This procedure provides the steps required to enable BGP Auto Discovery or configure BGP VPLS on a VPLS site.

- BGP AD enables a VPLS PE router to discover other PE routers that are part of the same VPLS domain. T-LDP based label signaling is used for the pseudowire.
- BGP VPLS provides the mechanism for service member auto-discovery based on Route Target. MP-BGP based label signaling is used for the pseudowire.

Note 1 — BGP AD and BGP VPLS implementations only apply to regular VPLS sites and B-Sites, but not to I-Sites. For BGP VPLS, the B-Site cannot be used as a backbone for an I-Site or Epipe.

Note 2 — For the 7210 SAS-M and 7210 SAS-X, BGP AD only is supported on VPLS service sites (not on MPVLS or B-sites).

1 Prior to configuring a site for BGP AD or BGP VPLS, you must complete the following actions:

i Create a routing policy to define the required community members. See Procedure 22-15. This defines the VSI Import/Export Routing Targets.

ii Enable BGP on the routing instance of each NE in the VPLS or BGP VPLS. See Procedure 23-1 for more information.

iii Configure global-level BGP on each NE in the VPLS or BGP VPLS. See Procedure 23-2 for more information. The following items are required for BGP AD implementation.

- You must enable the L2 VPN parameter in the Family panel on one or more of the following:
  - the VPN tab of the BGP Site form
  - the VPN tab of the BGP Peer Group form, which contains the peers that are involved in the BGP signaling
  - the VPN tab of the BGP peer form, which participates in BGP signaling
- Create a peer group under BGP. This peer group is used to collectively define the peers involved in the VPLS.
- Create the required peers under the peer group. These peers are the NEs involved in the VPLS.

iv Create a PW template policy. See chapter 73 for information about PW template policies.

v Distribute the PW template policy to each NE that is or will be a component of the VPLS or BGP VPLS.

vi Ensure that the BGP AD Administrative Status parameter is set to Up and that the VPLS ID parameter is configured.

2 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

3 Configure the filter criteria and click on the Search button. A list of services appears.

4 Select the required VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

5 Perform one of the following:

a On the navigation tree, right-click on the required site and choose Properties. The VPLS Site (Edit) form opens with the General tab displayed.

b Create a new site. Perform steps 4 to 8 in Procedure 68-7.

6 Click on the BGP tab. The General tab is displayed.

7 Enable the Enable BGP parameter. The BGP section is displayed.

8 Configure the Route Distinguisher parameter.

9 Click on the Configuration button to configure the Route Targets and the PW template policies. The BGP Configuration form opens, with the VSI Import Policies tab displayed.

10 Select up to five import policies, as required. Alternatively, you can enter the policy names manually in the provided fields.

11 Perform one of the following:

a Enter the Import Route Target name manually in the provided field. The format be “target:x:y”.

b Click on the Import Route Target Select button. The Select...-BGP Info form opens. Click on the Search button to display the available import route targets. The community members you defined when creating a routing policy in step 1 appear in the list. Select the required target and click OK. The Select...-BGP Info form closes.

12 Click on the VSI Export Policies tab and select up to five export policies, as required. Alternatively, you can enter the policy names manually in the provided fields.

13 Perform one of the following:

a Enter the Export Route Target name manually in the provided field. The format must be “target:x:y”.

b Click on the Export Route Target Select button. The Select...-BGP Info form opens. Click on the Search button to display the available export route targets. The community members you defined when creating a routing policy in step 1 appear in the list. Select the required target and click OK. The Select...-BGP Info form closes.

14 Click on the PW Template Binding tab.

15 Perform one of the following:

a To use an existing PW Template Binding, go to step 16.

b To add a new PW Template Binding, go to step 17.

16 To use an existing PW Template Binding:

i Click on the Search button. A list of applicable PW Template Bindings is displayed.

ii Select the required entry or entries from the list.

iii Go to step 18.

17 To create a new PW Template Binding:

i Click on the Create button. The PW Template Binding (Create) form opens with the General tab displayed.

ii Enter a Split Horizon Group name, if required.

iii Click on the Select button. The Select PW Template form is displayed.

iv Click on the Search button. A list of applicable PW Templates is displayed.

v Select the PW Template you created in step 1.

vi Click on the OK button to accept the selection. The Select PW Template form close and the Policy ID field is populated by your choice.

vii Click on the Select button beside the Member Group Name parameter. The Select Operational Group - PW Template Binding form opens.

viii Configure the filter criteria. A list of operational groups appears.

ix Choose an operational group from the list and click on the OK button. The Select Operational Group - PW Template Binding form closes and the PW Template Binding (Create) form refreshes with the operational group information.

x Click on the PW Templates Binding Route Target tab and click on the Create button. The PW Template Binding Route Target (Create) form is displayed.

Note — This Import Route Target is used by the NE to decide which PW Template to use to create SDP bindings. If a far-end neighbor has a matching export target (that is, to the PW Template Import Target being defined here), then this PW Template is selected by the NE to create the pseudowire that is used to link both sites of the VPLS. If nothing is entered, and multiple PW Templates are defined, the first one found by the NE is used (most likely the one with the lowest PW Template Policy ID).

Enter the required Import Route Target in the field and click OK. The PW Template Binding Route Target (Create) form closes and the entered Import Route Target is displayed in the table on the PW Template Binding Route Target tab.

xi Click on the OK button to accept the selection. The PW Template Binding (Create) form closes and the new PW Template Binding is displayed in the table on the PW Template Binding tab.

xii Repeat steps i to xi to create additional PW Template Bindings, as required.

xiii Select the required entry or entries from the list.

18 Click on the OK button to apply the configuration changes you have made. The BGP Configuration form closes.

19 If you are configuring a BGP VPLS, go to step 20. Otherwise go to step 23.

20 Enable the Enable BGP VPLS parameter. The BGP VPLS section is displayed.

21 Configure the parameters:

- VE Name
- Max VE ID
- VE ID
- Administrative State

22 Select an operational group for the BGP site to monitor. Perform the following steps.

Note — This step does not apply to the 7210 SAS-M or 7210 SAS-X.

i Click on the Select button beside the Monitored Group Name parameter. The Select Operational Group - BGP Multi-homing VPLS site form opens.

ii Configure the filter criteria. A list of operational groups appears.

iii Choose an operational group from the list and click on the OK button. The Select Operational Group - BGP Multi-homing VPLS site form closes and the BGP Multi-homing VPLS site (Create) form refreshes with the operational group information.

23 If you are configuring BGP AD, go to step 24. Otherwise go to step 27.

24 Enable the Enable BGP AD parameter. The BGP AD section is displayed.

25 Configure the parameters:

- VPLS ID
- Formatted VSI ID Prefix
- Administrative State

Note 1 — The Global Service VPLS ID is set to the value defined at the service level.

Note 2 — If VPLS ID is defined at the service level, then the 5620 SAM ensures that each site has the same VPLS ID. If a site has a different VPLS ID, an alarm is raised and the ID mismatch is indicated in the Status panel of the VPLS site properties form.

The same VPLS ID value is propagated to each site in a VPLS. If you change the VPLS ID of a site without using the 5620 SAM, the 5620 SAM displays a warning form.

26 Click on the OK button. The VPLS Site (Edit) form closes.

27 Click on the OK button. A dialog box appears.

28 Close the VPLS Service (Edit) form.

Procedure 68-55 To configure a site for BGP VPLS Multi-homing

This procedure provides the steps required to configure a site for BGP VPLS Multi-homing. BGP VPLS Multi-homing provides redundancy support through the configuration of a number of multi-homed sites, rather than through the use of MC-LAG or MC-Ring as access mechanisms. Dual-homing between a CE device and a pair of VPLS PE devices (potentially in different autonomous systems) is an example of such a configuration.

Note 1 — Only regular VPLS sites and B-Sites can be configured for BGP VPLS Multi-homing. However, the B-Sites cannot be used as a backbone for an I-Site or Epipe.

Note 2 — I-VPLS and MVPLS services cannot be configured for this application.

Note 3 — An RD or RT configured under the BGP of a VPLS site cannot be removed as long as there is a multi-homing site ID configured whose administration state is up.

Note 4 — You can see a list of all current BGP VPLS Multi-homing sites in a multi-homing VPLS service by viewing the BGP Multi-homing Sites tab on the service configuration form.

1 Prior to configuring a site for BGP VPLS Multi-homing, you must complete the following actions:

i Create a routing policy to define the required community members. See Procedure 22-15 for more information. This defines the VSI Import/Export Routing Targets.

ii Enable BGP on the routing instance of each NE in the VPLS or BGP VPLS. See Procedure 23-1 for more information.

iii Configure global-level BGP on each NE in the VPLS or BGP VPLS. See Procedure 23-2 for more information. The following items are required:

- Enable the L2 VPN parameter on one or more of the following:
  - the VPN tab of the BGP site form
  - the VPN tab of the BGP Peer Group form, which contains the peers that are involved in the BGP multi-homing
  - the VPN tab of the BGP peer form, which participates in BGP signaling
- Create a peer group under BGP. This peer group is used to collectively define the peers involved in the VPLS.
- Create the required peers under the peer group. These peers are the NEs involved in the VPLS.

Note — For optimal processing while a BGP multi-homing site is activated or de-activated, or the system is rebooted, you should also:

- Enable the L2 VPN parameter in the Rapid Update Address Family panel on the BGP site VPN tab.
- Enable the Enable Rapid Withdrawal parameter on the BGP site Behavior tab.

iv Create a PW template. See chapter 73 for information about PW templates.

v Distribute the PW Template to each NE that is or will be a component of the VPLS or BGP VPLS.

vi Create SDPs for the BGP VPLS Multi-homing site(s), if manually-provisioned service tunnels are required. Refer to Procedure 27-1.

2 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

3 Configure the filter criteria and click on the Search button. A list of services appears.

4 Select the required VPLS or HVPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

5 Perform one of the following:

i On the navigation tree, right-click on the required site and choose Properties. The VPLS Site (Edit) form opens with the General tab displayed.

ii Create a new site. Perform steps 4 to 8 in Procedure 68-7.

6 Click on the BGP tab. The General tab is displayed.

7 Enable the Enable BGP parameter. The BGP section is displayed.

8 Configure the Route Distinguisher parameter.

9 Click on the Configuration button to configure the Route Targets and the PW Templates. The BGP Configuration form opens, with the VSI Import Policies tab displayed.

10 Select up to five import policies, as required. Alternatively, you can enter the policy names manually in the provided fields.

11 Perform one of the following:

a Enter the Import Route Target name manually in the provided field. The format must be “target:x:y”.

b Click on the Import Route Target Select button. The Select... -BGP Configuration form opens. Click on the Search button to display the available import route targets. The community members you defined when creating a routing policy in step 1 appear in the list. Select the required target and click OK. The Select... -BGP Configuration form closes.

12 Click on the VSI Export Policies tab and select up to five export policies, as required. Alternatively, you can enter the policy names manually in the provided fields.

13 Perform one of the following:

a Enter the Export Route Target name manually in the provided field. The format must be “target:x:y”.

b Click on the Export Route Target Select button. The Select... -BGP Configuration form opens. Click on the Search button to display the available export route targets. The community members you defined when creating a routing policy in step 1 appear in the list. Select the required target and click OK. The Select... -BGP Configuration form closes.

14 Click on the PW Template Binding tab.

15 Perform one of the following:

a To use an existing PW Template Binding, go to step 16.

b To create a new PW Template Binding, go to step 17.

16 To use an existing PW Template Binding:

i Click on the Search button. A list of applicable PW Template Bindings is displayed.

ii Select the required entry or entries from the list.

iii Go to step 18.

17 To create a new PW Template Binding:

i Click on the Create button. The PW Template Binding (Create) form opens with the General tab displayed.

ii Enter a Split Horizon Group name, if required.

iii Click on the Select button. The Select PW Template form is displayed.

iv Click on the Search button. A list of applicable PW Templates is displayed.

v Select the PW Template you created in step 1.

vi Click on the OK button to accept the selection. The Select PW Template form close and the Policy ID field is populated by your choice.

vii Click on the PW Templates Binding Route Target tab and click on the Create button. The PW Template Binding Route Target (Create) form is displayed.

Note — This Import Route Target is used by the NE to decide which PW Template to use to create SDP bindings. If a far-end neighbor has a matching export target (that is, to the PW Template Import Target being defined here), then this PW Template is selected by the NE to create the pseudowire that is used to link both sites of the VPLS. If nothing is entered, and multiple PW Templates are defined, the first one found by the NE is used (most likely the one with the lowest PW Template Policy ID).

Enter the required Import Route Target in the field and click OK. The PW Template Binding Route Target (Create) form closes and the entered Import Route Target is displayed in the table on the PW Template Binding Route Target tab.

viii Click on the OK button to accept the selection. The PW Template Binding (Create) form closes and the new PW Template Binding is displayed in the table on the PW Template Binding tab.

ix Repeat steps i to viii to create additional PW Template Bindings, as required.

x Select the required entry or entries from the list.

18 Click on the OK button to apply the configuration changes you have made. The BGP Configuration form closes.

19 Click on the Multi-homing tab.

20 Click on the Create button. The BGP Multi-homing Site (Create) form opens.

21 Configure the parameters:

- Multi-homing Site Name
- Multi-homing ID
- Enable Multi-homing to

22 Click on the Select button to specify a SAP, Spoke SDP, Split Horizon Group, or Mesh SDP Binding, based on the option you selected for the Enable Multi-homing to parameter. The appropriate selection form opens to allow you to search for the required object.

23 Select the required object and click OK. The selection form closes and the BGP Multi-homing Site (Create) form is refreshed to display the selected object.

24 Configure the parameters:

- Failed Threshold
- Use Node Level Boot Timer
- Boot Timer (seconds)
- Use Node Level Site Activation Timer
- Activation Timer (seconds)
- Administrative State

If you enable either the Use Node Level Boot Timer and/or Use Node Level Site Activation Timer parameters, then the associated Boot Timer (seconds) and/or Activation Timer (seconds) parameters will not be configurable. These parameter values will be inherited from the network element configuration.

The Boot Timer (seconds) and Activation Timer (seconds) parameters can be configured for an NE on the BGP Multi-homing tab under the Redundancy tab in the Network Element (Edit) form. See Procedure 13-2 for more information on changing device properties.

25 Click on the Select button to specify a Monitored Group Name. The Select Monitored Group Name form is displayed.

26 Click on the Search button to display a list of eligible Monitored Group Names.

27 Select the required Monitored Group Name and click OK. The Select Monitored Group Name form closes and the BGP Multi-homing Site (Create) form is refreshed to display the selected Monitored Group Name.

28 Click on the Apply button. A dialog box appears.

29 Click on the OK button. The BGP Multi-homing VPLS Site (Create) form refreshes.

30 Check the following indicators:

- Operational State: indicates the operational status of the multi-homing site.
- Designated Forwarder: indicates whether this site has been declared as designated forwarder, depending on the result of the BGP election.

31 Click on the OK button. The BGP Multi-homing VPLS Site (Create) form closes.

32 Click on the OK button. The VPLS Site (Edit) form closes.

33 Close the VPLS Service (Edit) form.

Procedure 68-56 To re-evaluate the PW Templates associated with a BGP AD or BGP VPLS

Use this procedure to re-evaluate changes made to the Route Targets associated with the PW Template bindings of an existing site with BGP configuration. This procedure can only be performed on an existing VPLS that has been configured with BGP AD or BGP VPLS. The procedure allows you to make configuration changes and propagate them to the service without having to shutdown and then turn up a site.

1 Choose Manage→Service→Services from the 5620 SAM main menu.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Select the required VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, right-click on the required site and choose Properties. The VPLS Site (Edit) form opens with the General tab displayed.

5 Click on the BGP tab.

6 Click on the Configuration button to open the BGP Configuration form.

7 Make any required changes to the Route Targets or PW Template bindings. See Procedures 68-54 or 68-55 as required, for detailed instructions on configuring these items.

8 Click on the PW Template Binding tab and click on the Apply button to apply the changes you have made.

9 Perform one of the following:

a If you need to update the PW Templates under other sites for this service, repeat steps 4 to 8 as required, then go to step 13.

b If you do not need to update the PW Templates under other sites for this service go to step 10.

10 Click on the Re-evaluate PW Template button to run an evaluation of the PW Template bindings. A pop-up window appears indicating if the re-evaluation was successful. If it was not, the reason for the failure is displayed.

If you make any subsequent modifications, you can re-evaluate the template again.

11 Click on the OK button. The BGP Configuration form closes.

12 Click on the OK button to close the VPLS Service (Edit) form. The procedure is complete.

13 Return to the VPLS Service (Edit) form.

14 Click on the Re-evaluate PW Template button. The Add form opens to allow you to select one of the PW Templates you modified.

15 Click on the Search button to display a list of PW Templates and select the required one.

16 Click on the OK button to run an evaluation of the selected PW Template. A pop-up window appears indicating if the re-evaluation was successful. If it was not, the reason for the failure is displayed.

17 Repeat steps 14 to 16 for any other sites that you want to re-evaluate a PW Template for.

18 Click on the OK button to close the VPLS Service (Edit) form.

Procedure 68-57 To assign tunnel administrative groups to a BGP or BGP AD VPLS

Perform this procedure to assign tunnel administrative groups to a BGP or BGP AD VPLS. The tunnel administrative groups are applicable only when the VPLS is configured as a PBB tunnel. The VPLS must be configured to include B-sites and Multi-Segment Tunnel Selection must be enabled in the system preferences. See chapter 79 for more information about tunnel administrative groups.

1 Choose Manage→Service→Services from the 5620 SAM main menu.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Select the required BGP or BGP AD VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 Click on the Tunnel Admin Groups tab.

5 Select the tunnel administrative groups in the Unassigned list that you want to assign to the tunnel and click the right arrow to move them into the Assigned list.

6 Click on the OK button to close the VPLS Service (Edit) form.

7 Close the Manage Services form.

Procedure 68-58 To create an HVPLS

Perform this procedure to create an HVPLS. An HVPLS consists of a VPLS in which one or more sites connect to other sites in the same VPLS, different VPLS, or to VLL services.

Note — One VPLS site in an HVPLS must be configured with an SHG. See "Split horizon groups" in this chapter for more information.

1 Add a VPLS to the HVPLS.

a Create a new VPLS.

i Perform Procedure 68-1.

Caution — If you are creating an HVPLS that includes two sites in the same VPLS connected by spoke SDPs, do not create mesh SDP bindings between the sites. Mesh SDP binding functionality is available in the spoke SDP bindings between the sites.

ii Go to step 2.

b Use an existing VPLS. Go to step 3.

2 Create another service for inclusion in the HVPLS, if required.

a Create a VPLS.

i Perform Procedure 68-1.

ii Go to step 3.

b Create a VLL.

i Perform the appropriate VLL creation procedure in chapter 67.

ii Go to step 3.

3 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens with the General tab displayed.

4 Configure the filter criteria. A list of services appears.

5 Choose a VPLS that you want to include in the HVPLS and click on the OK button. The VPLS Service (Edit) form opens.

6 Right-click on Spoke SDP Bindings below the site and choose Create Spoke SDP Bindings. The Spoke SDP Binding (Create) form opens with the General tab displayed.

7 Perform steps 10 to 51 Procedure 68-44. Choose the destination NE for the site that you want to include in the HVPLS as the Tunnel Termination Site.

8 Perform Procedure 68-7 to add sites to the HVPLS.

Procedure 68-59 To create an MVPLS

An MVPLS runs RSTP or MSTP to manage traffic blocking on the associated VPLS. Perform this procedure to create an MVPLS to run MSTP, or to run RSTP and manage traffic on the associated VPLS SAPs or redundant spoke SDPs. The procedure also applies to the I-Sites and B-Sites used in PBB.

1 Choose Create→Service→MVPLS from the 5620 SAM main menu. The MVPLS service (Edit) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the MVPLS. The Select Customer - MVPLS form opens.

3 Select a customer for the MVPLS and click on the OK button. The Select Customer - MVPLS form closes, and the MVPLS service (Edit) form refreshes with the customer name.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Priority
- Administrative State
- Default Mesh VC ID
  This parameter is configurable when the Inherit Service ID Value parameter is disabled.
- Inherit Service ID Value
- Per Service Hashing for LAG Enabled

5 Configure the OLC state:

i Click on the Apply button.

ii Configure the parameters:

- Current OLC State
- Revert OLC State

6 To configure service tunnel required bandwidth for the service, perform the following steps.

Note — In order to configure service tunnel required bandwidth, you must enable multi-segment tunnel selection and service bandwidth management at the system level.

i Click on the Bandwidth tab.

ii Configure the Bandwidth Method parameter.

iii If the Bandwidth Method parameter is set to Manual or Calculate, configure LSP Path Booking parameter.

iv If the Bandwidth Method parameter is set to Manual, enter a required bandwidth value for each CoS (see CoS 0 Bandwidth - CoS 7 Bandwidth).

7 On the navigation tree, right-click on Sites under MVPLS and choose one of the following, as required:

- Create MVPLS B-Site
- Create MVPLS I-Site
- Create MVPLS Site

The Select Network Elements - MVPLS form opens with a list of available sites.

8 Select a site and click on the OK button. Depending on your selection in step 7, the MVPLS B-Site (Create), MVPLS I-Site (Create), or MVPLS Site (Create) form opens with the General tab displayed.

9 Perform one of the following:

a Create an RSTP site for the MVPLS.

i For regular VPLS sites, perform steps 5 to 7 of Procedure 68-7. Specify RSTP as the value for the STP Mode parameter in step 7 of Procedure 68-8. Go to step iv when completed.

ii For B-Sites, perform steps 6 to 20 of Procedure 68-60. Specify RSTP as the value for the STP Mode parameter in step 9iv. Go to step iv when completed.

iii For I-Sites, perform steps 10 to 22 of Procedure 68-65. Specify RSTP as the value for the STP Mode parameter in step 14 iv. Go to step iv when completed.

iv Repeat step i, ii, or iii, as required, for each site that you want to create in the MVPLS.

b Create an MSTP site for the MVPLS.

Note — MSTP is configurable only on the 7210 SAS-D, 7210 SAS-E, 7450 ESS, 7750 SR, and 7950 XRS.

i For regular VPLS sites, perform steps 5 to 7 of Procedure 68-7. Specify MSTP as the value for the STP Mode parameter in step 7 of Procedure 68-8. Go to step iv when completed.

ii For B-Sites, perform steps 6 to 20 of Procedure 68-60. Specify MSTP as the value for the STP Mode parameter in step 9iv. Go to step iv when completed.

iii For I-Sites, perform steps 10 to 22 of Procedure 68-65. Specify MSTP as the value for the STP Mode parameter in step 14iv. Go to step iv when completed.

iv Repeat step i, ii, or iii, as required, for each site that you want to create in the MVPLS.

10 Click on the OK button. The MVPLS service (Edit) form reappears.

11 If the MVPLS site is to manage traffic on associated VPLS SAPs, create a SAP for the MVPLS with a defined redundant VLAN range.

Note — If an MVPLS site has SAPs that manage traffic on the associated VPLS SAPs, you must define a redundant VLAN range during SAP creation in the MVPLS.

i For regular VPLS sites, perform steps 5 to 33 of Procedure 68-24. Ensure that you perform Procedure 68-31to specify a redundant VLAN range. Go to step iv when completed.

ii For B-Sites, perform steps 5 to 27 of Procedure 68-66. Ensure that you perform step 22 to specify a redundant VLAN range. Go to step iv when completed.

iii For I-Sites, perform steps 5 to 30 of Procedure 68-70. Ensure that you perform step 24 to specify a redundant VLAN range. Go to step iv when completed.

iv Click on the OK button. The MVPLS service (Edit) form reappears.

12 Click on the OK button. The MVPLS service (Edit) form closes.

Procedure 68-60 To create a B-site for VPLS or MVPLS

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Select the required VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, right-click on the Sites icon and choose Create VPLS B-Site from the contextual menu. The Select Network Elements - VPLS form opens with a list of available sites.

5 Select a site and click on the OK button. The B-Site (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Name
- Description
- MTU
- Default Mesh VC ID
- Administrative State
- Monitor Access Interface Operational State
- Per Service Hashing for LAG Enabled

7 Click on the Backbone tab. The General tab is displayed.

8 Configure the backbone parameters:

- Source MAC Address
- Use SAP Backbone MAC Address
- Administrative State
- MAC Notification Interval (seconds)
- MAC Notification Count

Note 1 — The Source MAC Address should not be duplicated for other B-sites within the same B-VPLS.

Note 2 — The Source MAC Address parameter is the only applicable parameter when configuring PBB on a 7210 SAS-M or a 7210 SAS-X.

Note 3 — The Use SAP Backbone MAC Address parameter is configurable only on the 7750 SR, 7750 SR-c12, 7750 SR-12E, 7450 ESS, or 7950 XRS. The NE must also be configured with an IOM 3 MDA or an XMA.

9 Configure MFIB, STP, FIB, and MRP parameters for the B-site, if required.

i Click on the Forwarding Control tab. The MFib tab is displayed.

ii Configure the parameters:

- Table size (entries)
- High Watermark (%)
- Low Watermark (%)

iii Click on the STP tab to configure STP parameters for the B-site, if required. Otherwise, go to step v.

iv Configure the bridge-level STP parameters for the B-site.

Alcatel-Lucent STP in a VPLS interoperates with customer STP implementations as a mechanism for loop detection and prevention. The bridge-level parameters balance the STP resiliency and speed of convergence. Modifying the bridge-level parameters must be done within the constraints of the following formulas:

- 2 × (Bridge Forward Delay – 1.0 s) >= Bridge Max Age
- Bridge Max Age >= 2 × (Bridge Hello Time + 1.0 s)

Note 1 — If you are configuring an MVPLS B-site, set the STP Mode parameter to RSTP or MSTP, depending on the MVPLS type. The MSTP option is available only if you are creating an MVPLS. See Procedure 68-59 for more information about creating an MVPLS.

Note 2 — MSTP is configurable only on the 7450 ESS, 7710 SR, 7750 SR, and 7950 XRS.

- Bridge Forward Delay (seconds)
- Bridge Hello Time (seconds)
- Bridge Max Age (seconds)
- Priority
- STP Mode
- Maximum BPDUs (PDUs/Hello Interval)
- Administrative State

v Click on the FIB tab to configure FIB parameters for the B-site, if required. Otherwise, go to step 12.

vi Configure the parameters:

- High Watermark (%)
- Low Watermark (%)
- Local Age Time (seconds)
- Remote Age Time (seconds)
- Size (entries)
- Aging Enabled
- Learning Enabled
- Discard Unknown Destinations
- MAC Flush on fail
- Propagate MAC Flush

vii Depending on the type of device being configured, the Mac Move panel appears. Configure the MAC move parameters, if required:

- Move Frequency
- Retry Timeout
- Number of Retries
- Administrative State
- Primary Ports Cumulative Factor
- Secondary Ports Cumulative Factor

viii If you are configuring an MVPLS B-site that requires MSTP, click on the MSTP tab. Otherwise, go to step 12.

