service tunnels associated with the static LSP
- LDP Tunneling to view a list of LDP-over-RSVP tunnels associated with the static LSP
- Statistics to view the static LSP site and interface statistics
- Faults to view alarm information for the static LSP

5 Close the Static LSP (Edit) form.

6 Close the Manage Static LSPs form.

Procedure 25-8 To create a dynamic LSP

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Click on the Create button. The Create Dynamic LSP step form opens with the Identification step displayed.

3 Configure the parameters:

- Name
- Description
- ID
- Auto-Assign ID
- Preference

Note — When a range policy is applied to a dynamic LSP, a dimmed text field appears beside the Service ID parameter to indicate that a range policy is in effect.

If a format policy is applied to a dynamic LSP, a combo box appears beside the object field during object creation, to indicate that a format policy is in effect. When there is only one matching policy, the combo box is dimmed. When there are multiple matching policies, the combo box is used to choose a policy. The sequence of the options in the combo box are specified by the policy Priority parameter.

4 Click on the Next button. The Define Source and Destination Sites step is displayed.

5 Specify the source and destination sites for the dynamic LSP.

Note — You can also manually specify an IP address for each parameter in the step.

i Click on the Source Site ID parameter Select button. The Select a Network Element - Create Dynamic LSP form opens with a list of the available sites.

ii Choose a site and click on the OK button. The Select a Network Element - Create Dynamic LSP form closes and the Create Dynamic LSP form displays the source site information, which includes the system Source IP Address parameter value. The parameter is automatically populated with the system IP address of the site.

iii If you are creating a P2P RSVP LSP, you can alternatively configure a loopback interface other than the system interface. Otherwise, go to step vi.

iv Click on the Source IP Address parameter Select button. The Select a Virtual Router Interface form opens with a list of the available interfaces.

v Choose an interface and click on the OK button. The Select a Virtual Router Interface form closes and the Create Dynamic LSP form displays the Source IP Address and Source Interface Name information of the selected loopback interface.

vi Click on the Destination Site ID parameter Select button. The Select a Network Element - Create Dynamic LSP form opens with a list of the available sites.

vii Choose a site and click on the OK button. The Select a Network Element - Create Dynamic LSP form closes and the Create Dynamic LSP form displays the destination site information. The default displayed destination interface is the system interface.

viii If you are creating a P2P RSVP LSP, you can alternatively configure a loopback interface other than the system interface as the destination. Otherwise, go to step 6.

ix Click on the Destination IP Address parameter Select button. The Select a Virtual Router Interface form opens with a list of the available interfaces.

x Choose an interface and click on the OK button. The Select a Virtual Router Interface form closes and the Create Dynamic LSP form displays the Destination IP Address and Destination Interface Name information of the selected loopback interface.

6 Click on the Next button. The Auto Select Hop-Less MPLS Path step form opens.

7 Configure the parameters:

- Auto Select Hop-less Path
- Reserved Bandwidth (Mbps)

The Reserved Bandwidth (Mbps) parameter is configurable when the Auto Select Hop-less Path parameter is enabled.

8 If the Auto Select Hop-less Path parameter in step 7 is enabled, go to step 10.

9 Click on the Next button. The Add MPLS Paths form opens. This step binds the LSP to the MPLS path to create an MPLS path.

i Configure the Path Destination Matching parameter.

ii Click on the Create button. The LSP-Path Binding form opens with the Choose Path Type step displayed.

iii Configure the Type parameter.

iv Click on the Next button. The Choose MPLS Path step is displayed.

v Choose an MPLS path to associate with the LSP. You can also create an MPLS path by clicking on the Create MPLS Path button. See Procedure 25-4 for more information.

vi Click on the Next button. The Set Traffic Options form opens.

vii Configure the parameters:

- Reserved Bandwidth (Mbps)
- Hop Limit
- Inherit Value
- Record Actual Path
- Path Preference

The Path Preference is only configurable on Standby LSP paths (Type parameter set to standby).

viii Click on the Next button. The Set Initial States form opens.

ix Configure the Administrative parameter.

x Click on the Finish button. The LSP-Path Binding form closes and a dialog box appears.

xi Click on the OK button. The Create Dynamic LSP step form reappears.

10 Click on the Next button. The Properties - Traffic Engineering and Protection step is displayed.

11 Configure the parameters:

- Fast Reroute
- Hop Limit
- IGP Shortcut Enabled
- BGP RSVP LSP Transport Tunnel
- BGP Shortcut Enabled
- Diff-Serv Class Type
- Main Class Type Retry Limit

12 Click on the Next button. The Properties - IGP Shortcut step is displayed.

13 Configure the parameters:

- LFA Type
- Relative Metric

14 Click on the Next button. The Properties - Fast Reroute step is displayed.

15 Configure the parameters:

- Backup Type
- Hop Limit
- Reserved Bandwidth (Mbps)
- Node Protect
- Propagate Administrative Groups

16 Click on the Next button. The Properties - Signalling step is displayed.

17 Configure the parameters:

- Retry Timer (seconds)
- Retry Limit
- RSVP Reserve Style
- Include ADSPEC in RSVP
- Propagate Administrative Groups via Session Attribute Object

18 Click on the Next button. The Properties - Make before Break step is displayed.

19 Configure the Make before Break parameter.

20 Click on the Next button. The Properties - CSPF form opens.

21 In the CSPF panel, configure the parameters:

- Enable CSPF
- Enable TE Metric

22 Click on the Next button. The Properties - Route Selection step is displayed.

23 Configure the parameters:

- Metric
- Least-Fill Path Selection

The Least-Fill Path Selection parameter can only be enabled when the Enable CSPF parameter is enabled in step 21.

24 Click on the Next button. The Properties - Administrative Groups step is displayed.

25 Assign one or more MPLS administrative groups to the dynamic LSP.

i Select the required MPLS administrative groups in the Unassigned list.

ii Click on the right arrow button. The groups are assigned to the dynamic LSP and moved to the Assigned list.

After you assign administrative groups to an MPLS interface, the total value of the groups is displayed in a bit mask format by the Groups Included (bitmask) indicator on the General tab.

26 Click on the Next button. The Properties - LDP Tunneling step is displayed.

27 Configure the LDP over RSVP include parameter.

28 Click on the Next button. The Properties - Auto-Bind step is displayed.

29 Configure the Enable Auto-Bind parameter.

Note — The Enable Auto-Bind parameter is configurable only on a 7710 SR, 7750 SR, or 7950 XRS.

30 Click on the Next button. The Set Initial State step is displayed.

31 Configure the Administrative parameter.

32 Click on the Finish button. The 5620 SAM prompts you to view the dynamic LSP.

33 Enable the View the newly created Dynamic LSP parameter to view the dynamic LSP configuration after closing the form, if required.

Note — If you enable the View the newly created Dynamic Lsp parameter you can configure the collection of egress accounting statistics using the dynamic LSP configuration form.

34 Click on the Close button. The Create Dynamic LSP form closes.

35 If the View the newly created Dynamic LSP parameter is enabled in step 33, the Dynamic LSP (Edit) form opens with the newly created dynamic LSP configuration displayed.

i View the configuration, if required.

ii If you need to enable the collection of egress accounting statistics, go to step iii. Otherwise go to step v.

iii Click on the Accounting tab.

iv Configure the parameters in the Egress Accounting Statistics panel:

- Click on the Select button. The Select Accounting Policy - Dynamic LSP form opens. Choose the required accounting policy and click on the OK button. Only accounting policies with the CombinedMplsLspEgressStats stats type are available for selection.
- Collect Accounting Statistics
- Administrative State

Note 1 — The Ingress Accounting Statistics panel displays a read-only view. If an ingress accounting statistics record exists, you can click on the Properties button to view the record.

Note 2 — The collection of ingress accounting statistics is configured in Procedure 25-2.

See “Statistics collection overview” in the 5620 SAM Statistics Management Guide for more information on about the collection of statistics.

v Click on OK to close the Dynamic LSP (Edit) form.

36 Click on OK to close the Manage Dynamic LSPs form.

Procedure 25-9 To configure a dynamic LSP

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Click on the Search button. A list of dynamic LSPs is displayed.

3 Choose a dynamic LSP from the list and click on the Properties button. The Dynamic LSP (Edit) form opens with the General tab displayed.

4 Configure the Description parameter.

5 Configure the Administrative parameter in the States panel.

6 Click on the Properties tab button.

7 Configure the parameters in the Traffic Engineering Properties panel:

- Fast Reroute
- Hop Limit
- BGP RSVP LSP Transport Tunnel
- IGP Shortcut Enabled
- BGP Shortcut Enabled
- Diff-Serv Class Type
- Main Class Type Retry Limit
- Auto Bandwidth

8 If you enabled the IGP Shortcut Enabled parameter in step 7, configure the parameters in the IGP Shortcut panel:

- LFA Type
- Relative Metric

9 If you enabled the Fast Reroute parameter in step 7, configure the parameters in the Fast Reroute panel:

- Backup Type
- Hop Limit
- Reserved Bandwidth (Mbps)
- Node Protect
- Propagate Administrative Groups

10 Configure the Make before Break parameter in the Make before Break panel.

11 Configure the parameters in the CSPF panel:

- Enable CSPF
- Enable TE Metric

12 Configure the parameters in the Signalling panel:

- Retry Timer (seconds)
- Retry Limit
- RSVP Reserve Style
- Include ADSPEC in RSVP
- Propagate Administrative Groups via Session Attribute Object

13 Configure the parameters in the Route Selection panel:

- Metric
- Least-Fill Path Selection

14 Configure the LDP over RSVP include parameter in the LDP Tunneling panel.

15 Configure the Enable Auto-Bind parameter in the Auto-Bind panel.

16 If you enabled the Auto Bandwidth parameter in step 7, configure the parameters in the Auto Bandwidth panel:

- Adjust Up Threshold (%)
- Adjust Down Threshold (%)
- Minimum Bandwidth (mbps)
- Monitor Bandwidth
- Sample Multiplier
- Overflow Limit
- Adjust Up Bandwidth (mbps)
- Adjust Down Bandwidth (mbps)
- Maximum Bandwidth (mbps)
- Adjust Multiplier
- Overflow Limit Threshold (%)
- Overflow Limit Bandwidth (mbps)
- FC BE Sampling Weight (%)
- FC AF Sampling Weight (%)
- FC H2 Sampling Weight (%)
- FC H1 Sampling Weight (%)
- FC L2 Sampling Weight (%)
- FC L1 Sampling Weight (%)
- FC EF Sampling Weight (%)
- FC NC Sampling Weight (%)

17 Click on the LSP-Path Bindings tab. A list of LSP paths is displayed.

18 Click on the Create button. The LSP-Path Binding step form opens and the Choose Path Type step is displayed. The Type parameter is set to secondary if a primary path exists.

19 Click on the Next button. The Choose MPLS Path step is displayed. Choose an MPLS path to associate with the LSP. You can also create an MPLS path by clicking on the Create MPLS Path button. See Procedure 25-4 for more information.

20 Click on the Next button. The Set Traffic Options step is displayed.

21 Configure the parameters:

- Reserved Bandwidth (Mbps)
- Hop Limit
- Inherit Value

22 Click on the Next button. The Set Initial States step is displayed.

23 Configure the Administrative State parameter.

24 Click on the Finish button. The LSP-Path Binding form closes and a dialog box appears.

25 Click on the OK button.

26 Click on the OK button. A dialog box appears.

27 Click on the Yes button. The Dynamic LSP (Edit) form closes.

28 Close the Manage Dynamic LSPs form.

Procedure 25-10 To create a dynamic LSP from a tunnel template

Before you can create an LSP from a tunnel template, you must create the tunnel template. You can use an existing LSP to create a tunnel template. See "XML API template script format" in the *5620 SAM Scripts and Templates Developer Guide* for more information about creating a tunnel template.

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Click on the Create from Template button. A Create Dynamic LSP from Template form opens with a list of tunnel templates.

3 Choose a template from the list.

4 Click on the OK button. A Create Dynamic LSP from Template form opens.

5 Configure the parameters:

- Name
- Description
- ID
- Auto-Assign ID
- Preference
- Administrative State

6 Specify the source sites for the dynamic LSP.

i Click on the Select button beside the Source Site ID parameter. The Select Network Element form opens with a list of the available sites.

ii Choose a site from the list and click on the OK button. The Select a Network Element form closes and the Create Dynamic LSP from Template form displays the source site information.

iii Click on the Select button beside the Source IP Address parameter. The Select Network Element form opens with a list of the available sites.

iv Choose a site from the list and click on the Ok button. The Select a Network Element form closes and the Create Dynamic LSP from Template form displays the source IP address information.

7 Configure the Destination Site ID and the Destination IP Address parameters.

8 Click on the Accounting tab.

9 Click on the Select button beside the Accounting Policy parameter. A Select Policy form opens.

10 Choose a policy from the list.

11 Click on the OK button.

12 Configure the Collect Accounting Statistics and the Administrative State parameters.

13 Click on the Properties tab.

14 Configure the parameters:

Note — The number of parameters that can be configured depends on how the template was created. All of the parameters are configurable when the template is based on an object. A subset of the parameters can be configured when the template is based on an object class.

- Guarding Lsp
- Guarding Lsp
- Fast Reroute
- Hop Limit
- IGP Shortcut Enabled
- BGP RSVP LSP Transport Tunnel
- BGP Shortcut Enabled
- Diff-Serv Class Type
- Multi-Class Type Retry Limit
- Auto Bandwidth
- Propagate Administrative Groups
- LFA Type
- Relative Metric
- Backup Type
- Hop Limit
- Reserved Bandwidth (Mbps)
- Node Protect
- Retry Timer (seconds)
- RSVP Reserve Style
- Retry Limit
- Include ADSPEC in RSVP
- Make before Break
- Enable CSPF
- Enable TE Metric
- Metric
- Least-Fill Path Selection
- Groups Included
- Groups Excluded (bitmap)
- Persistent
- Permit Merge
- Record Actual Route
- Record Label
- Committed Rate
- Peak Rate
- Setup Priority
- Hold Priority
- Backup Setup Priority
- Backup Hold Priority
- LDP over RSVP include
- Enable Auto-Bind

15 Click on the OK button. The Create Dynamic LSP from Template form closes.

16 When the Show Created Object parameter is enabled on the template, the Dynamic LSP (Edit) form opens. Close the Dynamic LSP (Edit) form.

17 Close the Manage Dynamic LSPs form.

Procedure 25-11 To list dynamic LSPs

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Configure the filter criteria. A list of dynamic LSPs is displayed.

3 Choose an LSP and click on the Properties button. The Dynamic LSP (Edit) form opens.

4 To view LSP path information:

i Click on the LSP Paths tab.

ii Double-click on an LSP path.

iii Review the state information.

The LSP path information includes whether the bypass tunnel for the LSP is active, or whether the LSP is in a fast reroute state.

Procedure 25-12 To run an OAM validation test for a dynamic LSP

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Configure the filter criteria. A list of dynamic LSPs is displayed.

3 Choose an LSP and click on the Properties button. The Dynamic LSP (Edit) form opens.

4 Click the One Time Validation button.

5 Refer to Procedure 77-9 for more information on using the One Time Validation function and reviewing the test results.

Procedure 25-13 To create a Point-to-Multipoint LSP

1 Choose Manage→MPLS→Point-to-Multipoint LSPs from the 5620 SAM main menu. The Manage Point-to-Multipoint LSPs form opens.

2 Click on the Create button. The P2MP LSP (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Name
- ID
- Auto-Assign ID
- P2MPId
- Administrative
- System ID (Loopback IP Address)
- IP Address

When you configure the System ID (Loopback IP Address) parameter, the Management IP Address and Site Name parameters are automatically populated with the values associated with that NE. The IP Address parameter is also automatically populated, however, you can specify a new value for the parameter, if required.

4 Click on the Properties tab.

5 Configure the parameters in the Traffic Engineering and Protection panel:

- Fast Reroute
- Hop Limit

6 Configure the parameters in the Fast Reroute panel:

- Backup Type
- Hop Limit
- Reserved Bandwidth (Mbps)
- Node Protect
- Propagate Administrative Groups

The Node Protect parameter is only configurable when the Reserved Bandwidth (Mbps) parameter is set to a value greater than 0.

7 Configure the Make before Break parameter.

8 Configure the parameters in the CSPF panel:

- Enable CSPF
- Enable TE Metric

9 Configure the parameters in the Signalling panel:

- Retry Timer (seconds)
- Retry Limit
- RSVP Reserve Style
- Include ADSPEC in RSVP
- Propagate Administrative Groups via Session Attribute Object

10 Click on the P2MP Primary Instance tab.

11 Click the Create button. The P2MP Instance (Create) form opens with the General tab displayed.

12 Configure the parameters:

- Name
- ID
- Auto-Assign ID
- Administrative

13 Click on the Properties tab.

14 Configure the parameters in the Traffic Engineering Properties panel:

- Reserved Bandwidth (Mbps)
- Hop Limit
- Inherit Value
- Record Actual Path
- Record Label

When you enable the Inherit Value parameter, the Hop Limit parameter for the P2MP Instance is set to the same value as you configured for the parent P2MP LSP.

15 Configure the parameters in the Make Before Break panel:

- Make before Break
- Inherit Value
- Resignal

When you enable the Inherit Value parameter, the Make before Break parameter for the P2MP instance is set to the same value as you configured for the parent P2MP LSP.

16 Configure the parameters in the Administrative Groups panel:

- Inherit Value (for Groups Included)
- Inherit Value (for Groups Excluded)

When you enable the Inherit Value parameters, the Included and/or Excluded Groups for the P2MP instance are set to the same values you configure for the parent P2MP LSP. If you do not enable the Inherit Value parameters, you can configure the Included Groups and Excluded Groups for the P2MP Instance independently from the parent P2MP LSP. (See step 21.)

17 Click on the S2L Paths tab.

18 Click the Create button. The S2L Path (Create) form opens with the General tab displayed. Each S2L path object represents a root-to-leaf (S2L) sub-LSP path for the primary instance of the P2MP LSP.

19 Configure the parameters:

- Name
- ID
- Destination Site ID
- Administrative

20 Repeat steps 18 and 19 to configure another S2L path, if required.

21 Click on the Administrative Groups tab.

22 Assign one or more MPLS administrative groups to the P2MP Instance.

i Choose the required Included Groups in the Unassigned list.

ii Click on the right arrow button. The groups are assigned to the Point-to-Multipoint LSP and moved to the Assigned list.

iii Select the required Excluded Groups in the Unassigned list.

iv Click on the right arrow button. The groups are assigned to the Point-to-Multipoint LSP and moved to the Assigned list.

After you assign the Included and Excluded Groups, the total value of the groups is displayed in a bit mask format by the Groups Included and Groups Excluded indicators on the P2MP Instance Properties tab.

23 Click on the OK button. The P2MP Instance (Create) form closes.

24 Click on the S2L Paths tab in the main P2MP LSP (Create) form.

25 Click on the Search button to populate the table. The S2L Paths you configured in step 18 appears. You can choose an entry from the list and click on Properties to edit it, if required.

26 Click on the Administrative Groups tab in the main P2MP LSP (Create) form.

27 Assign one or more MPLS administrative groups to the P2MP LSP.

i Select the required Included Groups in the Unassigned list.

ii Click on the right arrow button. The groups are assigned to the Point-to-Multipoint LSP and move to the Assigned list.

iii Select the required Excluded Groups in the Unassigned list.

iv Click on the right arrow button. The groups are assigned to the Point-to-Multipoint LSP and move to the Assigned list.

After you assign the Included and Excluded Groups, the total value of the groups is displayed in a bit mask format by the Groups Included (bitmap) and Groups Excluded (bitmap) indicators on the P2MP LSP Properties tab.

28 Click OK to close the P2MP LSP (Create) form.

29 Close the Manage Point-to-Multipoint LSPs form.

30 To complete the configuration of the Point-to-Multipoint LSP, you must:

a Configure the required PIM tunnel interfaces. See Procedure 22-1.

b Configure tunnel interfaces on the required IGMP routing instance. See Procedure 23-46.

c Configure tunnel interfaces on the required multicast info policy. See Procedure 45-4.

31 After you complete the configuration of the Point-to-Multipoint LSP, you can reopen the P2MP LSP form to create, configure and run OAM diagnostics, if required.

i Click on the Tests tab. The Test Suite, P2MP Ping, and P2MP Trace tabs are displayed.

ii Create or search for the test suite or particular type of test you want to run from the tab pages. Click on either the Create or Search buttons as required.

iii Click the Execute button to run a selected test.

See chapters 32 and 77 for more information about how to configure OAM diagnostics.

Procedure 25-14 To create a Manual Bypass LSP

1 Choose Manage→MPLS→Manual Bypass LSPs from the 5620 SAM main menu. The Manage Manual Bypass LSPs form appears.

2 Click on the Create button. The Create Bypass-only LSP form opens with the Identification step displayed.

3 Configure the parameters:

- Name
- Description
- ID
- Auto-Assign ID

4 Click on the Next button. The Define Source and Destination Sites step is displayed.

5 Specify the source and destination sites for the manual bypass LSP.

Note — You can also manually specify an IP address for each parameter in this step.

i Click on the Source Site ID parameter Select button. The Select a Network Element - Create Bypass-only LSP form opens with a list of the available sites.

ii Choose a site and click on the OK button. The Select a Network Element - Create Bypass-only LSP form closes and the Create Bypass-only LSP form displays the source site information, which includes the Source IP Address parameter value. This parameter is automatically populated with the system IP address of the site.

iii Click on the Destination Site ID parameter Select button. The Select a Network Element - Create Bypass-only LSP form opens with a list of the available sites.

iv Choose a site and click on the OK button. The Select a Network Element - Create Bypass-only LSP form closes and the Create Bypass-only LSP form displays the destination site information. The displayed destination interface is the system interface because an LSP can terminate only on a system interface.

6 Click on the Next button. The Auto Select Hop-Less MPLS Path form opens.

7 Configure the Auto Select Hop-Less Path parameter.

8 If the Auto Select Hop-less Path parameter in step 7 is enabled, go to step 10.

9 Click on the Next button. The LSP-Path Binding opens, with the Choose MPLS Path step displayed.

i Choose an MPLS path to associate with the LSP. You can also create an MPLS path by clicking on the Create MPLS Path button. See Procedure 25-4.

ii Click on the Next button. The Set Traffic Options step is displayed.

iii Configure the parameters:

- Hop Limit
- Inherit Value
- Record Actual Path

iv Click on the Next button. The Set Initial States step is displayed.

v Configure the Administrative parameter.

vi Click on the Finish button. The LSP-Path Binding form closes and a dialog box appears.

vii Click on the OK button. The Create Bypass-only LSP form reappears.