Note — MSTP is configurable only on the 7450 ESS, 7710 SR, 7750 SR, and 7950 XRS.

ix Configure the parameters:

- Region Name
- Region Revision
- Bridge Max Hops

x Click on the MST Instances tab.

xi Click on the Create button. The MST Instance (Create) form opens with the General tab displayed.

xii Configure the parameters:

- Instance Index
- Priority

xiii Click on the VLAN Ranges tab. Click on the Create button. The MST Instance Managed VLAN range (Create) form opens.

xiv Configure the parameters:

- Min. VLAN Tag
- Max. VLAN Tag

xv Click on the OK button. The MST Instance Managed VLAN Range (Create) form closes, and a dialog box appears.

xvi Click on the OK button. The MST Instance (Create) form refreshes with the new managed VLAN range.

xvii Click on the OK button. The MST Instance (Create) form closes and a dialog box appears.

xviii Click on the OK button. The MVPLS Site (Create) form refreshes with the new MST instance.

xix Click on the MRP tab.

xx Configure the parameters:

- MRP Admin Status
- MRP Max Attributes
- MRP Flood Time (seconds)
- MRP Attribute-Table-Low-Watermark
- MRP Attribute-Table-High-Watermark
- MMRP Endstation Only

Note — You can view information regarding MMRP Entries for the access interface and/or SDP Binding by clicking on the MMRP Entries tab.

10 To configure service tunnel required bandwidth for the site, perform the following steps.

Note — In order to configure service tunnel required bandwidth, you must enable multi-segment tunnel selection and service bandwidth management at the system level.

i Click on the Bandwidth tab.

ii Enable the Override Service Configuration parameter.

iii Configure the Bandwidth Method parameter.

iv If the Bandwidth Method parameter is set to Manual, enter a required bandwidth value for each CoS (see CoS 0 Bandwidth - CoS 7 Bandwidth).

11 Configure a Provider Tunnel for the site, if required.

When you configure an inclusive Provider Tunnel, multicast and broadcast Ethernet frames are always forwarded over a P2MP LSP, defined as the Inclusive Provider Multicast Service Interface (I-PMSI). When a Provider Tunnel is not configured, these frames are replicated at the ingress PE and a copy of each frame is forwarded over the P2P PW to each destination PE participating in the VPLS instance. Provider Tunnels can be configured on VPLS and B-VPLS sites.

Note — Provider tunnels are supported on the 7750 SR-7, 7750 SR-12, 7750 SR-c4, 7750 SR-c12, 7750 SR-12E, and 7450 ESS NEs in all chassis modes, as well as on the 7540 ESS, provided all network IP interfaces are on IOM3/IMM ports (chassis mode D).

i Click on the Provider Tunnel tab.

ii Enable the Enable Provider Tunnel parameter.

iii Configure the parameters:

- Administrative State
- Data Delay Interval (seconds)
- Root And Leaf
- Type
- LSP Template

The Administrative State parameter is only configurable when the Enable BGP AD parameter has been enabled for the site.

The LSP Template parameter is only configurable when the Type parameter is set to RSVP.

12 Create an endpoint for redundancy (dual homing) on the B-site, if required.

i Click on the Endpoints tab.

ii Click on the Create button. The Endpoint (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Name
- Description
- Revert Time (seconds)
- Suppress Standby Signalling
- Ignore Standby Signalling
- MAC Pinning

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Endpoint (Create) form closes and the B-Site (Create) form reappears with the new endpoint displayed in the list.

13 If you are configuring an MVPLS B-site, go to step 17.

14 Configure an SHG on the site, if required.

Note — You must configure an SHG or RSHG if you plan to create a spoke circuit from this VPLS B-site to a VLL or to another VPLS.

i Click on the Split Horizon Groups tab.

ii Click on the Create button. The Site, New Split Horizon Group (Create) form opens.

iii Configure the parameters:

- Name
- Description

iv Click on the OK button. The Site, New Split Horizon Group (Create) form closes.

Note — You can view information about the I-Sites and Epipe sites associated with the B-Site by clicking on the Associated Sites tab.

15 To create a B-L2 access interface for the site, perform steps 5 to 29 of Procedure 68-66.

16 To create a mesh SDP binding for the site, perform steps 5 to 24 of Procedure 68-43.

17 To create a redundant spoke SDP binding under an endpoint, perform steps 4 to 40 of Procedure 68-44.

18 To create a spoke SDP binding for the site, perform steps 7 to 40 of Procedure 68-44.

Note 1 — You cannot create a spoke SDP binding on an MVPLS site that runs MSTP, or enable MSTP on a site that has a spoke SDP binding.

Note 2 — You cannot enable MSTP on a SAP that has a non-zero encapsulation value.

19 Create a virtual MEP on the site, if required. For more information about virtual MEPs, see section 78.1.

i Click on the ETH-CFM tab.

ii Configure the Tunnel Fault Notification parameter.

iii Click on the Create button in the Virtual MEP panel. The MEP (Create) form opens.

iv Click on the Select button. The Select Maintenance Entity Group form opens.

v Choose a MEG from the list.

vi Click on the OK button. The Select Maintenance Entity Group form closes, and the MEG information is displayed on the MEP (Create) form.

vii Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- Description
- MAC Address
- CCM Enabled
- Priority Level for CCM
- Fault Propagation
- CCM Padding Packet Size (Bytes)
- Low-priority Defect

Note — The CCM Padding Packet Size (Bytes) parameter cannot be configured when the CCM interval parameter is set to 10 ms or 100 ms.

viii As required, configure the Test Generation Options parameters:

- Role
- Use as Test Source
- Use as Test Target

Note — The Role, Use as Test Source, and Use as Test Target parameters are configurable only when you set the Direction parameter to Up.

ix Click on the OK button. The MEP (Create) form closes, and the virtual MEP is created on the B-VPLS site.

Note — After the site is created and is operational, you can open the MEP (Edit) form and view an information field on the General tab that displays the number of Continuously Running Tests currently on the MEP.

20 Click on the OK button. The B-Site (Create) form closes, and a dialog box appears.

21 Click on the OK button. The VPLS Service (Create) form displays the new site on the navigation tree under VPLS.

22 Click on the OK button. The VPLS Service (Create) form closes.

23 Close the Manage Services form.

Procedure 68-61 To enable SPB on a control B-VPLS site

Perform the following procedure to enable SPB on the B-VPLS and configure the B-site as a control B-VPLS.

Note — All of the B-sites in the VPLS must be configured as control B-VPLS sites.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Select the required VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, right-click on the B-site and choose Properties. The VPLS Site (Edit) form opens with the General tab displayed.

5 Click on the Backbone tab. The General tab is displayed.

6 Click on the SPB tab.

7 Configure the SPB Mode parameter by choosing the Control B-VPLS option.

8 Click on the Create button in the SPB Instance for Control Service panel. The SPB (Create) form opens with the General tab displayed.

Note — The SPB instance configuration, except the ISIS instance and the Bridge Priority parameter on the Level 1 tab, must be identical on all the sites in a control B-VPLS.

9 Configure the parameters:

- ISIS Instance
- Forwarding Identifier (FID)
- Administrative State
- Automatic Enable Interface

10 Configure the parameters in the ISIS panel:

- LSP Life Time (seconds)
- LSP Wait (seconds)
- LSP Initial Wait (seconds)
- LSP Second Wait (seconds)
- SPF Wait (seconds)
- SPF Initial Wait (milliseconds)
- SPF Second Wait (milliseconds)
- Overload
- Overload Timeout (seconds)
- Overload On Boot
- Overload On Boot Timeout (seconds)

The Overload Timeout (seconds) parameter is configurable only if the Overload parameter is set to Enabled.

The Overload On Boot Timeout (seconds) parameter is configurable only if the Overload On Boot parameter is set to Enabled.

11 Click on the Level 1 tab.

12 Configure the parameters:

- Bridge Priority
- Unicast Forwarding Tree Topology

13 Create the ECT-to-FID range mapping.

i Click on the ECT Algorithm to FID Range Mappings tab.

ii Click on the Create button. The ECT Algorithm to FID Range Mapping (Create) form opens.

iii Configure the parameters:

- FID Range Start
- FID Range End
- FID Range Algorithm

iv Click on the OK button. The ECT Algorithm to FID Range Mapping (Create) form closes and a dialog box appears.

v Click on the OK button.

vi Repeat steps i to v, as required.

Note — The ECT-to FID range mapping parameter values must be identical on all the sites in the control SPB B-VPLS. In addition, each site must have the same number of ECT-to-FID range mapping objects.

14 Create the IS-IS interface, or SPB link, of an access interface if you have not enabled the Automatic Enable Interface parameter.

Note — If you enabled the Automatic Enable Interface in step 9, all of the L2 access interfaces on the site and all of the L2 access interfaces that are subsequently created on the B-site are automatically enabled for SPB.

i Click on the Access Interfaces tab.

ii Click on the Create button. The Access Interface, ISIS Instance (Create) form opens with the General tab displayed.

iii Click on the Select button in the SAP panel to select the L2 access interface. The Select SAP - Access Interface - ISIS Instance form opens.

iv Select an L2 access interface and click on the OK button. The Select SAP - Access Interface - ISIS Instance form closes.

v Configure the Description parameter.

vi Configure the Administrative State to specify the administrative state for SPB on the SAP.

vii Click on the Behavior tab and configure the parameters:

- LSP Pacing Interval (seconds)
- Retransmit Interval (seconds)

viii Click on the Level 1 tab and configure the parameters:

- Hello Interval (seconds)
- Hello Multiplier
- Metric

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Access Interface, ISIS Instance (Create) form closes.

15 Configure SPB on the B-VPLS spoke SDP binding if you have not enabled the Automatic Enable Interface parameter.

Note — If you enabled the Automatic Enable Interface in step 9, all of the spoke SDP bindings on the site and all of the spoke SDP bindings that are subsequently created on the B-site are automatically enabled for SPB.

i Click on the SDP Binding tab.

ii Click on the Spoke SDP Bindings tab.

iii Click on the Create button. The Spoke SDP Binding Interface, ISIS Instance (Create) form opens with the General tab displayed.

iv Click on the Select button in the Circuit panel to select the spoke SDP binding. The Select Circuit - Spoke SDP Binding Interface - ISIS Instance form opens.

v Select a circuit and click on the OK button. The Select Circuit - Spoke SDP Binding Interface - ISIS Instance form closes.

vi Configure the Description parameter.

vii Configure the Administrative State to specify the administrative state for SPB on the spoke SDP binding.

viii Click on the Behavior tab and configure the parameters:

- LSP Pacing Interval (seconds)
- Retransmit Interval (seconds)

ix Click on the Level 1 tab and configure the parameters:

- Hello Interval (seconds)
- Hello Multiplier
- Metric

x Click on the OK button. A dialog box appears.

xi Click on the OK button. The Spoke SDP Binding Interface, ISIS Instance (Create) form closes.

16 Click on the OK button. The SPB - ISIS Instance (Create) form closes.

17 Click on the OK button. The Site - VPLS Service (Edit) form closes.

18 Close the VPLS Service (Edit) form.

19 Close the Manage Services form.

Note — You can perform an RCA audit on the SPB control B-VPLS to verify the configuration. See Procedure 80-3 for more information and Table 80-1 for a description of probable causes.

Procedure 68-62 To enable SPB on a user B-VPLS site

Perform the following procedure to enable SPB on the B-VPLS and configure the B-site as a user B-VPLS. A control SPB B-VPLS service must already exist. See Procedure 68-61 for more information about how to create a control SPB B-VPLS.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Select the required VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, right-click on the B-site and choose Properties. The VPLS Site (Edit) form opens with the General tab displayed.

5 Click on the Backbone tab. The General tab is displayed.

6 Click on the SPB tab.

7 Set the SPB Mode parameter to User B-VPLS.

8 Click on the Select button in the User Service panel to associate the user B-VPLS with a control B-VPLS. The Select Association with Control B-VPLS Site form opens.

9 Select a B-site and click on the OK button. The Select Association with Control B-VPLS Site form closes.

Note — You must select the same control B-VPLS for all the sites in a user B-VPLS.

10 Configure the Forwarding Identifier (FID) parameter.

Note — The Forwarding Identifier (FID) parameter must be the same for all the user B-VPLS sites within the SPB B-VPLS.

11 Click on the OK button. The VPLS Site (Edit) form closes.

12 Close the VPLS Service (Edit) form.

13 Close the Manage Services form.

Note — You can perform an RCA audit on the SPB user B-VPLS service to ensure a correct configuration. See Procedure 80-3 for more information and Table 80-1 for a description of probable causes.

Procedure 68-63 To view SPB fate-shared objects

Perform the following procedure to list all of the SPB-enabled B-VPLS SAPs, spoke SDP bindings, and user B-VPLS sites that are fate-shared.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Select the required VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, right-click on the B-site and choose Properties. The VPLS Site (Edit) form opens with the General tab displayed.

5 Click on the SBP Fate Sharing tab. The SAPs tab is displayed with a list of fate-shared SAPs within the SPB B-VPLS.

6 Click on the Spoke SDPs tab. A list of fate-shared spoke SDP bindings within the SPB B-VPLS is displayed.

7 Click on the SPB User Sites tab. A list of SPB user B-VPLS sites associated with the control B-VPLS is displayed.

8 Close the VPLS Site (Edit) form.

9 Close the VPLS Service (Edit) form.

10 Close the Manage Services (Edit) form.

Procedure 68-64 To view SPB instances on an NE

Perform the following procedure to list all of the SPB instances associated with an NE.

1 Right-click on an NE in the Equipment navigation tree and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

2 Click on the Globals tab. The Load Balancing tab is displayed.

3 Click on the Service tab. The General tab is displayed.

4 Click on the SPB Control Instances tab. A list of all SPB instances configured on the NE is displayed.

5 Close the Network Element (Edit) form.

Procedure 68-65 To create an I-VPLS

1 Choose Create→Service→VPLS from the 5620 SAM main menu. The VPLS Service (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the VPLS. The Select Customer - VPLS Service form opens.

3 Select a customer for the VPLS and click on the OK button. The Select Customer - VPLS Service form closes, and the VPLS Service (Create) form displays the customer information.

4 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Priority
- Administrative State
- Default Mesh VC ID
  This parameter is configurable when the Inherit Service ID Value parameter is disabled.
- Inherit Service ID Value
- Automatic Mesh SDP Binding Creation
- Profile Name
  This parameter is configurable when the Automatic Mesh SDP Binding Creation parameter is enabled.
- Transport Type
  This parameter is configurable when the Automatic Mesh SDP Binding Creation parameter is enabled and the Profile Name parameter is left blank.

5 Configure the OLC state:

i Click on the Apply button.

ii Configure the parameters:

- Current OLC State
- Revert OLC State

6 To configure service tunnel required bandwidth for the service, perform the following steps.

Note — In order to configure service tunnel required bandwidth, you must enable multi-segment tunnel selection and service bandwidth management at the system level.

i Click on the Bandwidth tab.

ii Configure the Bandwidth Method parameter.

iii If the Bandwidth Method parameter is set to Manual or Calculate, configure LSP Path Booking parameter.

iv If the Bandwidth Method parameter is set to Manual, enter a required bandwidth value for each CoS (see Override Service Configuration).

7 Perform one of the following.

a Create an I-site for the VPLS. Go to step 8.

b Complete service creation if I-sites, I-L2 access interfaces, and SDP bindings for the VPLS are to be created later. Go to step 27.

8 On the navigation tree, right-click on Sites and choose Create VPLS I-Site from the contextual menu. The Select Network Elements - VPLS form opens with a list of available sites.

9 Select a site and click on the OK button. The I-Site (Create) form opens with the General tab displayed.

10 Configure the parameters:

- Name
- Description
- MTU
- Administrative State
- Monitor Access Interface Operational State
- Per Service Hashing for LAG Enabled
- Tunnel Fault Notification

Tunnel Fault Notification is configurable on sites where the device has ports configured in access or hybrid mode with QinQ encapsulation.

If you are configuring a tunnel facility MEP, Tunnel Fault Notification must be set to Accept, in order to accept the fault propagation from the tunnel facility MEP.

11 Click on the Backbone tab.

12 Select the Backbone VPLS site.

i Click on the Select button. The Select Backbone VPLS Site - I-Site form is displayed.

ii Click on the Search button. A list with all the B-VPLSs that can be used by the I-VPLS is displayed. You can narrow the search by using the using the filtered properties shown in the form. Only B-VPLSs that are present in PEs that have the I-Sites of the VPLS is shown.

iii Select a B-VPLS and click on the OK button. The Select Backbone VPLS Site - I-Site form closes and the Service ID of the chosen B-VPLS appears on the I-Site (Create) form.

Note — The selection of the B-site in this step must be repeated for each I-site you create, since you must select the B-VPLS site that is within the same site as the I-site.

13 Configure the parameters:

- Send Flush All From Me
- Send Flush All But Mine
- Administrative ISID
- Backbone STP
- Force Q Tag Forwarding

Note 1 — The Force Q Tag Forwarding parameter is only displayed if the NE for this site is in chassis mode D or higher or Sparrow.

Note 2 — Only the Administrative ISID and Backbone STP parameters are applicable when configuring PBB on a 7210 SAS-M or a 7210 SAS-X.

14 Configure MFib, STP, FIB, and MAC Protection parameters for the I-site, if required.

i Click on the Forwarding Control tab. The MFib tab is displayed.

ii Configure the parameters:

- Table size (entries)
- High Watermark (%)
- Low Watermark (%)

iii Click on the STP tab to configure STP parameters for the I-site, if required. Otherwise, go to step v.

iv Configure the bridge-level STP parameters for the I-site.

Alcatel-Lucent STP in a VPLS interoperates with customer STP implementations as a mechanism for loop detection and prevention. The bridge-level parameters balance the STP resiliency and speed of convergence. Modifying the bridge-level parameters must be done within the constraints of the following formulas:

- 2 × (Bridge Forward Delay – 1.0 s) >= Bridge Max Age
- Bridge Max Age >= 2 × (Bridge Hello Time + 1.0 s)

Note 1 — If you are configuring an MVPLS I-site, set the STP Mode parameter to RSTP or MSTP, depending on the MVPLS type. The MSTP option is available only if you are creating an MVPLS. See Procedure 68-59 for more information about creating an MVPLS.

Note 2 — MSTP is configurable only on the 7450 ESS, 7710 SR, 7750 SR, and 7950 XRS.

- Bridge Forward Delay (seconds)
- Bridge Hello Time (seconds)
- Bridge Max Age (seconds)
- Priority
- STP Mode
- Maximum BPDUs (PDUs/Hello Interval)
- Administrative State

v Click on the FIB tab to configure FIB parameters for the I-site, if required. Otherwise, go to step 19.

vi Configure the parameters:

- High Watermark (%)
- Low Watermark (%)
- Local Age Time (seconds)
- Remote Age Time (seconds)
- Size (entries)
- Aging Enabled
- Learning Enabled
- Discard Unknown Destinations
- MAC Flush on fail
- Propagate MAC Flush

vii Depending on the type of device being configured, the Mac Move panel appears. Configure the MAC move parameters, if required:

- Move Frequency
- Retry Timeout
- Number of Retries
- Administrative State
- Primary Ports Cumulative Factor
- Secondary Ports Cumulative Factor

viii Click on the MAC Protection tab to configure the list of protected MAC addresses.

ix Click on the Create button. The MAC Protection (Create) form opens.

x Configure the Protected Mac Address parameter.

xi Click on the OK button to close the form and add the MAC address to the list of protected MAC addresses.

xii If you are configuring an MVPLS I-site that requires MSTP, click on the MSTP tab. Otherwise, go to step 18.

Note — MSTP is configurable only on the 7450 ESS, 7710 SR, 7750 SR, and 7950 XRS.

xiii Configure the parameters:

- Region Name
- Region Revision
- Bridge Max Hops

xiv Click on the MST Instances tab.

xv Click on the Create button. The MST Instance (Create) form opens with the General tab displayed.

xvi Configure the parameters:

- Instance Index
- Priority

xvii Click on the VLAN Ranges tab. Click on the Create button. The MST Instance Managed VLAN range (Create) form opens.

xviii Configure the parameters:

- Min. VLAN Tag
- Max. VLAN Tag

xix Click on the OK button. The MST Instance Managed VLAN Range (Create) form closes, and a dialog box appears.

xx Click on the OK button. The MST Instance (Create) form refreshes with the new managed VLAN range.

xxi Click on the OK button. The MST Instance (Create) form closes and a dialog box appears.

xxii Click on the OK button. The MVPLS Site (Create) form refreshes with the new MST instance.

15 Configure ingress multicast forwarding, if required.

Note — An Operational Channels tab appears when you access the VPLS I-Site form in the Edit mode. It displays data for the operational channels when traffic from a specific multicast source for a specific multicast group passes through the service. You must click on the Search button to refresh the data. See chapter 42 for information about listing the operational channel parameters.

i Click on the Multicast tab.

ii Click on the Mcast Path Mgmt tab.

iii Click on the Select button to choose a multicast info policy. The Select Ingress Info Policy form opens.

iv Select a policy in the list and click on the OK button. The Select Ingress Info Policy form closes and the policy identifier is displayed on the Site (Create) form.

16 To configure service tunnel required bandwidth for the site, perform the following steps.

Note — In order to configure service tunnel required bandwidth, you must enable multi-segment tunnel selection and service bandwidth management at the system level.

i Click on the Bandwidth tab.

ii Enable the Override Service Configuration parameter.

iii Configure the Bandwidth Method parameter.

iv If the Bandwidth Method parameter is set to Manual, enter a required bandwidth value for each CoS (see CoS 0 Bandwidth - CoS 7 Bandwidth).

17 Configure IGMP snooping for the site, if required.

i Click on the Multicast tab.

ii Click on the IGMP Snooping tab.

iii Configure the parameters:

- Administrative State
- Query Interval (seconds)
- Robust count
- Report source address
- Use query source address
- Query source address

The Query source address parameter is configurable when the Use query source address parameter is enabled.

18 If you are configuring an MVPLS I-site, go to step 20.

19 Configure an SHG on the site, if required.

Note — You must configure an SHG or RSHG if you plan to create a spoke circuit from this VPLS I-site to a VLL or to another VPLS.

i Click on the Split Horizon Groups tab.

ii Click on the Create button. The Site, New Split Horizon Group (Create) form opens.

iii Configure the parameters:

- Name
- Description
- Restrict Protected Source
- Restrict Protected Source Action
- Restrict Unprotected Destination

iv Click on the OK button. The Site, New Split Horizon Group (Create) form closes.

20 To create an I-L2 access interface for the I-site, perform steps 4 to 32 of Procedure 68-70.

21 To create a spoke SDP binding between the I-site and regular VPLS sites, click on the Components tab and perform steps 9 to 40 of Procedure 68-44, as required. I-sites can only use spoke SDP bindings.

Note 1 — You cannot create a spoke SDP binding on an MVPLS site that runs MSTP, or enable MSTP on a site that has a spoke SDP binding.

Note 2 — You cannot enable MSTP on an access interface that has a non-zero encapsulation value.

22 Click on the OK button. The I-Site (Create) form closes, and a dialog box appears.

23 Click on the OK button. The VPLS Service (Create) form displays the new I-site on the navigation tree under VPLS.

24 Repeat steps 8 to 23 to create additional I-sites for the I-VPLS.

25 Add protected MAC addresses at the service level, if required. Protected MAC addresses that you add on the site level, as performed in step 14, are automatically added to the service-level MAC protection list.

i Click on the Forwarding Control tab.

ii Click on the MAC Protection tab.

iii Click on the Create button. The MAC Protection (Create) form opens.

iv Configure the Protected Mac Address parameter.

v Click on the OK button. The MAC Protection (Create) form closes and the protected MAC address is listed on the VPLS Service (Create) form.

26 To configure bandwidth for the service if required, click on the Bandwidth tab. The Required Bandwidth tab is displayed. Proceed as follows:

Note 1 — The Bandwidth tab is only available if service CAC is configured. See "To configure service CAC to automatically bind PBB tunnels" in the *5620 SAM System Administrator Guide* for information about enabling and disabling service CAC.

Note 2 — The ability to configure required bandwidth is only applicable to I-sites.

i For each CoS, enter the value for the CoS Bandwidth (Mbps), as required.

ii Click on the General tab to determine the CAC status.

If the Verify CAC button is enabled, the CAC has not been verified. The Probable Cause and CAC Status fields provide details.

The CAC Status field describes the current CAC status of the service. CAC statuses are as follows.

- CAC Verified indicates that all tunnels have sufficient bandwidth to admit service and that requested bandwidth for the service is booked on the appropriate physical links.
- CAC Failed indicates that the attempt made to admit service into the network was unsuccessful. The most likely cause for this is insufficient bandwidth. See the Probable Cause field for more specific information.
- BW Defined, No CAC Request indicates that the required bandwidth is defined on the service; however, a CAC request has not occurred.
- CAC To be Verified indicates that a tunnel has been configured on the service either manually or through the CLI; however, the required bandwidth has not been verified in the network.

The Probable Cause field describes possible reasons for the current CAC state. Probable causes are as follows.

- No Candidate Tunnels Found indicates that the autobind tunnel function was found, but no suitable tunnels were found.
- Different PBB Tunnels Applied to Service indicates that two or more different PBB tunnels are configured on this service.
- Not Enough Bandwidth on any Candidate Tunnels indicates that one or more candidate tunnels were found, but the available bandwidth was insufficient to admit the service.
- Automatic PBB Tunnel Selection Failed indicates that a suitable PBB tunnel was found, but there were errors when attempting to assign the tunnel to the service. A dialog box will provide more details.
- Site Missing Tunnel indicates that at least one selected site is not configured with a PBB tunnel.
- All PBB Tunnels have not been Verified indicates that all sites within the service have a tunnel configured, but the available bandwidth has not been booked or verified in the network.

iii To manually verify the CAC, click on the Verify CAC button if it is enabled. The 5620 SAM will attempt to find the most appropriate PBB tunnel for the service based on available bandwidth, and to automatically bind the tunnel to the service if one has not already been assigned.

27 Click on the OK button. The VPLS Service (Create) form closes.

28 Close the Manage Services form.

Procedure 68-66 To create a VPLS or MVPLS B-L2 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Choose a VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the access interface; expand the entries for that site.

5 Right-click on L2 Access Interfaces and choose Create B-L2 Access Interface. The B-L2 Access Interface (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Description
- Administrative State
- MC Ring Node
- Tunnel Fault Notification

Tunnel Fault Notification is configurable on interfaces where the device has ports configured in access or hybrid mode with QinQ encapsulation.

If you are configuring a tunnel facility MEP, Tunnel Fault Notification must be set to Accept, in order to accept the fault propagation from the tunnel facility MEP.

7 Choose a transit prefix policy for the interface, if required.

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy - B-L2 Access Interface form opens.

ii Select a transit prefix policy and click on the OK button.

8 Choose an SHG for the interface, if required.

i Click on the Select button in the Split Horizon Group panel. The Select Split Horizon Group Name - B-L2 Access Interface form opens.

Note — You must configure an SHG or residential SHG for a VPLS if you plan to create a spoke circuit from this VPLS site to a VLL or another VPLS.

ii Select an SHG and click on the OK button. The Select Split Horizon Group Name - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the SHG name.

9 Click on the Port tab.

10 Click on the Select button to choose a port for the B-L2 access interface. The Select Terminating Port - VPLS B-L2 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

11 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - VPLS B-L2 Access Interface form closes, and the VPLS B-L2 Access Interface (Create) form displays the port information.

12 Configure the parameters:

- Outer Encapsulation Value
- Inner Encapsulation Value

Caution — The creation of a SAP that uses the same port and encapsulation values as an existing inactive MSAP fails under the following conditions:

- If you try to use the 5620 SAM to create a SAP, the configuration fails and the 5620 SAM displays an error message.
- If you use a CLI to create a SAP in a service other than the service that contains the MSAP, the configuration succeeds but the MSAP is inactive until the regular SAP is deleted. Although the 5620 SAM displays the SAP and MSAP, the MSAP remains inactive and consumes resources.
- If you use a CLI to create a SAP in the service that contains the MSAP, the SAP creation fails.

Alcatel-Lucent recommends that you delete an inactive MSAP from the 5620 SAM if you need to create a regular SAP on the same port using the same encapsulation values. See Procedure 65-34 for more information about deleting MSAPs.

For a B-L2 access interface, only Null, dot1q, and QinQ encapsulation are supported.

When the selected port uses dot1q encapsulation, you can enable the Auto-Assign ID parameter to have the Outer Encapsulation Value parameter automatically assigned. If you choose this, the system assigns the lowest unused encapsulation value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter in the User Preferences form. Choose Application→ User Preferences from the main menu.

13 Depending on the port that you have chosen, the Egress Multicast Group tab is configurable. Configure the EMG, if required.

i Click on the Egress Multicast Group tab. The Select Egress Multicast Group-B-L2 Access Interface form opens.

ii Select an EMG and click on the OK button. The Select Egress Multicast Group-B-L2 Access Interface form closes, and the Egress Multicast Group tab refreshes with the EMG name.

Note — The Egress Multicast Group-L2 Interface form lists only EMGs that have the same egress filter and encapsulation type as the interface.

14 If the selected port uses FR encapsulation, configure Frame Relay for the interface.

i Click on the Frame Relay tab.

ii Set the FRF-12 Mode parameter to Enabled.

iii Configure the parameters:

- FRF-12 End-To-End Fragment Threshold
- Scheduling Class
- Fragment Interleave

15 Assign ingress and egress QoS policies to the interface, if required.

i Click on the QoS tab.

Note — Items such as policies, schedulers, and filters can be applied later to multiple service components at once by selecting and right-clicking the components in the service navigation tree, choosing Properties, and configuring the parameters on the appropriate tab. This action opens a properties form in a new window for the component that was right-clicked. The navigation tree is not displayed in this new window.

ii Configure the Ingress Match QinQ Dot1P parameter.

The Ingress Match QinQ Dot1P parameter is configurable only when the encapsulation type of the port is dot1q or QinQ.

iii Click on the Select button in the Ingress Policy panel to choose an ingress QoS policy. The Select Ingress Policy - B-L2 Access Interface form opens.

iv Select an ingress QoS policy and click on the OK button. The Select Ingress Policy - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the ingress QoS policy name.

Note — If you select an access ingress policy that has a forwarding class mapped to an ingress queue group, the port that you choose for the VPLS L2 access interface must use the same access ingress queue group.

See Procedure 16-1 for information about configuring Ethernet ports. See chapter 42 for information about queue group template policies.

v Click on the Ingress Queue Group Template Policy Select button in the Forwarding Plane Redirect panel to choose a policy. The Select Forwarding Plane Queue Group Instance form opens.

vi Choose a policy from the list and click on the OK button. The Select Forwarding Plane Queue Group Instance form closes. The VPLS L2 Access Interface (Create) form refreshes with the Ingress Queue Group Template Policy information displayed.

vii Configure the Instance ID parameter.

viii Configure the Egress Mark QinQ Top Bits Only parameter.

The Egress Mark QinQ Top Bits Only parameters are configurable only when the encapsulation type of the port is dot1q or QinQ.

ix Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - B-L2 Access Interface form opens.

x Select an egress QoS policy and click on the OK button. The Select Egress Policy - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the egress QoS policy name.

Note — If you select an access egress policy that has a forwarding class mapped to an egress queue group, the port that you choose for the VPLS L2 access interface must use the same access egress queue group.

See Procedure 16-1 for information about configuring Ethernet ports. See chapter 42 for information about queue group template policies.

xi If the port you selected in step 10 is not an HSMDA port then go to step 16.

xii Configure the Packet Byte Offset (bytes) parameter, if required. Before you can configure the parameter, you must select the associated Override check box.

xiii Click on the Select button in the Egress HSMDA Override panel to choose a WRR policy. The Select WRR Policy form opens.

xiv Choose a WRR policy and click on the OK button. The Select WRR Policy form closes and the VPLS L2 Access Interface (Create) form reappears with the WRR policy information displayed.

xv Click on the Select button in the Egress HSMDA Override panel to choose an HSMDA egress secondary shaper policy. The Select Secondary Shaper form opens.

xvi Choose a secondary shaper and click on the OK button. The Select Secondary Shaper form closes and the VPLS L2 Access Interface (Create) form reappears with the secondary shaper information displayed.

xvii Configure the parameters:

- Use Shared Queue
- Use Multipoint Shared Queue

16 Click on the Schedulers tab to configure scheduling; otherwise, go to step 18.

Note — The Schedulers tab is configurable only when a port is assigned to the interface.

17 Perform one of the following.

a Specify that an aggregation scheduler policy is not applied to the interface.

i Set the Aggregation parameter to off.

Note — The Aggregation parameter is not configurable if the port you selected in step 10 is an HSMDA port.

ii Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

Note 1 — The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are configurable only when there is no scheduler specified in the Egress Scheduler panel.

Note 2 — The Frame-Based Accounting parameter is not configurable if the port you selected in step 10 is an HSMDA port.

Note 3 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

iii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - B-L2 Access Interface form opens.

iv Select an ingress scheduler and click on the OK button. The Select Ingress Scheduler - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the ingress scheduler information displayed.

v Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Policer Control Policy form opens.

vi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPLS B-L2 Access Interface (Create) form reappears with the ingress policer control policy information displayed.

vii If the port you selected in step 10 is an HSMDA port, go to step 18.

viii Click on the Select button in the Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - B-L2 Access Interface form opens.

ix Select an egress scheduler and click on the OK button. The Select Egress Scheduler - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the egress scheduler information displayed.

x Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Policer Control Policy form opens.

xi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPLS B-L2 Access Interface (Create) form reappears with the egress policer control policy information displayed.

xii Go to step 18.

b Specify that an access scheduler policy is applied to the interface.

Note — You cannot specify an access scheduler policy if the port you selected in step 10 is an HSMDA port. Go to step 18.

i Set the Aggregation parameter to on.

ii Configure the Frame-Based Accounting parameter.

iii Click on the Select button in the Aggregation Scheduler panel to choose an aggregation scheduler. The Select Aggregation Scheduler - B-L2 Access Interface form opens.

iv Select an aggregation scheduler and click on the OK button. The Select Aggregation Scheduler - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the aggregation scheduler information displayed.

18 Assign ingress and egress ACL filters to the interface, if required.

Note — Only MAC filters are allowed for B-L2 Access Interfaces.

i Click on the ACL tab.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - B-L2 Access Interface form opens.

iii Select an ingress ACL filter and click on the OK button. The Select Ingress Filter - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the ingress ACL filter name.

iv Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - B-L2 Access Interface form opens.

v Select an egress ACL filter and click on the OK button. The Select Egress Filter - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the egress ACL filter name.

19 Assign an accounting policy to the interface, if required.

i Click on the Accounting tab.

ii Configure the Collect Accounting Statistics and Ingress Counter Type parameters.

iii Click on the Select button to choose an accounting policy. The Select Accounting Policy - B-L2 Access Interface form opens.

iv Select an accounting policy and click on the OK button. The Select Accounting Policy - B-L2 Access Interface form closes, and the B-L2 Access Interface (Create) form refreshes with the accounting policy name.

20 Configure BPDU Termination, STP, FIB, and MRP parameters for the interface, if required.

i Click on the Forwarding Control tab. Depending on the device being configured, the BPDU Termination tab is displayed. Otherwise, go to step iii.

ii Configure the parameters:

- L2 Protocol Termination

  When the L2 Protocol Termination parameter is set to Enabled, a list of L2PT protocols is displayed. Select all that are required.
- BPDU Translation
- Force L2PT on Managed L2 Access Interface

  The Force L2PT on Managed L2 Access Interface parameter is only available for MVPLS B-L2 access interfaces. When the Force L2PT on Managed L2 Access Interface parameter is set to Enabled, a list of L2PT protocols is displayed. Select all that are required.

iii Click on the STP tab.

iv Configure the parameters:

- Path Cost
- Port Number
- Priority
- Edge Port
- Edge Capability Detection
- Link Type
- Root Guard
- Administrative State

v Click on the FIB tab.

vi Configure the parameters:

- Aging Enabled
- Learning Enabled
- Limit Mac Move
- Limit Mac Move Level
- Discard Unknown Source

vii If you are creating an MVPLS to run MSTP, the MST Instances tab is configurable. Otherwise, go to step xiv.

viii Click on the MST Instances tab to edit a SAP MST instance.

ix Select an MST instance and click on the Properties button.

x The B-L2 Access Interface MST Instance (Edit) form opens. Configure the parameters:

- Path Cost
- Priority

xi Click on the OK button to close the B-L2 Access Interface MST Instance (Edit) form. A dialog box appears.

xii Click on the OK button. The B-L2 Access Interface (Create) form refreshes with the new MST instance.

xiii If you are configuring an MVPLS B-L2 access interface, go to step 21.

xiv Click on the MRP tab.

xv Configure the parameters:

- MRP Join Time (tenths of a second)
- MRP Leave Time (tenths of a second)
- MRP Leave All Time (tenths of a second)
- MRP Periodic Time (tenths of a second)
- MRP Periodic Enabled

Note — You can view information regarding MMRP Entries by clicking on the MMRP tab.

xvi Click on the Select button to select an PBB MRP Policy. The Select PBB MRP Policy form opens.

xvii Choose the desired policy and click OK.

21 Assign a DoS protection policy to the interface, if required.

Note — A default DoS protection policy is automatically assigned to the interface.

i Click on the Security tab.

ii Click on the Select button. The Select NE DoS Protection - B-L2 Access Interface form opens.

iii Select a DoS protection policy in the list and click on the OK button. The Select NE DoS Protection - B-L2 Access Interface form closes and the policy ID is displayed on the B-L2 Access Interface (Create) form.

iv Configure the MAC Monitoring parameter.

22 Configure a redundant VLAN range, if required.

Note — If an MVPLS site has SAPs that manage traffic on the associated VPLS SAPs, you must define a redundant VLAN range during SAP creation. The redundant VLAN range defines the range of VC IDs for VPLS SAPs that the MVPLS manages.

i Click on the Redundancy tab.

ii Click on the Create button. The RedundantVlanRange (Create) form opens.

iii Configure the parameters:

- Min VLAN ID
- Max VLAN ID

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The B-L2 Access Interface (Create) form refreshes with the redundant VLAN range entry.

23 Configure anti-spoofing filters for the interface, if required.

i Click on the Anti-Spoofing tab.

ii Configure the MAC Pinning parameter.

24 Specify the queue overrides.

i Click on the Override Policy Items tab.

Note — The Override Policy Items tam contains a number of tabs. However, the tabs that are displayed depend on the port type that you have chosen for this interface.

- If you configured a non-HSMDA port, then the Access Ingress Queues, Access Egress Queues, Ingress Policer, and Egress Policer tabs are active.
- If you configured an HSMDA port, then the Access Ingress Queues, Access Egress HSMDA Queues and Ingress Policer tabs are active.

ii See Procedure 43-42 for information about setting queue overrides.

25 Associate a MEP with the B-L2 Access interface, if required.

i Click on the ETH-CFM tab.

ii Perform steps 8 to 27 in Procedure 68-37.

26 Assign an ANCP policy to the interface, if required.

i Click on the ANCP Static Map tab. The ANCP Static Map (Create) form opens.

ii Configure the ANCP String parameter.

iii Click on the Select button to choose an ANCP Policy. The Select ANCP Policy - ANCP Static Map form opens.

iv Select an ANCP policy and click on the OK button. The Select ANCP Policy - ANCP Static Map form closes and the ANCP Static Map form reappears with the ANCP policy information displayed.

v Click on the OK button. The ANCP Static Map form closes.

27 Click on the OK button. The B-L2 Access Interface (Create) form closes and a dialog box appears.

28 Click on the Yes button. The VPLS Service (Edit) form reappears.

29 Repeat steps 4 to 28 for each additional B-L2 access interface that you want to create.

30 Click on the OK button. A dialog box appears.

31 Click on the Yes button. The VPLS Service (Edit) form closes.

32 Close the Manage Services form.

Procedure 68-67 To create a static ISID range on a VPLS B-L2 access interface or spoke SDP binding

Perform the following procedure to create a static ISID range to allow I-VPLS services to connect to non-SPB I-VPLS services. You can create one or more static ISID ranges on a B-L2 access interface or spoke SDP binding on a control or user B-VPLS site. See Procedures 68-61 and 68-62 for information about how to enable SPB on a control or user site.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Choose a VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, expand the B-VPLS site.

5 Perform one of the following:

a To add a static ISID range on a B-L2 access interface, expand the L2 Access Interfaces icon, and click on the B-L2 access interface. The Port (Edit) form opens with the General tab displayed.

b To add a static ISID range on an SDP binding, expand the Spoke SDP Bindings icon and click on the SDP binding. The Spoke SDP Binding (Edit) form opens with the General tab displayed.

6 Click on the Static ISID tab. The Static ISID Ranges tab is displayed.

7 Click on the Create button. The Static ISID Range Entry (Create) form opens.

8 Configure the parameters:

- Entry ID
- From ISID
- To ISID

9 Click on the OK button. The Static ISID Range Entry (Create) form closes.

10 To create additional range entries, repeat steps 7 to 9.

11 To view the status information about the configured static ISIDs, click on the Static ISID Ranges tab.

12 Click on the OK button. The Port (Edit) form or the Spoke SDP Binding (Edit) form closes and a dialog box appears.

13 Click on the Yes button. The VPLS Service (Edit) form reappears.

14 Click on the OK button. A dialog box appears.

15 Click on the Yes button. The VPLS Service (Edit) form closes.

16 Close the Manage Services form.

Procedure 68-68 To create a static B-MAC on a B-VPLS site

Perform the following procedure to create a static B-MAC to allow remote PBB Epipe VLL services to connect to an SPB network. You can create a static B-MAC on a B-L2 access interface or spoke SDP binding on a control or user B-VPLS site. See Procedures 68-61 and 68-62 for information about how to enable SPB on a control or user site.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Choose a VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the B-VPLS site. The Site (Edit) form opens with the General tab displayed.

5 Click on the Static MACs tab.

6 Click on the Create button. The Conditional Static MAC (Create) form opens.

7 Configure the MAC Address parameter.

8 Perform one of the following:

a Choose a SAP.

i Click on the Select button in the SAP panel. The Select SAP - Conditional Static MAC form opens with a list of SAPs.

ii Choose a SAP and click on the OK button. The Select SAP - Conditional Static MAC form closes.

b Choose a spoke SDP binding.

i Click on the Select button in the Spoke SDP Binding panel. The Select Spoke SDP Binding - Conditional Static MAC form opens with a list of spoke SDP bindings.

ii Choose an SDP binding and click on the OK button. The Select Spoke SDP Binding - Conditional Static MAC form closes.

9 Click on the OK button. The Conditional Static MAC (Create) form closes.

10 To create additional static B-MACs, repeat steps 6 to 9.

11 Click on the OK button. The Site (Edit) form closes and a dialog box appears.

12 Click on the Yes button. The VPLS Service (Edit) form reappears.

13 Click on the OK button. A dialog box appears.

14 Click on the Yes button. The VPLS Service (Edit) form closes.

15 Close the Manage Services form.

Procedure 68-69 To create an ISID policy on a control or user B-VPLS site

Perform the following procedure to create an ISID policy. An ISID policy defines a group of actions for individual ISIDs or ISID ranges. You can define whether the default multicast tree is used and whether the advertisement of ISIDs in SPB is supressed when I-VPLS or static ISIDs are used for unicast services. See Procedures 68-61 and 68-62 for information about how to enable SPB on a control or user site.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Choose a VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the B-VPLS site. The Site (Edit) form opens with the General tab displayed.

5 Click on the ISID Policy tab.

6 Click on the Create button. The ISID Policy Range Entry (Create) form opens.

7 Configure the parameters:

- Entry ID
- From ISID
- To ISID
- Use Default Multicast Tree
- Advertise Local

You cannot set the Use Default Multicast Tree and the Advertise Local parameters to False at the same time.

8 Click on the OK button. The ISID Policy Range Entry (Create) form closes.

9 To create additional policies, repeat steps 6 to 8.

10 Click on the OK button. The Site (Edit) form closes and a dialog box appears.

11 Click on the Yes button. The VPLS Service (Edit) form reappears.

12 Click on the OK button. A dialog box appears.

13 Click on the Yes button. The VPLS Service (Edit) form closes.

14 Close the Manage Services form.

Procedure 68-70 To create a VPLS I-L2 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Choose a VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you want to add the access interface; expand the entries for that site.

5 Right-click on L2 Access Interfaces and choose Create I-L2 Access Interface. The I-L2 Access Interface (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Description
- Administrative State
- MC Ring Node
- Tunnel Fault Notification

Tunnel Fault Notification is configurable on interfaces where the device has ports configured in access or hybrid mode with QinQ encapsulation.

If you are configuring a tunnel facility MEP, Tunnel Fault Notification must be set to Accept.

7 Choose a transit prefix policy for the interface, if required.

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy - VPLS I-L2 Access Interface form opens.

ii Select a transit prefix policy and click on the OK button.

8 Choose an SHG for the interface, if required.

i Click on the Select button in the Split Horizon Group panel. The Select Split Horizon Group Name - I-L2 Access Interface form opens.

Note — You must configure an SHG or residential SHG for a VPLS if you plan to create a spoke circuit from this VPLS site to a VLL or another VPLS.

ii Select an SHG and click on the OK button. The Select Split Horizon Group Name - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the SHG name.

9 Click on the Port tab.

10 Click on the Select button to choose a port for the I-L2 access interface. The Select Terminating Port - VPLS I-L2 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

11 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - VPLS I-L2 Access Interface form closes, and the VPLS I-L2 Access Interface (Create) form displays the port information.

Note — If you select an Ethernet Tunnel Endpoint, the Port form is refreshed and an Ethernet Tunnel tab is added.

12 Configure the parameters:

- Outer Encapsulation Value
- Inner Encapsulation Value

Caution — The creation of a SAP that uses the same port and encapsulation values as an existing inactive MSAP fails under the following conditions:

- If you try to use the 5620 SAM to create a SAP, the configuration fails and the 5620 SAM displays an error message.
- If you use a CLI to create a SAP in a service other than the service that contains the MSAP, the configuration succeeds but the MSAP is inactive until the regular SAP is deleted. Although the 5620 SAM displays the SAP and MSAP, the MSAP remains inactive and consumes resources.
- If you use a CLI to create a SAP in the service that contains the MSAP, the SAP creation fails.

Alcatel-Lucent recommends that you delete an inactive MSAP from the 5620 SAM if you need to create a regular SAP on the same port using the same encapsulation values. See Procedure 65-34 for more information about deleting MSAPs.

For an I-L2 access interface, only Null, dot1q, and QinQ encapsulations are supported. In the case of I-MPVLS L2-access interfaces, Null encapsulation is not supported. I-MPVLS L2-access interfaces with MSTP configured support QinQ. These ports must also be of Ethernet type PBB.

When the selected port uses dot1q encapsulation, you can enable the Auto-Assign ID parameter to have the Outer Encapsulation Value parameter automatically assigned. If you choose this, the system assigns the lowest unused encapsulation value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter in the User Preferences form. Choose Application→ User Preferences from the main menu.

The Inner Encapsulation Value is configurable only when the port is an Ethernet with QinQ encapsulation.

If the port you have chosen is an Ethernet Tunnel Endpoint, you will be able to set the Outer Encapsulation Value to 8191. This automatically enables the Ethernet Tunnel Endpoint Control SAP parameter.

13 Configure the Ethernet Tunnel Endpoint Control SAP parameter, if required.

Note — Enabling the Ethernet Tunnel Endpoint Control SAP parameter creates the control L2 Access Interface (also known as a Control SAP). It also automatically sets the value of the Outer Encapsulation Value parameter to 8191.

If you are currently creating a same-fate SAP, the Ethernet Tunnel Endpoint Control SAP parameter must not be enabled.

14 Depending on the port that you have chosen, the Egress Multicast Group tab is configurable. Configure the EMG, if required.

i Click on the Egress Multicast Group tab. The Select Egress Multicast Group-I-L2 Access Interface form opens.

ii Select an EMG and click on the OK button. The Select Egress Multicast Group-I-L2 Access Interface form closes, and the Egress Multicast Group tab refreshes with the EMG name.

Note — The Egress Multicast Group-L2 Interface form lists only EMGs that have the same egress filter and encapsulation type as the interface.

15 If the selected port uses FR encapsulation, configure Frame Relay for the interface.

i Click on the Frame Relay tab.

ii Set the FRF-12 Mode parameter to Enabled.

iii Configure the parameters:

- FRF-12 End-To-End Fragment Threshold
- Scheduling Class
- Fragment Interleave

16 Assign ingress and egress QoS policies to the interface, if required.

i Click on the QoS tab.

Note — Items such as policies, schedulers, and filters can be applied later to multiple service components at once by selecting and right-clicking the components in the service navigation tree, choosing Properties, and configuring the parameters on the appropriate tab. This action opens a properties form in a new window for the component that was right-clicked. The navigation tree is not displayed in this new window.

ii Configure the Ingress Match QinQ Dot1P parameter.

The Ingress Match QinQ Dot1P parameter is configurable only when the encapsulation type of the port is dot1q or QinQ.

iii Click on the Select button in the Ingress Policy panel to choose an ingress QoS policy. The Select Ingress Policy - I-L2 Access Interface form opens.

iv Select an ingress QoS policy and click on the OK button. The Select Ingress Policy - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the ingress QoS policy name.

Note — If you select an access ingress policy which has a forwarding class mapped to an ingress queue group, you must ensure that port that you are configuring for the VPLS L2 access interface has the access ingress queue group with the same name created on it.

See Procedure 16-1 in chapter 16 for more information about how to configure Ethernet ports. See chapter 42 for more information about queue group template policies.

v Click on the Ingress Queue Group Template Policy Select button in the Forwarding Plane Redirect panel to choose a policy. The Select Forwarding Plane Queue Group Instance form opens.

vi Choose a policy from the list and click on the OK button. The Select Forwarding Plane Queue Group Instance form closes. The VPLS L2 Access Interface (Create) form refreshes with the Ingress Queue Group Template Policy information displayed.

vii Configure the Instance ID parameter.

viii Configure the Egress Mark QinQ Top Bits Only parameter.

The Egress Mark QinQ Top Bits Only parameter is configurable only when the encapsulation type of the port is dot1q or QinQ.

ix Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - I-L2 Access Interface form opens.

x Select an egress QoS policy and click on the OK button. The Select Egress Policy - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the egress QoS policy name.

Note — If you select an access egress policy which has a forwarding class mapped to an egress queue group, you must ensure that port that you are configuring for the VPLS L2 access interface has the access egress queue group with the same name created on it.

See Procedure 16-1 in chapter 16 for more information about how to configure Ethernet ports. See chapter 42 for more information about queue group template policies.

xi If the port you selected in step 11 is not an HSMDA port then go to step 17.

xii Configure the Packet Byte Offset (bytes) parameter, if required. Before you can configure the parameter, you must select the associated Override check box.

xiii Click on the Select button in the Egress HSMDA Override panel to choose a WRR policy. The Select WRR Policy form opens.

xiv Choose a WRR policy and click on the OK button. The Select WRR Policy form closes and the VPLS L2 Access Interface (Create) form reappears with the WRR policy information displayed.

xv Click on the Select button in the Egress HSMDA Override panel to choose an HSMDA egress secondary shaper policy. The Select Secondary Shaper form opens.

xvi Choose a secondary shaper and click on the OK button. The Select Secondary Shaper form closes and the VPLS L2 Access Interface (Create) form reappears with the secondary shaper information displayed.

xvii Configure the parameters:

- Use Shared Queue
- Use Multipoint Shared Queue

17 Click on the Schedulers tab to configure scheduling; otherwise, go to step 19.

Note — The Schedulers tab is configurable only when a port is assigned to the interface.

18 Perform one of the following.

a Specify that an aggregation scheduler policy is not applied to the interface.

i Set the Aggregation parameter to off.

Note — The Aggregation parameter is not configurable if the port you selected in step 11 is an HSMDA port.

ii Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

Note 1 — The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are configurable only when there is no scheduler specified in the Egress Scheduler panel.

Note 2 — The Frame-Based Accounting parameter is not configurable if the port you selected in step 11 is an HSMDA port.

Note 3 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

iii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - I-L2 Access Interface form opens.

iv Select an ingress scheduler and click on the OK button. The Select Ingress Scheduler - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the ingress scheduler information displayed.

v Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Policer Control Policy form opens.

vi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPLS I-L2 Access Interface (Create) form reappears with the ingress policer control policy information displayed.

vii If the port you selected in step 11 is an HSMDA port, go to step 19.

viii Click on the Select button in the Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - I-L2 Access Interface form opens.

ix Select an egress scheduler and click on the OK button. The Select Egress Scheduler - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the egress scheduler information displayed.

x Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Policer Control Policy form opens.

xi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPLS I-L2 Access Interface (Create) form reappears with the egress policer control policy information displayed.

xii Go to step 19.

b Specify that an access scheduler policy is applied to the interface.

Note — You cannot specify an access scheduler policy if the port you selected in step 11 is an HSMDA port. Go to step 19.

i Set the Aggregation parameter to on.

ii Click on the Select button in the Aggregation Scheduler panel to choose an aggregation scheduler. The Select Aggregation Scheduler - I-L2 Access Interface form opens.

iii Select an aggregation scheduler and click on the OK button. The Select Aggregation Scheduler - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the aggregation scheduler information displayed.

19 Assign ingress and egress ACL filters to the interface, if required.

i Click on the ACL tab.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - I-L2 Access Interface form opens.

iii Select an ingress ACL filter and click on the OK button. The Select Ingress Filter - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the ingress ACL filter name.

iv Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - I-L2 Access Interface form opens.

v Select an egress ACL filter and click on the OK button. The Select Egress Filter - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the egress ACL filter name.

vi Click on the Select button in the IPv6 Ingress Filter panel to choose an IPv6 ingress ACL filter. The Select IPv6 Ingress Filter - I-L2 Access Interface form opens.

vii Select an IPv6 ingress ACL filter and click on the OK button. The Select IPv6 Ingress Filter - I-L2 Access Interface form closes and the I-L2 Access Interface (Create) form reappears with the IPv6 ingress ACL filter information displayed.

viii Click on the Select button in the IPv6 Egress Filter panel to choose an IPv6 egress ACL filter. The Select IPv6 Egress Filter - I-L2 Access Interface form opens.

ix Select an IPv6 egress ACL filter and click on the OK button. The Select IPv6 Egress Filter - I-L2 Access Interface form closes and the I-L2 Access Interface (Create) form reappears with the IPv6 egress ACL filter information displayed.