10 Click on the Next button. The Properties step is displayed.

11 Configure the Hop Limit parameter in the Traffic Engineering And Protection panel.

12 Configure the Make before Break parameter in the Make before Break panel.

13 In the CSPF panel, configure the parameters:

- Enable CSPF
- TE Metric

14 Configure the parameters in the Signalling panel:

- Retry Timer (seconds)
- Retry Limit
- RSVP Reserve Style
- Include ADSPEC in RSVP
- Propagate Administrative Group via Session Attribute Object

15 Configure the parameters in the Inter Area/Level Traffic Engineering panel:

- Exclude Node in ERO
- Exclude Node IP Address

16 Click on the Next button. The Admin Groups step is displayed.

17 Assign one or more included MPLS administrative groups to the bypass-only LSP.

i Choose the required MPLS administrative groups in the Included Groups - Unassigned list.

ii Click on the right arrow button. The groups are assigned to the bypass-only LSP and move to the Assigned list.

Note — When you assign included administrative groups to an MPLS interface, the assigned groups are displayed in bit mask form by the Groups Included (bitmask) indicator on the General tab.

18 Assign one or more excluded MPLS administrative groups to the bypass-only LSP, if required.

i Choose the required MPLS administrative groups in the Excluded Groups - Unassigned list.

ii Click on the right arrow button. The groups are assigned to the bypass-only LSP and move to the Assigned list.

Note — When you assign excluded administrative groups to an MPLS interface, the assigned groups are displayed in bit mask form by the Groups Excluded (bitmask) indicator on the General tab.

19 Click on the Next button. The Set Initial State step is displayed.

20 Configure the Administrative parameter.

21 Click on the Finish button. The 5620 SAM prompts you to view the bypass-only LSP.

22 Enable the View the newly created Bypass Only Lsp parameter to view the bypass-only LSP configuration after closing the form, if required.

23 Click on the Close button. The Create Bypass-only LSP form closes.

24 If the View the newly created Bypass Only Lsp parameter in step 22 is enabled, the Bypass-only LSP (Edit) form opens with the newly created bypass-only LSP configuration displayed.

i View the configuration, if required.

ii Close the Bypass-only LSP (Edit) form.

25 Close the Manage Manual Bypass LSPs form.

Procedure 25-15 To configure a Manual Bypass LSP

1 Choose Manage→MPLS→Manual Bypass LSPs from the 5620 SAM main menu. The Manage Manual Bypass LSPs form opens.

2 Configure the filter criteria and click on the Search button. A list of bypass-only LSPs is displayed.

3 Choose an LSP and click on the Properties button. The Bypass-only LSP (Edit) form opens with the General tab displayed.

4 Configure the Description parameter in the Identity panel.

5 Configure the Administrative parameter in the States panel.

6 Click on the Properties tab.

7 Configure the Hop Limit parameter in the Traffic Engineering and Protection panel.

8 Configure the Make before Break parameter in the Make before Break panel.

9 Configure the parameters in the CSPF panel:

- Enable CSPF
- Enable TE Metric

10 Configure the parameters in the Signalling panel:

- Retry Timer (seconds)
- Retry Limit
- RSVP Reserve Style
- Include ADSPEC in RSVP
- Propagate Administrative Groups via Session Attribute Object

11 Configure the parameters in the Inter Area/Level Traffic Engineering panel:

- Exclude Node In ERO
- Exclude Node IP Address

12 Click on the OK button. A dialog box appears.

13 Click on the Yes button. The Bypass-only LSP (Edit) form closes.

14 Close the Manage Manual Bypass LSPs form.

Procedure 25-16 To configure an LSP path

The following procedure applies to Dynamic LSPs and Manual Bypass LSPs, unless otherwise noted. Dynamic LSPs are used to demonstrate the steps.

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Configure the filter criteria and click on the Search button. A list of dynamic LSPs is displayed.

3 Choose a dynamic LSP from the list.

4 Click the on Properties button. The Dynamic LSP (Edit) form opens with the General tab displayed.

5 Click on the LSP-Path Bindings tab. A list of LSP paths is displayed.

6 If you are accessing this form to update the MPLS path for a Dynamic LSP, then go to step 14. Otherwise, go to step 7.

7 Choose an LSP-Path Binding from the list and click on the Properties button. The LSP-Path Binding (Edit) form opens with the General tab displayed.

8 Configure the Administrative parameter in the States panel.

9 Configure the parameters in the Transport Properties panel:

- Setup Priority
- Hold Priority

10 Configure the parameters in the Traffic Engineering Properties panel:

- Reserved Bandwidth (Mbps)
- Hop Limit
- Record Actual Path
- Record Label
- Diff-Serv Class Type
- Diff-Serv Backup Class Type

The Diff-Serv Backup Class Type parameter is only applicable to Dynamic LSPs.

11 Configure the parameters in the Make before Break panel:

- Make before Break
- Inherit Value
- Resignal

12 Configure the parameters in the Administrative Groups panel:

- Groups Included
- Inherit Value
- Groups Excluded (bitmap)
- Inherit Value

13 Replace the existing MPLS path for a primary or secondary LSP with another MPLS path, if required, by proceeding as follows:

Note — You can update the existing MPLS path only for a primary or secondary LSP path that has the Make before Break parameter enabled. The MPLS path you want to use must already exist on the NE, and must not be used by any other LSP paths under the parent LSP.

i Click on the Update MPLS Path button. If the Update MPLS Path button is not visible, click on the More Actions button and choose Update MPLS Path. The Choose MPLS Path form opens and displays the eligible MPLS paths.

ii Choose the required MPLS path from the list.

iii Click on the OK button. The Choose MPLS Path form closes and the LSP-Path Binding (Edit) form is refreshed with the parameters related to the updated MPLS path selection.

iv Click on the OK button. The The LSP-Path Binding (Edit) form closes and the LSP-Path Binding list is refreshed with the updated MPLS path selected.

v Go to step 18.

14 Choose the MPLS path from the list that you want to use to replace the existing path. See step 13 for restrictions.

15 Click on the Update MPLS Path button. If the Update MPLS Path button is not visible, click on the More Actions button and choose Update MPLS Path. The Choose MPLS Path form opens and displays the eligible MPLS paths.

16 Choose the required MPLS path from the list.

17 Click on the OK button. The Choose MPLS Path form closes and the LSP-Path Binding list is refreshed with the updated MPLS path selected.

18 Click the Set as Secondary or Set as Standby buttons for a selected LSP-Path Binding to change its Type to one of these choices, if required.

19 Click the Switch Standby to Standby button for a selected LSP-Path Binding if you need to switch from the current active standby LSP path to another standby LSP path. This applies only to dynamic LSPs. The button choices include:

- Switch: This option allows you to switch manually from an active standby path to another inactive standby path. You can do this as often as required, without having to select Clear first.
- Force Switch: This option is essentially the same as the Switch option, but you cannot switch back unless you first press Clear to remove the Force Switch flag.
- Clear: This option is used to clear the Force Switch flag.

20 Click on the Administrative Groups tab.

21 Assign an MPLS administrative group to the dynamic LSP.

i Choose an MPLS administrative group in the Unassigned list.

ii Click on the right arrow button. The group is assigned to the dynamic LSP and moves to the Assigned list.

After you assign administrative groups to an MPLS interface, the total value of the assigned groups is displayed in a bit mask format by the Groups Included (bitmask) indicator on the General tab.

22 Click on the General Tab and in the Shared Risk Link Group panel, configure the Enable SRLG for FRR or Enable SRLG parameter, if available and required.

23 Click on the Tests tab to configure OAM diagnostics for the LSP path, if required. The supported test type tabs appear. See chapter 32 for more information about how to configure OAM diagnostics.

24 View a list of hops, if required.

i Click on the following tabs to list the path hops, if required:

- Provisioned Path
- Actual Path
- CSPF Path

ii Click on the Topology View button to view the topology map for the path, if required. See chapter 6 for information about using topology maps.

25 Click on the OK button. The LSP-Path Binding (Edit) form closes.

26 Click on the OK button. The Dynamic LSP (Edit) form closes.

Procedure 25-17 To create an LSP path using a tunnel template

Before you can create an LSP path from a tunnel template, you must create the tunnel template. You can use an existing LSP path to create a tunnel template. See "XML API template script format" in the *5620 SAM Scripts and Templates Developer Guide* for more information about creating a tunnel template.

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Click on the Create from Template button. A Create Dynamic LSP from Template form opens with a list of previously created templates.

3 Choose a LSP template from the list. The template must be one where you associated a child LSP Path template to the parent LSP template.

4 Click on the OK button. A Create Dynamic LSP from Template form opens. See Procedure 25-10 for information about creating a dynamic LSP from a template.

5 Click on the OK button. Perform one of the following:

   a If the Show Created Object parameter is enabled on the template, the Dynamic LSP (Edit) form opens. Go to step 6.

   b Open the Dynamic LSPs (Edit) form.

      i Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

      ii Choose the dynamic LSP that you created in step 4.

      iii Click on the Properties button. The Dynamic LSP (Edit) form opens.

6 Click on the LSP-Path Bindings tab.

7 Click on the Create from Template button. A pop-up menu appears with an LSP path template.

8 Click on the template that you need to use for the LSP path.

9 Configure the parameters:

- Type
- Administrative
- Fast Reroute
- Backup Type
- Hop Limit
- Backup Setup Priority
- Backup Hold Priority
- Minimum Bandwidth (mbps)
- Committed Rate
- Peak Rate
- Setup Priority
- Hold Priority
- Reserved Bandwidth
- Hop Limit
- Record Actual Path
- Record Label
- Persistent
- Permit Merge
- IGP Shortcut Enabled
- Diff-Serv Class Type
- Diff-Serv Backup Class Type
- Main Class Type Retry Limit
- Make before Break
- Resignal
- Enable CSPF
- Rebuild Timer
- Groups Included
- Groups Excluded (bitmap)
- Groups Included
- Enable SRLG

10 Click on the Inheritance tab.

11 Configure the Overridden Properties parameter.

12 Click on the OK button. A dialog box appears.

13 Click on the OK button. The Create LSP Path From Template form closes.

14 Close the Manage Dynamic LSPs form.

Procedure 25-18 To configure an LSP Path optimization policy

1 Choose Manage→MPLS→LSP Path Optimization from the 5620 SAM main menu. The Manage LSP Path Optimization form opens.

2 Choose LSP Path Optimization Policy (Path/Routing Management: MPLS) from the drop-down menu.

3 Click on the Create button. A drop-down menu appears.

4 Choose Create Optimization Policy. The LSP Path Optimization Policy (Create) form opens with the General tab displayed.

5 Configure the parameters:

- ID
- Auto-Assign ID
- Description

6 Click on the Candidate Definition tab to apply filters to define eligible LSP Paths for optimization. When no filters are applied, all eligible LSP Paths are listed in the Execution Candidates form.

7 To further limit the number LSP Paths that are listed in the Execution Candidate form, define rule-based groups and add only those NEs that contain the LSP Paths that you need include.

i Click on Select button beside the Filter Name parameter in the LSP Path Filter panel. A Select LSP Path Filter dialog box appears.

ii Apply a filter, or create and apply a filter and click on the Search button. A list of LSP Path filters is displayed.

iii Choose an LSP Path filter from the list.

iv Click on the OK button. The LSP Path Filter panel is refreshed with the selected LSP Path Filter.

v Click on the Select button beside the Filter Name parameter in the Dynamic LSP Filter panel.

vi Apply a filter, or create and apply a filter and click on the Search button. A list of dynamic LSP filters is displayed.

vii Choose a dynamic LSP filter from the list

viii Click on the OK button. The Dynamic LSP Filter panel is refreshed with the selected dynamic LSP filter.

ix Click on the Select button beside the Name parameter in the Rule-Based Group panel. A list of rule-based groups is displayed

x Choose a rule-based group from the list.

xi Click on the OK button. The Rule-Based Group panel is refreshed with the selected rule-based group.

8 Click on the Execution Rules tab. Configure the parameters:

- Sequencing Target
- Sequencing Order
- Pacing Interval (seconds)

9 Click on the Apply button. The form displays with schedule information.

Note 1 — The Schedule Optimization button does not appear during LSP path optimization policy creation. The LSP path optimization policy must be created first before a schedule can be applied. You must click on the Apply button.

Note 2 — After a schedule is applied to a LSP Optimization Policy, you cannot make changes to the schedule from the Optimization Scheduled Task form.

10 Click on the Schedule Optimization button. An Optimization Scheduled Task (Create) form opens.

11 Configure the parameters:

- Scheduled Task Name
- Scheduled Task Description
- Administrative State

12 Click on the Select button beside the ID parameter. A Select Schedule - Optimization Scheduled Task form opens.

13 Perform one of the following:

a Click on the Create button to create a schedule. A SAM Schedule Create form opens. See Procedure 7-1 for more information about how to create a schedule.

b Choose a previously created schedule.

14 Click on the OK button. The Optimization Scheduled Task form displays schedule and optimization information.

15 Click on the OK button. The Select Schedule - Optimization Scheduled Task form closes and the LSP Path Optimization Policy form reappears.

16 Click on the Execution Candidates tab.

17 Click on the Search button to display only the eligible LSP Paths that were filtered in step 7. If a filter was not applied, all eligible LSP Paths are listed.

18 Click on the Optimize button. To view the results of optimization, see Procedure 25-20.

19 Close the LSP Path Optimization Policy form.

Procedure 25-19 To terminate an LSP Path optimization policy that is in progress

1 Choose Manage→MPLS→LSP Path Optimization from the 5620 SAM main menu. The Manage LSP Path Optimization form opens.

2 Choose LSP Path Optimization Policy (Path/Routing Management: MPLS) from the drop-down menu.

3 Create a filter to search for optimization policies that are in progress. Click on the Search button. A list of LSP Path optimization policies that are in progress appears.

4 Choose a LSP Path optimization policy from the list.

5 Click on the Properties button. The LSP Path Optimization Policy (Edit) form opens with the General tab displayed.

6 Click on the Stop Current Optimization button. If the Stop Current Optimization button is not visible, click on the More Actions button and choose Stop Current Optimization. The Optimization parameter value changes from In Progress to Not In Progress.

7 Close the LSP Path Optimization Policy (Edit) form.

Procedure 25-20 To view LSP Path optimization policy results

Use the following procedure to view the re-signaling information as a result of the LSP Path optimization policy execution. See Procedure 25-18 for more information about how to configure a LSP Path optimization policy.

1 Choose Manage→MLPS→LSP Path Optimization from the 5620 SAM main menu. The Manage LSP Path Optimization form opens.

2 Choose LSP Path (Path/Routing Management MPLS) from the drop-down menu.

3 Click on the Search button. A list of LSP Paths appears.

4 Choose the LSP Path on which you executed a LSP optimization policy.

5 Click on the Properties button. An LSP-Path Binding (Edit) form opens.

6 View the parameters, as described in section 25.1.

- Resignal Eligible
- Last Performed Type
- Last Performed
- Last Performed State

7 Close the LSP-Path Binding form.

8 Close the Manage LSP Path Optimization form.

Procedure 25-21 To view detour and bypass path information

Perform this procedure to view information regarding detour and bypass tunnel paths and their protected LSPs. Detour and bypass paths are typically configured for fast-reroute-enabled LSPs on NEs for service protection against NE or link failure. The RSVP protocol is used to detect an NE or link loss.

Note 1 — This procedure applies to dynamic LSPs only.

Note 2 — Detours are employed in One-to-One backup configurations. A separate backup LSP is established for each LSP that is backed up.

Bypass Tunnels are employed in Many-to-One backup configurations in which a single backup LSP is used to back up multiple original LSPs.

Whether a path is a detour or bypass path is determined by the Backup Type parameter value specified during LSP creation. The Backup Type parameter can be set only when the Fast Reroute parameter for the LSP is set to true.

1 Navigate to a dynamic LSP that you want to examine. The path is Manage→MPLS→Dynamic LSPs.

2 Choose the required LSP and click on the Properties button. The Dynamic LSP (Edit) form opens.

3 Click on the RSVP Sessions tab. The detour or bypass originating, transiting, and terminating RSVP sessions associated with the LSP are listed. Type, site, next and previous hop, and other related information is available.

Note — The SRLG Disjoint FRR Properties and SRLG Not Strict FRR Properties indicators apply to primary LSP sessions only, and not to bypass LSP sessions.

4 Choose the desired RSVP session of type detour or bypass from the list and click on the Properties button. The Session (View) form opens.

5 To view the Protected LSPs for the specific bypass or detour:

- **i** Click on the Protected LSP Paths tab. All the protected LSPs for a specific bypass or detour tunnel are listed.
- **ii** Use the scroll bar at the bottom of the list frame to view the available information on the Protected LSPs.

6 To view the Detour or Bypass Tunnel Paths for the detour or bypass tunnel:

i Click on the Detour/Bypass Tunnel Path tab. Information regarding the detour or bypass paths is displayed. Sufficient information is provided to permit tracing a path from its originating site, through its transit hops, and to its termination site.

ii Use the scroll bar at the bottom of the list frame to view the available information on the paths, including ID, Type, and so on.

7 To view additional specific Detour or Bypass information, perform the following steps, as appropriate:

a For a selected detour session, click on the Detour tab. The Detour Session ID, Detour PLR ID, and Avoided Downstream Site ID are listed.

b For a selected bypass session, click on the Bypass Tunnel tab. The Bypass Tunnel's current State is displayed.

Note — For 5620 SAM to accurately gather the information about the detour and bypass tunnel path (and the LSPs protected by a detour or a bypass tunnel), 5620 SAM must be managing all routers participating the LSP fast reroute. This is required by 5620 SAM for all SR and 7705 SAR network elements along the primary path of a fast reroute-enabled LSP.

Procedure 25-22 To view exclude route object information

Perform this procedure to view the address of the NE to be avoided as signalled in the EXCLUDE_ROUTE object.

Note — This procedure applies to dynamic LSPs only.

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Choose a dynamic LSP and click on the Properties button. The Dynamic LSP (Edit) form opens with the General tab displayed.

3 Click on the RSVP Sessions tab.

4 Choose the desired RSVP session from the list and click on the Properties button. The Session (View) form opens with the General tab displayed.

5 View the Exclude Node IP Address property. If no EXCLUDE_ROUTE object is signalled, the address is 0.0.0.0.

6 Close the Session (View) form.

7 Close the Dynamic LSP (Edit) form.

8 Close The Manage Dynamic LSPs form.

Procedure 25-23 To create an LSP template for MVPN

1 Choose Policies→MPLS→LSP Template MVPN from the 5620 SAM main menu. The LSP Template MVPN Policies form opens.

2 Perform one of the following:

a Configure the Policy scope parameter to Global.

b Configure the Policy scope parameter to Local.

i Configure the Local Node IP Address parameter, if required.

ii Click on the Select button and choose a device.

3 Click on the Create button. The LSP Template MVPN Policy (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Displayed Name
- Description

5 Click on the Properties tab.

6 Configure the parameters in the Traffic Engineering and Protection panel:

- Reserved Bandwidth (Mbps)
- Fast Reroute
- Hop Limit
- Record Actual Path
- Record Label

7 Configure the parameters in the Fast Reroute panel:

- Backup Type
- Hop Limit
- Propagate Administrative Groups

Note — The Fast Reroute panel parameters are configurable if the Fast Reroute parameter is set to true.

8 Configure the Make before Break parameter.

9 Configure the parameters in the CSPF panel:

- Enable CSPF
- Enable TE Metric

10 Configure the parameters in the Signalling panel:

- Retry Timer (seconds)
- Retry Limit
- Propagate Administrative Groups via Session Attribute Object

11 Click on the Administrative Groups tab.

12 Assign one or more MPLS administrative groups to the LSP template MVPN policy.

i Choose the required Included Groups in the Unassigned list.

ii Click on the right arrow button. The groups are assigned to the Point-to-Multipoint LSP and moved to the Assigned list.

iii Choose the required Excluded Groups in the Unassigned list.

iv Click on the right arrow button. The groups are assigned to the Point-to-Multipoint LSP and moved to the Assigned list.

After you assign the Included and Excluded Groups, the total value of the groups is displayed in a bit mask format by the Groups Included and Groups Excluded indicators on the LSP Template MVPN Policy Properties tab.

13 Click on the OK button. The LSP Template MVPN Policy, Global Policy (Create) form closes and the Manage Lsp Template for Mvpn form reappears with the LSP MVPN template displayed.

14 Choose the LSP MVPN template and click on the Properties button. The LSP Template MVPN Policy - Global Policy (Edit) form opens with the General tab displayed.

15 Click on the Distribute button to manually distribute the policy locally to devices. If the Distribute button is not visible, click on the More Actions button and choose Distribute. Policies are also automatically distributed to devices when the policies are used by resources on the device.

Note 1 — When the policy is in draft mode, the Distribute button, or the Distribute option under the More Actions button, is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution, which also distributes the policy to existing local definitions. See chapter 42.

Note 2 — The MVPN LSP template cannot be used until you choose a default MPLS path and configure the Administrative parameter in the local policy definition after the global policy is distributed. After the changes are applied to the local policy, the policy can be switched back to Sync With Global mode and the local changes are saved.

16 Click on the Local Definitions tab.

17 Click on the Search button. A list of LSP MVPN templates is displayed.

18 Choose an LSP MVPN template from the list and click on the Properties button. The LSP Template MVPN Policy, Local Policy (Edit) form opens with the General tab displayed.

19 Click on the Switch Mode button to change the configuration mode to Local Edit Only.

20 Click on the Properties tab.

21 Click on the Select button to choose a default MPLS path. The Select Default MPLS Path - Lsp MVPN Template, Local Policy form opens with a list of default MPLS paths displayed.

22 Choose an MPLS path from the list and click on the OK button. The default MPLS path is displayed.

23 Click on the General tab.

24 Configure the Administrative parameter.

25 Click on the OK button. A dialog box appears.

26 Click on the OK button. The LSP Template MVPN Policy, Local Policy form closes.

Procedure 25-24 To view LSP templates for MVPN created using CLI

Perform this procedure to view read-only one-hop P2P LSP and mesh P2P LSP templates created using CLI.

You cannot modify the local or global definitions of these template types using the 5620 SAM. You cannot distribute these template types to other NEs using the 5620 SAM. See the specific device documentation for more information about how to create a one-hop P2P LSP or mesh P2P LSP template.

1 Choose Policies→MPLS→LSP Template MVPN from the 5620 SAM main menu. The LSP Template MVPN Policies form opens.

2 Perform one of the following:

- **a** Configure the Policy scope parameter to Global.
- **b** Configure the Policy scope parameter to Local.
  - **i** Configure the Local Node IP Address parameter, if required.
  - **ii** Click on the Select button and choose an NE.

3 Choose one of the following from the Type column drop-down menu.

- One-Hop P2P LSP
- Mesh P2P LSP

4 Click on the Search button. A list of LSP templates for MVPN is displayed.

5 Choose an LSP template and click on the Properties button. The LSP Template MVPN Policy - *template_type* (View) form opens with the General tab displayed.

6 Choose the LSP MVPN template and click on the Properties button. The LSP Template MVPN Policy - Global Policy (Edit) form opens with the General tab displayed.