20 Assign an accounting policy to the interface, if required.

i Click on the Accounting tab.

ii Configure the Collect Accounting Statistics and Ingress Counter Type parameters.

iii Click on the Select button to choose an accounting policy. The Select Accounting Policy - I-L2 Access Interface form opens.

iv Select an accounting policy and click on the OK button. The Select Accounting Policy - I-L2 Access Interface form closes, and the I-L2 Access Interface (Create) form refreshes with the accounting policy name.

21 Configure BPDU Termination, STP, and FIB parameters for the interface, if required.

i Click on the Forwarding Control tab. Depending on the device being configured, the BPDU Termination tab is displayed. Otherwise, go to step iii.

ii Configure the parameters:

- L2 Protocol Termination
  When the L2 Protocol Termination parameter is set to Enabled, a list of L2PT protocols is displayed. Select all that are required.
- BPDU Translation
- Force L2PT on Managed L2 Access Interface
  The Force L2PT on Managed L2 Access Interface parameter is only available for MVPLS I-L2 access interfaces. When the Force L2PT on Managed L2 Access Interface parameter is set to Enabled, a list of L2PT protocols is displayed. Select all that are required.

iii Click on the STP tab.

iv Configure the parameters:

- Path Cost
- Port Number
- Priority
- Edge Port
- Edge Capability Detection
- Link Type
- Root Guard
- Administrative State

v Click on the FIB tab.

vi Configure the parameters:

- Aging Enabled
- Learning Enabled
- Maximum Entries
- Limit Mac Move
- Limit Mac Move Level
- Discard Unknown Source
- Restrict Protected Source
- Restrict Protected Source Action
- Restrict Unprotected Destination

vii If you are creating an MVPLS to run MSTP, the MST Instances tab is configurable. Otherwise, go to step 22.

viii Click on the MST Instances tab to edit a SAP MST instance.

ix Select an MST instance and click on the Properties button.

x The I-L2 Access Interface MST Instance (Edit) form opens. Configure the parameters:

- Path Cost
- Priority

xi Click on the OK button to close the I-L2 Access Interface MST Instance (Edit) form. A dialog box appears.

xii Click on the OK button. The I-L2 Access Interface (Create) form refreshes with the new MST instance.

22 Assign a DoS protection policy or DDoS protection policy to the interface, if required.

Note — A default DoS protection policy is automatically assigned to the interface.

i Click on the Security tab.

ii Click on the Select button in the NE DoS Protection panel and select a DoS protection policy from the Select NE DoS Protection - I-L2 Access Interface form.

iii Click on the Select button next to the NE DDoS Protection Policy panel and select a DDoS protection policy from the Select NE DDoS Protection Policy - I-L2 Access Interface form.

iv Configure the MAC Monitoring parameter.

23 Configure an Ethernet tunnel.

Note — You can only configure Ethernet tunnel SAP path parameters if you are creating a same-fate SAP.

i Click on the Ethernet Tunnel tab.

ii If you are configuring a fate-sharing Ethernet Tunnel Endpoint SAP (also referred to as same-fate SAP) then go to step iii. Otherwise, go to step 24.

iii Click on the Create button. The Ethernet Tunnel (Create) form opens.

iv Configure the parameters:

- Path ID
- Tag (Outer Encapsulation Value)
- Tag (Inner Encapsulation Value)

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The L2 Access Interface (Create) form refreshes with the Ethernet Tunnel entry.

24 Configure a redundant VLAN range, if required.

Note — If an MVPLS site has SAPs that manage traffic on the associated VPLS SAPs, you must define a redundant VLAN range during SAP creation. The redundant VLAN range defines the range of VC IDs for VPLS SAPs that the MVPLS manages.

i Click on the Redundancy tab.

ii Click on the Create button. The RedundantVlanRange (Create) form opens.

iii Configure the parameters:

- Min VLAN ID
- Max VLAN ID

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The I-L2 Access Interface (Create) form refreshes with the redundant VLAN range entry.

25 Configure IGMP snooping for the interface, if required.

i Click on the IGMP Snooping tab. The General tab is displayed.

ii Configure the parameters:

- Import Policy
- Fast Leave
- Multicast Router Attached
- Send Queries
- General Query Interval (seconds)
- Maximum Response Interval (seconds)
- Robust count
- IGMP Version
- Last Member Query Interval (tenths of seconds)
- Maximum Number of Groups
- Maximum Number of Sources per Group
- Maximum Number of Group Sources per Group

The General Query Interval (seconds), Maximum Response Interval (seconds), Robust count, and IGMP Version parameters are configurable when the Send Queries parameter is enabled.

iii Click on the Static Mcast Group tab to configure a static multicast group, if required. Otherwise, go to step 26.

iv Click on the Create button. The Access Interface Igmp Snooping Mcast Group Display (Create) form opens.

v Configure the parameters:

- Group Address
- Source Address

vi Click on the Apply button if you want to create additional entries. A dialog box appears.

vii Click on the OK button.

viii Repeat steps iv to vii to create an additional entry, if required.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Static Mcast Group tab refreshes with the new multicast group entries.

26 Configure anti-spoofing filters for the interface, if required.

i Click on the Anti-Spoofing tab.

ii Configure the MAC Pinning parameter.

27 Specify the queue overrides.

i Click on the Override Policy Items tab.

Note — The Override Policy Items tab contains a number of tabs. However, the tabs that are displayed depend on the port type that you have chosen for this interface.

- If you configured a non-HSMDA port, then the Access Ingress Queues, Access Egress Queues, Ingress Policer, and Egress Policer tabs are active.
- If you configured an HSMDA port, then the Access Ingress Queues, Access Egress HSMDA Queues and Ingress Policer tabs are active.

ii See Procedure 43-42 for information about setting queue overrides.

28 Associate a MEP with the I-L2 Access interface, if required.

i Click on the ETH-CFM tab.

ii Configure the Tunnel Fault Notification parameter.

iii Click on the Create button in the Virtual MEP panel. The MEP (Create) form opens with the General tab displayed.

iv Click on the Select button. The Select Maintenance Entity Group form opens.

v Select an entry and click on the OK button. The Select Maintenance Entity Group form closes.

vi Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- Description
- MAC Address
- CCM Enabled
- Priority Level for CCM
- Fault Propagation
- CCM Padding Packet Size (Bytes)
- Low-priority Defect

Note — The CCM Padding Packet Size (Bytes) parameter cannot be configured when the CCM interval parameter is set to 10 ms or 100 ms.

vii As required, configure the Test Generation Options parameters:

- Role
- Use as Test Source
- Use as Test Target

Note — The Role, Use as Test Source, and Use as Test Target parameters are configurable only when you set the Direction parameter to Up.

viii If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab. Otherwise, go to step xii.

ix Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

x Click on the AIS tab.

xi Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

xii Click on the OK button. The MEP (Create) form closes.

29 Assign an ANCP policy to the interface, if required.

- **i** Click on the ANCP Static Map tab.
- **ii** Click on the Create button. The ANCP Static Map (Create) form opens.
- **iii** Configure the ANCP String parameter.
- **iv** Click on the Select button to choose an ANCP Policy. The Select ANCP Policy - ANCP Static Map form opens.
- **v** Select an ANCP policy and click on the OK button. The Select ANCP Policy - ANCP Static Map form closes and the ANCP Static Map form reappears with the ANCP policy information displayed.
- **vi** Click on the OK button. The ANCP Static Map form closes.

30 Click on the OK button. The I-L2 Access Interface (Create) form closes and a dialog box appears.

31 Click on the Yes button. The VPLS Service (Edit) form reappears.

32 Repeat steps 4 to 31 for each additional I-L2 access interface that you want to create.

33 Click on the OK button. A dialog box appears.

34 Click on the Yes button. The VPLS Service (Edit) form closes.

35 Close the Manage Services form.

Procedure 68-71 To configure a GNE site on a VPLS service

Use this procedure to add a GNE site and GNE service interfaces to an existing VPLS service.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Choose a VPLS service and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the component tree, right-click on VPLS Service and choose Create GNE Site. The Select Network Elements - VPLS Service form opens with a list of available sites.

5 Choose a site and click on the OK button. The GNE Site (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Name
- Description

7 Click on the Apply button.

8 To configure an interface for the GNE site, perform the following steps:

i Click on the GNE Service Interfaces tab and then click on the Create button. The GNE Service Interface (Create) form opens with the general tab displayed.

ii Configure the parameters:

- Name
- Description
- Type

iii Click on the Ports tab and then click on the Select button beside the Interface Index field. The Select Generic NE Interface form appears.

iv Select an interface from the list and click on the OK button. The GNE Service Interface (Create) form reappears with the interface information displayed.

v Configure the parameters:

- Encapsulation Type
- Outer Encapsulation Value
- Inner Encapsulation Value

vi Click on the OK button. The GNE Site (Create) form reappears with the interface information displayed in the service component tree.

9 Click on the Scripts tab to attach or execute configuration scripts on the GNE site.

The Scripts tab displays the script instances and versions that are applied to the device. See “Creating and executing scripts” in the *5620 SAM Scripts and Templates Developer Guide* for more information.

10 Click on the OK button. The VPLS Service (Edit) form reappears with the new information displayed in the service component tree.

11 Click on the OK button. The VPLS Service (Edit) form closes.

You can use the topology maps to view the service. See chapter 6 for more information about service topology maps.

Procedure 68-72 To force a switchover to a redundant spoke SDP binding

This procedure can only be performed on a VPLS that has been configured with endpoints that are associated redundant spoke SDP bindings.

1 Choose Manage→Service→Services from the 5620 SAM main menu.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Select the required VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site where you want to perform the switchover; expand the entries for that site.

5 Right-click on the redundant spoke SDP binding under an endpoint for the site that you want to perform the switchover for.

6 Select Force Switchover from the popup menu.

7 You can clear the switchover at a later time by performing steps 1 to 5 again and then select the Clear Forced Switchover item from the popup menu.

Note — You must clear a manually forced switchover by using the Clear Forced Switchover button when the active spoke SDP binding is restored. The 5620 SAM cannot automatically switch to another active spoke SDP binding if this is not done.

8 Click on the OK button to close the Spoke SDP Binding (Edit) form.

9 Click on the OK button to close the VPLS Service (Edit) form.

Procedure 68-73 To run a VPLS service OAM validation test

An OAM validator test suite must be created for the tested entity. See chapter 77 for more information about how to create a validator test suite.

Note 1 — As an alternative, you can also run an OAM validation test on the service by performing a One Time Validation. This is a mostly automated procedure and is described in Procedure 77-9.

Note 2 — OAM validation tests are not supported for HVPLS.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears at the bottom of the Manage Services form.

3 Choose a VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 Click on the Validate button. If the Validate button is not visible, click on the More Actions button and choose Validate. If an OAM validator test suite is not associated to the service, a dialog box appears. Perform the following steps:

   i Click on the OK button to associate the service with an existing OAM validator test suite. The Choose Validator Test Suite form appears.

   ii Configure the filter criteria. A list of OAM validator test suites appears.

   iii Select an OAM validator test suite and click on the OK button. The Choose Validator Test Suite form closes.

5 View the State Cause indicators. When the validation test fails, a check mark appears beside the OAM Validation Failed indicator.

6 Click on the Tests tab. The Test Suite tab is displayed.

7 Click on the Tested Entity Result tab.

8 Choose an entry and click on the Properties button. The Tested Entity Result (Edit) form opens with the General tab displayed.

9 Click on the Results tab to display the validation test results.

10 If you need to compare two test results from the same type of test, choose the two test results and click on the Compare button; the Difference form opens. Otherwise go to step 13.

11 Compare the test results.

12 Close the Difference form.

13 Close the Tested Entity Result form.

14 Close the VPLS Service (Edit) form.

15 Close the Manage Services form.

Procedure 68-74 To add or modify FIB entries associated with a VPLS

1 Choose Manage→Service→FIB Entries from the 5620 SAM main menu.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Choose a VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 Click on the Forwarding Control tab.

5 Click on the FIB Entries tab.

6 Click on the Search button. A list of FIB entries appears.

7 Add or modify FIB entries as required.

a To add a FIB entry:

i Click on the Create button. The FIB Entry (Create) form opens.

ii Configure the parameters:

- MAC Address
- Auto Complete

iii Choose an interface, service circuit, or endpoint from the list on the L2 Interfaces, Service Circuits, or Endpoints tab.

iv Click on the OK button. The FIB Entry (Create) form closes, and the FIB Entries form refreshes with the new FIB entry.

b To modify FIB entries:

i Choose a FIB entry from the list and click on the Properties button. The FIB Entry (Edit) form opens.

ii Configure the parameters and view the information as required.

iii Click on the OK button. A dialog box appears.

iv Click on the OK button to close the VPLS Service (Edit) form.

Procedure 68-75 To list FIB entries associated with a VPLS

1 Choose Manage→Service→FIB Entries from the 5620 SAM main menu.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Choose a VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 Click on the Sites tab.

5 Click on the VPLS, B-VPLS, or I-VPLS tabs, if required.

6 Select the site can click on the Properties button. The VPLS Site (Edit) form opens with the General tab displayed.

7 Click on the Forwarding Control tab.

8 Click on the FIB Entries tab.

9 Click on the Resync button for the FIB entries on the right side of the form. The Resync button on the bottom of the form is for re synchronizing the entire VPLS site.

10 Click on the Find button. A list of FIB entries appears.

Procedure 68-76 To view the service topology associated with a VPLS service

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears at the bottom of the Manage Services form.

3 Choose a VPLS and click on the Topology View button. The Service Topology map opens.

See chapter 6 for more information about service topology views.

Note — In the VPLS topology map view, a redundant spoke SDP binding under an endpoint displays differing colors, depending on whether it is in the active or backup state. Backup spoke SDP bindings are shown in purple.

4 Close the Service Topology form.

5 Close the Manage Services form.

Procedure 68-77 To view the VPLS service operational status

The Aggregated Operational State and State Cause indicators on the General tab of the service management form display information about service faults.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears at the bottom of the Manage Services form.

3 Select a service and click on the Properties button. The VPLS Service (Edit) form opens.

4 View the Aggregated Operational State and State Cause indicators. When the Aggregated Operational State is Down or Partially Down, a check mark beside the appropriate State Cause indicator identifies the type of associated service fault.

5 Click on the appropriate tab to view or edit an object that is identified as faulty by a State Cause indicator.

6 Click on the Faults tab to view the alarms for the object. The Object Alarms tab is displayed.

7 Click on the Aggregated Alarms tab to view the aggregated alarms for the object, if required.

8 Click on the Tests tab if the OAM Validation Failed indicator is enabled. You can view the OAM validation test suite results by clicking on the Tested Entity Result tab.

Note 1 — You can run the OAM Validation test suite for this service from this form by clicking on the Validate button. If the Validate button is not visible, click on the More Actions button and choose Validate.

Note 2 — As an alternative, you can also run an OAM validation test on the service by performing a One Time Validation. This is a mostly automated procedure and is described in Procedure 77-9.

9 Close the VPLS Service (Edit) form.

10 Close the Manage Services form.

Procedure 68-78 To view IGMP snooping queriers

1 Choose Manage→Service→Services from the 5620 SAM main menu.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Choose a VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on a site. The Site (Edit) form opens with the General tab displayed.

5 Click on the Multicast tab.

6 Click on the IGMP Snooping tab. The General tab is displayed.

7 Click on the MRouters tab. The MRouters table displays a list of IGMP snooping queriers and their properties.

8 Click on the Refresh button to view periodic updates to the Mrouters table.

9 Close the Site (Edit) form.

10 Close the VPLS Service (Edit) form.

Procedure 68-79 To view MLD snooping queriers

1 Choose Manage→Service→Services from the 5620 SAM main menu.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Choose a VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on a site. The Site (Edit) form opens with the General tab displayed.

5 Click on the Multicast tab.

6 Click on the MLD Snooping tab. The General tab is displayed.

7 Click on the MRouters tab. The MRouters table displays a list of MLD snooping queriers and their properties.

8 Click on the Refresh button to view periodic updates to the Mrouters table.

9 Close the Site (Edit) form.

10 Close the VPLS Service (Edit) form.

Procedure 68-80 To modify a VPLS

Caution — Modifying parameters can be service-affecting.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Choose a VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

The following tabs contain parameter information for the service:

- General tab—displays the general service properties
- MVR tab—displays multicast package policy information for the service
- Bandwidth tab — displays service tunnel bandwidth booking information for the service.
- Tests tab—allows the creation and execution of service-specific diagnostic tests
- Forwarding Control tab—lists the FIB and STP instances
- Sites tab—lists the sites that belong to the service
- L2 Access Interfaces tab—lists the L2 access interfaces that belong to the service
- L2 Management Interfaces tab—lists the L2 management interfaces that belong to the service
- Mesh SDP Bindings tab—displays the mesh SDP bindings that belong to the service
- Spoke SDP Bindings tab—displays the spoke SDP bindings that belong to the service, including active and backup SDP bindings associated with endpoints.
- Endpoints tab—displays the endpoints associated with the service
- Template tab—displays the template used to create the service, if applicable
- Faults tab—displays the faults associated with the service

Note — Users with the administrator scope of command role can click on the Select button on the Template tab to associate a service template with the service object, if required.

4 Navigate to related components for the service using the navigation tree, as required.

Certain service components have related objects that can be easily examined using the navigation tree. For such objects, right-clicking them in the navigation tree offers a “Navigate to...” option in the contextual menu. If you select this option, the properties form for the related object is displayed. This can be very convenient, especially for complex services containing many sites and components.

The VPLS components for which you can navigate to such related objects include:

- I-Sites: you can navigate to the associated B-VPLS or B-(M)VPLS
- L2 Access Interfaces: you can navigate to the opposite SAP in a VLAN Uplink configuration
- Redundant L2 Access Interfaces: you can navigate to the opposite SAP.
- Mesh SDP Bindings: you can navigate to the opposite (return) mesh SDP
- Spoke SDP Bindings: you can navigate to the opposite (return) spoke SDP

5 Modify the components and parameters for the service, as required.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The VPLS Service (Edit) form closes, and the Manage Services form reappears.

8 Close the Manage Services form.

Procedure 68-81 To modify a VLPS using the topology view

The topology view for a service provides a graphical representation of the various components and their interconnections. You can also use this view to add, modify, or just navigate to service components. This provides an alternative approach to performing these functions from the navigation tree view.

Working from the topology view can expedite the creation of the components, since many of the fields you would ordinarily have to set in the configuration forms will be automatically populated using this approach. The configuration forms can also be accessed directly at any time from this view by right-clicking a component. This allows quick access to conduct more detailed component configuration.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears at the bottom of the Manage Services form.

3 Choose a VPLS and click on the Topology View button. The Service Topology map opens.

The remainder of this procedure contains a number of sub-procedures describing the various components that can be created and modified from the topology view. These include:

- Creating a new site. Go to step 4.
- Creating site components. Go to step 10.
- Creating SDP bindings. Go to step 23.

Adding a new site

4 Right-click on any blank space in the service topology map. A contextual menu is displayed. You can choose to create one of the following:

- VPLS Site
- VPLS B-Site
- VPLS I-Site

5 Select the required option. The Select Network Elements form appears.

6 Select one or more sites to add to the service and click OK. The VPLS Site (Create), VPLS I-Site (Create), or VPLS B-Site (Create) form is displayed, depending on your menu item selection. If you selected more than one site, the VPLS Site (Multiple Instances) (Create), VPLS I-Site (Multiple Instances) (Create), or VPLS B-Site (Multiple Instances) (Create) form is displayed, depending on your menu item selection.

7 Click on the OK button. The VPLS Site (Create) (or VPLS Site (Multiple Instances) (Create)) form closes and the new site (or sites) is displayed on the map.

8 If you want to perform detailed configuration of site properties for the new site, right-click on the site icon and select Properties from the contextual menu. The VPLS Site (Edit) form opens. Refer to Procedure 68-1 for detailed site configuration information.

9 Return to step 3 for a list of other functions you can perform from the topology view or go to step 53 to finish.

Creating site components

10 Right-click on any site icon in the service topology map. A contextual menu is displayed. You can choose to create one of the following:

- VPLS L2 Access Interface (this choice will actually display as either a regular L2 Access Interface, or a B-L2 or I-L2 variant, depending on the site you select). Go to step 11.
- VPLS L2 Management Interface. Go to step 15.
- VPLS Endpoint. Go to step 19.

11 If you choose to create a VPLS L2 Access Interface, then the VPLS L2 Access Interface (Create) form is displayed. If the selected site is a B-Site or I-Site, then the B-L2 or I-L2 Access Interface (Create) form is displayed accordingly.

12 Click on the Port tab and assign a port to the interface.

Refer to Procedure 68-24 (or Procedure 68-66 or 68-70 for B-L2 or I-L2 Access Interfaces respectively) for detailed information on further configuring the interface, if required.

13 Click on the OK button. The VPLS L2 Access Interface (Create) form closes.

14 Go to step 22.

15 If you choose to create a VPLS L2 Management Interface, then the VPLS L2 Management Interface (Create) form is displayed.

16 Click on the Port tab and assign a port to the interface.

Refer to Procedure 68-24 for detailed information on further configuring the interface, if required.

17 Click on the OK button. The VPLS L2 Management Interface (Create) form closes.

18 Go to step 22.

19 If you choose to create a VPLS Endpoint, then the Endpoint (Create) form is displayed.

20 Configure the Name parameter for the endpoint.

Refer to Procedure 68-1 (or 68-60 for B-Sites) for detailed information on further configuring the endpoint, if required.

21 Click on the OK button. The Endpoint (Create) form closes and the new endpoint is displayed in the topology view.

22 Return to step 3 for a list of other functions you can perform from the topology view or go to step 53 to finish.

Creating SDP bindings

23 Select the sites you want to connect in the service topology map and right-click on any one of them. A contextual menu is displayed.

Note 1 — If you intend to create either a spoke or a mesh binding between two sites, the order in which you select them is important. The first site you select will become the source site and the second site will become the destination site. Therefore, it is not recommended that you do a marquee-select in the topology view, since you will not be sure of this hierarchy. Instead, select the sites individually, and hold down the Shift or Ctrl key after your first selection.

Note 2 — If you intend to create a full mesh between sites, then the order in which you select the sites is not important.

Note 3 — If you intend to add a service site to an existing mesh of sites, then the first site you select must be the one that is not currently a part of the mesh. The second site you select can be any member of the existing mesh.

24 Select Connect from the contextual menu. Depending on the sites you selected, one or more of the following options are available:

- Create Spoke SDP Binding. Go to Step 25.
- Create Mesh SDP Binding. Go to Step 32.
- Create Full Mesh. Go to Step 39.
- Add To Existing Mesh. Go to Step 46.

25 If you choose the Create Spoke SDP Binding option, then the Spoke SDP Binding (Create) form is displayed.

Note 1 — For this function, it is assumed that you clicked on the source site first and then held down the Shift or Ctrl key while right-clicking on the destination site to display the contextual menu.

Note 2 — You can also create a spoke SDP binding between a site icon and an endpoint icon, or between two endpoint icons in the topology view. Appropriate endpoints must first exist or be created to enable this.

26 Enable the Auto-Select Transport Tunnel parameter.

27 You can manually configure other parameters here if required, or just click on the OK button. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Spoke SDP Binding (Create) form closes and the new binding between the two sites is displayed in the topology view. Refer to Procedure 68-44 for more detailed information on creating and configuring spoke SDP bindings, if required.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. Refer to Chapter 27 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

28 Assuming that the spoke SDP binding was successfully created in step 27, select the same two sites again in the topology view, although this time do so in the opposite order that you originally selected them. This will allow you to create a spoke binding for the return tunnel.

29 Right-click on the second site you selected and choose the Create Spoke SDP Binding ... option from the contextual menu. The Spoke SDP Binding (Create) form is displayed.

30 You can manually configure other parameters here if required, or just click on the OK button. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Spoke SDP Binding (Create) form closes and the new return binding between the two sites is displayed in the topology view.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. Refer to Chapter 27 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

31 Return to step 3 for a list of other functions you can perform from the topology view or go to step 53 to finish.

32 If you choose the Create Mesh SDP Binding option, then the Mesh SDP Binding (Create) form is displayed.

Note — For this function, it is assumed that you clicked on the source site first and then held down the Shift or Ctrl key while right-clicking on the destination site to display the contextual menu.

33 Enable the Auto-Select Transport Tunnel parameter.

34 You can manually configure other parameters here if required, or just click on the OK button. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Mesh SDP Binding (Create) form closes and the new binding between the two sites is displayed in the topology view. Refer to Procedure 68-43 for more detailed information on creating and configuring mesh bindings, if required.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. Refer to Chapter 27 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

35 Assuming that the mesh SDP binding was successfully created in step 34, select the same two sites again in the topology view, although this time do so in the opposite order that you originally selected them. This will allow you to create a mesh binding for the return tunnel.

36 Right-click on the second site you selected and choose the Create Mesh SDP Binding ... option from the contextual menu. The Mesh SDP Binding (Create) form is displayed.

37 You can manually configure other parameters here if required, or just click on the OK button. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Mesh SDP Binding (Create) form closes and the new return binding between the two sites is displayed in the topology view.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. Refer to Chapter 27 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

38 Return to step 3 for a list of other functions you can perform from the topology view or go to step 53 to finish.

39 If you choose the Create Full Mesh option, the Complete Vpls Mesh for Service Component form is displayed.

40 Configure the Transport Type parameter.

41 Click on the Select button to display the Tunnel Selection Profiles form, if required.

42 Click on the Search button to display a list of available Tunnel Selection Profiles.

43 Click on the desired profile entry and click OK. The Tunnel Selection Profiles form closes and your selection is displayed in the Complete Vpls Mesh for Service Component form.

44 Click on the OK button to accept your selection and close the Complete Vpls Mesh for Service Component form. One of the following will result:

- If available transport tunnels exist between the selected sites, then the new mesh bindings between the sites are created and displayed in the topology view. Refer to Procedure 68-43 for more detailed information on creating and configuring mesh bindings, if required.
- If available transport tunnels do not exist between all the sites, then the new bindings that can be created are displayed, and an error message is also displayed informing you that the full mesh could not be completed. Refer to Chapter 27 for information on how to create the required tunnels. Once the tunnels are created, you can repeat this sub-procedure.

45 Return to step 3 for a list of other functions you can perform from the topology view or go to step 53 to finish.

46 If you choose the Add To Existing Mesh option, the Complete Vpls Mesh for Service Component form is displayed.

47 Configure the Transport Type parameter.

48 Click on the Select button to display the Tunnel Selection Profiles form, if required.

49 Click on the Search button to display a list of available Tunnel Selection Profiles.

50 Click on the desired profile entry and click OK. The Tunnel Selection Profiles form closes and your selection is displayed in the Complete Vpls Mesh for Service Component form.