7 Click on the tabs to view information about the LSP template.

8 Close the LSP Template MVPN Policy - *template_type* (View) form.

9 Close the LSP Template MVPN Policies form.

Procedure 25-25 To view LSPs created by one-hop P2P and mesh P2P templates

Dynamic LSPs are automatically created when you use CLI to create and distribute a one-hop P2P or mesh P2P LSP template, and then associate the LSP template with an auto-LSP. Perform the following procedure to view the LSPs that are automatically created by one-hop P2P and mesh P2P templates.

Note — The dynamically-created LSPs cannot be associated with SDPs, and are not listed when you are creating an SDP.

1 Choose Manage→MPLS→Dynamic LSPs from the 5620 SAM main menu. The Manage Dynamic LSPs form opens.

2 Choose one of the following from the Type column drop-down menu.

- One-Hop Point-To-Point
- Mesh Point-To-Point

3 Click on the Search button. A list of dynamic LSPs is displayed.

4 Choose an LSP and click on the Properties button. The properties form for the object appears.

5 View the information on the various tabs, as required.

6 Close the object properties form.

7 Close the Manage Dynamic LSPs form.

Procedure 25-26 To list and view MPLS objects

1 Choose Manage→MPLS→MPLS Objects from the 5620 SAM main menu. The Manage MPLS Objects form opens.

2 Choose an MPLS object type and click on the Search button. A list of MPLS objects is displayed.

3 Choose an object and click on the Properties button. The properties form for the object appears.

4 View the information on the various tabs, as required.

5 Close the object properties form.

6 Close the Manage MPLS Objects form.

26 — MPLS-TP

26.1 MPLS-TP overview *26-2*

26.2 Simplified provisioning *26-3*

26.3 Workflow to configure MPLS-TP *26-3*

26.4 MPLS-TP procedures *26-4*

26.1 MPLS-TP overview

MPLS-TP is a set of MPLS protocol functions that enables the use of MPLS in transport networks and applications. MPLS-TP provides in-band proactive OAM and protection mechanisms that do not rely on a control plane, such as RSVP-TE, to operate. MPLS-TP enables MPLS to be deployed in a statically configured transport network without the need for a dynamic control plane.

The 7450 ESS, 7750 SR, and 7950 XRS have two primary roles in an MPLS-TP network:

- as a gateway PE between IP/MPLS and MPLS-TP domains
- as an LSR or LER for MPLS-TP LSPs

The 5620 SAM can configure LSR NEs even when LERs are not configured, or when the LERs or LSRs are not a 7450 ESS, 7750 SR, or 7950 XRS. See the specific NE documentation for more information about MPLS-TP.

The 5620 SAM provides simple provisioning for MPLS-TP management in a transport network. MPLS-TP relies on static configuration, rather than a control plane, to ensure end-to-end path configuration and consistency. The 5620 SAM support of MPLS-TP includes:

- bidirectional co-routed MPLS-TP LSPs and PWs
- MPLS-TP identifiers for NEs, LSPs, and PWs
- linear protection for MPLS-TP LSPs with working and protection paths for each LSP
- OAM and protection with both IP and non-IP encapsulation
- proactive CC/V for MPLS-TP LSPs using BFD
- on-demand CV for MPLS-TP LSPs and PWs using LSP ping and trace and VCCV ping and trace diagnostics
- static PW status signaling, with support for PW redundancy, MC-LAG, MC-APS, BGP multi-homing and active and standby dual-homing into IES, VPRN, or VPLS

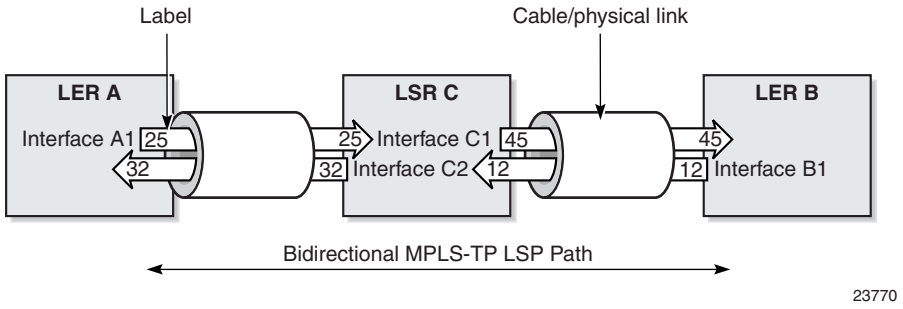
Proactive OAM

A proactive continuity check detects a loss of continuity defect between two MEPs in a MEG. Proactive connectivity verification detects an unexpected connectivity defect between two MEPs, and unexpected connectivity within the MEG with an unexpected MEP. The 5620 SAM implements both tests with a proactive OAM template.

Proactive OAM templates are based on BFD. BFD packets are sent using configurable timers. Continuity check packets contain a BFD control packet, while connectivity verification packets also include an identifier for the source MEP. The destination MEP can detect a connectivity defect if it is receiving packets from an incorrect peer MEP. When a defect is detected, the 5620 SAM generates an alarm.

26.2 Simplified provisioning

The 5620 SAM significantly simplifies the provisioning process of bidirectional MPLS-TP LSPs, where using CLI can be cumbersome and prone to error. Using the 5620 SAM, all of the components of an end-to-end bidirectional MPLS-TP LSP are automatically configured. Using CLI, all of the components of a bidirectional MPLS-TP LSP, including interfaces and labels, must be configured. The 5620 SAM automatically creates opposite interfaces based on the physical links between NEs, and assigns in and out labels across all of the interfaces. However, if a physical link does not exist between NEs, the 5620 SAM cannot auto-create the interfaces. The 5620 SAM prompts you to manually create the interfaces.



Consider the following when you create a bidirectional MPLS-TP LSP using 5620 SAM simplified provisioning:

- the NEs must be 5620 SAM-managed
- MPLS-TP tunnels that are created on the NEs using CLI are discovered by the 5620 SAM

Note — The 5620 SAM does not create the bidirectional MPLS-TP LSP when all of the MPLS-TP LSP endpoints (LERs) are not managed by the 5620 SAM. However, cross-connections (on LSRs) appear in the 5620 SAM database if the LSRs are managed.

In the example in Figure 26-1, you configure the LER A and LER B using the 5620 SAM. For the bidirectional MPLS-TP LSP path, you identify the hops by specifying the interfaces. In this example, the interfaces are A1 on LER A and C1 on LSR C. Since MPLS-TP is co-routed, the other interfaces (B1 and C2) are determined by the 5620 SAM based on the link between the two NEs. The 5620 SAM automatically chooses all of the labels, in both directions, based on the available labels on the two adjacent NEs. The 5620 SAM also creates the LSR C object. You must configure proactive OAM on LER NEs.

Figure 26-1 Sample bidirectional MPLS-TP LSP

26.3 Workflow to configure MPLS-TP

1 Enable MPLS-TP on the routing instances of all NEs that are to participate in the MPLS-TP network. See Procedure 26-1.

2 Create or configure an MPLS-TP instance. See Procedure 26-2.

3 Create a BFD template policy, if required. See Procedure 26-3.

4 Configure proactive OAM templates and protection templates, if required. See Procedures 26-4 and 26-5.

5 Perform one of the following, as required:

a Create a mesh of MPLS-TP LSPs. See Procedure 26-6. Create an MPLS-TP LSR cross-connect path. See Procedure 26-7.

b Create a bidirectional MPLS-TP LSP using simplified provisioning. See Procedure 26-8.

6 Create a service tunnel, if required, and enable MPLS-TP. See Procedure 27-1.

7 Create a spoke SDP binding using an MPLS-TP service tunnel, if required, on an Apipe, Epipe, Cpipe, VPLS, VPRN, IES, or mirror service. See Procedures 67-4, 67-10, 67-23, 68-44, 71-57, 70-8, and 69-3.

8 Configure static MPLS-TP pseudowire, if required, on a VPLS, VPRN, IES, Epipe, Cpipe or Apipe VLL, or on a mirror service. Ensure that the Control Word parameter for pseudowire OAM is set to Preferred. See Procedures 67-5, 67-11, 67-24, 68-45, 69-4, 70-9, and 71-58.

26.4 MPLS-TP procedures

Use the following 5620 SAM procedures to manage MPLS-TP.

Procedure 26-1 To enable MPLS-TP on a routing instance

1 Choose Routing→NE→Routing Instance from the 5620 SAM navigation tree view selector.

2 Right-click on the routing instance and choose Properties from the contextual menu. The Routing Instance (Edit) form opens with the General tab displayed.

3 Click on the Protocols tab.

4 Enable the MPLS Enabled parameter.

5 Enable the MPLS-TP Enabled parameter.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The Routing Instance (Edit) form closes. The 5620 SAM creates an MPLS-TP site and displays the site below the routing instance in the routing navigation tree.

Procedure 26-2 To configure an MPLS-TP instance

Ensure that you enable MPLS-TP on all of the NEs that are participating in the MPLS-TP network, as described in Procedure 26-1.

1 Navigate to an MPLS-TP instance by choosing Routing→NE→Routing Instance→MPLS-TP from the 5620 SAM navigation tree.

2 Right-click on the MPLS-TP instance, and choose Properties from the contextual menu. The MPLS-TP, Routing Instance (Edit) form opens with the General tab displayed.

3 Configure the parameters in the MPLS-TP General Configurations panel:

- Global ID
- Node ID
- TP-LSP ID Minimum
- TP-LSP ID Maximum

The Global ID and Node ID parameters are identifiers of an MPLS-TP site on the NE. The TP-LSP ID Minimum and TP-LSP ID Maximum parameters reserve a range of IDs that you use for MPLS-TP LSPs.

4 Configure the Administrative State parameter in the States panel.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The MPLS-TP, Routing Instance (Edit) form closes.

Procedure 26-3 To create an MPLS-TP BFD template policy

Perform this procedure to create a BFD template policy that you can assign to a proactive OAM policy in Procedure 26-4.

1 Choose Policies→MPLS→MPLS-TP BFD Templates from the 5620 SAM main menu. The Manage MPLS-TP BFD Templates form opens.

2 Click on the Create button. The BFD Template, Global Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Transmit Timer (milliseconds)
- Receive Timer (milliseconds)
- Multiplier
- Echo Receive Interval (milliseconds)
- Template Type

4 Click on the Apply button. The BFD Template (Edit) form refreshes with additional tabs.

5 Release and distribute the policy. See Procedure 42-1.

6 Close the BFD Template, Global Policy (Edit) form.

7 Close the Manage MPLS-TP BFD Templates form.

Procedure 26-4 To configure a proactive OAM template on an MPLS-TP instance

1 Choose Routing→NE→Routing Instance→MPLS-TP from the 5620 SAM navigation tree.

2 Right-click on the MPLS-TP instance in the navigation tree, and choose Properties from the contextual menu. The MPLS-TP, Routing Instance (Edit) form opens with the General tab displayed.

3 Click on the Proactive OAM Template tab.

4 Click on the Create button. The Proactive OAM Template, Routing Instance (Create) form opens with the General tab displayed.

5 Configure the parameters:

- Displayed Name
- Hold Time Down (centiseconds)
- Hold Time Up (centiseconds)

6 Click on the Select button in the BFD Template panel. The Select BFD Template - Proactive OAM Template list form opens.

7 Specify a search filter, if required, and click on the Search button. A list of configured BFD templates appears. See Procedure 26-3 for information about how to create a BFD template policy.

8 Choose a BFD template and click on the OK button. The Select BFD Template - Proactive OAM Template list form closes and the Proactive OAM Template (Create) form refreshes with the BFD template information.

9 Click on the OK button. The Proactive OAM Template (Create) form closes and a dialog box appears.

10 Click on the OK button.

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The MPLS-TP, Routing Instance (Edit) form closes.

Procedure 26-5 To configure a protection template on an MPLS-TP instance

1 Choose Routing→NE→Routing Instance→MPLS-TP from the 5620 SAM navigation tree.

2 Right-click on the MPLS-TP instance in the navigation tree, and choose Properties from the contextual menu. The MPLS-TP, Routing Instance (Edit) form opens with the General tab displayed.

3 Click on the Protection Template tab.

4 Click on the Create button. The Protection Template, Routing Instance (Create) form opens with the General tab displayed.

5 Configure the parameters:

- Displayed Name
- Revertive
- Wait To Restore (seconds)
- Rapid Protection Switch Coordination (milliseconds)
- Slow Protection Switch Coordination (milliseconds)

6 Click on the OK button. The Protection Template, Routing Instance (Create) form closes and a dialog box appears.

7 Click on the OK button.

8 Click on the OK button. A dialog box appears.

9 Click on the Yes button. The MPLS-TP, Routing Instance (Edit) form closes.

Procedure 26-6 To create an MPLS-TP LSP

1 Choose Manage→MPLS→MPLS-TP LSPs from the 5620 SAM main menu. The Manage MPLS-TP LSPs form opens.

2 Click on the Create button and choose Create LER TP-LSP. The LER TP-LSP (Create) form opens with the General tab displayed.

3 Configure the parameters in the Identity panel:

- Name
- TP-LSP ID
- Auto-Assign ID

The TP-LSP ID must be in the range of the TP-LSP ID Minimum and TP-LSP ID Maximum parameters that you specified in step 3 of Procedure 26-2.

4 Click on the Select button in the Source Site panel. The Select Source Site - LER TP-LSP list form opens.

5 Choose a source site and click on the OK button. The Select Source Site - LER TP-LSP list form closes.

6 Configure the parameters in the Destination panel:

- Destination Tunnel Number
- Destination Node ID
- Destination Global ID

7 Click on the TP-LSP Path tab.

8 Click on the Create button. The MPLS-TP LSP Path (Create) form opens with the General tab displayed.

Note — You can create one working path and one protecting path.

9 Configure a working path:

i Set the Path Type parameter to Working in the Identity panel.

ii Configure the Administrative parameter in the States panel.

iii Configure the parameters:

- LSP Path Number
- Ingress Label
- Egress Label

iv Click on the Select button in the Out Link panel. The Select Out Link - TP-LSP Path list form opens.

v Click on the Search button. A list of configured routing interfaces (numbered or MPLS-TP unnumbered) appears.

vi Choose a site and click on the OK button. The Select Out Link - TP-LSP Path list form closes.

vii If you choose a numbered outlink interface, configure the Next Hop parameter.

viii Go to step 11.

10 Configure a protecting path:

i Set the Path Type parameter to Protecting in the Identity panel.

ii Configure the parameters:

- LSP Path Number
- Ingress Label
- Egress Label

iii Configure the Administrative parameter in the States panel.

iv Click on the Select button beside the Interface Name parameter in the Out Link panel. The Select Out Link - MPLS-TP LSP Path list form opens.

v Click on the Search button. A list of configured routing interfaces (numbered or MPLS-TP unnumbered) appears.

vi Choose an interface and click on the OK button. The Select Out Link - MPLS-TP LSP Path list form closes.

vii If you choose a numbered outlink interface, configure the Next Hop parameter.

11 Configure a path MEP.

i Click on the Path MEP tab.

ii Click on the Create button. The Path MEP (Create) form opens with the General tab displayed.

iii Click on the Select button beside the Proactive OAM Template parameter. The Select Proactive OAM Template - Path MEP list form opens with a list of configured proactive OAM templates.

iv Choose a proactive OAM template and click on the OK button. The Select Proactive OAM Template - Path MEP list form closes.

v If you are configuring a protecting MEP, click on the Select button beside the Protection Template parameter. Otherwise, go to step vii. The Select Protection Template - Path MEP list form opens with a list of configured protection templates.

vi Choose a protection template and click on the OK button. The Select Protection Template - Path MEP list form closes.

vii Configure the parameters:

- Administrative State
- BFD Enabled

viii Click on the OK button. The Path MEP (Create) form closes and a dialog box appears.

ix Click on the OK button.

12 Go to step 10 to create a protecting path. Otherwise, go to step 13.

13 Click on the OK button. The TP-LSP Path (Create) form closes and a dialog box appears.

14 Click on the OK button.

15 Click on the OK button. The LER TP-LSP Path (Create) form closes and a dialog box appears.

16 Click on the OK button.

17 Close the Manage MPLS-TP LSPs form.

Procedure 26-7 To create an MPLS-TP LSR cross-connect path

1 Choose Manage→MPLS→MPLS-TP LSPs from the 5620 SAM main menu. The Manage MPLS-TP LSPs form opens.

2 Click on the Create button and choose Create LSR Path. The LSR Path (Create) form opens with the General tab displayed.

3 Configure the Display Name parameter in the Identity panel.

4 Click on the Select button beside the Site ID parameter to choose the site that is used as the cross-connect. The Select Site - LSR Path list form opens.

5 Choose a site and click on the OK button. The Select Site - LSR Path list form closes.

6 Configure the Administrative parameter in the States panel.

7 Configure the parameters:

- Forward Path Enabled
- Reverse Path Enabled

8 If you enabled the Forward Path Enabled parameter in step 7, perform the following. Otherwise, go to step 10.

i Configure the parameters:

- Forward Ingress Label
- Forward Egress Label

ii Click on the Select button in the Forward Out Link panel. The Select Forward Out Link - LSR Path list form opens.

iii Click on the Search button. A list of configured routing interfaces (numbered or MPLS-TP unnumbered) appears.

iv Choose a site and click on the OK button. The Select Forward Out Link - LSR Path list form closes.

v If you choose a numbered outlink interface, configure the Forward Next Hop parameter.

9 If you enabled the Reverse Path Enabled parameter in step 7, perform the following. Otherwise, go to step 10.

i Configure the parameters:

- Reverse Ingress Label
- Reverse Egress Label

ii Click on the Select button in the Reverse Out Link panel. The Select Reverse Out Link - LSR Path list form opens.

iii Click on the Search button. A list of configured routing interfaces (numbered or MPLS-TP unnumbered) appears.

iv Choose a site and click on the OK button. The Select Reverse Out Link - LSR Path list form closes.

v If you choose a numbered outlink interface, configure the Reverse Next Hop parameter.

10 Click on the LSP Path Binding tab to associate the LSR cross-connect path with LER LSPs.

11 Click on the Create button. The LSR Path Binding (Create) form opens.

12 Configure the LSP Path Number parameter.

13 Configure the parameters in the Source LER panel:

- Source TP-LSP ID
- From Node ID
- Source Global ID

14 Configure the parameters in the Destination LER panel:

- Destination TP-LSP ID
- From Node ID
- Source Global ID

15 Click on the OK button. A dialog box appears.

16 Click on the Yes button. The LSR Path Binding (Create) form closes.

17 Click on the OK button. The LSR Path (Create) form closes.

18 Close the Manage MPLS-TP LSPs form.

Procedure 26-8 To create a bidirectional MPLS-TP LSP

A bidirectional LSP consists of MPLS-TP LSPs or LER LSPs that are created on the edge NEs, and the LSR cross-connect—or transit path—that is created on the transit NEs. The 5620 SAM guides you through the creation of the bidirectional MPLS-TP LSP. When the Apply or OK button is disabled, verify that all necessary parameters are configured. When all possible parameters are configured, the 5620 SAM displays a Hint button to provide instructions on the necessary actions.

Note — 5620 SAM guided provisioning is available only for the creation of bidirectional MPLS-TP LSPs. The Hint button does not appear if you are configuring an existing bidirectional MPLS-TP LSP.

1 Choose Manage→MPLS→MPLS-TP LSPs from the 5620 SAM main menu. The Manage MPLS-TP LSPs form opens.

2 Click on the Create button and choose Create Bidirectional TP-LSP. The Bidirectional TP-LSP (Create) form opens with the General tab displayed.

3 Configure the Name parameter.

4 Perform the following to choose an LER A TP-LSP.

i Configure the TP-LSP ID parameter in the LER A panel. The TP-LSP ID parameter is configurable if you disable the TP-LSP ID Auto-Assigned parameter.

Note — The TP-LSP ID must be in the range of the TP-LSP ID Minimum and TP-LSP ID Maximum parameters that you specified in step 3 of Procedure 26-2.

ii Click on the Select button next to the Site ID parameter. The Select Source Site - Bidirectional TP-LSP list form opens.

iii Choose a source site and click on the OK button. The Select Source Site - Bidirectional TP-LSP list form closes and the source site information is refreshed.

5 Perform the following to choose an LER B TP-LSP.

i Configure the TP-LSP ID parameter in the LER B panel. The TP-LSP ID parameter is configurable if you disable the TP-LSP ID Auto-Assigned parameter.

Note — The TP-LSP ID must be in the range of the TP-LSP ID Minimum and TP-LSP ID Maximum parameters that you specified in step 3 of Procedure 26-2.

ii Click on the Select button next to the Site ID parameter. The Select Source Site - Bidirectional TP-LSP list form opens.

iii Choose a source site and click on the OK button. The Select Source Site - Bidirectional TP-LSP list form closes and the source site information is refreshed.

6 Click on the LSP Path tab.

7 Click on the Create button. The Bidirectional TP-LSP Path (Create) form opens with the General tab displayed.

8 Configure the parameters:

- Path Type
- LSP Path Number

Note — You can set the Path Type parameter to Working, and repeat steps 7 to 22 to create a protecting path. You can create one working path and one protecting path.

The LSP Path Number parameter is a global LSP path number that configures the LSP path number on the LER A working and protecting paths, the LER B working and protecting paths, and on the LSR static hop.The LSP Path Number parameter must be the same on all of the hops.

9 Click on the LER A tab.

10 Click on the Select button beside the Out-Link Interface Name parameter. The Select Out-Link - Bidirectional TP-LSP Path list form opens.

11 Click on the Search button. A list of configured routing interfaces (numbered or MPLS-TP unnumbered) appears.

12 Choose a site and click on the OK button. The Select Out-Link - Bidirectional TP-LSP Path list form closes and the Bidirectional TP-LSP Path (Create) form refreshes with the out-link interface information. The 5620 SAM automatically updates the Ingress Label and Egress Label parameters.

13 Click on the Hint button. A window appears displaying an instructional message.

14 Perform one of the following:

a If the message “You have configured the LER-A Out-Link Interface. As a result, 5620 SAM has created the next LSR Path Hop, and has auto-filled the data between the LER-A and the newly created LSR Path Hop.” appears, perform the following steps:

i Click on the LSR Path Hops tab.

ii Choose the LSR path hop with a configuration state of Incomplete and click on the Properties button. The LSR Hop (Edit) form opens.

iii Configure the parameters:

- Display Name
- Reverse Out-Link Interface

iv Click on the OK button. The LSR Hop (Edit) form closes.

v Go to step 16.

b If the message "You have configured the LER-A Out-Link Interface. 5620 SAM is unable to determine the next hop (this could be due to an unconnected cable). As a result, 5620 SAM has enabled the LSR Path Hop creation, and the LER-B Out-Link Interface selection." appears, perform the following:

- If the next hop in the path is not the LER B, go to step 15 to create an LSR path hop.
- If the next hop is the LER B, go to step 16.

c If the message "You have configured the LER-A Out-Link Interface. As a result, 5620 SAM has auto-completed the data between LER-A and LER-B." appears, perform the following steps:

i Click on the OK button to complete the path configuration. The Bidirectional TP-LSP Path (Create) form closes and the Bidirectional TP-LSP (Create) form reappears.

ii Go to step 23.

15 Perform the following to create an LSR path hop:

i Click on the LSR Path Hops tab.

ii Click on the Create button. The LSR Hop (Create) form opens.

iii Configure the Display Name parameter.

iv Click on the Select button beside the Forward Out-Link parameter. The Select Forward Out-Link - Bidirectional TP-LSP Path list form opens.

v Choose an interface and click on the OK button. The Select Forward Out-Link - Bidirectional TP-LSP Path list form closes and the LSR Path Hops (Create) form refreshes with the forward out-link interface information. The 5620 SAM automatically updates the Forward Ingress Label and Forward Egress Label parameters.

vi Click on the Hint button. The message "You have configured the Forward Out-Link Interface. As a result, 5620 SAM has auto-completed the data between this LSR Path Hop and the previous hop on the forward path." appears.

vii Click on the Select button beside the Reverse Out-Link parameter. The Select Reverse Out-Link - Bidirectional TP-LSP Path list form opens.

viii Choose an interface and click on the OK button. The Select Reverse Out-Link - Bidirectional TP-LSP Path list form closes and the LSR Path Hops (Create) form refreshes with the reverse out-link interface information. The 5620 SAM automatically updates the Reverse Ingress Label and Reverse Egress Label parameters.

ix Click on the OK button. The LSR Hop (Create) form closes.

x Click on the Hint button.

xi If the message "You have configured the LSR Path Hop Reverse Out-Link Interface. 5620 SAM is unable to determine the next hop (this could be due to an unconnected cable). As a result, 5620 SAM has enabled the LSR Path Hop creation, and the LER-B Out-Link Interface selection.", perform the following. Otherwise, go to step xiii.

- If the next hop in the path is not the LER B, return to step 15 to create an LSR path hop.
- If the next hop is the LER B, go to step 16.

xii If the message "You have configured the Reverse Out-Link Interface. As a result, 5620 SAM has created the next LSR Path Hop, and auto-completed the data between this LSR Path Hop and the newly created LSR Path Hop." appears, perform the following steps:

- Click on the LSR Path Hops tab.
- Choose the LSR path hop with a configuration state of Incomplete and click on the Properties button. The LSR Hop (Edit) form opens.
- Configure the parameters:
  - Display Name
  - Reverse Out-Link Interface
- Click on the OK button. The LSR Hop (Edit) form closes.
- Go to step 16.

xiii If the message "You have configured the Reverse Out-Link Interface. As a result, 5620 SAM has auto-filled the data between this LSR Path Hop and LER-B." appears, go to step 21.

16 Click on the LER B tab.

17 Click on the Select button beside the Out-Link Interface Name parameter. The Select Out-Link - Bidirectional TP-LSP Path list form opens.

18 Click on the Search button. A list of configured routing interfaces (numbered or MPLS-TP unnumbered) appears.

19 Choose a site and click on the OK button. The Select Out-Link - Bidirectional TP-LSP Path list form closes and the Bidirectional TP-LSP Path (Create) form refreshes with the out-link interface information. The 5620 SAM automatically updates the Ingress Label and Egress Label parameters.

20 Click on the Hint button. The message “You have configured the LER-B Out-Link Interface. As a result, 5620 SAM has auto-completed the data between LER-B and its next hop on the forward path. The path configuration is now complete.” appears. Perform the following steps:

i Click on the OK button to complete the path configuration. The Bidirectional TP-LSP Path (Create) form closes and the Bidirectional TP-LSP (Create) form reappears.

ii Go to step 23.

21 Click on the OK button. A dialog box appears.

22 Click on the OK button. The Bidirectional TP-LSP Path (Create) form closes.

23 Repeat steps 7 to 22 to create a protecting path, if required.

24 Click on the OK button. The Bidirectional TP-LSP (Create) form closes.

25 Create a BFD template on the LER A and LER B. See Procedure 26-3.

26 Create a proactive OAM template on the LER A and LER B. See Procedure 26-4.

27 Close the Manage MPLS-TP LSPs form.

27 — Service tunnels

27.1 Service tunnel overview *27-2*

27.2 IP/MPLS service tunnels *27-3*

27.3 Ethernet (G.8031) tunnels *27-5*

27.4 Ethernet (G.8032) rings *27-7*

27.5 Workflow to configure service tunnels *27-10*

27.6 Workflow to configure Ethernet (G.8032) rings *27-11*

27.7 Configuring service tunnel procedures *27-11*

27.1 Service tunnel overview

A service tunnel is an entity used to uni-directionally direct traffic from one device to another device. The service tunnel is provisioned to use a specific encapsulation method, such as GRE or MPLS, and the services are then mapped to the service tunnel. For instance, multi-NE VLL and VPLS traffic is transmitted using uni-directional service tunnels in this way.

The most common type of tunnel used in 5620 SAM is a Service Distribution Point binding. Service tunnels originate on an SDP on a source NE and terminate at a destination NE. The destination NE directs packets from the service tunnel to the correct service egress interfaces (SAPs) on that device. Services that originate and terminate on the same NE do not require service tunnels, because the same NE is both the source and the destination.

However, because the concept of a tunnel is a logical construct within 5620 SAM, a number of different configurable objects can actually be used as service tunnels, including:

- SDP binding:

  Because SDP bindings can be associated to a service of any type, the service tunnel discovery includes services that are associated to SDP bindings of a given service.
- Service to Tunnel Association:

  Discovery adds tunnels that are associated to a given service.
- Ethernet tunnel (G.8031):

  Discovery adds the global Ethernet Tunnel that the Tunnel Endpoint (SAP's terminating port) is a member of.
- Ethernet ring (G.8032):

  Discovery adds the Ethernet Ring that the Ethernet Element is a member of.
- Ethernet radio ring (G.8032):

  Discovery adds the Ethernet radio ring that the Ethernet Element is a member of. See the *5620 SAM MPR User Guide* for more information.
- PBB:

  Discovery adds the VPLS or MVPLS services which contain the PBB tunnel (B-Sites) of the given Epipe or VPLS.
- P2MP RSVP LSP:

  Discovery adds the P2MP LSPs retrieved from the MVPN LSP Template associated to PIM sites.
- Optical Transport Service:

  Discovery adds optical services that are traversing network interfaces which are being used by an L2/L3 VPN through any static or dynamic LSPs that are bound to SDPs on the service if the following are true:
  - LSPs are bound to service tunnels (SDPs) on the service
  - One or more of the corresponding hops on the LSP active path share the same port with the optical service termination

- Mobile backhaul (applicable to 9500 MPR and 7705 SAR on MPLS-based services running over VLAN):

  Discovery adds MPR VLL services that are associated to an SDP tunnel or are traversing through network interfaces which are being used by an L2/L3 VPN through any static or dynamic LSPs that are bound to SDPs on the service.

The Service Tunnels tab exists on the applicable service configuration forms. This tab lists the objects considered as service tunnels (such as SDPs, Ethernet rings, Ethernet tunnels, other services) that are currently used by the service you are querying. The associated Discover Service Tunnels button removes any previously discovered service tunnels on the service and initiates a manual rediscovery of the tunnels, based on direct usage and current service configurations.

For composite services, the service tunnel discovery action initiates the discovery of service tunnels on the participating services. The listing includes the service tunnels that are currently used by member services.

The Flow-through Services tab is on the configuration forms of the objects that can be used as a service tunnel. The tab lists the other services that are currently using the object you are querying as a service tunnel. The associated Discover Flow-through Services button removes any previously discovered flow-through services and initiates a manual rediscovery of the tunnels, based on direct usage and current service configurations.

For composite services, the concept of using a service as a service tunnel is not supported. The Flow-through Services tab does not appear on the composite service configuration forms.

For fault management, an association type of alarm relationship exists between a service and the service tunnels that the service uses. This allows the service tunnel alarms to propagate up to the service level. These association alarms are displayed on the Alarms on Related Objects tab, under the Faults tab of the service. Because this is a one-way association, service alarms are not propagated to the service tunnels that the service is using.

Tunnel selection profiles

The 5620 SAM uses a tunnel selection profile to assign transport tunnels for a service when the service is configured for automatic SDP binding creation. Tunnel selection profiles can also be used for services when the SDP binding creation is performed manually. The 5620 SAM chooses tunnels and return tunnels when the automatic selection of transport tunnels is enabled and a tunnel selection profile is specified.

A tunnel selection profile contains tunnel administrative groups. When the profile is used within a service to create SDP bindings, any tunnels that include the tunnel administrative group in that profile become eligible for consideration in the tunnel selection process. See chapter 79 for more information about tunnel administrative groups.

27.2 IP/MPLS service tunnels

Distributed service traffic is transported between PE NEs by circuits aggregated in unidirectional service tunnels.

The operational theory of a service tunnel is that the encapsulation of the data between the two managed edge NEs appears as a Layer 2 path to the service data although it is really traversing an IP or IP/MPLS core.

Tunnel policies from older releases of 5620 SAM can be converted to the newer template-based policies by using a “Convert” button located on the rule configuration form. You cannot configure CoS forwarding, LDP-over-RSVP, or multiple LSP bindings on SDP features.

A service tunnel uses GRE or MPLS encapsulation. For MPLS, a mesh of MPLS paths and LSPs must be present in the network core. You associate service tunnels with LSPs during service tunnel configuration. The 5620 SAM supports LSP creation using a basic LDP variant such as T-LDP, or using LDP over RSVP for tunnel-in-tunnel functionality based on traffic classification.

A 5620 SAM operator binds a service site to a service tunnel during service configuration. A service tunnel has a unique ID on an NE and cannot be deleted when it is currently associated with a service.

ACL IP and ACL MAC policy filters for service tunnels contain options for forwarding packets on a specific service tunnel based on matching criteria, as described in chapter 44.

IP/MPLS service tunnels design considerations

Consider the following before you configure IP/MPLS service tunnels:

- Service tunnels are unidirectional, so they are required in both directions between the source NE and the destination NE.
- The tunnel is not specific to one service or one type of service. After a tunnel exists, multiple SDPs can be aggregated over the tunnel. The SDPs can belong to different services and different customers.
- When a tunnel already exists, 5620 SAM does not automatically create a new tunnel, even if the only available tunnel is down. This prevents the creation of multiple inoperable tunnels.
- All services that are mapped to a tunnel use the same transport encapsulation type defined for the tunnel.
- Operations on the tunnel affect all the services that are associated with the tunnel. For example, the operational and administrative states of a tunnel control the state of service circuits that are carried on the tunnel. In the case of LSP-based tunnels, an LSP can be replaced in the tunnel without reconfiguring each service bound to the tunnel.
- A service tunnel is locally unique to an NE. The same tunnel ID can appear on other NEs.
- A service tunnel uses the system IP address to identify the far-end edge NE.
- A service tunnel can be configured using a tunnel template. A user who is assigned the create tunnel template scope of command role can create a tunnel template. The template manager can also apply the tunnel template to a service tunnel. See “Managing templates” in the *5620 SAM Scripts and Templates Developer Guide* for more information about the administrative tasks associated with tunnel templates.
- An SDP tunnel template can be applied to an auto tunnel policy.

See the appropriate device documentation for more detailed information about service tunnels.

Class-based forwarding

Packets of the same CoS and service are forwarded over a specific RSVP LSP (or a static LSP), which is part of an SDP that the service (instance) is bound to. The forwarding decision is based on the forwarding class of the packet, as assigned by the ingress QoS policy defined for the SAP.

When implementing class-based forwarding, consider the following:

- Class-based forwarding is typically implemented using the service tunnel configuration forms, as detailed in Procedure 27-1. Class-based forwarding configurations can also be altered after their initial creation by editing the service tunnel configuration form as detailed in Procedure 27-13.
- An LSP can carry packets of a forwarding class for one service and at the same time, carry packets of a different forwarding class for another service. In other words, the same LSP can be used by more than one SDP, even where the forwarding class assignments are different.
- Within an SDP, only one LSP can support a specific CoS.
- A service instance (or service site) can be bound to SDPs of differing CoS configurations, as well as regular SDPs.
- One LSP in the SDP must be designated as the default LSP. The default LSP is used by the SDP if there is no available LSP that matches the packet's forwarding class. When the default LSP is down, the SDP is also brought down.
- Class-based forwarding can be applied to all services supported by the SRs. For VPLS, you can specify an LSP to forward all multicast/broadcast packets (by default, the default LSP is used). For VLL, shared queuing must be enabled on the ingress SAP to support the class-based forwarding.
- Class-based forwarding is configurable on the 7750 SR, 7710 SR, 7450 ESS, and 7950 XRS.

27.3 Ethernet (G.8031) tunnels

The IEEE 802.1ah Provider Backbone Bridging specification employs Provider MSTP to ensure loop avoidance in a resilient native Ethernet core. With P-MSTP, failover times depend largely on the size of the network and the connectivity model used in the network. MPLS tunnels provide core scaling and fast failover times using MPLS FRR. A service based on native Ethernet backbone achieves the same fast failover times as MPLS FRR.

Core Ethernet tunnels compliant with the ITU-T G.8031 specification achieve 50 ms resiliency for backbone failures. A configured Ethernet tunnel can be selected when configuring an L2 access interface on a B-VPLS.

The 5620 SAM uses two different approaches to configure Ethernet tunnels in the network.

- Approach 1 (recommended):
  5620 SAM provisions an end-to-end Ethernet G.8031 tunnel which reduces configuration errors and aids the diagnosis of any problem in the tunnel. 5620 SAM automatically configures the Ethernet tunnel endpoint and path endpoint on each of the participating NEs. See Procedure 27-5 for more information.

  The Ethernet tunnel and path are network wide objects that provide the following benefits:
  - the Ethernet tunnel provides the aggregated State of the Tunnel and reports any inconsistency in the configuration of the endpoints or paths
  - faster and easier provisioning that allows you to configure common properties such as holdTime and revertTime at the network level and then apply them to each tunnel endpoint
  - 5620 SAM accelerates the creation of global and local MAs, and MEPs by using a continuity check
- Approach 2:
  The 5620 SAM provides the ability to provision Ethernet tunnel endpoints and path endpoints separately on each NE. See Procedure 27-4 for more information on creating Ethernet endpoints. If Ethernet tunnel endpoints are created this way (or discovered from the NE) you can associate them to a network-wide Ethernet tunnel and path, but this must be done manually.

Note — Network-wide Ethernet tunnels and paths are not automatically discovered from the NE.

Transit services

Transit services are supported on the 7210 SAS-D and 7210 SAS-M (in access-uplink mode), Release 4.0 R7 or later, and on the 7210 SAS-T.

Transit services use default QinQ SAPs (which are also called transit SAPs) to forward traffic for data services. Transit SAPs (notation *.*) receive and forward frames with any encapsulation value, and eliminate the need for customer VLAN-specific SAPs on virtual switching instances for service sites with transit SAPs. Data services use transit services for transparent forwarding, which can reduce configuration time and move traffic more efficiently.

Although transit services function as service tunnels, they are managed in the same way as other VPLS and VLL services in the 5620 SAM: they have service IDs, appear as services in navigation trees, contain sites and interfaces, and appear on service topology maps. Properties forms for transit services share the same tab structure and functionality as forms for other services in the 5620 SAM. You can use the Transported Services tab to view and access the data services that use the transit service (you must first discover the services). You can also view and access a transit service that is associated with a VLAN Uplink, using the Transit Services tab on the VLAN Uplink form. You can access VLAN Uplink forms from the service topology map. See "Service topology maps" in section 6.2 for more information.

Any alarms that are generated on a transit service are propagated to the data service that uses the transit service, and appear as alarms on related objects on the Faults tab of the data service properties form.

You can create transit services automatically for VPLS G.8032 Ethernet rings using the Create Transit Services function. See Procedure 27-10 for more information. Transit services created by this method are new services, and contain only transit SAPs. The 5620 SAM creates linked transit SAPs on all sites on the ring.

For non-G.8032 VPLS and VLL services, manually-configured transit SAPs on the services are used as a transit service by the 5620 SAM when the transit SAPs are connected by a physical link.

When you use the Connect to Ethernet Ring function to connect a data service to an Ethernet ring configured with a transit service, the 5620 SAM creates VLAN-specific SAPs for the data service only on the ring site for which Connect to Ethernet Ring is selected. The transit SAPs on the ring transparently forward traffic through other sites on the service.

You can combine transit services using the composite service functionality in the 5620 SAM. Composite services are created automatically when Auto Discover Composite Services is enabled in System Preferences, or manually using the Rediscover Composite Services function. See chapter 74 for more information about composite services.

For more information about transit services and transit SAPs (default QinQ SAPs), including restrictions, see the appropriate NE documentation.

27.4 Ethernet (G.8032) rings

Ethernet Ring Protection (ERP) as specified in ITU-T G.8032, is a protection mechanism for Ethernet ring topologies that provides a resilient Ethernet network. ERP provides sub-50ms protection and recovery switching for Ethernet traffic in a ring topology, and, at the same time, ensures that loops are not formed at the Ethernet layer. G.8032v1 supports a single ring topology; G.8032v2 supports multiple rings/ladder topology. For more information about Ethernet (G.8032) rings, see the ITU website at http://itu.int.

ERP topology

An ERP topology is a collection of Ethernet ring nodes that forms a closed physical loop. Between two and sixteen Ethernet ring nodes are supported per ERP topology. One ERP topology is supported per NE. Up to two ERP instances are supported per ERP topology. Ethernet ring links connect two adjacent Ethernet ring nodes participating in the same ERP topology.

Loop avoidance in the ring is achieved by guaranteeing that at anytime, traffic may flow on all but one of the ring links. This link is called the ring protection link (RPL). One designated node, the RPL Owner (also referred to as the master node), is responsible to block traffic over the RPL.

Supported ERP service types

You can configure the following service types in an ERP (G.8032) topology using the 5620 SAM on the following NEs:

- VPLS. VPLS that support ERP SAPs can connect to other rings and Ethernet services using VPLS SAPs. A VPLS can use a single ring (main or sub-ring) or multiple rings.
  - 7210 SAS 3.0 or later devices, except the 7210 SAS-X 24F 2XFP, Release 3.0 R1; Release 3.0 R2 and later support ERP
- VLAN service
  - OS 6400, OS 6850, OS 6850E, OS 6855, OS 9700E, OS 9800E, Release 6.4.4 or later
  - OS 6250M, Release 6.6.2 or later
  - OS 6450, Release 6.6.3 or later
  - 9500 MPR, Release 3.1 or later; see the *5620 SAM MPR User Guide* for more information.
- VLL service (Cpipe and Epipe services only)
  - 9500 MPR, Release 3.1 or later, see the *5620 SAM MPR User Guide* for more information.

Note — For OmniSwitch NEs, only the Ethernet ring element configuration (and not Ethernet ring) is supported on the 5620 SAM. See Procedure 27-7 for more information.

Automatic Ethernet ring creation

The 5620 SAM automatically unites Ethernet ring elements in the network into Ethernet rings, and creates path objects to link endpoints within the ring. In order for the 5620 SAM to create an Ethernet ring, the following must exist:

- at least two Ethernet ring elements with path endpoints
- a physical link between the endpoints

The 5620 SAM detects the ring elements and the physical link, then creates an Ethernet ring to contain the ring elements, and path objects to link them. If one of the ring elements is already part of an Ethernet ring, then the other element is added to the existing ring. If both elements are part of existing rings, then the rings are merged (see "Merging Ethernet rings" below).

Automatic Ethernet ring creation is triggered by the following events:

- creation or detection of a path endpoint on an Ethernet ring element
- creation or detection of a physical link between two path endpoints on Ethernet ring objects
- performance of a global Ethernet ring audit (see "Auditing Ethernet rings")

The 5620 SAM also detects and creates Ethernet sub-rings, and creates interconnects between rings and sub-rings when appropriate. You can view the sub-rings associated with a ring in the Sub-Rings tab of the Ethernet ring configuration form.

See Section 27.6 for information about using the 5620 SAM to automatically create Ethernet rings.

You can manually create Ethernet (G.8032) rings using the 5620 SAM GUI or using the OSS service provisioning client. See Procedure 27-8 to create Ethernet (G.8032) rings using the 5620 SAM GUI. See "MPLS, LSP, and service tunnel configuration" in the *5620 SAM XML OSS Interface Developer Guide* for information about configuring Ethernet (G.8032) rings using the OSS client application.

Merging Ethernet rings

When the 5620 SAM detects a physical link between two Ethernet ring element path endpoints on separate Ethernet rings, the rings are automatically merged together. One of the Ethernet rings is deleted, and the elements and paths from that ring are added to the other ring. The following criteria are used to determine which ring is deleted:

- If one of the rings was created manually using the 5620 SAM, then the other ring is merged into the manually-created ring.
- If both rings were created manually, then the smaller ring is merged into the larger ring, based on the number of Ethernet ring elements.
- If both rings were created automatically, then the smaller ring is merged into the larger ring, based on the number of Ethernet ring elements.
- If the rings have the same number of elements, and were both created the in the same manner, then the ring with the higher Manager ID is merged into the other ring.

Auditing Ethernet rings

You can use the 5620 SAM to perform a global or local audit of an ethernet ring. An audit can find missing elements, paths, and interconnects, and potentially merge rings if a link is found. When an audit discovers a problem that cannot be resolved, an alarm is raised against the ethernet ring, and the problems encountered by the audit are displayed in the alarm details. Performing another audit clears the alarm, if the problems have been resolved.

Procedure 27-16 describes how to audit Ethernet rings. Performing a global Ethernet ring audit both creates and merges Ethernet rings, even if automatic Ethernet ring creation is disabled.

Service provisioning on Ethernet (G.8032) rings

The 5620 SAM accelerates the provisioning of VPLS instances on Ethernet (G.8032) rings by automatically creating the control services and data services on the rings. Services are configured on Ethernet (G.8032) rings in the same method as service tunnels.

You can automatically configure transit services on VPLS G.8032 Ethernet rings. See "Transit services" in section 27.3 and Procedure 27-10 for more information.

You can create Ethernet (G.8032) rings using the 5620 SAM GUI or using the OSS service provisioning client. See Procedure 27-8 to create Ethernet (G.8032) rings using the 5620 SAM GUI. See "MPLS, LSP, and service tunnel configuration" in the *5620 SAM XML OSS Interface Developer Guide* for information about configuring Ethernet (G.8032) rings using the OSS client application.

27.5 Workflow to configure service tunnels

1. Before you can create an MPLS service tunnel, you must create a static or dynamic LSP. See Procedure 25-6 for static LSPs. See Procedure 25-8 for dynamic LSPs.
2. Create an IP/MPLS service tunnel and assign it to an NE as follows:
   a. Create an IP/MPLS service tunnel; see Procedure 27-1.
   b. Create an IP/MPLS service tunnel using a tunnel template. See Procedure 27-2.