51 Click on the OK button to accept your selection and close the Complete Vpls Mesh for Service Component form. One of the following will result:

- If available transport tunnels exist between the selected sites, then the new mesh bindings between the sites are created and displayed in the topology view. Refer to Procedure 68-43 for more detailed information on creating and configuring mesh bindings, if required.
- If available transport tunnels do not exist between the selected sites, then an error message is displayed to that affect. Refer to Chapter 27 for information on how to create the required tunnels. Once the tunnels are created, you can repeat this sub-procedure.

52 Return to step 3 for a list of other functions you can perform from the topology view or go to step 53 to finish.

53 Close the Service Topology form.

54 Close the Manage Services form.

Procedure 68-82 To delete a VPLS

Warning — Deleting a service may result in a service disruption for customers. Consider the implication of deleting the service before proceeding.

Note — A VPLS cannot be deleted if the L2 access interface has MSAPs that are in an active state. See chapter 65 for more information about MSAPs.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 As required, configure the filter criteria to locate the service or range of services to be deleted. Click on the Search button. A list of services appears at the bottom of the Manage Services form.

3 Choose a service or a range of services from the list.

4 Click on the Delete button. A warning form appears. This form is dynamic based on the priority of the service. Perform one of the following:

   a For services with a low priority, go to Step 5.

   b For services with a medium priority, configure the "Enter the highest priority of the service being deleted" text field by typing: Medium. Go to Step 5.

   c For services with a high priority, configure the "Enter the highest priority of the service being deleted" text field by typing: High. Go to step 5.

5 For all services, regardless of the priority configuration, acknowledge the check box that prompts you to confirm that you understand the implications of deleting the service.

Note — If you select multiple services with different priorities, you must enter the highest priority level of selected services before you can delete the services.

6 Click on the Yes button to confirm the action. The service is deleted and removed from the list.

7 Click on the Close button to close the Manage Services form.

69 — Mirror service management

69.1 Mirror service overview *69-2*

69.2 Sample mirror service configuration *69-4*

69.3 Workflow to create a mirror service *69-5*

69.4 Mirror service procedures *69-7*

69.1 Mirror service overview

The 5620 SAM GUI implementation of service mirroring provides mirroring of service traffic packets from any service type.

Caution — Service mirroring can affect performance across the network and in the source and destination devices, so must be planned accordingly.

In a mirror service, packets from one or more sources are forwarded to their normal destinations and a copy of the entire packet, or a specified portion of the packet, is sent to the mirror destination. The mirrored packet can be viewed using a packet-decoding device, typically called a sniffer, that is attached to the destination port. The 5620 SAM does not limit the number of destination and source sites added under a mirror service. The mirrored packets are transported unidirectionally through the core network using IP or MPLS tunneling.

With pseudo-wire redundancy support, an ICB can be enabled in the mirror service spoke and remote source, which can provide bidirectional service that enables support for active and standby PE redundancy. An endpoint can be used to group the redundant objects, which may be of mirror SDP bindings or SDP and SAP. In the mirror map view, the color for the active and backup states of the redundant mirror SDP differ.

Service mirroring can be used to do the following:

- Troubleshoot problems with customer packet delivery and content.
- Help service providers meet regulations by providing itemized call records and wiretaps, as authorized by investigative authorities.
- Simplify the complex traffic-analysis networks that are often implemented as overlays to the customer-facing network.

The 5620 SAM supports end-to-end mirror service configuration using the following methods:

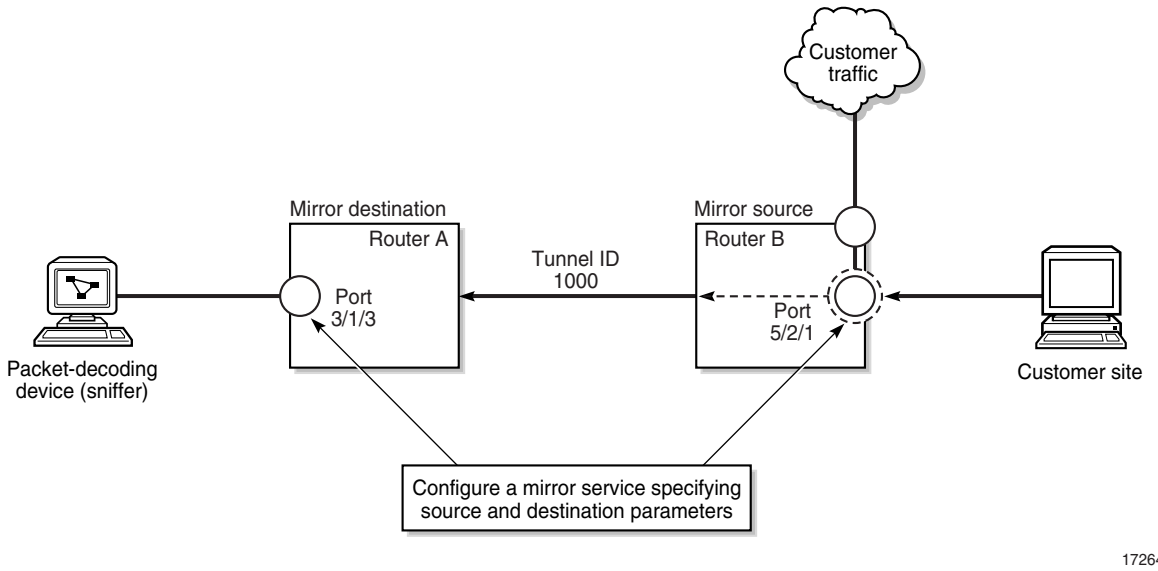
- Tabbed configuration forms with an embedded navigation tree. The navigation tree provides a logical view of the service and acts as a configuration interface.
- Preconfigured template. A user who has the Administrator scope of command role, or the Mirror Service Management and Template Script Management roles, can create a mirror service template.
- The Lawful Interception Management scope of command role allows an LI user to view and configure LI sources on existing mirror services. Information that is mirrored is hidden from all users who do not have LI user privileges. See chapter 28 for more information about configuring a LI user.

Note — Viewing or retrieving LI user activity records requires a user account with an assigned Lawful Interception Management scope of command role. The scope is restricted to the records of users in the same LI user group.

The mirror service operational status is aggregated based on the status of each site.

- Aggregate status is down if all destination sites are down.
- Aggregate status is up if one of the redundant destination site is up.
- Aggregate status is down if all source sites are down.
- Aggregate status is up if one of the redundant source sites is up.
- Aggregate status is unknown if no sites are added to the service.

Consider the following before you implement a mirror service:



- You must be assigned the administrator or mirror service management scope of command role to create or modify a mirror service, or to view any mirror-related objects in the 5620 SAM.
- The default customer is automatically associated with a mirror service. You cannot associate a different customer with a mirror service.
- You can only configure one endpoint per mirror site.
- You can configure the endpoint in the destination site with SAP and SDP with ICB.
- An endpoint cannot have more than one SAP.
- You can create a mirror SDP under the endpoint in the destination site.
- You can create up to four mirror SDPs under the endpoint in the source site. One mirror SDP must have ICB. Alternatively, you can create one mirror SDP under the source site.
- When the mirror SDP binding is under an endpoint, the STP cannot be enabled on the spoke.
- Mirror sites with valid SAPs are considered as destination sites during discovery.
- You can configure a site as a destination without a SAP in the mirror service. During re-synchronization, the site type remains destination.
- Auto-SDP creation is restricted to one destination.
- You can change the redundancy setting of a mirror SDP binding by deleting and adding the mirror SDP binding on an endpoint.
- You cannot delete an MC-LAG SAP if an ICB is on the same endpoint.
- You cannot have a SAP with a non-ICB mirror spoke on the same endpoint.
- The destination of a mirror service must be an L2 SAP.
- You can mirror the ingress or egress traffic on SAPs and ports.
- You can mirror the ingress or egress traffic that is associated with one or more subscriber hosts.
- You can specify match criteria, such as IP addresses, MAC addresses, or MPLS ingress labels, to filter the mirrored traffic.
- You can configure forwarding classes and profiles for mirror service traffic on supported devices.
- Mirror service IDs are obtained from the same pool of IDs that is used by other services. When you manually assign an ID value, ensure that you do not assign an ID that belongs to another service.
- Use the packet-slicing option to copy a specific packet size from each frame. This option is useful for monitoring network usage without copying the customer data. It also limits the amount of mirrored traffic that travels through the core network.

- When the mirror destination is not on the same NE as the mirror source, a mirror service requires a service tunnel between the source and destination NEs.
- The 5620 SAM can automatically create a service tunnel between the source and destination sites when the following conditions are met:
  - Automatic mesh SDP binding creation is enabled.
  - GRE or LDP is the transport type.
  - No other service tunnel is available between the source and destination sites.
- The mirror service source and destination encapsulation types must be the same.
- After an NE reboot or CPM activity switch, the debug configuration file for a mirror service is not by default reloaded on the NE. The 5620 SAM raises an alarm when this occurs. To ensure that the NE reloads the debug configuration file, you must specify the location of the file in the base 5620 SAM configuration. See "To enable debug configuration file reloading on an NE for mirror services" in the *5620 SAM System Administrator Guide* for more information.
- When multiple mirror services reference the same packet, for example, from a SAP and from a port, the packet is mirrored only once, based on the following criteria in the following non-configurable order:
  - MAC or IP filters
  - MPLS ingress label
  - SAP
  - port
- For IP-only mirroring, consider the following:
  - IP-only mirroring requires chassis mode C or D to be enabled.
  - By using "IP Only" as the encapsulation type, users can specify that only the IP packet is mirrored, without its original ATM/FR/POS/Ethernet DLC header.
  - When IP-only is configured on the source site, users can configure various mirroring sources, including subscribers and SAPs from Ipipe, IES, VPRN, VPLS, and MVPLS services. However, source ports and VLL services including Apipe, Epipe, and Fpipe cannot be configured.
  - For local IP-only mirroring, the source and destination MAC addresses must be configured.
  - For remote IP-only mirroring in a VPRN service, an IP mirror interface on the VPRN destination NE is used to receive the IP mirror packets and route them to the appropriate sniffer. If there are multiple sniffers connected to the VPRN using L3 interfaces, you must configure the routing policy to have IP mirror packets routed to the correct sniffer.
- For LI source configuration, consider the following:
  - You must be assigned the Lawful Interception Management scope of command role to view, create or modify any LI-related objects in the 5620 SAM.
  - LI source configurations are saved on an NE when the polling policy for the NE specifies LI Local Save Allowed. See chapter 9 for information about configuring in-band and out-of-band polling policies.

69.2 Sample mirror service configuration

Figure 69-1 shows a sample mirror service configuration.

Figure 69-1 Sample mirror service configuration

In this sample, Router B is the mirror source that carries the customer packets. Router A is the mirror destination. The ingress and egress traffic on Port 5/2/1 is mirrored on the destination, Port 3/1/3. Table 69-1 lists the high-level tasks to configure the sample mirror service.

Table 69-1 Sample mirror service configuration

Task	Description
1. Connect the packet sniffer to the mirror destination.	The packet sniffer is attached to Router A, Port 3/1/3.
2. Configure the mirror destination parameters.	Port 3/1/3 on Router A is specified as the mirror destination. Specify the Tunnel ID 1000 as the transport tunnel to the mirror destination. All the parameters required to configure the type of mirroring, for example, slicing and mirror classification, are specified in the destination parameters.
3. Specify the source entity that is to be mirrored.	The egress and ingress traffic on Port 5/2/1 is to be mirrored.

69.3 Workflow to create a mirror service

The following workflow lists the high-level steps required to create a mirror service. As a prerequisite for creating a mirror service, this workflow assumes the following:

- a group or customer with the required user access privileges has been configured.
- the IP or IP/MPLS core network exists.
- any required service tunnels are created including the static or dynamic LSP required to create the service tunnel; see Procedure 27-1.

- the access ports for the service are created; see chapter 16 for more information.
- any required pre-defined routing, QoS, scheduling, filter, accounting, and time of day suite policies are created; see chapter 42 for more information. You do not have to create pre-defined policies if policies are created on a per-service basis.
- any required MP-BGP for PE-to-PE routing is configured; see chapter 23 for more information about protocol configuration.
- the network services the mirror service will use are created.
- a packet-sniffing device at the L2 SAP that is the destination of the mirror service is configured.
- the SAP with the attached packet-sniffing device as the mirror destination is specified.
- the source of the packets to be mirrored is configured.

1 Create the mirror service. See Procedure 69-1.

i Define the general properties for the mirror service.

ii Specify the services for inclusion in the mirror service. You can specify multiple services in one operation.

iii Enable one or more routing protocols for the mirror site.

iv Create a destination site on the mirror service. See Procedure 69-2.

v Create a source site on the mirror service, if required. See Procedure 69-3.

vi Specify an endpoint on the site for redundancy, if required. See Procedure 69-5.

vii Create an L2 access interface on the destination site, if required. See Procedure 69-6.

viii Specify one or more SAPs on the site as a mirror source, if required. See Procedure 69-7.

ix Specify one or more ports on the site as a mirror source, if required. See Procedure 69-8.

x Specify one or more IP filters for the source site, if required. See Procedure 69-9.

xi Specify one or more IPv6 filters for the source site, if required. See Procedure 69-10.

xii Specify one or more MAC filters for the source site, if required. See Procedure 69-11.

xiii Specify one or more LI source MAC filters for the source site, if required. See Procedure 69-12.

xiv Specify one or more MPLS ingress labels for the source site, if required. See Procedure 69-13.

xv Specify one or more subscribers or subscriber hosts as mirror sources, if required. See Procedure 69-14.

xvi Turn up the mirror service.

2 As required, view mirror service information:

a View the service topology map associated with a Mirror Service. See Procedure 69-15.

b View the mirror service operational status. See Procedure 69-16.

c To view LI mirrored subscriber hosts configured with a RADIUS server. See Procedure 69-17.

3 As required, run an OAM validation test for a mirror service. See Procedure 69-19.

4 As required, modify a mirror service. See Procedure 69-20.

5 As required, delete a mirror service. See Procedure 69-21.

69.4 Mirror service procedures

Use the following procedures to create, delete, view, and modify mirror services.

Note 1 — If you are configuring mirror services using dot1q or qinq SAPs on a 7210 SAS (except for a 7210 SAS-D), you must first assign a mirror port. See Procedure 69-18.

Note 2 — On the 7210 SAS-X only, you can also configure access egress policies.

Procedure 69-1 To create a mirror service

1 Choose Create→Service→Mirror from the 5620 SAM main menu. The Mirror Service (Create) form opens with the General tab displayed.

2 Configure the parameters:

- Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Auto-Assign ID
- SVC Mgr Service ID
  This parameter is configurable when the Auto-Assign ID parameter is disabled.
- Service Name
- Description
- Service Tier
- Service Priority
- Administrative State

3 Perform one of the following:

a Leave the Automatic SDP Binding Creation parameter disabled.

When you leave the Automatic SDP Binding Creation parameter disabled, you must create SDP bindings for the service and bind the SDPs to a service tunnel in step 18 of Procedure 69-3.

b Enable the Automatic SDP Binding Creation parameter.

When you enable the Automatic SDP Binding Creation parameter, SDP bindings for the service are automatically created and bound to service tunnels.

i Configure the Transport Type parameter.

Note 1 — You must select GRE or LDP as the transport type to allow the 5620 SAM to automatically create SDP bindings between the source and destination sites. Automatic creation of SDP bindings cannot be configured if a service tunnel already exists between the source and destination sites.

Note 2 — To use MPLS:RSVP as the transport type, you must bind LSPs to service tunnels during service tunnel configuration. See chapter 27 for more information.

ii Configure the Use Bandwidth-Reserved Paths parameter, if applicable.

The Use Bandwidth-Reserved Paths parameter is configurable only when the Transport Type parameter is set to MPLS:RSVP or Any.

4 Configure the OLC state:

i Click on the Apply button.

ii Configure the parameters:

- Current OLC State
- Revert OLC State

5 To configure a mirror source on a destination site, perform steps 4 to 25 of Procedure 69-2.

6 To configure a mirror source on a site other than the destination site, perform steps 4 to 18 of Procedure 69-3. Otherwise, go to step 7.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The Mirror Service (Create) form closes.

Procedure 69-2 To create a destination site on a mirror service

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria and click the Search button. A list of mirror services appears.

3 Select a mirror service and click on the Properties button. The Mirror Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, right-click on Destination Site and choose Create Destination Site from the contextual menu. The Select Network Elements - Mirror Service form opens with a list of available sites displayed.

5 Select a site and click on the OK button. The Select Network Elements - Mirror Service form closes and the Mirror Site (Create) form opens with the system identifier of the selected site displayed in the Network Element panel.

6 Configure the parameters.

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State

7 Configure the NE-specific parameters, as listed in Table 69-2.

Table 69-2 NE-specific parameters

NE	Parameters	Dependencies
7450 ESS, 7710 SR, 7750 SR, and 7950 XRS	• Encapsulation Type	No dependencies.

8 Click on the Mirroring Configuration tab.

9 Configure the parameters:

- Source Administrative State
- Remote Source Capable

10 Configure the NE-specific parameters, as listed in Table 69-3.

Table 69-3 NE-specific parameters

NE	Parameters	Dependencies
7450 ESS, 7710 SR, 7750 SR, 7950 XRS	• Slice Size • Enable Port ID Mirroring	Choose the default of 0 for the Slice Size parameter when you configure a destination mirror site, unless slicing at the destination is necessary. Packet slicing reduces the amount of mirrored traffic that traverses the network. The Slice Size parameter is not displayed if the Encapsulation Type parameter is set to IP Only. The Port Id Mirroring and remote source are mutually exclusive. If Enable Port ID Mirroring is set to true on the destination site, then a remote source site cannot be added to the service. If a remote source site is already on the service, then Enable Port ID Mirroring cannot be set to true. Also, if remote mirror is used, then Enable Port ID Mirroring must be configured on all source sites. The Enable Port ID Mirroring parameter is configurable only if the Encapsulation Type parameter is set to PPP.
7210 SAS-D, 7210 SAS-E, 7210 SAS-M, 7210 SAS-T, 7210 SAS-X, 7450 ESS, 7710 SR, 7750 SR, 7950 XRS	• Forwarding Class	If you are configuring a 7210 SAS-X, go to step 16. If you are configuring a 7450 ESS, 7710 SR, 7750 SR, or 7950 XRS, Release 10.0 or earlier, go to step 11.
7210 SAS-D, 7210 SAS-E, 7210 SAS-M, 7210 SAS-T	• Profile	Go to step 16.

11 Click on the Source Far Ends tab.

12 Click on the Create button. The Remote Source (Create) form appears.

13 Configure the parameters:

- Remote Site ID
- Ingress Label
- Remote VC ID
- Remote ICB

14 Click on the OK button. The Remote Source (Create) form closes and a dialog box appears.

15 Click on the OK button. The Mirror Site (Create) form displays the remote source information.

16 Click on the OK button on the Mirror Site (Create) form. A dialog box appears.

17 Click on the OK button. The Mirror Service (Edit) form reappears with the service navigation tree displayed.

18 To add an L2 access interface, see Procedure 69-6.

19 To specify an endpoint on the site for redundancy, perform steps 5 to 18 of Procedure 69-5.

20 A mirror source can be on the same site as the mirror destination. If no mirror sources are on the destination site, go to Procedure 69-3.

21 To specify one or more SAPs on the site as mirror sources, perform steps 5 to 11 of Procedure 69-7.

22 To specify one or more ports on the site as mirror sources, perform steps 5 to 11 of Procedure 69-8.

23 To specify one or more IP filters for the source site, perform steps 4 to 11 of Procedure 69-9.

24 To specify one or more MAC filters for the source site, perform steps 4 to 11 of Procedure 69-11.

25 To specify one or more LI source LI MAC filter for the source site, perform steps 4 to 11 of Procedure 69-12.

Procedure 69-3 To create a source site on a mirror service

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria and click the Search button. A list of mirror services appears.

3 Select a mirror service and click on the Properties button. The Mirror Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, right-click on Source Site and choose Create Source Site from the contextual menu. The Select Network Elements - Mirror Service form opens with a list of available sites displayed.

5 Select a site and click on the OK button. The Select Network Elements - Mirror form closes and the Mirror Site (Create) form opens with the system identifier of the selected site displayed.

6 Configure the parameters.

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State
- Encapsulation Type

7 Click on the Mirroring Configuration tab.

8 Configure the parameters.

- Source Administrative State
- Remote Source Capable
- Slice Size
- Forwarding Class
- Enable Port ID Mirroring

Note 1 — The Slice Size parameter is not displayed if the Encapsulation Type parameter is set to IP Only.

Note 2 — The Enable Port ID Mirroring parameter is configurable only if you set the Encapsulation Type parameter to PPP in step 6.

The Port Id Mirroring and remote source are mutually exclusive. If Enable Port ID Mirroring is set to true on the destination site, then a remote source site cannot be added to the service. On the other hand, if a remote source site is already on the service, then Enable Port ID Mirroring cannot be set to true. Also, if remote mirror is used, then Enable Port ID Mirroring must be configured on all source sites.

9 Click on the L3 Encapsulation tab, if required. Otherwise, go to step 15.

Note — The L3 Encapsulation tab appears only if you are configuring a source site on an NE in chassis mode D. See chapter 15 for more information about chassis modes.

You can configure an Layer 3 encapsulation option to allow LI-mirrored packets to be placed into a routable header (either IP-UDP Shim or IP-GRE) and then forwarded in a routing context.

Note — The following conditions apply if you configure the Layer 3 encapsulation option:

- Configuring Mirror SDP bindings and Mirror SAPs is mutually exclusive to the L3 Encapsulation
- You cannot configure the Session ID or Intercept ID of a source later on in this procedure if the L3 Encapsulation is not configured here.
- You cannot configure L3 Encapsulation if a mirror source object (such as: IP filter, MAC filter, and so on) is first configured for this service.
- You cannot change the routing instance of L3 Encapsulation if a gateway is first configured for this service.

10 Click on the Create button. The Layer-3 Encapsulation null (Create) form appears.

11 Configure the parameters:

- Header Type
- Use Direction Bit

  The Use Direction Bit parameter is only displayed if you configured the Header Type option for IP-UDP Shim.

12 Click on the Select button to choose a Routing Instance ID.

The Select Routing Instance - Layer-3 Encapsulation - null form opens.

13 Choose the required instance from the list and click the OK button.

The Select Routing Instance - Layer-3 Encapsulation - null form closes and the Layer-3 Encapsulation null (Create) form displays your selection.

14 Configure a Gateway by performing the following in the Gateway panel:

i Click the Create button in the Gateway panel. The Layer-3 Encapsulation Gateway null (Create) form is displayed.

ii Configure the parameters.

- Source Address
- Destination Address
- Source Port
- Destination Port

The gateway Source Address and Destination Address must either both be unconfigured or both configured. Similarly, the gateway Source Port and Destination Port must either both be unconfigured or both configured.

The Source Port and Destination Port parameters are displayed only if you configured the Header Type option for IP-UDP Shim.

iii Click on the OK button. The Layer-3 Encapsulation Gateway null (Create) form closes and a confirmation message is displayed.

iv Click on the OK button. The new gateway appears in the list.

v Click on the OK button. The Layer-3 Encapsulation null (Create) form closes and a confirmation message is displayed.

vi Click on the OK button. The L3 encapsulation option appears in the list.

15 Click on the OK button. A dialog box appears.

16 Click on the OK button. The Mirror Site (Create) form closes, and the Mirror Service (Create) form reappears with the selected site displayed on the navigation tree under Source Sites.

17 Expand the newly created site object.

18 Perform one of the following:

a If the Automatic SDP Binding Creation parameter was disabled in step 3, choose an SDP binding for the mirror source by selecting Mirror SDP Binding under the source site in the service navigation tree and then right-clicking and choosing Create Mirror SDP Binding from the contextual menu.

b Go to step 25.

19 The Mirror SDP Binding (Create) form opens. Specify a destination NE for the mesh SDP binding:

a If the destination NE is a managed NE, choose from a list of managed NEs.

i Click on the Select button beside the Tunnel Termination Site parameter to choose a destination for the SDP binding. The Select Destination Network Element - Mirror SDP Binding form opens.

ii Select a NE and click on the OK button. The Select Destination Network Element - Mirror SDP Binding form closes and the Mirror SDP Binding (Create) form displays the destination NE ID in the Tunnel Termination Site panel.

b If the destination NE is not managed by the 5620 SAM, specify the system ID of the destination NE for the Tunnel Termination Site parameter.

20 Configure the parameters.

- VC ID
- Auto-Assign ID
- Ingress Label
- Egress Label
- Inter-Chassis Backup
- Precedence

21 Perform one of the following to specify a transport tunnel for the mirror SDP binding.

a Let the 5620 SAM configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure the Tunnel Auto-Selection Transport Preference parameter.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Mirror SDP Binding form opens.

ii Select a service tunnel for the mirror SDP binding and click on the OK button. The Select Tunnel - Mirror SDP Binding form closes, and the Mirror SDP Binding (Create) form displays the service tunnel identifier.

c Configure an MPLS-TP transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Mirror SDP Binding form opens.

ii Select an MPLS-TP service tunnel for the spoke SDP binding and click on the OK button. The Select Tunnel - Mirror SDP Binding form closes, and the Mirror SDP Binding (Create) form refreshes with the service tunnel identifier. See Procedure 27-1 for more information about how to create an MPLS-TP service tunnel.

22 Click on the Pseudowire OAM tab and configure the Control Word parameter.

Note — If you are creating a mirror SDP binding using an MPLS-TP service tunnel for pseudowire static configuration, you must set the Control Word parameter to Preferred. See Procedure 69-4.

23 Click on the OK button. A dialog box appears.

24 Click on the OK button. The Mirror SDP Binding (Create) form closes and the Mirror Service (Create) form displays the mirror SDP binding under Mirror SDP Binding for the site.

25 To specify an endpoint on the site for redundancy, perform steps 5 to 18 of Procedure 69-5.

26 To specify one or more SAPs on the site as mirror sources, perform steps 5 to 11 of Procedure 69-7.

27 To specify one or more ports on the site as mirror sources, perform steps 5 to 11 of Procedure 69-8.

28 To specify one or more IP filters for the source site, perform steps 4 to 11 of Procedure 69-9.

29 To specify one or more MAC filters for the source site, perform steps 4 to 11 of Procedure 69-11.

30 To specify one or more LI source LI MAC filter for the source site, perform steps 4 to 11 of Procedure 69-12.

31 To specify one or more MPLS ingress labels for the source site, perform steps 4 to 9 of Procedure 69-13.

32 To specify one or more subscribers or subscriber hosts as a mirror source, perform steps 4 to 11 of Procedure 69-14.

Procedure 69-4 To configure an MPLS-TP static pseudowire on a mirror SDP binding

Perform this procedure to create an MPLS-TP static pseudowire on the mirror SDP binding. An MPLS-TP service tunnel must be used in the mirror SDP binding, and the Control Word parameter for pseudowire OAM must be set to Preferred in step 22 of Procedure 69-3.