Note — Service tunnels are unidirectional, so they are required in both directions between the source NE and the destination NE.

   c. Create a tunnel administrative group and a tunnel selection profile and assign the tunnel selection profile to an SDP binding. See Procedure 79-1 and Procedures 27-1 and 27-3 for more information.
3. Perform one of the following to create an Ethernet service tunnel:
   a. Create an Ethernet service tunnel endpoint. See Procedure 27-4.
   b. Create an Ethernet service tunnel and assign endpoints to the tunnel. See Procedure 27-5.
4. Create transit services on Ethernet rings as required. See Procedure 27-10.
5. As required, discover and list service tunnel information. See Procedures 27-11 and 27-12.
6. Perform one of the following to view service tunnel information:
   a. View and manage service tunnels and tunnel elements. See Procedure 27-13.
   b. View the service tunnel topology. See Procedure 27-14.
7. As required, run an OAM validation test on a service tunnel. See Procedure 27-15.

27.6 Workflow to configure Ethernet (G.8032) rings

1 Perform one of the following to create Ethernet ring elements:

   a Create an Ethernet ring element for all supported devices except for OmniSwitch and 9500 MPR devices. See Procedure 27-6 for more information.

   b Create an Ethernet ring element for an OmniSwitch. See Procedure 27-7.

   c Create an Ethernet radio ring element for an 9500 MPR. See the *5620 SAM MPR User Guide* for more information.

2 Perform one of the following to create physical links:

   a Configure LLDP to automatically discover and create physical links. See "LLDP" in Chapter 22 for information about using LLDP.

   b Manually create a physical link. See Procedure 6-33.

3 If required, perform a global Ethernet ring audit to trigger Ethernet ring creation and mergers. See Procedure 27-16.

27.7 Configuring service tunnel procedures

Procedure 27-1 describes how to create an IP/MPLS service tunnel.

Procedure 27-1 To create an IP/MPLS service tunnel

Before you can create an MPLS service tunnel, you must create a static or dynamic LSP. See Procedure 25-6 for statics LSPs. See Procedure 25-8 for dynamic LSPs.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens.

2 Click on the Create button and choose IP/MPLS Service Tunnel (SDP). The IP/MPLS Service Tunnel (SDP) step form opens with the Name & Describe Service Tunnel (SDP) step displayed.

3 Configure the parameters:

- Name
- Description
- Auto-Assign ID
- ID

Note 1 — If a range policy is applied to a service tunnel, a grey text box appears beside the ID parameter to indicate that a range policy is in effect.

Note 2 — If a format policy is applied to a service tunnel, a combo box appears beside the object field during object creation to indicate that a format policy is in effect. When there is only one matching policy, the combo box is dimmed. When there are multiple matching policies, use the combo box to choose a policy. The sequence of the options in the combo box are ordered by the policy Priority parameter.

4 Click on the Next button. The Pick Source Node step is displayed.

5 Perform one of the following to configure the Source Site ID parameter:

a Choose an NE from the list.

i Click on the Select button. The Select a Network Element - Pick Source Node form opens.

ii Choose an NE in the list and click on the OK button. The Select a Network Element - Pick Source Node form closes and the Create Service Tunnel (SDP) form displays the source NE IP address.

b Enter the NE IP address.

6 Click on the Next button. The Pick Destination Node step is displayed.

7 If you are creating an SDP tunnel using MPLS-TP, perform the following. Otherwise, go to step 8.

i Enable the MPLS-TP Far-End parameter.

ii Click on the Select button next to the MPLS-TP Node ID. The Select... form opens with a list of NEs on which MPLS-TP is enabled.

iii Choose an NE and click on the OK button. The Select... form closes.

8 Perform one of the following to configure the Destination Site ID parameter:

a Choose an NE from the list.

i Click on the Select button. The Select a Network Element - Pick Destination Node form opens.

ii Choose an NE in the list and click on the OK button. The Select a Network Element - Pick Destination Node form closes and the Create Service Tunnel (SDP) form displays the destination NE IP address.

b Enter the NE IP address.

9 Click on the Next button. The Specify Transport step is displayed.

10 Perform one of the following:

a For GRE service tunnels:

i Specify GRE for the Underlying Transport parameter.

ii Configure the Signaling parameter.

iii Go to step 20.

b For MPLS service tunnels:

i Specify MPLS for the Underlying Transport parameter.

Note 1 — If the source or destination site is a 7210 SAS-M24F, 7210 SAS-M24F2XFP or 7210 SAS-M24F2XFP [ETR], you cannot configure the Underlying Transport parameter. The devices support only MPLS with TLDP signaling, LDP is not enabled.

Note 2 — When you implement class-based forwarding or specify a transport destination address, you must choose MPLS as the Underlying Transport parameter.

Note 3 — When you specify a transport destination address, you cannot implement class-based forwarding.

Note 4 — When you configure a service tunnel with a source site that is a 7705 SAR, you can choose IPv4 as the Underlying Transport parameter if the destination site is also a 7705 SAR, a GNE, or an unmanaged IP address.

ii Configure the parameters:

- Mixed Lsp Mode
- Revert Time (seconds)
- Ldp Enabled
- Enable BGP-Tunnel
- Signaling

The Revert Time (seconds) parameter appears when the Mixed Lsp Mode parameter is set to true.

Note 1 — When you implement class-based forwarding, you must use one of the following parameter configurations:

- Set Mixed Lsp Mode to true.
- Set Mixed Lsp Mode, Ldp Enabled, and Enable BGP-Tunnel parameters to false.

Note 2 — When you specify a transport destination address, you must use the following parameter configurations:

- Set Ldp Enabled to true.
- Set Mixed Lsp Mode and Enable BGP-Tunnel to false.

Note 3 — You cannot set Enable BGP-Tunnel to true when Ldp Enabled or Mixed Lsp Mode is set to true.

Note 4 — You cannot create a BGP or an LDP tunnel when an LSP exists between the source and destination NEs you specified in steps 4 and 8 respectively.

iii If you set the Ldp Enabled parameter to true, go to step 18.

iv If you set the Enable BGP-Tunnel parameter to true, go to step 20.

11 Click on the Next button. The Specify Class Forwarding step is displayed.

12 Configure the parameters:

- Class Forwarding Capability
- Administrative State
- Enforce Diff-Serv Lsp-Fc Map

Note — When the Class Forwarding Capability parameter is set to Off, the existing class-forwarding configurations are removed.

The Administrative State and Enforce Diff-Serv Lsp-Fc Map parameters are configurable when the Class Forwarding Capability parameter is set to On.

13 Click on the Next button. The Associate LSPs step is displayed.

14 Click on the Add button to bind an LSP to the service tunnel. The Bind LSPs to Service Tunnel form opens with the Bind LSP to Service Tunnel Stage step displayed.

15 Choose an LSP and click on the Finish button.

16 Click on the Close button. The Bind LSPs to Service Tunnel form closes and the LSP is listed on the Create Service Tunnel (SDP) form.

17 If you are enabling class-based forwarding on the LSP:

i Choose an LSP from the list and click on the Set As Default LSP button. This is mandatory. The Default LSP Name appears in the associated field.

ii For a VPLS, specify an LSP to forward all multicast/broadcast packets. Otherwise, the default LSP is used. If the LSP is specified, the Multicast LSP Name appears in the associated field.

iii For any LSPs used for class-based forwarding (including the default), choose the LSP from the list and click on the Choose a Forwarding Class button. Choose the required forwarding class from the contextual menu, which then appears in the Forwarding Class to LSP Mappings table.

18 Click on the Next button. The Specify Transport Destination Address step is displayed.

Note — This step appears if you set the Underlying Transport parameter to MPLS in step 10 and set the Ldp Enabled parameter to true.

19 Configure the Transport Destination Address parameter.

20 Click on the Next button. The Specify Hello Parameters step is displayed.

21 Configure the parameters:

- Keep-Alive Enabled
- Hello Time
- Hello Request Timeout
- Max Drop Count
- Hello Message Length
- Hold Down Time

22 Click on the Next button. The Specify MTU Values step is displayed.

23 Configure the parameters:

- Administrative MTU
- Advertised MTU Override

24 Click on the Next button. The Specify Metric step is displayed, if applicable.

25 Configure the Metric parameter, if applicable.

26 Click on the Next button. The VC Type Related Parameters step is displayed, if applicable.

27 Configure the VLAN VC Ethertype parameters, if applicable.

28 Click on the Next button. The Specify Initial State step is displayed.

29 Configure the Administrative parameter.

30 Click on the Next button. The Booking Factor step is displayed.

Note — This step appears if you set the Underlying Transport parameter to MPLS in step 10 and set the Ldp Enabled parameter to false.

31 Configure the SDP Bandwidth Booking Factor (%) parameter.

32 Click on the Next button. The Associate Service step is displayed.

33 Click on the Select button. The Select Associated Service form opens.

34 Choose a service from the list and click on the OK button. The Select Associated Service form closes. The Associated Service Name and Associated Service ID are updated.

35 Click on the Next button. The Admin Groups step is displayed.

36 Select the tunnel administrative groups in the Unassigned list that you want to assign to the tunnel and click the right arrow to move them into the Assigned list.

37 Click on the Next button. The Network Domain step is displayed.

38 Click the Select button. The Select Network Domain form opens.

39 Choose a network domain from the list and click on the OK button. The Select Network Domain form closes. The Name field is updated.

Note — All SDPs are associated with a network domain. This association is done during the creation or when editing an SDP in the Tunnel (Edit) form. You can also modify the network domain in the Tunnel (Edit) form. See step 57. The Egress Interfaces Consistency State status specifies if all the interface associations to SDP belong to a particular domain.

40 Perform one of the following:

- **a** If you specified MPLS for the Underlying Transport parameter in step 10, click on the Next button and go to step 41.
- **b** If you did not specify MPLS for the Underlying Transport parameter in step 10, click on the Next button and go to step 54.

41 The Port Binding step is displayed.

42 Click on the Select button. The Select Port form opens.

43 Choose an Ethernet or HSMDA port, or a LAG from the list and click on the OK button. The Select Port form closes.

Note — Only ports in hybrid mode or a LAG that contains hybrid ports can be selected.

44 Click on the Next button. The Configure PW Ports step is displayed.

45 Click on the Create button. The PW Port Binding (Create) form opens.

46 Click on the Select button in the PW Port ID panel. The Select PW Port ID - PW Port Binding form opens.

47 Perform one of the following:

a Choose an existing PW port from the list and click on the OK button. The Select PW Port ID - PW Port Binding form closes. Go to step 52.

b Click on the Create button. The PW Port (Create) form opens.

48 Configure the parameters:

- PW Port ID
- Auto-Assign ID
- Encapsulation Type

49 Configure node redundancy for the PW port, if required.

i Click on the Node Redundancy button. The Manage Node Redundancy form appears, preconfigured for MC peer groups.

ii Click on the Search button and configure an existing MC peer group, or click on the Create button and configure a new MC peer group. See Procedure 36-1.

The Node Redundancy button allows you to access the MC sync group configuration within the MC peer group in order to add PW port sync tags.

50 Click on the OK button. The PW Port (Create) form closes.

51 Choose the created PW port from the list and click on the OK button. The Select PW Port ID - PW Port Binding form closes.

52 Configure the parameters:

- VC ID
- Administrative State
- VC Type
- VLAN VC Tag
- Egress Shaper Virtual Port Name
- Intermediate Destination ID
- PW SAP Secondary Shaper

53 Click on the OK button. The PW Port (Create) form closes.

The PW port can also be used in the Service Access Points of the following service types:

- VPRN (see Procedure 29-6)
- IES (see Procedure 29-6)
- VPLS Capture (see Procedure 65-28)

Refer to the specific service chapter and forms when creating the required service access points. Specify the PW port as the Terminating Port when you create these service access points.

The PW port can also be specified as the terminating port for L3 access interfaces of the following service types:

- VPRN (see Procedure 71-22)
- IES (see Procedure 70-17)

The service access point and L3 access interface you create will appear in the lists on the Service Access Points and L3 Access Interfaces tabs of the PW Port (Edit) form.

54 Click on the Finish button to save the configuration. The 5620 SAM prompts you to view the service tunnel configuration.

55 Enable the View the newly created tunnel parameter to view the service tunnel configuration after closing the form, if required.

56 Click on the Close button. The Create Service Tunnel (SDP) form closes.

57 If the View the newly created tunnel parameter in step 55 is enabled, the Tunnel (Edit) form opens with the newly-created service tunnel configuration displayed.

i View or modify the configuration, if required.

ii Click on the Create a template button, if required. See "XML API template script format" in the *5620 SAM Scripts and Templates Developer Guide* for information about creating a template.

iii Close the Tunnel (Edit) form.

58 Close the Manage Service Tunnels form.

Procedure 27-2 To create an SDP using a tunnel template

Before you can create an SDP from a tunnel template, you must create the SDP tunnel template. For more information about creating SDP tunnel templates, see "Managing templates" in the *5620 SAM Scripts and Templates Developer Guide*.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels search form opens.

2 Click on the Create from Template button. A Create Service Tunnel From Template form opens with a list of previously configured SDP tunnel templates.

3 Choose a tunnel template from the list.

4 Click on the OK button. A Create Tunnel from Template form opens with the General tab displayed.

5 Configure the parameters:

- Name
- Description
- Auto-Assign ID
- ID
- Underlying Transport
- PBB Ethernet Type
- Ldp Enabled
- Signaling
- Source Site ID
- Destination Site ID
- Transport Destination Address
- Administrative
- Administrative MTU
- Advertised MTU Override
- Metric
- VLAN VC Ethertype
- No VLAN VC Ethertype

6 Click on the SDP Bandwidth tab. Configure the SDP Bandwidth Booking Factor (%) parameter.

7 Click on the Maintenance tab and configure the following parameters:

- Keep-Alive Enabled
- Hello Time
- Hello Message Length
- Hello Request Timeout
- Hold Down Time
- Max Drop Count

8 Click on the Accounting tab.

9 Click on the Select button beside the Accounting Policy parameter to assign an accounting policy to the service tunnel. A Select Policy form opens with a list of accounting policies.

10 Choose a policy from the list and click on the OK button. The Select Policy widow closes and the Accounting Policy parameter is updated

11 Click on the OK button. The Create SDP from Template form closes.

12 When the Show Created Object parameter is enabled on the template, the Tunnel (Edit) form opens. Close the Tunnel (Edit) form.

Procedure 27-3 To create a tunnel selection profile

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens.

2 Click on the Create button and choose Tunnel Selection Profile. The Tunnel Selection Profile (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Profile Name
- Description
- Transport Type
- Multi-Segment Tunnel Selection
- Redundant Path Selection

4 Specify an SDP binding template in the profile, if required. Perform the following.

Note — An SDP binding template allows the 5620 SAM to use the configuration information contained in the template for the automatic creation of SDP bindings. See "Managing templates" in the *5620 SAM Scripts and Templates Developer Guide* for information about creating a template.

i Click on the Select button in the SDP Binding Template panel. The Select SDP Binding Template form opens.

ii Specify a filter, if required, and click on the Search button. A list of SDP binding templates appears.

iii Choose an SDP binding template from the list and click on the OK button. The Tunnel Selection Profile (Create) form is refreshed with the SDP binding template information.

5 Click on the Tunnel Admin Groups tab.

6 Click on the tunnel administrative groups that you want to include in the profile in the Included Admin Groups-Unassigned panel. You can choose multiple groups by holding down the CTRL key when you click on the group.

7 Click on the right arrow to move the selected administrative groups to the Included Admin Groups-Assigned panel. You can move an assigned administrative group to the unassigned portion of the form, if required, by choosing the group and clicking on the left arrow.

8 Click on the tunnel administrative groups that you want to exclude from the profile in the Excluded Admin Groups-Unassigned panel. You can choose multiple groups by holding down the CTRL key when you click on the group.

9 Click the right arrow to move the selected administrative groups to the Excluded Admin Groups-Assigned panel. You can move an assigned parameter to the unassigned portion of the form, if required, by choosing the group and clicking on the left arrow.

10 Click on the OK button. The Tunnel Selection Profile (Create) form closes.

11 Close the Manage Service Tunnels form.

Procedure 27-4 To create or configure an Ethernet tunnel endpoint

Before you can create an Ethernet tunnel, you must configure the Ethernet tunnel endpoint.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels search form opens.

2 If you are configuring an existing Ethernet Tunnel Endpoint, go to step 8.

3 Click on the Create button.

4 Click on Ethernet Tunnel Endpoint from the contextual menu. The Select Network Elements form opens.

5 Choose a site on which to create an Ethernet tunnel endpoint.

6 Click on the OK button. The Ethernet Tunnel Endpoint (Create) form opens with the General tab displayed.

7 Go to step 10.

8 Select Ethernet Tunnel Endpoint (Ethernet Tunnel) on the drop-down menu in the Manage Service Tunnels form. Click on the Search button to display a list of the existing endpoints.

9 Select the endpoint you want to configure and click on the Properties button.

The Ethernet Tunnel Endpoint (Edit) form opens with the General tab displayed.

10 Configure the following parameters:

- Tunnel Endpoint ID
- Site ID
- Protection Type
- Encap Type
- Administrative State
- Hold Time Down
- Hold Time Up (deciseconds)
- Revert Time (seconds)
- Access Adapt QoS
- Enable Per Forwarding Path Ingress Queue
- Operational Path Endpoint Threshold
- Description
- Configured MAC Address

The Tunnel Endpoint ID and Site ID are only configurable when you are creating a new Ethernet Tunnel Endpoint.

The Access Adapt QoS, Enable Per Forwarding Path Ingress Queue, and Operational Path Endpoint Threshold parameters are only displayed when the Protection Type is set to Load Sharing.

11 Click on the Path Endpoints tab to configure the Path Endpoints.

12 Perform one of the following:

a If you are configuring an existing Ethernet Tunnel Path Endpoint, select the required path endpoint from the list and click Properties. The Ethernet Tunnel Path Endpoint (Edit) form opens with the General tab displayed.

b If you are configuring a new Ethernet Tunnel Path Endpoint, click on the Create button. The Ethernet Tunnel Path Endpoint (Create) form opens with the General tab displayed.

13 Configure the following parameters for each Path Endpoint.

- Path ID
- Description
- Administrative State
- Precedence
- APS Command

The Path ID parameter is only configurable when you are creating a new Ethernet Tunnel Path Endpoint.

The APS Command parameter is only displayed and configurable when you are configuring an existing Ethernet Tunnel Path Endpoint and when the Protection Type parameter you configured in step 10 is set to G8031 1:1. The associated "Perform APS Command" button is used to perform the selected command on the path endpoint.

14 Click on the Properties button in the Ethernet Path panel if you need to view or alter parameters on the Ethernet Path or configure a CFM Test. The Ethernet Path - Properties button is only displayed and selectable when you are configuring an existing Ethernet Tunnel Path Endpoint.

15 If you are configuring an existing Ethernet Tunnel Path Endpoint, go to step 23.

16 Click on the Port tab.

17 Click on the Select button. The Select Member Port form opens.

18 Click on the Search button to list the available ports. Choose the port to use for the Ethernet tunnel path endpoint.

19 Click on the OK button. The Ethernet Tunnel Path Endpoint (Create) form displays the selected member port.

20 Configure the parameters:

- Control Tag (Outer Encapsulation Value)
- Control Tag (Inner Encapsulation Value)

21 Click on the OK button. The Ethernet Tunnel Path Endpoint (Create) form closes and the Path Endpoints tab displays the new Ethernet Tunnel Path Endpoint in the list.

22 Go to step 30.

23 Click on the MEPs tab, if you need to create a MEP for the existing Ethernet Tunnel Path Endpoint. Otherwise go to step 30.

24 Click on the Create button. The MEP (Create) form opens with the General tab displayed.

25 Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Control MEP
- Control Sap Tag
- Low-priority Defect
- MAC Address
- Fault Propagation
- Type
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)
- CCM Padding Packet Size (Bytes)

The Control MEP parameter is only displayed if the Interface Type parameter is set to Ethernet Tunnel Path Endpoint.

The Control Sap Tag parameter is only configurable on a 7210 SAS-M Release 4.0 R2 and later, or a 7210 SAS-X Release 4.0 R2 and later.

The CCM Padding Packet Size (Bytes) parameter cannot be configured when the CCM interval parameter is set to 10 ms or 100 ms.

Note — When configuring a Down MEP on a Subscriber Group Interface SAP, the Direction parameter cannot be configured.

26 If the Maintenance Domain for this MEP has a Name Type of none and its Maintenance Association has a Name Format of icc-based, then the Y.1731 TEST and the AIS tabs will also be displayed. See Procedure 65-26 for more information.

27 Click on the OK button. A dialog box appears.

28 Click on the OK button. The MEP (Create) form closes and the newly-created MEP is displayed in the list on the MEPs tab.

29 Click on the OK button. The Ethernet Tunnel Path Endpoint (Edit) form closes and the Path Endpoints tab displays the available Ethernet Tunnel Path Endpoints in the list.

30 Repeat steps 12 to 29 for any other Ethernet Tunnel Path Endpoints you need to create or configure.

31 Click OK. A dialog box appears.

32 Click Yes to close the Ethernet Tunnel Endpoint form.

Procedure 27-5 To create an Ethernet tunnel

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels search form opens.

2 Click on the Create button.

3 Click on Ethernet Tunnel from the contextual menu. The Ethernet Tunnel (Create) form opens.

4 Configure the following parameters:

- Tunnel ID
- Name
- Description
- Protection Type
- Encap Type
- Hold Time Down
- Hold Time Up (deciseconds)
- Revert Time (seconds)
- Access Adapt QoS
- Enable Per Forwarding Path Ingress Queue
- Operational Path Endpoint Threshold

The Access Adapt QoS, Enable Per Forwarding Path Ingress Queue, and Operational Path Endpoint Threshold parameters are only displayed when the Protection Type is set to Load Sharing.

5 Click on the Apply button. The Ethernet Tunnel (Edit) form opens with the General tab displayed.

6 Click on the Components tab. Right click on Tunnel Endpoints and choose one of the following from the contextual menu.

a Create Ethernet Tunnel Endpoint.

i Refer to Procedure 27-4 to create an Ethernet Tunnel Endpoint. The endpoint will be listed as Endpoint A on the Ethernet Tunnel form in the Tunnel Endpoints Section.

Note — The parameter values specified in step 4 are automatically applied in the Ethernet Endpoint form when creating an endpoint.

ii Repeat step i to create Endpoint B.

iii Go to step 7.

b Add Existing Endpoint.

i The Select Endpoints form opens.

ii Click on the Search button and select an endpoint.

iii Click OK.

iv The endpoint is listed as Endpoint A on the Ethernet Tunnel form in the Tunnel Endpoints Section.

Note — The parameter values specified in step 4 are not automatically applied to the selected Ethernet endpoint.

v Repeat steps i to iv to select Endpoint B.

7 Right click on Paths and choose Create Ethernet Paths from the contextual menu to create a path. The Ethernet Path (Create) form opens with the General tab displayed.

8 Configure the parameters:

- Auto-Assign ID
- ID
- Description

9 Click on the Endpoints tab. Perform one of the following:

a Manually configure the following parameters for endpoints A and B.