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria and click on the Search button. A list of mirror services appears.

3 Select a miror service and click on the Properties button. The Mirror Service (Edit) form opens.

4 On the navigation tree, expand the source site on which you want to configure the mirror SDP binding, and expand the Mirror SDP Bindings icon.

5 Click on the mirror SDP binding on which you want to configure the static MPLS-TP pseudowire. The Mirror SDP Binding (Edit) form opens with the General tab displayed.

6 Click on the Control Channel tab.

7 Configure the parameters:

- Status
- Refresh Timer (seconds)
- Request Timer (seconds)

8 Click on the MPLS-TP PW tab.

9 Click on the Create button. The PW Path ID (Create) form opens.

10 Configure the Path AGI parameter.

11 Configure the parameters in the Source Attachment Individual Identifier panel:

- SAII Global ID
- SAII Node ID
- SAII AC ID

12 Configure the parameters in the Target Attachment Individual Identifier panel:

- TAII Global ID
- TAII Node ID
- TAII AC ID

13 Click on the OK button. The PW Path ID (Create) form closes.

14 Click on the OK button. The Mirror SDP Binding (Edit) form closes.

15 Close the Mirror Service (Edit) form.

16 Close the Manage Mirror Services form.

Procedure 69-5 To create an endpoint for redundancy support on the site

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria and click the Search button. A list of mirror services appears.

3 Select a mirror service and click on the Properties button. The Mirror Service (Edit) form opens with the General tab displayed.

4 Perform one of the following.

a To create an endpoint on a destination site, expand the Destination Site object to view the configured destination sites, and expand the destination site object on which you are creating the endpoint.

b To create an endpoint on a source site, expand the Source Site object to view the configured source sites, and expand the source site object on which you are creating the endpoint.

5 On the navigation tree, right-click on the Endpoints object below the site and choose Create Endpoints. The Endpoint (Create) form opens.

6 Configure the parameters.

- Name
- Description
- Revert Time (seconds)
- Disable Revert Time

7 Click on the OK button.

For the destination site, the L2 Access Interface (Test Equipment Interface) and Mirror SDP Binding objects appear under the Endpoints object.

For the source site, the Mirror SDP Binding object now appears under the Endpoints object.

8 To create an L2 access interface as the mirror destination, right-click on the L2 Access Interface (Test Equipment Interface) object under the Endpoints object and choose Create L2 Access Interface from the contextual menu. The L2 Access Interface (Create) form opens with the General tab displayed.

Note — You cannot create an L2 access interface on the endpoint if you create an L2 access interface in Procedure 69-6 without selecting an endpoint for redundancy.

9 Click on the Port tab.

10 Click on the Select button to choose a port for the L2 access interface. The Select Terminating Port - L2 Access Interface form opens.

11 Use the configurable filter and Search button to choose a port, and click on the Search button. The Select Terminating Port - L2 Access Interface form closes, and the L2 Access Interface (Create) form displays the port information.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

12 Configure other parameters, as required.

13 Click on the OK button on the L2 Access Interface (Create) form. The form closes and a dialog box appears.

14 Click on the OK button. The SAP object appears under the L2 Access Interface object.

15 To create a mirror SDP binding on the endpoint, right-click on the Mirror SDP Binding object under the Endpoints object in the service navigation tree and choose Create Mirror SDP Binding from the contextual menu. The Mirror SDP Binding (Create) form opens.

16 Configure the parameters.

- Tunnel Termination Site
- VC ID
- Auto-Assign ID
- Ingress Label
- Egress Label
- Inter-Chassis Backup
- Precedence

17 Click on the OK button. The Mirror SDP Binding (Create) form closes and a dialog box appears.

18 Click on the OK button. The Mirror Service (Edit) form reappears with the service navigation tree displayed.

Procedure 69-6 To create an L2 access interface on a destination site

Note — You cannot create an L2 access interface on the site if you create an L2 access interface for redundancy in Procedure 69-5.

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria and click the Search button. A list of mirror services appears.

3 Select a mirror service and click on the Properties button. The Mirror Service (Edit) form opens with the General tab displayed.

4 Expand the Destination Site object to view the destination sites.

5 Expand the destination site object on which you are creating the L2 access interface.

6 Configure an L2 access interface as the mirror destination by right-clicking on L2 Access Interface (Test Equipment Interface) under the destination site in the service navigation tree and choosing Create L2 Access Interface from the contextual menu. The L2 Access Interface (Create) form opens with the General tab displayed.

7 To configure an endpoint for redundancy, click on the Select button in the Redundancy panel to select the desired endpoint from the drop-down menu. Otherwise, go to step 8.

Note — If you select an endpoint for redundancy, the L2 access interface appears under the Endpoints object on the service navigation tree.

8 Click on the Port tab.

9 Click on the Select button in the Terminating Port panel to choose a port for the L2 access interface. The Select Terminating Port - L2 Access Interface form opens.

10 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - L2 Access Interface form closes, and the L2 Access Interface (Create) form displays the port information.

Note 1 — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

Note 2 — The form lists only ports that have the encapsulation type that you specified in the destination site creation, in Procedure 69-2

11 Configure the parameters.

- Outer Encapsulation Value
- Auto-Assign ID
- Inner Encapsulation Value

The Auto-Assign ID parameter is configurable if the port uses dot1q encapsulation. When the parameter is enabled, the 5620 SAM automatically configures the Outer Encapsulation Value parameter using the lowest unassigned value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter on the User Preferences form.

The Inner Encapsulation Value is configurable only when the port is an Ethernet or frame relay port with QinQ encapsulation.

12 Assign an egress QoS policy to the interface, if required.

i Click on the QoS tab.

ii Configure the Egress Mark QinQ Top Bits Only parameter.

iii Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - L2 Access Interface form opens.

iv Configure the filter criteria. A list of egress policies appear at the bottom of the Select Egress Policy - L2 Access Interface form.

v Select an egress policy and click on the OK button. The Select Egress Policy - L2 Access Interface form closes and the L2 Access Interface (Create) form displays the egress QoS policy information.

13 Assign a time of day suite to the interface, if required.

i Click on the TOD Suite tab.

ii Click on the Select button beside the Name parameter. The Select Time Of Day Suite - L2 Access Interface form opens.

iii Select a time of day suite and click on the OK button. The Select Time Of Day Suite - L2 Access Interface form closes and the L2 Access Interface (Create) form displays the time of day suite information.

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The Mirror (Create) form displays the L2 access interface information below L2 Access Interface (Test Equipment Interface) in the service navigation tree.

14 Click on the Schedulers tab, if required.

15 Configure the Aggregate Rate Limit (kbps) parameter.

16 Click on the IP Mirror MAC Addresses tab, if you are configuring local mirroring and you chose IP Only as the encapsulation type in step 6 of Procedure 69-2. Otherwise, go to step 18.

Note — If you want to configure remote mirroring in a VPRN service, you must create an IP Mirror Interface in that service. See chapter 71 for more information.

17 Configure the parameters:

- Destination MAC Address
- Source MAC Address

Note — The Source and Destination MAC addresses on L2 Access Interface must be both null or neither null. Both null means that there are no source or destination MAC addresses configured on the interface.

18 Assign an ANCP policy to the interface, if required.

i Click on the ANCP Static Map tab.

ii Click on the Create button. The ANCP Static Map (Create) form opens.

iii Configure the ANCP String parameter.

iv Click on the Select button to choose an ANCP Policy. The Select ANCP Policy - ANCP Static Map form opens.

v Select an ANCP policy and click on the OK button. The Select ANCP Policy - ANCP Static Map form closes and the ANCP Static Map form reappears with the ANCP policy information displayed.

vi Click on the OK button. The ANCP Static Map form closes.

19 Click on the OK button. A dialog box appears.

20 Click on the OK button. The L2 Access Interface (Create) form closes.

Procedure 69-7 To specify a SAP on the site as a mirror source

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria and click the Search button. A list of mirror services appears.

3 Select a mirror service and click on the Properties button. The Mirror Service (Edit) form opens with the General tab displayed.

4 Perform one of the following.

a To create a source interface on a destination site, expand the Destination Site object to view the configured destination sites, and expand the destination site object on which you are creating the source SAP.

b To create a source interface on a source site, expand the Source Site object to view the configured source sites, and expand the source site object on which you are creating the source SAP.

5 Perform one of the following:

a Right-click on the Source SAPs object below the site in the service navigation tree and choose Create Source Interface from the contextual menu. The Source Interface (Create) form opens. Go to step 6.

b Right-click on the LI Source SAPs object below the site in the service navigation tree and choose Create LI Source Interface from the contextual menu. The LI Source Interface (Create) form opens. Go to step 6.

Note 1 — A 5620 SAM operator with LI privileges can view, create, and delete LI source objects.

Note 2 — A mirror site can be configured with debug or LI sources, but not both. LI source configuration takes priority over debug source configuration.

6 Click on the Select button to choose an access interface to associate with the source interface. The Select Mirrored Interface - Source Interface form opens.

7 Use the configurable filter and Search button to choose an access interface, and click on the OK button. The Select Mirrored Interface - Source Interface form closes and the Source Interface (Create) form displays the selected interface information.

8 Configure the parameters:

- Enable Egress
- Enable Ingress
- Intercept ID
- Session ID

The Intercept ID and Session ID parameters are displayed only when creating an LI source SAP.

9 Click on the OK button. A dialog box appears.

10 Click on the OK button. The Mirror Service (Edit) form displays the source SAP below Source SAPs in the service navigation tree.

11 Repeat steps 6 to 10 to specify an additional source SAP for the site.

Procedure 69-8 To specify a port on the site as a mirror source

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria and click the Search button. A list of mirror services appears.

3 Select a mirror service and click on the Properties button. The Mirror Service (Edit) form opens with the General tab displayed.

4 Perform one of the following.

a To create a source port on a destination site, expand the Destination Site object to view the configured destination sites, and expand the destination site object on which you are creating the source port.

b To create a source port on a source site, expand the Source Site object to view the configured source sites, and expand the source site object on which you are creating the source port.

5 Right-click on the Source Ports object below the site in the service navigation tree and choose Create Source Port from the contextual menu. the Source Port (Create) form opens

6 Click on the Select button to choose a port. The Select - Source Port form opens.

A source port can be one of the following:

- physical port
- channel
- LAG
- bundle
- CCAG

7 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Source Port form closes and the Source Port (Create) form displays the port information.

8 Configure the parameters:

- Enable Egress
- Enable Ingress

9 Click on the OK button. A dialog box appears.

10 Click on the OK button. The Mirror Service (Create) form displays the source port below Source Ports in the service navigation tree.

11 Repeat steps 5 to 10 to specify an additional source port for the site.

Procedure 69-9 To specify a source IP or LI source IP filter entry for the mirror source

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria and click the Search button. A list of mirror services appears.

3 Select a mirror service and click on the Properties button. The Mirror Service (Edit) form opens with the General tab displayed.

4 Perform one of the following.

a To specify an IP filter entry on a destination site, expand the Destination Site object to view the configured destination sites, and expand the destination site object on which you are specifying the IP filter entry.

b To specify an IP filter entry on a source site, expand the Source Site object to view the configured source sites, and expand the source site object on which you are specifying the IP filter entry.

5 Perform one of the following:

a Right-click on the Source IP Filters object below the site in the service navigation tree and choose Create Source IP Filter from the contextual menu. The Source IP Filter (Create) form opens. Go to step 6.

b Right-click on the LI Source IP Filters object below the site in the service navigation tree and choose Create LI Source IP Filter from the contextual menu. The LI Source IP Filter (Create) form opens. Go to step 6.

Note 1 — A 5620 SAM operator with LI privileges can view, create, and delete LI source objects.

Note 2 — A mirror site can be configured with debug or LI sources, but not both. LI source configuration takes priority over debug source configuration.

6 Click on the Select button to choose an IP filter entry. The Select Filter - Source IP Filter form opens.

7 Use the configurable filter and Search button to choose an IP filter entry, and click on the OK button. The Select Filter - Source IP Filter form closes and the Source IP Filter (Create) form displays the selected IP filter ID and IP filter entry ID.

8 If you are configuring an LI source IP filter, configure the parameters. Otherwise, go to step 9.

- Intercept ID
- Session ID

The Intercept ID and Session ID parameters are displayed only when creating an LI source IP filter.

9 Click on the OK button. A dialog box appears.

10 Click on the OK button. The Mirror (Create) form displays the source IP filter below Source IP Filters in the service navigation tree.

11 Repeat steps 6 to 10 to specify an additional source IP filter.

Procedure 69-10 To specify a source IPv6 or LI source IPv6 filter entry for the mirror source

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria and click the Search button. A list of mirror services appears.

3 Select a mirror service and click on the Properties button. The Mirror Service (Edit) form opens with the General tab displayed.

4 Perform one of the following.

a To specify an IPv6 filter entry on a destination site, expand the Destination Site object to view the configured destination sites, and expand the destination site object on which you are specifying the IPv6 filter entry.

b To specify an IPv6 filter entry on a source site, expand the Source Site object to view the configured source sites, and expand the source site object on which you are specifying the IPv6 filter entry.

5 Perform one of the following:

a Right-click on the Source IPv6 Filters object below the site in the service navigation tree and choose Create Source IPv6 Filter from the contextual menu. The Source IPv6 Filter (Create) form opens.

b Right-click on the LI Source IPv6 Filters object below the site in the service navigation tree and choose Create LI Source IPv6 Filter from the contextual menu. The LI Source IPv6 Filter (Create) form opens.

Note 1 — A 5620 SAM operator with LI privileges can view, create, and delete LI source objects.

Note 2 — A mirror site can be configured with debug or LI sources, but not both. LI source configuration takes priority over debug source configuration.

6 Click on the Select button to choose an IPv6 filter entry. The Select Filter - Source IPv6 Filter form opens.

7 Use the configurable filter and Search button to choose an IPv6 filter entry, and click on the OK button. The Select Filter - Source IPv6 Filter form closes and the Source IPv6 Filter (Create) form displays the selected IPv6 filter ID and IPv6 filter entry ID.

8 If you are configuring an LI source IPv6 filter, configure the parameters. Otherwise, go to step 9.

- Intercept ID
- Session ID

The Intercept ID and Session ID parameters are configurable only if Layer 3 encapsulation is configured on the mirror site. See Procedure 69-2.

9 Click on the OK button. A dialog box appears.

10 Click on the OK button. The Mirror (Create) form displays the source IPv6 filter below Source IPv6 Filters or LI Source IPv6 Filters in the service navigation tree.

11 Repeat steps 6 to 10 to specify an additional source or LI source IPv6 filter.

Procedure 69-11 To specify a source MAC or LI source MAC filter entry for the mirror site

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria and click the Search button. A list of mirror services appears.

3 Select a mirror service and click on the Properties button. The Mirror Service (Edit) form opens with the General tab displayed.

4 Perform one of the following.

   a To specify a MAC filter entry on a destination site, expand the Destination Site object to view the configured destination sites, and expand the destination site object on which you are specifying the MAC filter entry.

   b To specify a MAC filter entry on a source site, expand the Source Site object to view the configured source sites, and expand the source site object on which you are specifying the MAC filter entry.

5 Perform one of the following:

   a Right-click on the Source MAC Filters object below the site in the service navigation tree and choose Create Source MAC Filter from the contextual menu. The Source MAC Filter (Create) form opens. Go to step 6.

   b Right-click on the LI Source MAC Filters object below the site in the service navigation tree and choose Create LI Source MAC Filter from the contextual menu. The LI Source MAC Filter (Create) form opens. Go to step 6.

Note 1 — A 5620 SAM operator with LI privileges can view, create, and delete LI source objects.

Note 2 — A mirror site can be configured with debug or LI sources, but not both. LI source configuration takes priority over debug source configuration.

6 Click on the Select button to choose a MAC filter entry. The Select Filter - Source Mac Filter form opens.

7 Use the configurable filter and Search button to choose a MAC filter entry, and click on the OK button. The Select Filter - Source Mac Filter form closes and the Source MAC Filter (Create) form displays the selected MAC filter ID and MAC filter entry ID.

8 Configure the parameters:

- Intercept ID
- Session ID

The Intercept ID and Session ID parameters are displayed only when creating an LI source MAC filter.

9 Click on the OK button. A dialog box appears.

10 Click on the OK button. The Mirror (Create) form displays the source MAC filter below Source MAC Filters in the service navigation tree.

11 Repeat steps 6 to 10 to specify an additional source MAC filter.

Procedure 69-12 To specify an LI source LI MAC filter for the mirror site

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria and click the Search button. A list of mirror services appears.

3 Select a mirror service and click on the Properties button. The Mirror Service (Edit) form opens with the General tab displayed.

4 Perform one of the following.

a To specify an LI MAC filter entry on a destination site, expand the Destination Site object to view the configured destination sites, and expand the destination site object on which you are specifying the LI MAC filter entry.

b To specify an LI MAC filter entry on a source site, expand the Source Site object to view the configured source sites, and expand the source site object on which you are specifying the LI MAC filter entry.

5 Right-click on the LI Source LI MAC Filters object below the site in the service navigation tree and choose Create LI Source LI MAC Filter from the contextual menu. The LI Source LI MAC Filter (Create) form opens.

Note 1 — A 5620 SAM operator with LI privileges can view, create, and delete LI source objects.

Note 2 — A mirror site can be configured with debug or LI sources, but not both. LI source configuration takes priority over debug source configuration.

6 Click on the Select button to choose an LI MAC filter entry. The Select LI MAC Filter Entry - LI Source LI MAC Filter form opens.

7 Use the configurable filter and Search button to choose an LI MAC filter entry, and click on the OK button. The Select LI MAC Filter Entry - LI Source LI MAC Filter form closes and the LI Source LI MAC Filter (Create) form displays the selected Filter Name and Filter Entry ID.

8 Configure the parameters:

- Intercept ID
- Session ID

The Intercept ID and Session ID parameters are displayed only when creating an LI source MAC filter.

9 Click on the OK button. A dialog box appears.

10 Click on the OK button. The Mirror (Create) form displays the LI Source LI MAC filter below LI Source LI MAC Filters in the service navigation tree.

11 Repeat steps 5 to 10 to specify an additional LI source LI MAC filter.

Procedure 69-13 To specify an MPLS ingress label for the mirror

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria and click the Search button. A list of mirror services appears.

3 Select a mirror service and click on the Properties button. The Mirror Service (Edit) form opens with the General tab displayed.

4 Expand the Source Site object to view the configured source sites, and expand the source site object on which you are specifying the MPLS ingress label.

5 Right-click on the Source MPLS Ingress Labels object below the site in the service navigation tree and choose Create Source Ingress Label from the contextual menu. The Source Ingress Label (Create) form opens.

6 Configure the Ingress Label parameter.

7 Click on the OK button. A dialog box appears.

8 Click on the OK button. The Mirror (Create) form displays the MPLS ingress label below Source MPLS Ingress Labels in the service navigation tree.

9 Repeat steps 5 to 8 to specify an additional source MPLS ingress label.

Procedure 69-14 To specify a source subscriber or LI source subscriber as a mirror source

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria and click the Search button. A list of mirror services appears.

3 Select a mirror service and click on the Properties button. The Mirror Service (Edit) form opens with the General tab displayed.

4 Expand the Source Site object to view the configured source sites, and expand the source site object on which you are specifying the subscriber as the mirror source.

5 Perform one of the following:

a Right-click on the Source Subscribers object below the site in the service navigation tree and choose Create Source Subscriber from the contextual menu. The Source Subscriber (Create) form opens. Go to step 6.

b Right-click on the LI Source Subscribers object below the site in the service navigation tree and choose Create LI Source Subscriber from the contextual menu. The LI Source Subscriber (Create) form opens. Go to step 6.

Note 1 — A 5620 SAM operator with LI privileges can view, create, and delete LI source objects.

Note 2 — A mirror site can be configured with debug or LI sources, but not both. LI source configuration takes priority over debug source configuration.

6 Configure the following parameters:

- Subscriber Identification String
- Forwarding Classes
- Enable Egress
- Enable Ingress
- Intercept ID
- Session ID

The Intercept ID and Session ID parameters are displayed only when creating an LI source subscriber.

7 You can further restrict the mirrored subscriber host traffic associated with the subscriber identification string by specifying SAP or SLA-profile criteria. To specify an SLA profile as a match criterion, go to step 13.

Note — You can configure parameters in the SAP/Subscriber Host Match Criteria panel or the SLA Profile Match Criteria panel, but you cannot configure parameters in both panels.

8 Click on the Select button in the SAP/Subscriber Host Match Criteria panel to specify a SAP on which to mirror subscriber host traffic. The Select SAP ID/Encap Value - Source Subscriber form opens.

9 Configure the filter criteria and click on the Select button. A list of SAPs is displayed.

Note — The form lists only dot1q- or QinQ-encapsulated SAPs that have subscriber management enabled.

10 Select a SAP in the list and click on the OK button. The Select SAP ID/Encap Value - Source Subscriber form closes and the SAP information is displayed on the Source Subscriber (Create) form.

11 Configure the parameters in the SAP/Subscriber Host Match Criteria panel to specify the subscriber host match criteria for the SAP:

- Host IP Address
- Host MAC Address

Note — The 5620 SAM does not accept the parameter values unless a SAP is specified in step 10.

12 Go to step 15.

13 Click on the Select button in the SLA Profile Match Criteria panel. The SLA Profile - Source Subscriber form opens.

14 Select an SLA profile in the list and click on the OK button. The Select SLA Profile - Source Subscriber form closes and the SLA profile name is displayed on the Source Subscriber (Create) form.

15 Click on the OK button. A dialog box appears.

16 Click on the OK button. The Mirror Service (Create) form displays the source subscriber below Source Subscribers in the service navigation tree.

17 Repeat steps 13 to 16 to specify an additional source subscriber, if required.

Procedure 69-15 To view the service topology associated with a mirror service

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter parameters and click on the Search button. A list of mirror services appears at the bottom of the Manage Mirror Services form.

3 Select a mirror service and click on the Topology View button. A Topology View dialog box appears.

4 Click on the Yes button to proceed. The Service Topology - *Service Name* map opens.

See chapter 6 for more information about service topology views.

Procedure 69-16 To view the mirror service operational status

The Aggregated Service Site Operational State and State Cause indicators on the General tab of the mirror service properties form display information about service faults.

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria. A list of mirror services appears at the bottom of the Manage Mirror Services form.

3 Select a mirror service and click on the Properties button. The Mirror *Service Name* (Edit) form opens.

4 View the Aggregated Service Site Operational State and State Cause indicators. When the Aggregated Operational State is Down or Partially Down, a check mark beside the appropriate State Cause indicator identifies the type of associated service fault.

5 Click on the appropriate tab to view or edit an object that is identified as faulty by a State Cause indicator.

6 Click on the Faults tab to view the alarms for the object. The alarms are grouped into various categories.

7 Close the Mirror Service (Edit) form.

8 Close the Manage Mirror Services form.

Procedure 69-17 To view LI mirrored subscriber hosts configured with a RADIUS server

Note 1 — You must have 5620 SAM LI user privileges to perform this procedure.

Note 2 — Before you can perform this procedure, at least one LI user account must exist on the NE.

Note 3 — Before you can perform this procedure, a 5620 SAM LI user must enable LI discovery for the NE using Procedure 28-8.

Note 4 — Only PPPoE subscriber hosts can be mirrored with RADIUS.

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria, if required, and click on the Search button. A list of mirror services appears.

3 Choose a mirror service and click on the Properties button. The Mirror *Service Name* (Edit) form opens with the General tab displayed.

4 Click on the Sites tab. A list of mirror service sites is displayed.

5 Choose a site and click on the Properties button. The Mirror Site (Edit) form opens with the General tab displayed.

6 If an LI source configuration object has not been created, the LI Source Configuration tab is dimmed. Click on the Create LI Source Configuration button at the bottom of the form. A dialog box appears.

Note 1 — You must create an LI source configuration object for the NE to mirror subscriber hosts for LI.

Note 2 — The Create LI Source Configuration button is a toggle that also lets you delete an LI source configuration object. If you delete an LI source configuration object, all associated LI source objects are deleted.

Note 3 — An LI source configuration object is automatically created when an LI source object is created.

7 Click on the OK button. The LI Source Configuration tab is enabled, and an LI source configuration object is created.

8 Click on the LI Source Subscribers Via RADIUS tab.

9 Configure the filter criteria, if required, and click on the Search button. A dialog box appears.

10 Click on the OK button. A list of subscribers appears.

11 Choose a subscriber and click on the Properties button. The LI Source Subscriber Host form opens.

12 View the information on the form.

13 Close the LI Source Subscriber Host form.

Procedure 69-18 To create a mirror port on a 7210 SAS

If you are creating a mirror service using qinq or dot1q SAPs, (except for the 7210 SAS-D) you must first create a mirror port.

1 Right-click on an NE in the Equipment view and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

2 Click on the Globals tab button.

3 Click on the Service tab button. The General sub-tab is displayed.

4 Click on the Select button in the Mirror Port panel. The Mirror Port form opens. Select a mirror port and click on the OK button. The Mirror Port form closes and the Mirror Port panel refreshes with the mirror port ID.

Procedure 69-19 To run an OAM validation test for a mirror service

An OAM validator test suite must be created for the tested entity. See chapter 77 for more information about how to create an OAM validator test suite.

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Mirror Services form.

3 Select a service and click on the Properties button. The Mirror Service (Edit) form opens with the General tab displayed.

4 Click on the Validate button. If an OAM validator test suite is not associated to the service, a dialog box appears. Perform the following steps:

   i Click on the OK button to associate the service with an existing OAM validator test suite. The Choose Validator Test Suite form appears.

   ii Configure the filter criteria. A list of OAM validator test suites appears.

   iii Select an OAM validator test suite and click on the OK button. The Choose Validator Test Suite form closes.

5 View the State Cause indicators. When the validation test fails, a check mark appears beside the OAM Validation Failure indicator.

6 Click on the Tests tab.

7 Click on the Tested Entity Result tab.

8 Select an entry and click on the Properties button. The Tested Entity Result form opens and displays information about the validation test.

9 Close the Tested Entity Result form.

10 Close the Mirror Service (Edit) form.

11 Close the Manage Mirror Services form.

Procedure 69-20 To modify a mirror service

Caution — Modifying parameters can be service-affecting.

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 Configure the filter criteria. A list of mirror services appears at the bottom of the Manage Mirror Services form.

3 Select a mirror service and click on the Properties button. The Mirror *Service Name* (Edit) form opens with the general properties of the service displayed on the General tab.

4 Click on the other tabs to edit additional properties, as required.

5 Modify the parameters on the appropriate tab, as required.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button to confirm the action. The Mirror *Service Name* (Edit) form closes and the Manage Mirror Services form reappears.

8 Click on the Close button to close the Manage Mirror Services form.

Procedure 69-21 To delete a mirror service

Warning — Deleting a service may result in a service disruption for customers. Consider the implication of deleting the service before proceeding.