- Site ID
- Path ID
- Precedence
- Administrative State
- Control Tag (Outer Encapsulation Value)
- Control Tag (Inner Encapsulation Value)
- Member Port

Note — A path endpoint cannot be administratively enabled if one of the following is true:

- An operationally up same-fate SAP on the Ethernet tunnel endpoint does not have a tag configured for the path endpoint.
- The Control Tag (Outer Encapsulation Value), Control Tag (Inner Encapsulation Value), and Member Port parameters are not configured.

b Perform the following steps to specify a path endpoint for endpoints A and B.

i Click on the Select button beside the Path ID parameter. The Select Path Endpoint form opens.

ii Click on the Search button and select an available endpoint.

iii Click OK. The endpoint parameters are automatically populated.

Note — To delete an Ethernet tunnel path endpoint, click on the Search button to display a list of endpoints, select an endpoint, then click on the Delete button.

10 Click on the Intermediate Services tab to view and specify the intermediate services for the Ethernet path. The services that you add to the list (or that already appear there) are in the order of proceeding from Endpoint A to Endpoint B. Perform the following to add an intermediate service:

i Click on the Create button. The Select Service form opens.

ii Click on the Search button to display a list of intermediate services available to include in this path. Only VLL services can be included.

iii Select the required service and click on the OK button.

The Select Service form closes and the service you chose is displayed in the list on the Intermediate Services tab.

Note — 5620 SAM does not perform a validation to confirm whether the selected service is actually along the path between the two path endpoints.

iv Repeat steps i to iii to add another intermediate service, if required.

Note 1 — If you have an intermediate service highlighted in the list and want to add another service immediately above it, click on the Insert Component button rather than the Create button. The Create button places an additional service at the bottom of the list, whereas the Insert Component button places it directly above a highlighted service.

Note 2 — You can change the ordering of intermediate services in the list by selecting a particular service and using the Move Up or Move Down buttons.

11 Click on the CFM Continuity Check tab to configure a CFM Continuity Check test for each path.

It is mandatory to have the following steps completed before selecting a test:

- Create a Maintenance Domain. The Name Type must be None. See chapter 78 for more information.
- Create a CFM Continuity Check Test. See Procedure 32-6 for information.

12 Click on the Select button. The Select CFM Test form opens.

13 Click on the Search button to list the available CFM tests. Choose a CFM test.

14 Click on the OK button. The CFM Test is listed and the MEP Auto Creation check boxes are enabled.

15 Perform one of the following:

a Enable one of the MEP Auto Creation buttons:

i Click on the Run Continuity Check Protocol button to create Maintenance Associations and local and remote MEPs. Any existing Remote MEPs that do not match the local MEPs are deleted. MEPs are turned up and CCM Messages are enabled, and the control MEP property is set on the MEPs.

ii Click on the Create MEPs button to create local MEPs. Any existing Remote MEPs that do not match the local MEPs are deleted.

b Continue to step 16 and select the Run Continuity Check Protocol button or Create MEPs button at a later date.

16 If required, click on the MEP tab to display the MEP form and select the check box to set the Control MEP parameter.

17 Click on the OK button. The Ethernet Tunnel form is displayed with the new Path information.

18 If the Protection Type parameter in step 4 was set to G8031 1:1, then repeat steps 7 to 17 for the other path.

19 If the Protection Type parameter in step 4 was set to Load Sharing, then repeat steps 7 to 17 for all paths.

20 Click Apply. The Path Id, Operational State, and CC Protocol State are updated and the path endpoints with this specific configuration are sent to the NEs.

Note — The CC protocol state appears under the global path (in the navigation tree and on the CFM Continuity Check form). The CC protocol state displays the state of the continuity check protocol running between the MEPs of the two endpoints of the path.

21 Click OK. A dialog box appears.

22 Click Yes to close the Ethernet Tunnel (Create) form.

Procedure 27-6 To create or configure an Ethernet Ring Element

This procedure describes how to create a new Ethernet Ring Element or configure an existing one.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels search form opens.

2 If you are configuring an existing Ethernet Ring Element, go to step 8.

3 Click on the Create button.

4 Click on Ethernet Ring Element from the contextual menu.

5 Choose a site from the Select Network Elements form to create an Ethernet Ring Element.

Note — You can create multiple ring elements at this point if you select more than one site here.

6 Click on the OK button. The Ethernet Ring Element (Create) form opens with the General tab displayed.

7 Go to step 10.

8 Select Ethernet Ring Element (Ethernet Ring) on the drop-down menu in the Manage Service Tunnels form. Click on the Search button to display a list of the existing ring elements.

9 Select the ring element you want to configure and click on the Properties button.

The Ethernet Ring Element (Edit) form opens with the General tab displayed.

10 Configure the following parameters:

- ID
- Auto-Assign ID
- Site ID
- Description
- Administrative State
- Compatible Version
- CCM Hold Time Down (deciseconds)
- CCM Hold Time Up (deciseconds)
- Guard Time (deciseconds)
- Revert Time (seconds)
- Ring Protection Link Type
- Ring Node ID

The ID and Site ID are only configurable when you are creating a new Ethernet Ring Element.

11 Configure the parameters for a sub-ring, if required:

- Type
- Ethernet Ring ID
- VPLS
- Propagate Topology Change

12 Click on the Path Endpoints tab to configure the Path Endpoints.

13 Perform one of the following:

a If you are configuring an existing Ethernet Ring Path Endpoint, select the required path endpoint from the list and click Properties. The Ethernet Ring Path Endpoint (Edit) form opens with the General tab displayed.

b If you are configuring a new Ethernet Ring Path Endpoint, click on the Create button. The Ethernet Ring Path Endpoint (Create) form opens with the General tab displayed.

14 Configure the following parameters for each Path Endpoint.

- Path ID
- Description
- Administrative State
- Path Endpoint Type

The Path ID parameter is only configurable when you are creating a new Ethernet Ring Path Endpoint.

15 If configuring an Ethernet Ring Path Endpoint on a 7210 SAS-M Release 4.0 R2 and later, or a 7210 SAS-X Release 4.0 R2 and later, configure the Switch Command parameter and click on the Perform Switch Command button.

16 If you are configuring an existing Ethernet Ring Path Endpoint, go to step 24.

17 Click on the Port tab.

18 Click on the Select button. The Select Member Port form opens.

19 Click on the Search button to list the available ports. Choose the port to use for the Ethernet ring path endpoint.

20 Click on the OK button. The Ethernet Ring Path Endpoint (Create) form displays the selected member port.

21 Configure the parameters:

- R-APS Tag (Outer Encapsulation Value)
- R-APS Tag (Inner Encapsulation Value)

22 Click on the OK button. The Ethernet Ring Path Endpoint (Create) form closes.

The Path Endpoints tab displays the new Ethernet Ring Path Endpoint in the list.

23 Repeat steps 3 to 22 for the other Ethernet Ring Path Endpoint you need to create, if required.

24 Click OK. A dialog box appears.

25 Click Yes to close the Ethernet Ring Element form.

Procedure 27-7 To create or configure an Ethernet Ring Element on an OmniSwitch NE

This procedure describes how to create a new Ethernet Ring Element or configure an existing Ethernet Ring Element on an eligible OmniSwitch NE. 6.4.4 or 7.2.1 NEs support G.8032v1. 6.4.5 R02 and 7.3.1 NEs support G.8032v2.

Note 1 — For ERP created with stacked VLAN services, only NNIs can be added as ERP path endpoints.

Note 2 — Before creating ERP with stacked VLAN services, the port/LAG mode must be Network and Bind type must be ERP, associated with that particular VLAN. To achieve this:

- From the Equipment view, chose a port. Right- click on the port, and choose Properties. The Physical Port form opens.
- Choose the Network value for the Mode parameter.
- Choose the ERP value for the Bind Type parameter.
- Port → L2 Network Interfaces → VLAN, delete the VLAN association in which the ERP needs to be created
- Port → L2 Network Interfaces → VLAN, add it to the stacked VLAN with the Bind Type value as ERP.

For 6.4.5 R02 NEs, Network port/LAG can be added in ERP without binding.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels search form opens.

2 If you are configuring an existing Ethernet Ring Element, go to step 8.

3 Click on the Create button.

4 Click on Ethernet Ring Element from the contextual menu.

5 Choose an OmniSwitch site from the Select Network Elements form to create an Ethernet Ring Element.

6 Click on the OK button. The Ethernet Ring Element (Create) form opens with the General tab displayed.

7 Go to step 10.

8 Select Ethernet Ring Element (Ethernet Ring) on the drop-down menu in the Manage Service Tunnels form. Click on the Search button to display a list of the existing ring elements.

9 Select the ring element you want to configure and click on the Properties button. The Ethernet Ring Element (Edit) form opens with the General tab displayed.

10 Configure the following parameters:

- ID
- Auto-Assign ID
- Site ID
- Description
- Administrative State
- Guard Time (centiseconds)
- Revert Time (minutes)
- Ring Protection Link Type
- Name
- Service ID
- AIS Meg Level
- Virtual Channel
- Revertive Mode

The ID and Site ID are only configurable when you are creating a new Ethernet Ring Element.

11 Click on the Path Endpoints tab.

12 Perform one of the following:

a If you are configuring an existing Ethernet Ring Path Endpoint, select the required path endpoint from the list and click Properties. The Ethernet Ring Path Endpoint (Edit) form opens with the General tab displayed.

b If you are configuring a new Ethernet Ring Path Endpoint, click on the Create button. The Ethernet Ring Path Endpoint (Create) form opens with the General tab displayed.

13 Configure the following parameters for each Path Endpoint.

- Path ID
- Description
- Path Endpoint Type

The Path ID parameter is only configurable when you are creating a new Ethernet Ring Path Endpoint.

14 If you are configuring an existing Ethernet Ring Path Endpoint, go to step 22.

15 Click on the Port tab.

16 Click on the Select button. The Select Member Port form opens.

17 Click on the Search button to list the available ports. Choose the port to use for the Ethernet ring path endpoint.

18 Click on the OK button. The Ethernet Ring Path Endpoint (Create) form displays the selected member port.

Note 1 — You must select a ring element for each site that will be part of the Ethernet ring.

Note 2 — The Ethernet ring can only have one element configured as an RPL owner or None. This is configured using the element's Ring Protection Link Type parameter.

Note 3 — The Ethernet Ring Path can be a LAG or port.

Note 4 — For 6.4.5 R02 NEs, ports must be added as a tagged access interface to the corresponding VLAN before being selected as a member port for the ERP.

19 Configure the Path ID parameter.

20 Click on the OK button. The Ethernet Ring Path Endpoint (Create) form closes.

The Path Endpoints tab displays the new Ethernet Ring Path Endpoint in the list.

21 Repeat steps 3 to 20 for the other Ethernet Ring Path Endpoint you need to create, if required.

Note — If only one Ethernet Ring Path Endpoint is created, the Ethernet Ring Element will be created as a sub-ring.

22 Click OK. A dialog box appears.

23 Click Yes to close the Ethernet Ring Element form.

24 Perform one of the following:

a If you are configuring an Ethernet Ring Element on an Omniswith NE that supports G.8032v1, continue to step 25.

b If you are configuring an Ethernet Ring Element on an Omniswith NE that supports G.8032v2, go to step 28.

25 Click on the Protected Services tab to view and specify the services for the Ethernet path. The services that you add to the list (or that already appear there) are in the order of proceeding from Endpoint A to Endpoint B. Perform the following to add a standard or stacked VLAN service:

Note — Protected Services are not applicable for 6.4.5 R02 NEs.

i Click on the Add button. The Select Service form opens.

ii Click on the Search button to display a list of services available to include in this path. Only standard and stacked VLAN services can be included.

iii Select the required service and click on the OK button.

The Select Service form closes and the service you chose is displayed in the list on the Services tab.

Note 1 — 5620 SAM does not perform a validation to confirm whether the selected service is actually along the path between the two path endpoints.

Note 2 — If ERP is created with standard VLAN service, then standard VLAN services for Release 6.4.4/6.6.2 NEs and IPM Enterprise VLAN services for Release 6.6.2 NEs can be added as Protected services.

Note 3 — If ERP is created with stacked VLAN service, then stacked/IPM stacked VLAN services for 6.4.4/6.6.2 NEs can be added as Protected Services.

26 To edit or view Protected Services, click on the Properties button of a selected standard VLAN service. The Ethernet Ring Element (Edit) form opens with the General tab displayed.

27 Click on the Protected Services tab. Choose a service. The Protected Services (Edit) form opens. Click on the Properties tab to edit or view the Protected service.

28 To view collected statistics, click on the Statistics tab. To collect statistics, click on the Collect button. See “Statistics collection overview” in the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

29 Click on the OK button. The Ethernet Ring Element (Edit) form closes.

Procedure 27-8 To create an Ethernet (G.8032) ring

This procedure describes how to create an Ethernet (G.8032) ring and its associate Control Service and Data service and how to assign ring elements to the ring.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels search form opens.

2 Click on the Create button.

3 Click on Ethernet Ring from the contextual menu. The Ethernet Ring (Create) form opens.

4 Configure the following parameters:

- Mgr ID
- Auto-Assign ID
- Element ID
- Name
- Description
- Hold Time Down
- Hold Time Up (deciseconds)
- Revert Time (seconds)
- Guard Time (deciseconds)
- Compatible Version
- Auto Create Global MEG
- Maintenance Domain ID
- CCM Interval
- Run CCM On Create

Note 1 — If you enable the Auto Create Global MEG parameter, the ETH-CFM tab will display all associated Global MEGs created for this Ethernet Ring.

Note 2 — If path discovery generates Ethernet Ring paths, then the Auto Create Global MEG, Maintenance Domain ID, CCM Interval, and Run CCM on Create parameters are not propagated to the per-path CFM Continuity Check tab configuration. Auto-generation of a MEG and/or MEPs can be configured on a per-path basis.

Alternatively, if path discovery is not operational (that is, no Ethernet Ring paths are populated into the Ethernet Ring), then the General tab Path CFM Defaults parameters are propagated and a MEG and/or MEPs are generated upon manual creation of the Ethernet Ring paths.

5 Click on the Apply button. The Ethernet Ring (Edit) form opens with the General tab displayed.

6 Click on the Components tab.

7 Right click on Ring Elements and choose one of the following items from the contextual menu.

a Create Ethernet Ring Element.

i Perform steps 5 to 22 in Procedure 27-6 to create an Ethernet Ring Element. When you are done, the element will be displayed on the Components tab in Ethernet Ring form.

Note 1 — You must create a ring element for each site that will be part of the Ethernet ring.

Note 2 — The Ethernet ring can only have one element configured as an RPL owner and one element configured as an RPL neighbor. This is configured using the element's Ring Protection Link Type parameter.

Note 3 — The parameter values specified in step 4 are initially populated in the Ethernet Ring Element form when creating a ring element from the Components tab. However, you can change these as required.

ii Repeat step i to create the other required ring elements.

Note — You can create all the ring elements required for the ring in one step. See step 5 in Procedure 27-6.

iii Go to step 8.

b Add an existing Ethernet Ring Element.

i The Select Element form opens.

ii Click on the Search button and select an element.

iii Click OK.

The element will be displayed on the Components tab in Ethernet Ring form.

Note 1 — You must select a ring element for each site that will be part of the Ethernet ring.

Note 2 — The Ethernet ring can only have one element configured as an RPL owner and one element configured as an RPL neighbor. This is configured using the element's Ring Protection Link Type parameter.

Note 3 — When you add an existing Ethernet endpoint, the parameter values specified in step 4 are not populated into the properties of that endpoint.

iv Repeat steps i to iii to select the other required ring elements.

8 To create an Ethernet Path:

i Right click on Paths and choose Create Ethernet Ring Path from the contextual menu to create a path. The Ethernet Path (Create) form opens with the General tab displayed.

Note — You must create a path for each element in the ring. Each element (site) in the ring will therefore have two endpoints (from two different paths) associated with it.

ii Configure the parameters:

- Auto-Assign ID
- ID
- Description

iii Click on the Endpoints tab to configure the endpoints for the path. Perform step iv to manually configure the parameters for endpoints A and B. Perform step v to select an available path endpoint on endpoints A and B.

Note — One and only one endpoint within the entire Ethernet ring must have its Ring Protection Link Type parameter configured as Ring Protection Link End. All other endpoints in the Ethernet ring must have this parameter set to a value of Normal.

iv Manually enter the following parameters to configure endpoints A and B.

- Path ID
- Ring Protection Link Type
- Administrative State
- R-APS Tag (Outer Encapsulation Value)
- R-APS Tag (Inner Encapsulation Value)
- Member Port

Note — Path endpoints cannot be administratively enabled if:

- the R-APS Tag or Member Port parameters are not configured
- a MEP is not configured on the path endpoint

v Choose an available path endpoint on endpoints A and B.

- Click on the Select button in the Path Endpoint section. The Select Path Endpoint form opens.
- Click on the Search button and select an available endpoint.
- Click OK. The endpoint parameters are automatically populated.

9 Click on the CFM Continuity Check tab to configure a CFM Test for the path.

10 Reconfigure the following parameters in the Global MEG Auto Creation panel, if required. The values that are initially displayed when you open this tab are the same ones you configured in step 4.

- Auto Create Global MEG
- Maintenance Domain ID
- CCM Interval
- Run CCM On Create

Note — If path discovery generates Ethernet Ring paths, then these parameters are not propagated to individual paths. Auto-generation of a MEG and/or MEPs may be configured on a per-path basis.

11 Click on the Select button. The Select CFM Test form opens. Perform one of the following:

a Click on the Search button to list the available CFM tests.

i Select the required CFM test.

ii Click OK.

The Select CFM Test form closes and the Global ID and ID parameters for the selected test appear on the CFM Continuity Check tab.

b Click on the Create button to create the required CFM test. The Global Maintenance Entity Group (Create) form opens, with the General tab displayed.

Note — The Initial CCM Interval for the CFM test you select or create must be set to 10 ms or 100 ms, otherwise the subsequent MEP creation will fail. The 7210 SAS-E, 7210 SAS-M and 7210 SAS-X do not support the 10 ms value.

Refer to Procedure 32-6 for information on creating the test.

12 Click on the Intermediate Services tab to view and specify the intermediate services for the Ethernet path. The services that you add to the list (or that already appear there) are in the order of proceeding from Endpoint A to Endpoint B. Perform the following to add an intermediate service:

i Click on the Create button. The Select Service form opens.

ii Click on the Search button to display a list of intermediate services available to include in this path. Only VLL services can be included.

iii Select the required service and click on the OK button.

The Select Service form closes and the service you chose is displayed in the list on the Intermediate Services tab.

Note — 5620 SAM does not perform a validation to confirm whether the selected service is actually along the path between the two path endpoints.

iv Repeat steps i to iii to add another intermediate service, if required.

Note 1 — If you have an intermediate service highlighted in the list and want to add another service immediately above it, click on the Insert Component button rather than the Create button. The Create button places an additional service at the bottom of the list, whereas the Insert Component button places it directly above a highlighted service.

Note 2 — You can change the ordering of intermediate services in the list by selecting a particular service and using the Move Up or Move Down buttons.

13 Perform this step if you need to create Interconnects for sub-rings. The Interconnects connect a sub-ring to the main ring.

a Right click on Interconnects and choose Create Ethernet Ring Interconnect from the contextual menu to create an interconnect. The Ethernet Ring Interconnect (Create) form opens.

b Configure the parameters:

- Auto-Assign ID
- ID
- Description

c Configure the Element A end node for the interconnect.

i In the Element A panel, click on the Select button beside the ID field and select a site from the Select Element - Ethernet Ring Interconnect form.

ii Configure the parameters:

- Type
- Interconnected Ethernet Ring Element
- Propagate Topology Change

d Configure the Element B end node for the interconnect.

i In the Element B panel, click on the Select button beside the ID field and select a site from the Select Element - Ethernet Ring Interconnect form.

ii Configure the parameters:

- Type
- Interconnected Ethernet Ring Element
- Propagate Topology Change

14 To automatically create a Control service for the Ethernet (G.8032) ring, go to step 15. To manually create the Control service, go to step 18.

15 To automatically create a Control service for the Ethernet (G.8032) Ring:

i Click on the Create Control Service button. The Create Control Service form opens.

ii Click on the Select button beside the Customer field and select a customer from the Select Customer form.

iii Configure the following parameters if your Ethernet Ring is an Ethernet Virtual link sub-rings.

- Upper Ring Outer Encap
- Upper Ring Inner Encap

iv Click on the Select button beside the Control Service Template field if required and select a template from the Select Control Service Template form.

Note 1 — Only use the Control Service Template if you need to customize the parameter fields associated with the sites or SAPs such as the description or name.

Note 2 — If you need to create a Control Service Template, choose, Manage→Templates from the 5620 SAM main menu. Click on the Browse Example button and select the Ethernet Ring example. For more information about creating service tunnel templates, see "Managing templates" in the *5620 SAM Scripts and Templates Developer Guide*.

Note 3 — If a template is not specified, all created objects will use their default property values.

v Click on the OK button to apply the changes and close the form.

16 Click OK. A dialog box appears.

17 Click Yes to close the Ethernet Ring (Create) form.

18 Manually create a Control service for the Ethernet ring if you did not auto-create one in step 15.

i Perform Procedure 68-1 to create a Control service on a VPLS.

ii Perform Procedure 68-24 to create an L2 Access Interface for each path endpoint in the Ethernet ring. Each site in the Control VPLS must have two control L2 Access Interfaces.

When creating the L2 access interfaces, ensure the following requirements:

- The Terminating Port and Encap Type must have the same values used to create the particular path endpoint in step 8.
- The Outer Encapsulation Value and Inner Encapsulation Value parameters for the port in each L2 Access Interface must be set to the same value as the R-APS Tag (Outer Encapsulation Value) and R-APS Tag (Inner Encapsulation Value) respectively that you used for the particular path endpoint in step 8. This defines the interface as a Control SAP for the Ethernet ring.

19 Perform Procedure 68-1 to create the Data services on the VPLS required for the Ethernet Ring. The Data service must be a regular VPLS, I-VPLS, or B-VPLS type.

20 To automatically connect the Data services to the Ethernet Ring, go to step 21. To manually connect the Data service, go to step 22.

21 To automatically connect the Data service to the Ethernet Ring:

i Select one or more Site icon(s) associated with the Data service and choose Connect to Ethernet Ring from the contextual menu. The Connect to Ethernet Ring form opens.

Note — When you use the Connect to Ethernet Ring function to connect a data service to an Ethernet ring configured with a transit service, the 5620 SAM creates VLAN-specific SAPs for the data service only on the ring site for which Connect to Ethernet Ring is selected. The transit SAPs on the ring transparently forward traffic through other sites on the service.

ii Click on the Select button beside the Select Ethernet Ring field and select a Ethernet ring from the Select Ethernet ring form.

iii Configure the following parameters.

- Data Service Outer Encap
- Data Service Inner Encap

iv Click on the Select button beside the Data Site Template field if required, and select a template from the Data Site Template form.

Note 1 — Only use the Data Site Template, if you need to create an I-VPLS or B-VPLS type data service.

Note 2 — If you need to create a Data Site Template, choose Manage→Templates from the 5620 SAM main menu. Click on the Browse Example button and select the Ethernet Ring example.