1 Choose Manage→Service→Mirror Services from the 5620 SAM main menu. The Manage Mirror Services form opens.

2 As required, configure the filter criteria to locate the service or range of services to be deleted. A list of services appears at the bottom of the Manage Mirror Services form.

3 Choose a mirror service or a range of services from the list.

4 Click on the Delete button. A warning form appears. This form is dynamic based on the priority of the service. Perform one of the following:

- **a** For services with a low priority, go to Step 5.
- **b** For services with a medium priority, configure the “Enter the highest priority of the service being deleted” text field by typing: Medium. Go to Step 5.
- **c** For services with a high priority, configure the “Enter the highest priority of the service being deleted” text field by typing: High. Go to step 5.

5 For all services regardless of how their priority is configured, acknowledge the check box that prompts you confirm that you understand the implications of deleting the service.

Note — If you select multiple services with different priorities, you must enter the highest priority level of selected services before you can delete the services.

6 Click on the Yes button to confirm the action. The service is deleted and removed from the list.

7 Click on the Close button to close the Manage Mirror Services form.

70 — IES management

70.1 IES management overview *70-2*

70.2 Sample IES configuration *70-8*

70.3 Workflow to create an IES *70-10*

70.4 IES management procedures *70-13*

70.1 IES management overview

An IES is a routed connectivity service in which the customer traffic passes through an L3 IP router interface to the Internet.

IES allows customer-facing IP interfaces in the same routing instance to be used for service network core-routing connectivity. IES requires that the IP addressing scheme that is used by the customer be unique among other provider addressing schemes and potentially the entire Internet.

Packets that arrive at the edge device are associated with an IES based on the access interface on which they arrive. An access interface is uniquely identified using:

- port
- service ID
- IP address

IES configuration

The 5620 SAM supports end-to-end IES configuration using the following methods:

- Tabbed configuration forms with an embedded navigation tree. The navigation tree provides a logical view of the service and acts as a configuration interface.
- Preconfigured template. A user who is assigned the template management role can create a service template. See "Managing templates" in the *5620 SAM Scripts and Templates Developer Guide* for more information about the administrative tasks associated with service templates.

The 5620 SAM supports the configuration in IES of an L3 aggregation mechanism called routed CO. Routed CO uses DHCP relay to manage dynamic subscriber hosts; the network resources for static subscriber hosts are explicitly provisioned. Routed CO supports all residential subscriber management functions of the 5620 SAM. See chapter 65 for more information about residential subscriber management and routed CO.

Routed CO uses a subscriber interface that defines up to 256 subnets. A subscriber interface has child objects called group interfaces. A group interface supports the configuration of multiple SAPs as child objects. A SAP in a group interface supports all residential subscriber management functions. A group interface does not allow the specification of IP subnets or addresses, but inherits the addressing scheme of the parent subscriber interface. The 5620 SAM service topology map displays IES subscriber interfaces, group interfaces, and the associated SAPs.

You can configure NAT for dynamic subscriber hosts in a routed CO deployment. NAT implementation in an IES requires a NAT configuration on the NE base routing instance and a NAT policy that is associated with a subscriber profile. See chapter 22 for information about configuring and deploying NAT on a base routing instance. See chapter 57 for information about configuring a NAT policy. See chapter 65 for information about associating a NAT policy with a subscriber profile.

When you use the 5620 SAM to create or discover a service, the 5620 SAM assigns a default Service Tier value to the service. The Service Tier parameter value is relevant only in the context of composite service topology views. See chapter 74 for more information about the hierarchical organization of composite services.

Common to all device services, such as IES, are policies that are assigned to the service. Policies are defined at a global level and can then be applied to components of the service, such as interfaces or circuits, when the service is configured or modified. The following policies are common to all device services:

- QoS policies define ingress classification, policing, shaping, and marking on the ingress side of the interface. QoS policies are configured using the Access Ingress Policy form, the Access Egress Policy form, and the ATM QoS Policy form.
- Policer control policies to control access ingress policers and access egress policers under a common hierarchy. Policer control policies are configured using the Policer Control Policy Manager.
- Scheduling policies define hierarchical rate limiting and scheduling to govern the scheduling of queues. Scheduler policies are configured using the Scheduler Policy form.
- Port scheduler policies define hierarchical bandwidth allocation and scheduling at the egress port level. Port scheduler policies are configured using the Port Scheduler Policy form.
- Filter policies control network traffic into or out of an interface or circuit based on DHCP, IP, or MAC matching criteria. Filter policies are configured using the ACL IP Filter form, the ACL MAC Filter form, and the DHCP Filter form.
- Accounting policies measure the traffic on a service to ensure proper billing and enforcement of SLAs. Accounting policies are configured using the Accounting Policy form.
- ANCP policies provide status and control information based on port-up and port-down messages and current line rate changes between the edge device and the access NE. ANCP policies are configured using the Manage Subscriber Policies form.
- Routing policies control the size and content of the routing tables, the routes that are advertised, and the best route to take to reach a destination. Routing policies are configured using the Routing Policy Manager.
- Time of day suites specify time and day restriction policies that are assigned to QoS policies and schedulers, ACL filters, and aggregation schedulers. Time of day suites and time range policies are configured using the Time of Day Suite form and Time Range form, respectively.

See chapter 42 for more information about policies.

Although IES is part of the routing domain, the usable IP address space may be limited. IES allows a portion of the service provider address space to be reserved for service IP provisioning and to be administered by a separate, but subordinate, address authority.

Multiple IESs can be created to separate customer-owned IP interfaces. More than one IES can be created for one customer. More than one IP interface can be created in one IES. All IP interfaces created in an IES belong to the same customer.

The IES IP interfaces are restricted to the routing protocols that can be defined on the interface based on the fact that the customer has a different routing domain for this service. The IP interfaces support the following routing protocols:

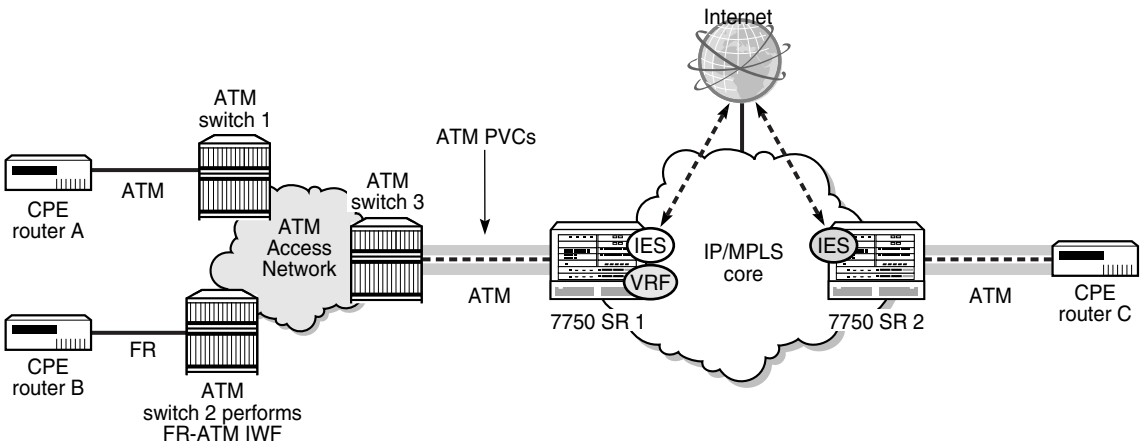
- RIP
- OSPF

- BGP
- IS-IS
- PIM
- IGMP

Customer routes can be advertised to the network core using static routes, RIP, or BGP. BGP and static routes are the most commonly used routing methods.

IPCP extensions allow you to configure IP addresses and DNS names of remote devices to enable inter-operability with other networks. Specifically setting an IPCP extension is necessary to connect to a mobile service provider network. Routers for mobile services rely on other network routers to provide IP addresses and DNS names (primary and secondary) for a PPP link.

When an IPCP extension is configured, an edge device configured with PPP/MLPPP can signal a far end device.



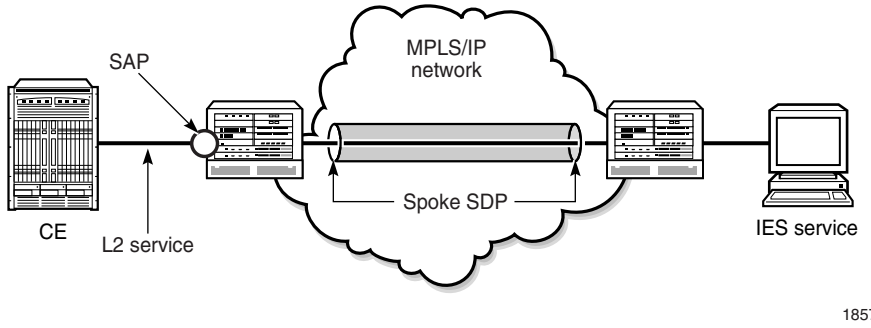
An IES can be connected to a VLL service or to a VPLS by an internal cross-connect through a CCAG adapter. This configuration eliminates the need for the physical port, cable, and other MDA-specific components and results in a less costly and more reliable interconnection. See chapter 74 for information about joining services to form composite services.

ATM SAP terminations for IES

CE routers that have access to an ATM network can connect with an IES service using ATM SAP terminations on a 7750 SR or 7710 SR. The interconnection between ATM point-to-point and L3 services uses RFC 2684-encapsulated IPv4 traffic over an ATM PVC that terminates on a specially configured SAP. All RFC 2684-encapsulated traffic can be routed over ATM networks, frame relay, and directly through ATM connections.

Figure 70-1 shows how CPE router A in an existing ATM network can access L3 IP services, such as an IES, using a statically configured ATM PVC on a 7750 SR (SR #1). CPE router B is connected to a frame relay, which connects to ATM switch 2 through IWF (service interworking). The RFC 2684-encapsulated traffic moves from both CPE routers through the ATM access network to a SAP configured on a 7750 SR #1 to serve a specific IES. At the same time, SDPs on the router are configured to a service to forward traffic over the IP/MPLS core. Destination CPE router C can receive RFC 2684-encapsulated traffic over an IP network over an ATM switch connected directly using 7750 SR #2.

Figure 70-1 ATM SAP network connection to an IES



The two connection methods used between an ATM network and the IES router: LLC/SNAP encapsulation and VC multiplexing.

A VLL Epipe service can terminate directly on an IES service using an SDP spoke on the 7750 SR, 7450 ESS, or 7950 XRS. Traffic that terminates on an IES service is identified by the interface ID of the SDP on the L2 access router and the VC ID label in the service packet. All routing protocols supported by IES are also supported for spoke SDP termination.

Figure 70-2 shows a spoke SDP terminating directly on an IES. The spoke SDP could be tied to VLL Epipe or VPLS. No configuration is required for the CE-to-PE connection on the SAP.

Figure 70-2 SDP spoke termination on an L2 service

Routed CO dual homing using SRRP

Subscriber Router Redundancy Protocol (SRRP) allows two separate connections to an access NE such as DSLAM to operate in an active/standby configuration similar to the way in which VRRP interfaces operate. SRRP is a collection of functions and messaging protocols that allows a system to create a set of redundant gateway IP addresses that are shared by a local and remote NE.

Each SRRP instance is created within the context of a subscriber group IP interface and is identified by a unique SRRP instance ID, which must be unique within the NE. This SRRP instance controls the redundant routing for all subscriber subnets configured or associated with the group interface. One SRRP instance is supported for each group interface and the SRRP ID must be the same as the SRRP instance ID on the group IP interface on the redundant NE.

A subscriber subnet redundant gateway IP host address is assigned at the subscriber IP interface level and is used for each SRRP instance associated with the subscriber subnet. The redundant IP host address must be configured for a subscriber subnet before it can be associated with an SRRP instance.

When SRRP is active on a group interface, the SRRP instance advertises to a remote NE using in-band messaging on the group-interface SAPs and out-of-band messaging on the group-interface redundant interface. If the remote NE uses the same SRRP instance ID, one NE enters a master state, while the other NE enters a backup state. Since the NEs share a common SRRP gateway MAC address (used for the SRRP gateway IP address and for proxy ARP functions), either NE can act as the default gateway for the attached subscriber hosts. This functionality helps to preserve subscriber QoS enforcement. The master state allows routing to and from the subscriber hosts associated with the group IP interface. The backup state stops ingress forwarding for packets destined to the SRRP gateway MAC and causes all packets destined to subscriber hosts on the group IP interface to be forwarded to a redundant IP interface associated with the group IP interface.

Normally, when anti-spoofing is enabled on a group-interface SAP, the SAP drops SRRP packets because they do not contain a subscriber MAC or IP address. However, you can use a configuration option to enable anti-spoofing for subscriber hosts on a group-interface SAP that participates in SRRP advertisements.

The underlying mechanism that controls state transitions is based on a dynamic priority level that an SRRP instance maintains. The SRRP instance with the highest priority level assumes the master operating state. An SRRP instance with a higher current priority level always preempts an SRRP instance with a lower priority level. If the priority levels are equal, the SRRP instance with the lowest source SRRP host IP address assumes the master state. The local SRRP instance priority may also be controlled by associating the instance with an existing VRRP policy.

To prevent a flood of AccessInterfaceDown alarms that an SRRP fault or link failure may generate for LAG-based MSAPs, the 5620 SAM performs alarm suppression. See chapter 65 for more information.

The redundant IP interface is a special interface that connects two systems with one or more common SRRP instances. The interface is configured with a /31 address and a spoke SDP binding, creating an Ethernet pseudowire shortcut between the redundant NEs. When the SRRP instance is in backup state, the group interface associated with this instance is not allowed to forward or route traffic downstream towards the subscriber. As a result of this, the packets are shunted across the redundant interface so that the active group interface does the forwarding or routing.

If the redundant IP interface goes down, the system allows the group IP interfaces associated with the down interface to forward locally downstream, when they are in the backup SRRP state. While forwarding downstream in the backup state, the system uses the MAC address associated with the group IP interface, not the SRRP redundant gateway MAC address.

SRRP is supported on the 7450 ESS in mixed mode, 7710 SR and 7750 SR.

DoS protection

To protect an IES from a high incoming packet rate that characterizes a DoS attack, you can use the 5620 SAM to create DoS protection policies for the IES L3 access interfaces. A DoS protection policy limits the number of control-plane packets that an interface receives each second, and optionally logs a violation notification if a policy limit is exceeded. You can use the NE System Security form to view the violations for a specific NE.

You can configure a DoS protection policy to control the following on an IES L3 access interface:

- the control-plane packet arrival rate per subscriber host on the interface
- the overall control-plane packet arrival rate for the interface
- whether an NE sends a notification trap if a policy limit is exceeded

Each IES L3 access interface on an NE that supports DoS protection is automatically assigned a default DoS protection policy. This default policy limits only the overall packet arrival rate for the interface, and cannot be deleted or modified. See "To configure an NE DoS protection policy" in the *5620 SAM System Administrator Guide* for information about creating a DoS protection policy.

DDoS protection

To protect an IES from a high incoming packet rate that characterizes a DDoS attack, you can use the 5620 SAM to configure TMS interfaces to route malicious traffic through the ISA-TMS MDA where the malicious traffic is cleaned before being released to the network.

The TMS interface on an IES consists of one IES and two VPRNs as follows:

- The management VPRN communicates with the TMS server to determine whether incoming packets are malicious. Configuration of this VPRN is optional.
- The Off-Ramp VPRN receives the malicious traffic and routes it through the ISA-TMS MDA where the traffic is scrubbed. Configuration of this VPRN is mandatory.
- The On-Ramp IES returns the cleaned traffic to the network. Configuration of this IES is mandatory.

See Procedure 70-14 for information about creating a TMS interface on an IES.

You can configure a DDoS protection policy on an IES group interface SAP or L3 access interface. See "To configure an NE DDoS protection policy" in the *5620 SAM System Administrator Guide* for information about configuring a DDoS protection policy.

Local DHCP servers

A local DHCP server can be associated with a network interface or L3 access interface on an IES. See section 65.4.

Local user database

A local user database can be associated with a local DHCP server and PPPoE configurations on group interfaces. See section 65.4.

PPPoE protocol on IES

An IES can be configured to support PPPoE. PPPoE is used in subscriber networks to encapsulate PPP frames inside Ethernet frames. PPPoE combines the point-to-point protocol used by DSL sessions with Ethernet framing to support multiple subscribers in a LAN. Using the group interface configuration form, you can assign a PPPoE policy and a local user database to authenticate PPPoE subscribers.

L2TP configuration for IES

An IES group interface can be configured to terminate LNS PPP sessions. L2TP is a session-layer protocol that extends the PPP model by allowing L2 and PPP endpoints to reside on different devices that are interconnected by a PSN. L2TP extends the PPP sessions between the CPE and PPP/L2TP termination points on the L2TP network server (LNS), via an intermediate L2TP access concentrator (LAC). The LAC is the initiator of session-generated L2TP tunnels; the LNS is the server that waits for new tunnels. Manually configured and initiated L2TP tunnels can be initiated or stopped from either the LNS or LAC.

After a tunnel is established, the network traffic between the peers is bidirectional. If a tunnel carrying a session fails, another tunnel from the same tunnel group re-establishes the session. Within each L2TP tunnel, one or more L2TP sessions can exist. Each L2TP session transports PPP packets.

At least one ISA-LNS group must be configured for the LNS NE.

On an LNS NE, L2TP destinations configured for L2TP tunnel profiles can include the following:

- loopback L3 access interfaces for a VPRN or IES service
- loopback interfaces configured for a base routing instance

See chapter 14 for more information about ISA-LNS groups. See Procedure 14-6 for information about creating and configuring an ISA-LNS group. See chapter 23 for more information about L2TP. See Procedure 70-12 for information about configuring an IES group interface to terminate LNS PPP sessions.

70.2 Sample IES configuration

Figure 70-3 shows a sample IES configuration.

Figure 70-3 Sample IES configuration

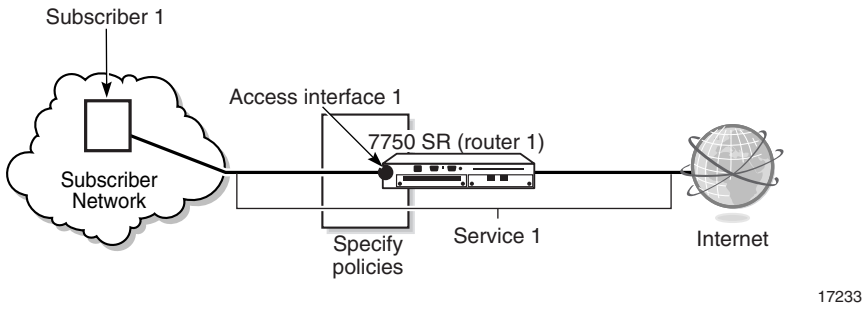


Table 70-1 lists the high-level tasks necessary to configure this sample IES.

Table 70-1 Sample IES configuration

Task	Description
1. Configure policies as required	Policies should be configured prior to creating a service. Participation in policies by access interfaces is defined when you configure or modify access interfaces during service creation or modification. The following key policies can be applied to resources that are part of an IES. • QoS access ingress and egress interface policies. Choose Policies→QoS→SROS QoS→Access Ingress or Access Egress, then the name of the form you need to configure, to open these forms. • Scheduler policy. Choose Policies→QoS→SROS QoS→Scheduler, then the name of the form you need to configure, to open the scheduler policy forms. • ACL IP filter policies. Choose Policies→Filter→ACL IP Filter to open the IP filter form. • Accounting policy. Choose Tools→Statistics→Accounting Policies to open the accounting policy form. • ANCP policy. Choose Policies→Residential Subscriber to open the Manage Subscriber Policies form.
2. Create and configure Subscriber 1	Choose Manage→Service→Customers to open the customer manager form and create a customer.

(1 of 2)

Task	Description

3. Create and configure Service 1	Ensure that the operator creating the service has Service Mgmt and Interface Mgmt user group privileges. See "5620 SAM user security tasks" in the *5620 SAM System Administrator Guide* for more information about user and user group privileges.
	Choose Create→Service→IES. Use the tabbed form and embedded navigation tree to configure the service. You configure the following key elements when you configure Service 1.
	• Choose Subscriber 1 as the customer for the IES.
	• Choose router 1 as the site for the IES.
	• Create and configure Access interface 1. You do the following to configure an access interface:
	  • Configure general parameters such as a name, ID, and MAC address.
	  • Assign an application profile, if required.
	  • Assign a transit IP or transit prefix policy, if required.
	  • Specify a port that is in access or hybrid mode.
	  • Add unicast routing protocols as required.
	  • Assign ingress and egress QoS policies, as required.
	  • Add multicast routing protocols as required.
	  • Assign an aggregation scheduler for traffic rate limiting across the card or port, if required. Otherwise, assign ingress and egress scheduler policies.
	  • Assign ACL filter policies as required.
	  • Assign an accounting policy, if required.
	  • Specify a local DHCP server, if required.
	  • Specify a ToD suite, if required.
	  • Configure subscriber management parameters, if required.
	  • Specify a DoS protection policy, if required.
	  • Specify a DDoS protection policy, if required.
	  • Specify one or more IP addresses for the IES access interface: one primary IP address and, optionally, multiple secondary IP addresses.
	  • Specify BFD parameters as required.
	  • Configure the ARP timeout and proxy ARP settings, if required.
	  • Configure IPCP parameters, if required.
	  • Configure ICMP parameters, if required.
	  • Configure DHCP parameters, if required.
	  • Configure ARP host configuration, if required.
	  • Configure VRRP parameters, if required.
	  • Configure anti-spoofing parameters, if required.
	  • Create a MEP, if required.
	  • Configure router advertisement parameters.
	  • Create QoS policy overrides, if required.
	  • Configure ANCP parameters, if required.

(2 of 2)

70.3 Workflow to create an IES

The following workflow lists the high-level steps required to create an IES. As a prerequisite for creating a IES, this workflow assumes the following:

- a group or customer with the required user access privileges has been configured.
- the IP or IP/MPLS core network exists.
- any required service tunnels are created including the static or dynamic LSP required to create the service tunnel; see Procedure 27-1.
- the access ports for the service are created; see chapter 16 for more information.

- any required pre-defined routing, QoS, scheduling, filter, accounting, and time of day suite policies are created; see chapter 42 for more information. You do not have to create pre-defined policies if policies are created on a per-service basis.
- any required MP-BGP for PE-to-PE routing is configured; see chapter 23 for more information about protocol configuration.

1 Create the IES. See Procedure 70-1.

   i Choose a customer to associate with the IES.

   ii Define the general properties for the IES.

   iii Turn up the IES service.

2 As required, configure AA reporting to the 5670 RAM. See Procedure 70-2.

3 As required, create an IES site or GNE IES site. See Procedures 70-3 and 70-4.

4 As required, perform one or more of the following on an IES site.

   a Apply routing protocols, such as OSPF, RIP, or IS-IS, to an IES site, if required. See Procedure 70-5.

   b Add an IGMP interface to an IES. See Procedure 70-6.

   c Add a PIM interface to an IES. See Procedure 70-7.

   d Create an L2 SDP spoke termination on an IES service. See Procedure 70-8.

   e Add a subscriber interface to an IES. See Procedure 70-10.

   f Add an AARP interface to an IES. See Procedure 70-11.

   g Add a group interface to an IES. See Procedure 70-12.

   h Configure WLAN GW for an IES group interface. See Procedure 70-13.

   i Add a TMS interface to the IES. See Procedure 70-14.

   j Implement dual homing using SRR. See Procedure 70-15.

   k Create and enable a video interface for the IES site, if required. See Procedure 30-2.

5 As required, create an L3 access interface on an IES site. See Procedure 70-17.

6 As required, perform one or more of the following on an IES L3 access interface.

   a Configure custom object attributes for AA reporting to the 5670 RAM. See Procedure 70-18.

   b Bind the L3 access interface to a VPLS site. See Procedure 70-19.

   c Apply OSPF, RIP, or IS-IS to an IES L3 interface. See Procedure 70-20.

   d Assign ingress and egress QoS policies. See Procedure 70-21.

   e Assign ingress and egress QoS policies on the 7210 SAS. See Procedure 70-22.

f Configure scheduling. See Procedure 70-23.

g Assign ingress and egress ACL filters. See Procedure 70-24.

h Associate a local DHCPv4 or DCHPv6 server. See Procedure 70-25.

i Assign an accounting policy. See Procedure 70-26.

j Assign an ANCP policy. See Procedure 70-27.

k Assign a time of day suite. See Procedure 70-28.

l Configure residential subscriber management. See Procedure 70-29.

m Assign a DoS protection policy or DDoS protection policy. See Procedure 70-30.

n Assign an IP address. See Procedure 70-31.

o Configure bi-directional forwarding detection. See Procedure 70-32.

p Configure IPv4 ICMP. See Procedure 70-33.

q Configure IPv6 ICMP. See Procedure 70-34.

r Configure IPCP. See Procedure 70-35.

s Configure ARP. See Procedure 70-36.

t Configure neighbor discovery. See Procedure 70-37.

u Configure IPv4 DHCP. See Procedure 70-38.

v Configure ATM. See Procedure 70-39.

w Create a VRRP instance. See Procedure 70-40.

x Configure anti-spoofing filters. See Procedure 70-41.

y Configure router advertisement. See Procedure 70-42.

z Specify queue overrides. See Procedure 70-43.

aa Configure IPv6 DHCP. See Procedure 70-44.

ab Configure an MLD interface on the L3 access interface. See Procedure 23-62.

7 As required, view IES information.

a View the IES service operational status. See Procedure 70-45.

b View the service topology map associated with an IES. See Procedure 70-46.

8 As required, create an L3 access interface on an IES site.

9 As required, modify a IES.

a Using the Manage Services form. See Procedure 70-47.

b Using the topology view. See Procedure 70-48.

10 As required, delete an IES. See Procedure 70-49.

70.4 IES management procedures

Use the following procedures to perform IES creation and management tasks.

Procedure 70-1 To create an IES

Note — The 7210 SAS-M does not support IES in Network mode.

1 Choose Create→Service→IES from the 5620 SAM main menu. The IES Service (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the IES. The Select Customer - IES Service form opens.

3 Choose a customer for the IES and click on the OK button. The Select Customer - IES Service form closes, and the IES Service (Create) form reappears with the customer information displayed in the Customer panel.

4 Configure the parameters:

- Service ID
- Auto-Assign ID
- SVC Mgr Service ID
- Service Name
- Description
- Service Tier
- Service Priority
- Administrative State
- Current OLC State
- Revert OLC State

The Service ID parameter is configurable when the Auto-Assign ID parameter is disabled.

The SVC Mgr Service ID parameter is configurable when the Auto-Assign ID parameter is disabled.

The Current OLC State and Revert OLC State parameters are configurable when you click on the Apply button.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button to confirm the action. The IES Service (Create) form closes.

7 Close the Manage Services form.

Procedure 70-2 To configure an IES for AA reporting to the 5670 RAM

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services is displayed.

3 Choose an IES in the list and click on the Properties button. The IES Service (Edit) form opens with the General tab displayed.