Note 3 — If a template is not specified, all created objects use their default property values.

v Click on the OK button to apply the changes and close the form.

22 To manually connect the Data service to the Ethernet Ring, perform Procedure 68-24 to create an L2 Access Interface for each path endpoint in the Ethernet ring. Each site in the Data service must have at least two L2 Access Interfaces.

Note — When creating the L2 access interfaces, the Terminating Port and Encap Type must have the same values used to create the particular path endpoint in step 8.

Procedure 27-9 To create an Ethernet (G.8032v2) ring on OmniSwitch NEs

This procedure describes how to create an Ethernet (G.8032v2) ring on OmniSwitch 6.4.5 R02 and 7.3.1 NEs.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels search form opens.

2 Click on the Create button.

3 Click on Ethernet Ring from the contextual menu. The Ethernet Ring (Create) form opens.

4 Configure the following parameters:

- Mgr ID
- Auto-Assign ID
- Element ID
- Name
- Description
- Service Composition

5 If the Service Composition parameter was set to VPLS or VPLS and VLAN, configure the following parameters:

- Hold Time Down (centiseconds)
- Hold Time Up (deciseconds)
- Revert Time (seconds)
- Guard Time (deciseconds)
- Compatible Version

6 If the Service Composition parameter was set to VLAN or VPLS and VLAN, perform the following steps to configure control service defaults:

i Configure the VLAN Application Type parameter.

ii Click on the Select button in the VLAN Control Service panel. A list of VLAN services is displayed.

iii Choose a service from the list and click on the OK button. The VLAN service information is displayed on the Ethernet Ring (Create) form.

7 Click on the Apply button. The Ethernet Ring (Edit) form opens with the General tab displayed.

8 Click on the Components tab.

9 Right click on Ring Elements and choose one of the following items from the contextual menu:

Note 1 — You must create a ring element for each site in the Ethernet ring, and a path for for each of these ring elements. Each element will therefore have two endpoints (from two different paths) associated with it.

Note 2 — The Ethernet ring can only have one element configured as an RPL owner and one element configured as an RPL neighbor. This is configured using the element's Ring Protection Link Type parameter.

Note 3 — The parameter values specified in step 4 are initially populated in the Ethernet Ring Element form when creating a ring element from the Components tab, however, you can change these as required.

Note 4 — One and only one endpoint within the entire Ethernet ring must have its Ring Protection Link Type parameter configured as Ring Protection Link End. All other endpoints in the Ethernet ring must have this parameter set to a value of Normal.

a Create Ethernet Ring Element with path endpoints.

i See Procedure 27-7 for information about creating an Ethernet Ring Element with path endpoints on OmniSwitch NEs. The element will be displayed on the Components tab in Ethernet Ring (Edit) form.

ii Repeat step i to create the other required ring elements with path endpoints.

b Add an existing Ethernet Ring Element.

i The Select Element form opens.

ii Click on the Search button and select an element.

iii Click OK. The element will be displayed on the Components tab in the Ethernet Ring (Edit) form.

iv Repeat steps i to iii to select the other required ring elements.

10 Right click on Paths and choose Properties from the contextual menu. The Ethernet Ring Paths (Edit) form opens.

11 Click on the CFM Continuity Check tab to configure a CFM Test for the path.

12 Configure the Auto Create Global MEG parameter.

13 Click on the Select button next to the Maintenance Domain parameter. A list of maintenance domains appears.

14 Choose a maintenance domain from the list and click on the OK button. The maintenance domain information is displayed on the Ethernet Ring Paths (Edit) form.

15 Configure the CCM Interval and Run CCM On Create parameters.

16 Click on the Select button in the CFM Test panel. The Select CFM Test form opens. Perform one of the following:

a Click on the Search button to list the available CFM tests.

i Select the required CFM test.

ii Click OK.

The Select CFM Test form closes and the Global ID and ID parameters for the selected test appear on the CFM Continuity Check tab.

b Click on the Create button to create the required CFM test. The Global Maintenance Entity Group (Create) form opens, with the General tab displayed.

Refer to Procedure 32-6 for information about creating the test.

Note — The Initial CCM Interval for the CFM test you select or create must be set to 10 ms or 100 ms, otherwise the subsequent MEP creation will fail.

17 Close the Ethernet Ring Paths (Edit) form.

18 Click Yes to close the Ethernet Ring (Create) form.

Procedure 27-10 To configure a transit service on an Ethernet ring

Perform this procedure to create a transit service on a VPLS G.8032 Ethernet ring. The Ethernet ring must already exists. See "Transit services" in section 27.3.

Transit services are supported on the 7210 SAS-D and 7210 SAS-M (in access-uplink mode), Release 4.0 R7 or later, and on the 7210 SAS-T.

Transit SAPs apply only on QinQ ports.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens.

2 Choose Ethernet Ring (Ethernet Ring) from the drop-down menu and click on the Search button. A list of Ethernet ring services is displayed.

3 Choose an Ethernet ring from the list and click on Properties. The Ethernet Ring (Edit) form opens with the General tab displayed.

4 Click on the Create Transit Service button. If the button is not visible, click on the More Actions button and choose Create Transit Service. The Create Transit Service form opens.

5 Click on the Select button beside the Customer field and choose a customer from the Select Customer form.

6 Configure the parameters:

- Transit Service Outer Encap
- Transit Service Inner Encap

Note — The default value for these parameters is *, or 4095. When you create a transit service, you must leave the parameters at the default value.

7 Click on the Select button beside the Transit Service Template field if required and choose a template from the Select Transit Service Template form.

Note 1 — Only use the Transit Service Template if you need to customize the parameter fields associated with the sites or SAPs such as the description or name.

Note 2 — If you need to create a Transit Service Template, choose Manage→Templates from the 5620 SAM main menu. Click on the Browse Example button and choose the Ethernet Ring example. For more information about creating service tunnel templates, see "Managing templates" in the *5620 SAM Scripts and Templates Developer Guide*.

Note 3 — If a template is not specified, all created objects use their default property values.

8 Click on the OK button. A dialog box appears.

9 Perform one of the following:

a To view the properties for the service, click on the Yes button. The properties form for the transit service opens, with the General tab displayed. View the properties, and close the form. The Ethernet Ring (Edit) form is displayed.

b Click on the No button. The Create Transit Service form closes and the Ethernet Ring (Edit) form is displayed.

10 Discover the transit service.

i Click on the Flow-through Services tab. A list of services is displayed.

ii Click on the Discover Services button. The transit service is added to the list.

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The Ethernet ring (Edit) form closes.

Note — You can combine transit services using the composite service functionality in the 5620 SAM. Composite services are created automatically when Auto Discover Composite Services is enabled in System Preferences, or manually using the Rediscover Composite Services function. See chapter 74 for more information about composite services.

Procedure 27-11 To discover service tunnels

Use this procedure to list all service tunnels objects (SDPs, Ethernet rings, Ethernet tunnels, other services, and so forth) that are currently used by the service you are querying.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services is displayed.

3 Choose a service in the list and click on the Properties button. The Service (Edit) form opens with the General tab displayed.

4 Click on the Service Tunnels tab.

5 Click the Discover Service Tunnels button to re-populate the list.

Any previously discovered service tunnels on the service are removed and an on-demand re-discovery of these is triggered.

A confirmation dialog appears when the discovery is complete.

6 Click OK.

7 Click on an item in the list and the Properties button to view the object information.

8 Close the Service (Edit) form.

Procedure 27-12 To discover flow-through services

Use this procedure to list all other services that are currently using the object you are querying as a service tunnel. These are collectively referred to as flow-through services. Refer to the "Service tunnel overview" section for a list of applicable service tunnel objects.

1 Open the configuration form of the object you want to examine.

2 Click on the Flow-through Services tab.

3 Click the Discover Flow-through Services button to re-populate the list.

Any previously discovered flow-through services are removed and a manual re-discovery of these is triggered.

A confirmation dialog appears when the discovery is complete.

4 Click OK.

5 Click on a service in the list and the Properties button to view the service information.

6 Close the object's configuration form.

Procedure 27-13 To view and manage service tunnels and tunnel elements

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens

2 Configure the filter criteria from the drop-down menu. The filter list contains all of the object types that can be used as service tunnels, along with related service tunnel management objects. The listing is hierarchical and includes:

- Ethernet Ring Element
- Ethernet Tunnel Endpoint
- Radio Ring
- Service Tunnel
  - Ethernet Tunnel
  - Ethernet Ring
  - P2MP LSP
  - ODU Trail
  - Service (Service Management)
    - IES Service
    - MPR VLL
    - Mirror Service
    - Optical Transport Service
    - VLAN Service
    - VLL
    - VPLS
    - VPRN
  - Tunnel (Service Tunnel Management)
- Tunnel Selection Profile

Note — For all service tunnel objects except Service, the search will display all objects of that type, regardless of whether or not they are being used as a service tunnel.

If you want to see only those objects that are currently being used as a service tunnel, enable the check box for the “Used By a Service” configurable filter item that exists in the list form.

3 Click on the Search button. A list containing the selected object type is displayed.

Note — If you searched on Service (or on a specific service type) used as a service tunnel, be aware that the generated list contents are subject to change, depending on current usage and on when the last on-demand (manual) discovery was conducted. There is no auto-discovery for this listing.

In other words, only those services will be listed that were known to be used as service tunnels when the last discovery was conducted. Because the discovery is only updated on user demand, the list of services generated here may not be up to date.

Procedure 27-11 details the on-demand discovery of service tunnels (including a service used by another service as a tunnel).

4 Choose a service tunnel in the list and click on the Properties button. The Tunnel (Edit) form opens with the General tab displayed.

5 View or configure the parameters on the General tab, as required.

6 View the States and State Cause indicators, if applicable, for troubleshooting information, such as a failed OAM diagnostic.

7 Click on the other tabs to view information or modify the parameters.

8 Save the changes and close the Tunnel (Edit) form.

9 Close the Manage Service Tunnels form.

Procedure 27-14 To view the service tunnel topology

1 Choose Application→Service Tunnel Topology from the 5620 SAM main menu. The Service Tunnel Topology map opens.

2 View the topology map as required. See chapter 6 for information about using topology maps.

3 Close the topology map.

Procedure 27-15 To run an OAM validation test on a service tunnel

An OAM validator test suite must be created for the tested entity. See chapter 77 for more information about how to create an OAM validator test suite.

Note — As an alternative, you can also run an OAM validation test on the service tunnel by performing a One Time Validation. This is a mostly automated procedure and is described in Procedure 77-9.

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens

2 Configure the filter criteria and click on the Search button. A list of service tunnels is displayed.

3 Choose a service tunnel in the list and click on the Properties button. The Tunnel (Edit) form opens with the General tab displayed.

4 Click on the Validate button. If the Validate button is not visible, click on the More Actions button and choose Validate.

If an OAM validator test suite is not associated to the service tunnel, a dialog box appears. Perform the following steps:

i Click on the OK button to associate the service tunnel with an existing OAM validator test suite. The Choose Validator Test Suite form appears.

ii Configure the filter criteria. A list of OAM validator test suites appears.

iii Choose a OAM validator test suite and click on the OK button. The Choose Validator Test Suite form closes.

5 View the State Cause indicators. When the validation test fails, a check mark appears beside the OAM Validation Failure indicator.

6 Click on the Tests tab.

7 Click on the Tested Entity Result tab.

8 Choose an entry and click on the Properties button. The Tested Entity Result (Edit) form opens with the General tab displayed.

9 Click on the Results tab to display the validation test results.

10 If you need to compare two test results from the same type of test, choose the two test results and click on the Compare button; the Difference form opens. Otherwise, go to step 13.

11 Compare the test results.

12 Close the Difference form.

13 Close the Tested Entity Result (Edit) form.

14 Close the Tunnel (Edit) form.

15 Close the Manage Service Tunnels form.

Procedure 27-16 To perform an Ethernet (G.8032) ring audit

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens.

2 Configure the filters and click on the Search button. A list of Ethernet rings appears.

3 Perform one of the following:

- **a** To perform a global Ethernet ring audit, go to step 4,
- **b** To perform a local Ethernet ring audit, go to step 7.

4 Click on the Global Ring Audit button. The Global Ring Audit dialog box appears.

5 Click on the Yes button. The dialog box closes, and the Ring Audit progress window appears. When the audit completes, a notification box appears.

6 Click on the Yes button. Go to step 9.

7 Select an Ethernet ring from the list, and click on the Properties button. The Ethernet Ring (edit) form appears.

8 Click on the Ring Audit button. When the audit completes, a warning or information window appears displaying the results of the audit.

9 If the audit encountered any problems that could not be resolved, an alarm is raised against the Ethernet ring listing the problems. To clear the alarm, resolve the problems and then repeat the audit.

28 — Lawful Intercept

28.1 Lawful Intercept overview *28-2*

28.2 Workflow to configure LI *28-4*

28.3 5620 SAM LI configuration procedures *28-5*

28.1 Lawful Intercept overview

Lawful Intercept, or LI, is a term that describes the interception and monitoring of network subscriber traffic by authorized agencies for law-enforcement purposes. A subscriber whose traffic is intercepted using LI is called a target. LI target traffic is replicated by a service mirror that uses subscriber information as the match criteria. LI has the following characteristics.

- LI is not detectable by a target subscriber.
- LI-related traffic is delivered separately from other network traffic.
- LI-related alarms only appear for authorized LI users.
- LI configuration information is stored in a separate and encrypted file.
- LI uses SSL security for data encryption, server authentication and message integrity between the 5620 SAM server and the single-user GUI clients or client delegate servers.

LI functions are managed separately from other 5620 SAM functions. LI mirroring is a special type of service mirroring that requires the following:

- on each LI NE in a mirror service:
  - SSH user security
  - an LI user profile
  - a user account that has LI privileges
- on the 5620 SAM:
  - SSL on the single-user GUI clients, client delegate servers and JMS server
  - a user account that has LI privileges
  - an assigned Lawful Interception Management scope of command role
  - an LI mediation policy

LI management requires a dedicated user authorization level. The 5620 SAM LI configuration forms, parameters, mirror services, and mirrored traffic are displayed only for a user with LI privileges, who can perform the following:

- create, configure, and view LI sources that use IP, MAC, SAP, and subscriber filters
- view LI-related alarms
- configure LI mediation policies
- modify the LI user password

Caution — An LI user password cannot be modified unless it is known. When an LI user password is not known, the LI user account is unavailable.

Note — Viewing or retrieving LI user activity records requires a user account with an assigned Lawful Interception Management scope of command role. The scope is restricted to the records of users in the same LI user group.

To further enhance security, LI policies and filters, and LI-related alarms are completely hidden from users without LI privileges.

See chapter 69 for more information about mirror service management. See "5620 SAM user security tasks" in the *5620 SAM System Administrator Guide* for more information about user privileges and scope of command roles. See chapter 44 for more information about filter policy configuration.

Security

The 5620 SAM admin user, or an operator with an assigned Administrator scope of command role, must create an LI user account to be used for LI configuration. A user with the admin scope of command can perform only the following LI functions:

- Create an LI user scope of command profile and associate a non-admin user account with the LI profile.
- Configure an LI user profile that is restricts the LI user to LI activities only and does not allow system administrator activities.
- Create a password for the LI user.
- Configure CLI and SNMP access for the LI user account.

The 5620 SAM admin user cannot perform the following LI functions:

- Assign LI privileges to a user who is associated with the admin profile.
- View LI-related alarms.
- Delete an LI user.
- View, create, modify, or delete LI objects.
- View or modify LI mediation policies.

The following conditions apply to LI users and LI user groups:

- LI configuration requires the Lawful Interception Management scope of command role.
- The Lawful Interception Management role can be assigned to only one scope of command profile.
- A scope of command profile that has an assigned Lawful Interception Management role can include other roles except for the admin role.
- You cannot change the scope of command profile assignment for a user group when the profile includes the Lawful Interception Management role.
- An LI user group must be created as an LI user group; you cannot change a non-LI user group to an LI user group
- You cannot change an LI user group to a non-LI user group.
- A user account can have the Lawful Interception Management or the admin role, but not both.
- A user who belongs to an LI user group cannot be changed to a non-LI user.
- An LI span of control profile restricts LI user access to specific NEs.

28.2 Workflow to configure LI

The following is the sequence of high-level activities required to configure LI using the 5620 SAM.

1. Enable SSH security on each NE that is to perform an LI function. For more information about configuring SSH, see chapter 10.
2. Enable SSL security between the 5620 SAM main server and single-user GUI clients, and between the 5620 SAM main server and client delegate servers. For more information about configuring SSL security, see "Configuring SSL security" in the *5620 SAM | 5650 CPAM Installation and Upgrade Guide*.
3. Plan the 5620 SAM LI user-account creation according to the requirements for LI user access to other 5620 SAM functional areas.
4. As the 5620 SAM admin user, perform the following steps to create an LI user on the 5620 SAM. See Procedure 28-1 for more information.
   - **i** Create a 5620 SAM LI scope of command profile that has an assigned Lawful Interception Management role.
   - **ii** Create a 5620 SAM LI user group that is associated with the new scope of command profile.
   - **iii** Create a 5620 SAM LI user account and assign it to the new user group.
   - **iv** If required, create an additional NE LI user account using the 5620 SAM GUI. See Procedure 28-2 for more information.
5. Provide the login credentials for the 5620 SAM LI user account to the authorized LI administrator or LI user.
6. As the LI user, change the password of the 5620 SAM LI user account so that it is unknown to the 5620 SAM admin user. See "5620 SAM user security tasks" in the *5620 SAM System Administrator Guide* for more information.
7. As the NE admin user, perform the following steps using a CLI to create an LI user on the NE.
   - **i** Create an LI user profile on the NE. See Procedure 28-3 for information about creating an NE user profile using a CLI.
   - **ii** Create an LI user account on the NE that is associated with the LI user profile. See Procedure 28-4 for information about creating an NE user account using a CLI.

8 Provide the login credentials for the LI NE user account to the LI user.

9 As the LI user, perform the following steps as required.

i Change the password of the LI NE user account so that it is unknown to the NE admin user. See Procedure 28-5 for more information.

ii Synchronize the global LI NE user configuration profile with the local LI NE user configuration profile. If you do not synchronize the local profile with the global profile, the LI NE user does not appear in the list of users for SNMPv3 for the LI mediation policy. See Procedure 28-6.

iii Create a LI mediation policy for the NE that uses SSH for CLI sessions and secure file transfers. See Procedure 28-7 for more information.

iv Create a Block Reservation policy to reserve a filter entry block in the base ACL MAC filter for LI MAC Filter entries. See Procedure 44-9 for more information.

v Create a LI MAC filter policy to filter out traffic to non-LI users for LI mirror services. See Procedure 44-8 for more information.

vi Specify whether the NE stores the LI source configuration locally or reconfigures the LI sources after a reboot. See chapter 69 for information about saving LI source configurations.

vii Use the 5620 SAM to enable NE discovery for LI. See Procedure 28-8 for more information.

viii Configure LI mirror services, including associating the LI MAC filter policy to the LI mirror service created in step v. See chapter 69 for information about configuring mirror services.

ix Configure the LI Filter Lock to configure who can modify base IPv4 and MAC filters referenced by an LI Source. See Procedure 28-9 for more information.

x View LI user and system logs to monitor LI activity. See “User activity logging” in the *5620 SAM System Administrator Guide* for more information about accessing user and system logs.

xi Configure LI on a specific NAT subscriber. See Procedure 28-10 for more information.

xii Enable or disable use of an SSL connection for LI users and to make HTTPS requests over the XML OSS interface and the 5620 SAM GUI. See Procedure 28-11 for more information.

28.3 5620 SAM LI configuration procedures

This section describes how to configure LI on the 5620 SAM and on an NE.

Procedure 28-1 To create an LI user account on the 5620 SAM

Note — You require 5620 SAM admin user privileges to perform this procedure.

1 Using an account with an assigned User Management scope of command role, choose Administration→Security→5620 SAM User Security from the 5620 SAM main menu. The 5620 SAM User Management (Edit) form opens with the General tab displayed.

2 Click on the Scope of Command tab.

3 Click on the Create button and choose Profile from the drop-down list. The Scope of Command Profile (Create) form opens with the General tab displayed.

4 Configure the parameters:

- Auto-Assign ID
- Profile ID
- Profile Name
- Description

5 Assign one or more scope of command roles to the profile. Perform the following steps.

i Click on the Roles tab.

ii Click on the Add button. The Select Role - Role form opens.

iii Select one or more roles to include in the scope of command profile.

Note 1 — One of the roles you choose must be the Lawful Interception Management role.

Note 2 — You cannot include the Administrator role in an LI scope of command profile.

Note 3 — The 5620 SAM allows the creation of only one scope of command profile that contains the Lawful Interception Management role.

iv Click on the OK button. The Select Role - Role form closes and a dialog box appears.

v Click on the OK button.

vi Click on the OK button. The Scope of Command Profile (Create) form closes.

6 Click on the User Groups tab.

7 Click on the Create button. The User Group (Create) form opens with the General tab displayed.

8 Configure the parameters:

- User Group
- Description
- User Group State
- Apply Local Authentication Only
- Account Expiry
- Password Expiry
- Override Global Timeout
- Client Timeout (minutes)

9 Perform the following steps to assign the new LI scope of command profile to the user group.

i Click on the Select button beside the Profile ID field in the Scope of Command panel. The Select Scope of Command Profile - User Group form opens.

ii Select the LI scope of command profile from the list and click on the OK button. The Select Scope of Command Profile - User Group list form closes and the User Group (Create) form is refreshed with the scope of command profile information.

10 Perform the following steps to assign a span of control profile to the user group.

i Click on the Select button beside the Profile ID field in the Span of Control panel. The Select Span of Control Profile - User Group form opens.

ii Select a profile from the list and click on the OK button. The Select Span of Control Profile - User Group list form closes and the User Group (Create) form is refreshed with the span of control profile information.

11 Click on the OK button. The User Group (Create) form closes and the 5620 SAM User Security - Security Management (Edit) form reappears.

12 Click on the Users tab.

13 Click on the Create button. The User (Create) form opens.

14 Configure the parameters:

- User Name
- Description
- User State
- E-mail Address
- Password Change Required
- User Password
- Confirm Password
- Valid Client IP address
- Enable IP Address validation

15 Perform the following to associate the user with the newly created LI user group.

i Click on the Select button beside the User Group parameter. The groupName - User list form opens.

ii Choose the LI user group from the list and click on the OK button. The groupName - User list form closes and the User (Create) form is refreshed with the user group information.

16 Click on the OK button. The User (Create) form closes and the 5620 SAM User Security - Security Management (Edit) form reappears.

17 Close the 5620 SAM User Security - Security Management (Edit) form.

Procedure 28-2 To create an additional NE LI user account using the 5620 SAM GUI

Note 1 — You require 5620 SAM LI user privileges to perform this procedure.

Note 2 — Before you can perform this procedure, at least one LI user account must exist on the NE.

Note 3 — Before you can perform this procedure, a 5620 SAM LI user must enable LI discovery for the NE using Procedure 28-8.

1 Choose Administration→Security→NE User Configuration from the 5620 SAM main menu. The NE User Configuration form opens.

2 Click on the Create button. The NE User (Create) form opens with the General tab displayed.

3 Configure the following parameters:

- User Name
- Description
- Access

You must specify the li, snmp, and console values for the Access parameter.

Additional configurable parameters are displayed.

4 Configure the additional parameters:

- Password
- Confirm Password
- Home Directory
- Restrict to Home
- Console Login Exec File
- Console Cannot Change Password
- Console New Password At Login

Specify an MD5 authentication key for the Password parameter. See Procedure 28-5 for information about generating a user authentication key.

5 Perform the following steps to assign a console profile, if required.

i Click on the Console Profiles tab. The list of profiles numbered one through eight appears. A user can have up to eight console profiles.

ii Use the Select button beside one of the Profile 1 through Profile 8 parameters to choose a console profile. See “To configure a user account for access to a managed device” in the *5620 SAM System Administrator Guide* for information about creating console profiles.

6 Click on the SNMPv3 tab.

i Enable the Authentication Protocol parameter.

ii Specify an authentication key generated using Procedure 28-5 for the New Authentication Password and Confirm New Auth Password parameters.

iii Enable the Privacy Protocol parameter.

iv Specify a DES encryption key generated using Procedure 28-5 for the New Privacy Password and Confirm New Privacy Password parameters.

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The NE User (Create) form closes and the NE User Configuration form reappears.

7 Close the NE User Configuration form.

Procedure 28-3 To create an NE LI user profile using CLI

Note — You require NE admin user privileges to perform this procedure.

1 Open an SSH session on the NE as described in chapter 11.

2 Enter the following commands in sequence at the prompt to create an NE user profile. The following is a sample configuration:

```
configure system security profile li-prof ↵
default-action deny-all ↵
li ↵
 entry 10 ↵
 match "configure li" ↵
 action permit ↵
 exit ↵
 entry 20 ↵
 match "exit" ↵
 action permit ↵
 exit ↵
 entry 30 ↵
 match "help" ↵
 action permit ↵
 exit ↵
 entry 40 ↵
 match "back" ↵
 action permit ↵
 exit ↵
 entry 50 ↵
```

```
match "show li" ↵
action permit ↵
exit ↵
entry 60 ↵
match "info" ↵
action permit ↵
exit ↵
entry 70 ↵
match "configure system security user" ↵
action permit ↵
exit ↵
entry 80 ↵
match "admin save" ↵
action permit ↵
exit ↵
exit all ↵
admin save ↵
```

3 Close the SSH session.

4 Right-click on the NE in the 5620 SAM topology map and choose Resync→Resync All MIBs from the contextual menu to update the NE configuration in the 5620 SAM.

Procedure 28-4 To create an LI user account on an NE using a CLI

Note — You require NE admin user privileges to perform this procedure.

1 Open an SSH session on the NE as described in chapter 11.

2 Enter the following commands in sequence at the prompt to create an LI user:

```
configure system security snmp ↵
```

To specify the SNMP access group configuration, perform one of the following:

a For an NE at Release 8.0 R7 or earlier, type the following:

```
access group LI_group security-model usm security-level
privacy context li exact read li-view write li-view notify iso
↵
```

b For an NE at Release 8.0 R7. 8.0 R8, 8.0 R9, 9.0 R1, or 9.0 R2, type the following:

```
access group LI_group security-model usm security-level
privacy context li exact read iso write iso notify iso ↵
```

c For a Release 8.0 NE at R10 or later, and for a Release 9.0 R3 or later NE, type the following:

```
access group "LI_group" security-model usm security-level
privacy read "iso" write "iso" notify "iso" ↵

access group "LI_group" security-model usm security-level
privacy context "li" exact read "li-view" write "li-view"
notify "iso" ↵

exit all ↵

configure system security user LI_username ↵

password LI_password ↵

snmp group LI_group ↵

console member LI_profile ↵

console no member default ↵

exit all ↵

admin save ↵
```

where
LI_group is the name of the LI user group on the NE
LI_usename is the name of the LI user account on the NE
LI_password is the password for the LI user account on the NE
LI_profile is the name of an LI user profile; see Procedure 28-3 for information about creating an LI user profile

3 Close the SSH session.

4 Right-click on the NE in the 5620 SAM topology map and choose Resync→Resync All MIBs from the contextual menu to update the NE configuration in the 5620 SAM.

Procedure 28-5 To configure NE LI user security

Perform this procedure to change the password for an LI user account on an NE and to configure LI user authentication and SNMP data encryption on the NE.

Note — You require NE LI user privileges to perform this procedure.

1 Use the NE LI user account to open an SSH session on the NE. See chapter 11 for information about opening an SSH session on an NE.

2 Enter the following command to obtain the SNMP engine ID of the NE.

```
show system info ↵
```

The SNMP engine ID is displayed.

3 Record the SNMP engine ID for use in the following steps.

4 Log in to a 5620 SAM main server, client delegate server, or single-user client station using an appropriate user account.

Note 1 — If you are logging on to a main server or client delegate server station, you must log in as the samadmin user.

Note 2 — If you are logging on to a 5620 SAM single-user client station, you must log in as a local administrator, or as the user who installed the client.

5 Open a console window.

6 Navigate to the *install_dir*/nms/bin directory

where *install_dir* is the 5620 SAM installation location, typically /opt/5620sam/server or /opt/5620sam/client on RHEL and Solaris, and C:\5620sam\client on Windows

7 Perform the following steps to generate an MD5 authentication key for the NE LI user account. An authentication key is used to create an encrypted authentication password.

i Perform one of the following.

- On a RHEL or Solaris station, enter the following at the CLI prompt:

```
./nmsclient.bash password2key MD5 password engine_ID ↵
```

- On a Windows station, enter the following at the CLI prompt:

```
nmsclient.bat password2key MD5 password engine_ID ↵
```

where
password is the ASCII password string used to generate the key
engine_ID is the SNMP engine ID obtained in step 2

The utility generates the authentication key.

ii Record the key value for use later in the procedure.

8 Perform the following steps to generate an MD5 DES privacy key for the NE LI user account. A DES privacy key is used to encrypt the SNMP packets for additional security.

i Perform one of the following.

- On a RHEL or Solaris station, enter the following at the CLI prompt:

```
./nmsclient.bash password2key MD5 password engine_ID ↵
```

- On a Windows station, enter the following at the CLI prompt:

```
nmsclient.bat password2key MD5 password engine_ID ↵
```

where
password is the ASCII password string used to generate the key
engine_ID is the SNMP engine ID obtained in step 2

The utility generates the DES privacy key.

ii Record the key value for use later in the procedure.

9 Close the console window.

10 Enter the following commands in sequence at the CLI prompt to change the LI user password and to configure LI security for the user account:

```
configure system security user username ↵

password new_LI_password ↵

snmp ↵

authentication md5 authentication_key privacy des-key
DES_privacy_key ↵

exit all ↵

admin save ↵
```

where
LI_group is the name of the LI user group on the NE
LI_username is the name of the LI user account on the NE
new_LI_password is the new password for the LI user account on the NE
authentication_key is the MD5 authentication key value generated for the NE LI user in step 7
DES_privacy_key is the DES privacy key value generated for the NE LI user in step 8

11 Close the SSH session.

Procedure 28-6 To synchronize the global 5620 SAM NE user configuration profile with the local NE user configuration profile

Perform this procedure to synchronize the global NE user configuration with the local NE user configuration. You must perform this procedure before you can create an LI mediation policy.

Note 1 — You require 5620 SAM LI user privileges to perform this procedure.

Note 2 — If you do not synchronize the local profile with the global profile, the LI NE user does not appear in the list of users for SNMPv3 for the LI mediation policy.

1 Choose Administration→Security→NE User Configuration from the 5620 SAM main menu. The NE User Configuration form opens with a list of NE users.

2 Choose the NE LI user you created in Procedure 28-4 and click on the Synchronize button. The Synchronize - SR Local User form opens.

3 Choose the NE on which the local policy is defined from the Available Nodes panel and click on the right-arrow to move the NE to the Selected Node panel.

4 Click on the Synchronize button.

5 Close the Synchronize -SR Local User form.

6 Close the NE User Configuration form.

Procedure 28-7 To configure an LI mediation policy

Perform this procedure to create an LI mediation policy that enables the creation of source objects for an LI service mirror.

Note — You require 5620 SAM LI user privileges to perform this procedure.

1 Choose Administration→Mediation from the 5620 SAM main menu. The Mediation (Edit) form opens with the General tab displayed.

2 Click on the LI Mediation Security tab.

3 Click on the Create button. The LI Mediation Policy (Create) form opens.

4 Click on the Select button beside the User Name parameter in the SNMPv3 panel to view a list of configured users. The Select User - LI Mediation Policy form opens.

5 Select the NE LI user you created in Procedure 28-4 from the list and click on the OK button. The user name is displayed on the LI Mediation Policy (Create) form.

6 The SNMP passwords in the 5620 SAM mediation policy must match the encrypted passwords generated for the NE LI user in Procedure 28-5. Perform the following steps to set the mediation-policy passwords.

   i Click on the Properties button. The NE User Configuration form opens.

   ii Click on the SNMPv3 tab.

   iii Enable the Authentication Protocol parameter.

   iv Specify the password used to generate the authentication key in Procedure 28-5 for the New Authentication Password and Confirm New Auth Password parameters.

   v Enable the Privacy Protocol parameter.

   vi Specify the password used to generate the DES encryption key in Procedure 28-5 for the New Privacy Password and Confirm New Privacy Password parameters.

   vii Click on the OK button. A dialog box appears.

   viii Click on the Yes button. The NE User Configuration form closes.

7 Click on the OK button. A dialog box appears.

8 Click on the OK button. The Mediation Policy (Create) form closes and the Mediation (Edit) form reappears.

9 Click on the OK button. The Mediation (Edit) form closes.

Procedure 28-8 To enable NE discovery for LI

Perform this procedure to enable LI discovery of an NE. Before you can enable LI discovery for an NE, the NE must be successfully discovered. See chapter 10 for information about configuring NE discovery.

Note — You require 5620 SAM LI user privileges to perform this procedure.

1 Choose Administration→Discovery Manager from the 5620 SAM main menu. The Discovery Manager (Edit) form opens with the Discovery Rules tab displayed.

2 Click on the Managed State tab. A list of discovered NEs is displayed.

3 Choose an NE on which Procedures 28-3 and 28-4 have been performed, and click on the Properties button. The Node Discovery Control (Edit) form opens with the General tab displayed.

4 Click on the LI Mediation Security tab.

5 Click on the Select button in the Dual Read Access Mediation Policy panel. The Configure Mediation Security - Node Discovery Control list form opens.

6 Choose the LI mediation policy created in Procedure 28-7 and click on the OK button. The Configure Mediation Security - Node Discovery Control list form closes.

7 Click on the Select button in the Dual Write Access Mediation Policy panel. The Configure Mediation Security - Node Discovery Control list form opens.

8 Choose the LI mediation policy created in Procedure 28-7 and click on the OK button. The Configure Mediation Security - Node Discovery Control list form closes.

9 Click on the Select button in the Dual Trap Access Mediation Policy panel. The Configure Mediation Security - Node Discovery Control list form opens.

10 Choose the LI mediation policy created in Procedure 28-7 and click on the OK button. The Configure Mediation Security - Node Discovery Control list form closes.

11 Click on the OK button. The Node Discovery Control (Edit) form closes and the Discovery Manager (Edit) form reappears.

12 Click on the Resync Status tab.

13 Click on the Search button. A list of NEs is displayed.

14 Choose the NE and click on the Resync button. The Resync Options form opens.

15 Select Choose MIB Entries and click on the Next button. The Choose MIB Entries list form opens.

16 Select all TIMETRA-MIRROR-MIB entries in the list and click on the Finish button.

Note — Resynchronizing only the TIMETRA-MIRROR-MIB entries resynchronizes only LI source objects and keeps the resynchronization time to the minimum required.

17 Click on the Close button. The Resync Options form closes and the Discovery Manager (Edit) form reappears.

18 Click on the OK button. The Discovery Manager (Edit) form closes.

Procedure 28-9 To configure the LI Filter Lock

This procedure allows a 5620 SAM LI user to configure a parameter that permits base IPv4 and MAC filters referenced by an LI Source to be modified or deleted. The LI Filter Lock parameter specifies who can modify the LI filters. The available options are:

- Locked: no user can modify the LI filters
- Unlocked For LI Users: only users with LI privileges can modify the LI filters
- Unlocked For All: all users can modify the LI filters

Note — You require 5620 SAM LI user privileges to view the LI Configuration Status tab and to perform this procedure.

1 Right-click on a discovered device in the Equipment navigation tree and choose Properties from the contextual menu. The Network Element (Edit) form is displayed.

2 Click on the LI Configuration Status tab.

3 Configure the LI Filter Lock parameter.

4 Click OK to apply the configuration and close the Network Element (Edit) form.

Procedure 28-10 To configure LI on a specific NAT subscriber

Perform this procedure if you need to configure LI on a specific NAT subscriber.

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria, if required, and click on the Search button. A list of mirror services appears.

3 Choose a mirror service and click on the Properties button. The Mirror *Service Name* (Edit) form opens with the General tab displayed.

4 Click on the Sites tab. A list of mirror service sites are displayed.

5 Choose a site and click on the Properties button. The Mirror Site (Edit) form opens with the General tab displayed.

6 Click on the LI NAT Sources tab.

Note — The LI NAT Sources tab appears only if the Encapsulation Type parameter for the mirror site is set to Ethernet and the L3 encapsulation Header Type parameter is set to IP-UDP Shim. See Procedure 69-3 for more information about how to configure L3 encapsulation.

7 Click on the Configure LI Source Configuration button.

8 Click on the Ethernet Header tab.

9 Configure the parameters:

- Source MAC Address
- Destination MAC Address
- EtherType

10 Click on the L2 Aware Subscribers tab.

11 Click on the Create button. The LI Source NAT L2 Aware Subscriber (Create) form opens.

12 Configure the parameters:

- Subscriber ID
- Intercept ID
- Session ID

13 Click on the OK button. A dialog box appears.

14 Click on the OK button. The LI Source NAT L2 Aware Subscriber (Create) form becomes a tab.

15 Click on the OK button. The LI Source NAT L2 Aware Subscriber (Create) tab closes and the Mirror Service (Edit) form reappears with the Sites tab displayed.

16 Choose a site and click on the Properties button. The Mirror Site (Edit) form opens with the General tab displayed.

17 Click on the LI NAT Sources tab. The Ethernet Header tab is displayed.

18 Click on the Dual Stack Lite LSN Subscribers tab.

19 Click on the Create button. The LI Source Dual Stack Lite LSN Subscriber (Create) form opens.

20 Configure the parameters:

- Routing Instance ID
- IP Address
- Prefix Length
- Intercept ID
- Session ID

21 Click on the OK button. A dialog box appears.

22 Click on the OK button. The LI Source Dual Stack Lite LSN Subscriber (Create) form becomes a tab.

23 Click on the OK button. The LI Source Dual Stack Lite LSN Subscriber (Create) tab closes and the Mirror Service (Edit) form reappears with the Sites tab displayed.

24 Choose a site and click on the Properties button. The Mirror Site (Edit) form opens with the General tab displayed.

25 Click on the LI NAT Sources tab. The Ethernet Header tab is displayed.

26 Click on the Classic LSN Subscribers tab.

27 Click on the Create button. The LI Source Classic LSN Subscriber (Create) form opens.

28 Configure the parameters:

- Routing Instance ID
- IP Address
- Prefix Length
- Intercept ID
- Session ID

29 Click on the OK button. A dialog box appears.

30 Click on the OK button. The LI Source Classic LSN Subscriber (Create) form becomes a tab.

31 Click on the OK button. The LI Source Classic LSN Subscriber (Create) tab closes and the Mirror Service (Edit) form reappears with the Sites tab displayed.

32 Click on the Apply button. A dialog box appears.

33 Click on the Yes button.

34 Close the Mirror Service (Edit) form.

35 Close the Manage Mirror Services form.

Procedure 28-11 To enable or disable the use of a secure channel for LI users

Perform this procedure to enable or disable SSL for LI users.

Caution — Contact your Alcatel-Lucent technical support representative before you attempt to modify the nms-server.xml file. Modifying the nms-server.xml file can have serious consequences that can include service disruption.

Note — You must perform this procedure on each main server in a redundant 5620 SAM deployment.

1 Log in to the 5620 SAM main server station as the samadmin user.

2 Navigate to the 5620 SAM server configuration directory, typically /opt/5620sam/server/nms/config.

3 Create a backup copy of the nms-server.xml file.

4 Open the nms-server.xml file using a plain-text editor.

5 Search for the following XML tag.

```
<liConf
```

liUserRequireSSL="value"

where *value* is set to true or false to enable or disable the secure channel check for LI users.

6 Edit the “liUserRequireSSL=” line to enable or disable SSL, as required.

7 Save and close the nms-server.xml file.

8 Open a console window.

9 Navigate to the server binary directory, typically /opt/5620sam/server/nms/bin.

10 If the main server is a standalone server, or the primary server in a redundant deployment, enter the following:

```
bash$ ./nmsserver.bash read_config ↵
```

The main server reads the nms-server.xml file and puts the configuration change into effect.

11 If the main server is the standby server in a redundant deployment, enter the following:

```
bash$ ./nmsserver.bash force_restart ↵
```

The main server restarts and puts the configuration change into effect.

29.9 IPsec VPN procedures ***29-27***

29.1 IPsec overview

The 5620 SAM supports the configuration of IPsec VPRN services, which are generically called IPsec VPNs. An IPsec VPN enables the secure extension of a corporate VPN over uncontrolled or untrusted private and public networks. The ISA tunnel on the 7750 SR, 7750 MG, and the 7450 ESS in mixed mode, provides IPsec tunneling and encryption between sites.

You can use the 5620 SAM to configure IPsec sessions and the security associations that are required in a bidirectional IPsec tunnel. You can configure multiple IPsec tunnels for a VPRN.

5620 SAM IPsec session configuration supports the following:

- encryption methods such as DES, 3DES, AES-128, AES-192, and AES-256
- authentication and hashing methods such as HMAC-MD5, HMAC-SHA1, and HMAC-SHA2
- key distribution methods such as IKE shared secret with PFS, and manual exchange
- key generation algorithms such as Diffie-Helman
- IPsec modes
- shared secret authentication
- NAT traversal for IKEv1 and IKEv2
- DPD for the IPsec tunnel

An IPsec VPN service includes IPsec tunnels that terminate on IES or VPRN IPsec gateways. These gateways support L3 forwarding through an interface that connects to an IPsec tunnel. You can use the 5620 SAM to configure VPRN services to which individual hosts connect over the Internet to an IES or VPRN IPsec gateway. You can configure one or more tunnel interfaces in a VPRN service, and can configure multiple tunnel security profiles for each tunnel interface.

IKE policies are used to negotiate IPsec security associations, or SAs, between IPsec peers. An SA is a relationship between two or more IPsec peers that defines how the peers communicate securely. IKE policies are exchanged between IPsec peers to negotiate a secure communication channel; they specify how traffic is encrypted between source and destination sites in an IPsec VPN by establishing a shared security policy using authentication keys.

IPsec transform policies specify the protocol for the IPsec authentication header and the encryption protocol for the encapsulating security payload, or ESP, and define the attributes that are used to secure the data.

After an IPsec peer initiates an IPsec session, there are two main phases:

- authentication and protection of IPsec peer identities and negotiation of matching IKE SA policies between peers to establish a secure channel for negotiating IPsec SAs in the next phase
- IPsec SA parameter negotiation and establishment of matching peer SAs

After the second phase, the IPsec peers exchange data over the IPsec tunnel according to the IPsec parameters in the IKE and IPsec transform policies.

You can create a tunnel template to configure shared IPsec transforms and IKE policies. Each IPsec peer configuration can include the following:

- one or more configured IPsec transforms
- one IKE policy
- one unique IPsec tunnel
- one tunnel filter defined in the IPsec tunnel configuration

Each IPsec tunnel between IKE peers is identified by a unique remote peer IP address or a unique local IP address.

You can use the IPsec Application Function Manager to create and manage end-to-end IPsec components to form a secure VPN. See section 29.2 for more information.

The 5620 SAM OSSI supports IPsec VPN configuration.

IPv6 IPsec

OSPFv3 authentication requires IPv6. IPv6 IPsec requires the following:

- IPsec transport mode —required because the NE acts as an OSPFv3 authentication host
- IPsec static security association—defines the SPI values, algorithms, protocol and keys to be used, and requires the same configuration at each end of the tunnel
- AH and ESP
- MD5, SHA1, and SHA2

BFD

You can use BFD for static LAN-to-LAN IPsec tunnels on the 7750 SR-c4, 7750 SR-7, 7750 SR-12, 7750 SR-12E, 7750 SR-c12, and 7450 ESS in mixed mode. The following is the configuration information for implementing BFD over static LAN-to-LAN IPsec tunnels:

- You can have only one BFD session between a source/destination address pair.
- Each tunnel can be associated with only one BFD session. However, one or more tunnels, to a maximum of 500, can be associated with same BFD session.
- If one BFD session is associated with multiple tunnels, the tunnel that carries the BFD traffic must be operationally up before any of the other tunnels can be operationally up.
- When the 5620 SAM does not receive BFD packets from a peer before the detection time expires or a signal down notification is sent from a remote peer, the BFD session is considered down. When the 5620 SAM sets the associated IPsec tunnels in a down state, 5620 SAM performs the following:
  - sends a Delete Payload message to each remote peer from each associated tunnel and SA
  - removes the state and table entries from each associated tunnel and SA

29.2 IPsec VPN

You can create and manage the association between IPsec components, public and private services, to form a secure VPN. See "Typical applications for IPsec corporate services" in this section for the typical applications of an IPsec VPN.

You use the IPsec VPN step forms to perform the following:

- Configure the corporate service type.
- Enable the link between the corporate and secure service.
- Choose an NE service site.
- Configure the secure VPRN service.
- Configure the delivery service.
- Choose the Tunnel group.
- Create the policy.
- Deploy the IPsec VPN.

Tunnel types

Table 29-1 lists the tunnel types that you can create for an IPsec VPN.

Table 29-1 Tunnel types

Tunnel type	7750 SR	7750 MG	7450 ESS in mixed mode	7210 SAS
Dynamic (site-to-site)	✓	✓	✓	
Dynamic (soft client)	✓	✓	✓	
Static	✓	✓	✓	✓

The 5620 SAM creates the following after the successful creation of an IPsec VPN, regardless of the tunnel type:

- a secure VPRN service and NE sites
- the IES or VPRN delivery service and NE sites
- if you specify that the secure and corporate services are to be linked, a composite service that contains the corporate and secure services

The 5620 SAM performs specific configuration actions after the successful creation of an IPsec VPN, depending on the tunnel type. See Procedures 29-15 to 29-17 for more information.

Typical applications for IPsec corporate services