4 Click on the Application Assurance tab. The 5670 RAM Parameters tab is displayed.

5 Configure the parameters:

- Enable Application Performance Reporting
- Report Customer Name
- Number of IP Detail Addresses

6 To configure one or more custom DCP groups, see the custom DCP group configuration procedure in chapter 76.

7 To specify an application or application group for IP detail reporting, click on the IP Detail Application or IP Detail Application Group tab, as required. The IP Detail Application or IP Detail Application Group (Create) form opens.

Otherwise, go to step 13.

8 Configure the parameters:

- ID
- Auto-Assign ID

9 Click on the Select button and choose an application or application group from the Select Application or Select Application Group form.

10 Click on the OK button. The IP Detail Application or IP Detail Application Group (Create) form closes, and a dialog box appears.

11 Click on the OK button. The application or application group is listed on the IES Service (Create) form.

12 To specify another application or application group for IP detail reporting, repeat steps 7 to 11.

Note — You can specify up to 10 applications and up to 10 application groups.

13 Close the IES Service (Edit) form.

14 Close the Manage Services form.

Procedure 70-3 To configure an IES site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Perform one of the following.

a Create an IES site by performing the following steps:

i On the navigation tree, right-click on the Site icon and choose Create IES Site. The Select Network Elements - IES Service form opens with a list of available sites displayed.

ii Choose a site and click on the OK button. The IES Site (Create) form opens with the General tab displayed.

b Configure an existing IES site by performing the following steps:

i Expand the Sites icon in the service navigation tree.

ii Right-click on a Site icon and choose Properties from the contextual menu. The IES Site (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State
- Tunnel Fault Notification

Tunnel Fault Notification is configurable on sites where the device has ports configured in access or hybrid mode with QinQ encapsulation.

If you are configuring a tunnel facility MEP, Tunnel Fault Notification must be set to Accept in order to receive the fault notification from the tunnel facility MEP.

6 Click on the OK button. A dialog box appears.

7 Click on the OK button. The IES Site (Create) form closes, and the IES Service (Edit) form reappears with the new site information displayed in the service navigation tree.

8 Close the IES Service (Edit) form.

9 Close the Manage Services form.

Procedure 70-4 To configure a GNE site on an IES service

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the General tab displayed.

4 On the component tree, right-click on IES Service and choose Create GNE Site. The Select Network Elements - IES Service form opens with a list of available sites.

5 Choose a site and click on the OK button. The GNE Site (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Name
- Description

7 Click on the Apply button.

8 To configure an interface for the GNE site, perform the following steps:

i Click on the GNE Service Interfaces tab and then click on the Create button. The GNE Service Interface (Create) form opens with the general tab displayed.

ii Configure the parameters:

- Name
- Description
- Type

iii Click on the Ports tab and then click on the Select button beside the Interface Index field. The Select Generic NE Interface form appears.

iv Choose an interface and click on the OK button. The GNE Service Interface (Create) form reappears with the interface information displayed.

v Configure the parameters:

- Encapsulation Type
- Outer Encapsulation Value
- Inner Encapsulation Value

vi Click on the OK button. The GNE Site (Create) form reappears with the interface information displayed in the service component tree.

9 Click on the Scripts tab to attach or execute configuration scripts on the GNE site.

The Scripts tab displays the script instances and versions that are applied to the device. See "Script management" in the *5620 SAM Scripts and Templates Developer Guide* for more information.

10 Click on the OK button. The IES Service (Edit) form reappears with the new information displayed in the service component tree.

11 Click on the OK button. The IES Service (Edit) form closes.

You can use the topology maps to view the service. See chapter 6 for more information about service topology maps.

Procedure 70-5 To apply OSPF, RIP, or IS-IS to an IES site

Note — OSPF, RIP, or IS-IS must be enabled at the routing instance level before you can apply OSPF, RIP, or IS-IS to an IES.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose an IES in the list and click on the Properties button. The IES Site (Edit) form opens with the general properties of the service displayed on the General tab.

4 Click on the Sites tab.

5 Choose a site in the list and click on the Properties button. The IES Site (Edit) form opens.

6 Click on the Routing tab.

7 In the Protocols tab, click on the Create button. The Create Interface form opens.

8 Specify the interface type by configuring the What type of interface would you like to create? parameter.

9 Click on the OK button. The Interface (Create) form opens. See section 23.2 for information about configuring specific routing protocols.

Procedure 70-6 To add an IGMP interface to an IES

Note — IGMP must be enabled on the NE routing instance before you can create an IGMP interface.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose an IES and click on the Properties button. The IES Service (Edit) form opens with the General tab displayed.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on the Site icon and choose Properties from the contextual menu. The IES Site (Edit) form opens with the General tab displayed.

6 Click on the Multicast tab.

7 Click on the Interfaces tab.

8 Click on the Add button. The Create Interface form opens.

9 Set the What type of interface would you like to create? parameter to IGMP.

10 Click on the OK button. The IGMP Interface (Create) form opens with the General tab displayed.

11 Click on the Select button to specify an interface. The Select Interface form opens.

12 Click the Search button. A list of interfaces appears at the bottom of the Select Interface form.

13 Choose an interface and click the OK button. The Select Interface form closes and the Interface panel refreshes with the interface parameters.

14 Configure the parameters:

- Description
- Administrative State
- Administrative Version

15 Click on the Behavior tab.

16 Configure the parameters:

- Import Policy
- Maximum Number of Groups
- Maximum Number of Sources
- Subnet Check
- Disable Router Alert Check
- Sub Hosts Only

17 Click on the Multicast CAC tab to add a multicast CAC policy, if required. The General tab is displayed.

18 Click on the Select button in the Select Multicast CAC Policy panel to choose a multicast CAC policy. The Select Multicast CAC Policy - IGMP Interface form opens.

19 Choose a multicast CAC policy and click on the OK button. The Select Multicast CAC Policy - IGMP Interface form closes and the IGMP Interface, Routing Instance (Create) form appears.

20 Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)
- Constraint Admin State

21 Click on the Static Group/Source tab to add a static multicast group or source, if required.

22 Click on the Create button to add a new entry. The StaticGrpSrc, Interface ID - 6, Routing Instance (Create) form opens.

23 Configure the parameters:

- Static Multicast Group
- Static Source

24 Click on the OK button. The StaticGrpSrc, Routing Instance (Create) form closes and a dialog box appears.

25 Click on the OK button to confirm the action. The IGMP Interface, Routing Instance (Create) form reappears.

26 Click on the OK button to close the IGMP Interface, Routing Instance (Create) form.

27 Click on the OK button to close the IGMP Interface (Create) form.

28 Click on the Group Interfaces tab to identify an IGMP group interface for the IES service, if required.

i Click on the Create button. The IGMP Group Interface - Routing Instance (Create) form opens with the General tab displayed.

ii Configure the parameters:

- Description
- Query Source IP
- Administrative State
- Administrative Version
- Forwarding Service ID

iii Click on the Select button beside the Interface ID field in the IGMP Group Interface panel to choose an IGMP group interface.

iv Choose an IGMP group interface and click on the OK button. The Select IGMP Group Interface form closes and the IGMP Group Interface - Routing Instance (Create) form appears.

v Configure the parameters:

- Maximum Number of Groups
- Maximum Number of Sources

vi Click on the Multicast CAC tab to add a multicast CAC policy, if required. The General tab is displayed.

vii Click on the Select button in the Multicast CAC Policy panel. The Select Multicast CAC Policy - IGMP Interface Group form opens.

viii Choose a multicast CAC policy and click on the OK button. The Select Multicast CAC Policy - IGMP Group Interface form closes and the IGMP Interface, Routing Instance (Create) form reappears.

ix Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)
- Constraint Admin State

x Click on the OK button to close the IGMP Group Interface - Routing Instance (Create) form.

29 Close the Site (Edit) form.

30 Close the IES Service (Edit) form.

31 Close the Manage Services form.

Procedure 70-7 To add a PIM interface to an IES

Note — Before you can add a PIM interface to an IES, PIM must be applied to All or IES during the PIM configuration at the routing instance level. See Procedure 23-40 for more information.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose an IES and click on the Properties button. The IES Service (Edit) form opens with the General tab displayed.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on the Site icon and choose Properties from the contextual menu. The IES Site (Edit) form opens with the General tab displayed.

6 Click on the Multicast tab.

7 Click on the Add button. The Create Interface form opens.

8 Set the What type of interface would you like to create? parameter to PIM.

9 Click on the OK button. The PIM Interface (Create) form opens with the General tab displayed.

10 Click on the Select button to specify an interface. The Select Interface - PIM Interface form opens.

11 Configure the filter criteria. A list of available L3 access interfaces appears at the bottom of the Select Interface - PIM Interface form.

12 Choose an interface and click on the OK button. The Select Interface - PIM Interface form closes and the PIM Interface, Routing Instance (Create) form refreshes with the L3 access interface information.

13 Configure the parameters:

- Description
- Administrative State
- Administrative State IPv4
- BFD Enabled
- IPv6 BFD Enabled

14 Click on the Behavior tab.

15 Configure the parameters:

- Hello Interval (seconds)
- Tracking Support
- BSM Check Router Alert
- Improved assert
- Max Groups
- Three Way Hello
- Multicast Senders
- Hello Multiplier
- Assert Period
- DR Priority
- Sticky DR
- Sticky DR Priority
- P2MP to LDP Tree Join Enabled

Note — The Sticky DR Priority parameter is configurable when the Sticky DR parameter is enabled.

16 Click on the Neighbor tab, if present, to view and edit information. The Neighbor tab is present only when a neighbor PIM interface exists.

17 Click on the Multicast CAC tab to add a multicast CAC policy, if required. The General tab is displayed.

18 Click on the Select button in the Multicast CAC Policy panel to choose a multicast CAC policy. The Select Multicast CAC Policy - PIM Interface form opens.

19 Choose a multicast CAC policy and click on the OK button. The Select Multicast CAC Policy - PIM Interface form closes and the PIM Interface, Routing Instance (Create) form reappears.

20 Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)
- Constraint Admin State

21 Click on the IPv6 Specifics tab.

22 Configure the IPv6 Administrative State parameter.

23 Close the PIM Interface (Create) form.

24 Close the IES Site (Edit) form.

25 Close the IES Service (Edit) form.

26 Close the Manage Services form.

Procedure 70-8 To create an L2 SDP spoke termination on an IES service

Ensure that a service and site are created in the IES. To terminate an L2 service on an IES SDP spoke, you must identify the VC and an interface that belong to the VC. The interface must not have an associated port.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose an IES and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 On the navigation tree, click on the site to which you need to add the L2 SDP spoke termination; expand the entries for that site.

5 Right-click on Spoke Sdp Bindings and choose Create Spoke SDP Binding. The Spoke SDP Binding (Create) form opens with the General tab displayed.

6 Specify a source interface for the spoke SDP binding.

i Click on the Select button in the Source Interface panel. The Select Source Interface - Spoke SDP Binding form opens.

ii Configure the filter criteria. A list of source interfaces appears at the bottom of the Select Source Interface - Spoke SDP Binding form.

iii Choose a source interface and click on the OK button. The Select Source Interface - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form appears.

7 Specify a destination NE for the spoke SDP binding:

a If the destination NE is a managed NE, choose from a list of managed NEs.

i Click on the Select button beside the Tunnel Termination Site parameter. The Select Destination Network Element form opens.

ii Choose a destination NE and click on the OK button. The Select Destination Network Element form closes, and the Spoke SDP Binding (Create) form refreshes with the tunnel termination site (the destination NE) identifier displayed.

b If the destination NE is an unmanaged NE, specify the system ID for the Tunnel Termination Site parameter.

8 Configure the parameters:

- Description
- VC ID
- VC Type
- Auto-Assign ID
- Ingress Label
- Egress Label
- Enable Ingress FlowSpec IPv4
- Enable Ingress FlowSpec IPv6

These parameters appear only when a source interface is assigned to the spoke SDP binding.

9 Configure the parameters in the Hash Label panel:

- Enable Hash Label
- Enable Signal Capability

The Enable Hash Label and Enable Signal Capability parameters can only be configured for spoke-SDP bindings that are access interface terminated.

10 Perform one of the following to specify a transport tunnel for the spoke SDP binding.

a Let the 5620 SAM configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure the Tunnel Auto-Selection Transport Preference parameter.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Spoke SDP Binding form opens.

ii Choose a service tunnel for the spoke SDP binding and click on the OK button. The Select Tunnel - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the service tunnel identifier.

c Configure an MPLS-TP transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Spoke SDP Binding form opens.

ii Select an MPLS-TP service tunnel for the spoke SDP binding and click on the OK button. The Select Tunnel - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the service tunnel identifier. See Procedure 27-1 for more information about how to create an MPLS-TP service tunnel.

11 Specify an application profile for the spoke SDP binding.

i Click on the Select button beside the Application Profile parameter. The Application Profile String: - Spoke SDP Binding form opens.

ii Configure the filter criteria. A list of application profiles appears.

iii Choose an application profile and click on the OK button. The Application Profile String: - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form appears.

Note — The Application Profile String: - Spoke SDP Binding - IES service form displays only local profiles on the NE.

12 Choose one of the following AA transit policy types, if required.

Note 1 — You can only associate one AA transit policy type with a service object.

Note 2 — To bind a transit policy to an L3 access interface, a port must already exist on the interface.

Note 3 — You can bind a transit policy to only one L3 access interface or spoke SDP binding per NE.

Note 4 — The transit policy and the application profile must belong to the same application assurance group or partition.

a Associate an AA transit IP policy with the service object:

i Click on the Select button in the Transit IP Policy panel. The Select Transit IP Policy form opens.

ii Choose a transit IP policy and click on the OK button.

b Associate an AA transit prefix policy with the service object:

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.

ii Choose a transit IP policy and click on the OK button.

13 Associate an AA redundant protocol with the service object:

i Click on the Select button in the AA Redundant Protocol panel. The Select AA Redundant Protocol form opens.

ii Choose an AA redundant protocol and click on the OK button. The Select AA Redundant Protocol form closes.

14 Configure the AARP Service Reference Type parameter.

15 To configure custom object attributes for AA reporting to the 5670 RAM, perform the following steps:

i Click on the 5670 RAM Parameters tab.

ii Click on the Reporting tab.

iii Click on the Create button. The AA Reporting (Create) form opens.

iv Configure the parameters:

- Customer Name
- Subscriber Class
- Total Bandwidth Upstream (Kbps)
- Class of Service 1 Bandwidth Upstream (Kbps)
- Class of Service 2 Bandwidth Upstream (Kbps)
- Class of Service 3 Bandwidth Upstream (Kbps)
- Class of Service 4 Bandwidth Upstream (Kbps)
- Subscriber Name
- Subscriber Type
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)

v Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.

vi Click on the General tab.

16 Click on the QoS tab.

17 Configure the required parameters in the Forwarding Plane Redirect panel:

i Click on the Network Policy Select button to assign a policy to the Spoke SDP Binding. The Select Network Policy form opens.

ii Choose a policy and click on the OK button. The Network Policy form closes and the Spoke SDP Binding (Create) form refreshes with the Network Policy information displayed.

iii Click on the Ingress Queue Group Template Policy Select button to assign a policy to the Spoke SDP Binding. The Select Ingress Queue Group Template Policy form opens.

iv Choose a policy and click on the OK button. The Ingress Queue Group Template Policy form closes and the Spoke SDP Binding (Create) form refreshes with the Ingress Queue Group Template Policy information displayed.

v Configure the Instance ID parameter.

18 Configure the required parameters in the Port Redirect panel:

i Click on the Network Policy Select button to assign a policy to the Spoke SDP Binding. The Select Network Policy form opens.

ii Choose a policy and click on the OK button. The Network Policy form closes and the Spoke SDP Binding (Create) form refreshes with the Network Policy information displayed.

iii Click on the Egress Queue Group Template Policy Select button to assign a policy to the Spoke SDP Binding. The Select Egress Queue Group Template Policy form opens.

iv Choose a policy and click on the OK button. The Egress Queue Group Template Policy form closes and the Spoke SDP Binding (Create) form refreshes with the Egress Queue Group Template Policy information displayed.

v Configure the Instance ID parameter.

19 Click on the States tab.

20 Configure the Administrative State parameter.

21 Assign ingress and egress ACL filters to the spoke SDP binding, if required.

i Click on the ACL tab.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - Spoke SDP Binding form opens.

iii Choose an ingress ACL filter and click on the OK button. The Select Ingress Filter - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form reappears with the ingress ACL filter information displayed.

iv Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - Spoke SDP Binding form opens.

v Choose an egress ACL filter and click on the OK button. The Select Egress Filter - Spoke SDP Binding form closes, and the L3 Access Interface (Create) form reappears with the egress ACL filter information displayed.

22 Assign an accounting policy to the spoke SDP binding, if required.

i Click on the Accounting tab.

ii Configure the Collect Accounting Statistics parameter.

iii Click on the Select button to choose an accounting policy. The Select Accounting Policy - Spoke SDP Binding form opens.

iv Choose an accounting policy and click on the OK button. The Select Accounting Policy - Spoke SDP Binding form closes, and the L3 Access Interface (Create) form reappears with the accounting policy information displayed.

23 Associate a MEP with an SDP binding, if required.

i Click on the MEPs tab.

ii Click on the Create button. The MEP (Create) form opens with the General tab displayed.

iii Click on the Select button to choose a MEG. The Select Maintenance Entity Group form opens.

iv Choose an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Propagation
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)
- CCM Padding Packet Size (Bytes)

Note — The CCM Padding Packet Size (Bytes) parameter cannot be configured when the CCM interval parameter is set to 10 ms or 100 ms.

vi If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab. Otherwise, go to step 24.

vii Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

viii Click on the AIS tab.

ix Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

24 Click on the OK button. The MEP (Create) form closes.

25 Click on the OK button. The Spoke SDP Binding (Create) form closes and a dialog box appears.

26 Click on the OK button. The IES Service (Edit) form reappears with the new information displayed in the service navigation tree.

Procedure 70-9 To configure an MPLS-TP static pseudowire on an IES spoke SDP binding

Perform this procedure to create an MPLS-TP static pseudowire on the spoke SDP binding. An MPLS-TP service tunnel must be used in the SDP binding, and the Control Word parameter for pseudowire OAM must be set to Preferred. See Procedure 70-8.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Select an IES and click on the Properties button. The IES Service (Edit) form opens.

4 On the navigation tree, expand the site on which you want to configure the spoke SDP binding, and expand the Spoke SDP Bindings icon.

5 Click on the SDP binding on which you want to configure the MPLS-TP static pseudowire. The Spoke SDP Binding (Edit) form opens with the General tab displayed.

6 Click on the Control Channel tab.

7 Configure the parameters:

- Status
- Refresh Timer (seconds)
- Request Timer (seconds)
- Retry Timer (seconds)
- Timeout Multiplier
- Acknowledged

8 Click on the MPLS-TP PW tab.

9 Click on the Create button. The PW Path ID (Create) form opens.

10 Configure the Path AGI parameter.

11 Configure the parameters in the Source Attachment Individual Identifier panel:

- SAII Global ID
- SAII Node ID
- SAII AC ID

12 Configure the parameters in the Target Attachment Individual Identifier panel:

- TAII Global ID
- TAII Node ID
- TAII AC ID

13 Click on the OK button. The PW Path ID (Create) form closes.

14 Click on the OK button. The Spoke SDP Binding (Edit) form closes.

15 Close the IES Service (Edit) form.

16 Close the Manage Services form.

Procedure 70-10 To configure a subscriber interface on an IES

The 7450 ESS in mixed mode, 7710 SR and 7750 SR support the configuration of a subscriber interface in an IES.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears at the bottom of the Manage Services form.

3 Choose an IES and click on the Properties button. The IES Service (Edit) form opens.

4 On the navigation tree, navigate to the Subscriber Interfaces object. Perform one of the following:

a To create a subscriber interface, right-click on the Subscriber Interfaces object and choose Create IES Subscriber Interface from the menu. The IES Subscriber Interface (Create) form opens.

b To modify a subscriber interface, right-click on the subscriber interface object and choose Properties from the menu. The IES Subscriber Interface (Edit) form opens.

5 Configure the parameters:

- Auto-Assign ID
- Interface ID
- Name
- Description
- Administrative State
- Default Primary DNS Server Address
- Default Secondary DNS Server Address
- Allow Unmatched Subnets
- Tunnel Fault Notification

The Tunnel Fault Notification parameter is configurable on interfaces where the device has ports configured in access or hybrid mode with QinQ encapsulation.

If you are configuring a tunnel facility MEP, Tunnel Fault Notification must be set to Accept, in order to receive the fault notification from the tunnel facility MEP.

Note 1 — The Name value for a subscriber interface must be unique in the NE.

Note 2 — You must configure the Default Primary DNS Server Address parameter before you can configure the Default Secondary DNS Server Address parameter.

6 Click on the Select button in the Forwarding Service panel to choose a service. The Select Forwarding Service - IES Subscriber Interface form opens.

7 Choose a service and click on the OK button. The Select Forwarding Service - IES Subscriber Interface form closes, and the IES Subscriber Interface (Create) form reappears with the service information displayed.

8 Click on the Select button in the Forwarding Subscriber Interface panel to choose a subscriber. The Select Forwarding Subscriber Interface - IES Subscriber Interface form opens.

9 Choose a subscriber and click on the OK button. The Select Forwarding Subscriber Interface - IES Subscriber Interface form closes, and the IES Subscriber Interface (Create) form reappears with the subscriber information displayed.

10 Configure IPv6 forwarding on the subscriber interface, if required.

i Configure the IPv6 Allowed parameter.

ii Configure the parameters.

- Admin Link Local Address
- IPv6 Delegated Prefix Length
- IPv6 Allow Unmatching Prefixes
- Default Primary IPv6 DNS Server Address
- Default Secondary IPv6 DNS Server Address

You must remove the check mark from the Default check box to access the Default Primary IPv6 DNS Server Address and Default Secondary IPv6 DNS Server Address parameters.

iii Click on the IPv6 Subscriber Prefixes tab.

iv Choose a subscriber prefix and click on the Properties button, or click on the Create button to create a new subscriber prefix.

v In the Subscriber Prefix [Edit|Create] form, configure the parameters:

- Address ID
- IP Address
- Prefix Length
- WAN Host
- Prefix Delegation

11 Configure the Interface Class parameters, if required.

i Configure the Class parameter.

ii If you selected a value of Unnumbered for the Class parameter, configure the Unnumbered Type parameter.

iii Configure the Interface Name parameter or the IP Address parameter.

12 Configure the DHCP Server Synchronization parameters, if required:

- Delayed Up Period
- Delay on Init Only

13 Create IP addresses for the subscriber interface that are inherited by the SAPs in the group interfaces that are child objects of the subscriber interface.

i Click on the Addresses tab.

ii Click on the Create button. The IP Address (Create) form opens.

iii Configure the parameters:

- Address ID
- IP Address
- Prefix Length
- Populate Host Routes
- Track SRRP Instance
- Hold Up Time (milliseconds)
- Gateway IP Address
- Broadcast Address Format

iv Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

v Click on the OK button. The IES Subscriber Interface (Create) form reappears with the assigned IP addresses displayed.

vi Repeat steps ii to v for each additional IP address that you need to create.

14 Click on the DHCP tab.

15 Configure the parameters:

- IP address
- Use as source
- Enable DHCP Relay
- Description

16 Click on the Server tab.

17 Configure the parameters.

- Server 1 through Server 8
- Administrative State
- Emulated Server IP Address
- Lease Time
- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time Override

The Number of Days, Number of Hours, Number of Minutes, Number of Seconds, and Lease Time Override parameters are configurable only when the Lease Time parameter is set to Specified Time Period.

18 Click on the Client Applications tab.

19 Configure the Client Applications parameter. You can enable either or both of the PPPoE or DHCP choices.

20 Click on the PPPoE tab.

21 Configure the parameters:

- Description
- Session Limit

22 Click on the OK button. The IES Subscriber Interface (Create) form closes, and a dialog box appears.

23 Click on the OK button. The IES Service (Edit) form reappears with the new subscriber interface displayed in the service navigation tree.

24 Click on the OK button. A dialog box appears.

25 Click on the Yes button. The IES Service (Edit) form closes, and the Manage Services form reappears.

26 Close the Manage Services form.

Procedure 70-11 To add an AARP interface to an IES

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears at the bottom of the Manage Services form.

3 Choose an IES and click on the Properties button. The IES Service Subscriber (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you need to add the subscriber interface; expand the entries for that site.

5 Right-click on the AARP Interfaces icon below the site to which you need to add the subscriber interface, and choose Create AARP Interface. The AARP Interface (Create) form opens.

6 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- Configured IP MTU (Octets)

7 Click on the OK button. The AARP Interface (Create) form closes, and a dialog box appears.

8 Click on the OK button. The IES Service (Edit) form reappears with the new AARP interface displayed in the service navigation tree.

9 Click on the OK button. A dialog box appears.

10 Click on the Yes button. The IES Service (Edit) form closes, and the Manage Services form reappears.

11 Close the Manage Services form.

Procedure 70-12 To configure a group interface on an IES

The 7450 ESS in mixed mode, 7710 SR and 7750 SR support the configuration of a group interface in an IES.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose an IES and click on the Properties button. The IES Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, navigate to the site and subscriber interface on which you need to configure a group interface. Perform one of the following:

   a To create a group interface, right-click on the subscriber interface and choose Create IES Group Interface from the menu. The IES Group Interface (Create) form opens.

   b To modify a group interface, right-click on the group interface object and choose Properties from the menu. The IES Group Interface (Edit) form opens.

5 Configure the parameters:

- Auto-Assign ID
- Interface ID
- Name
- Description
- Administrative State
- MAC Address
- Trusted
- Operational State UP While Empty
- LNS
- Specific Type
- Enable WPP
- Enable Ingress Stats
- IPv6 Allowed
- IPv6 IPoE Bridged Mode Enabled
- QoS Route Lookup IPv4
- QoS Route Lookup IPv6
- Configured IP MTU

Note — The LNS parameter defines the type of group interface. This parameter is set at creation time and cannot be modified. Regular group interfaces cannot configure LNS attributes, and an LNS group interface does not allow PPPoE configuration or SAPs.

6 If you enabled the IPv6 Allowed parameter in step 5, configure IPv6 router advertisement and DHCPv6 on the group interface.

i Click on the IPv6 Advertisement tab and configure the parameters:

- Administrative State
- Current Hop Limit
- Managed Address Config
- Max Interval (seconds)
- Min Interval (seconds)
- Link MTU
- Other Stateful Config
- Reachable Time (milliseconds)
- Retransmit Time (milliseconds)
- Router Lifetime (seconds)
- Autonomous Address Configuration
- Preferred Life Time
- Valid Life Time

ii Click on the DHCPv6 tab.

iii Click on the Select button and select a local user database from the Select Local User Database form.

iv Click on the Proxy Server tab and configure the parameters:

- Administrative State
- Renew Timer
- Rebind Timer
- Valid Life Time
- Preferred Life Time
- Client Applications
- Server ID Type
- ID Type
- Value

Note — The ID Type and Value parameters are configurable only if the Server ID Type parameter is set to Enterprise.

v Click on the Relay tab and configure the parameters:

- Administrative State
- Description
- Remote ID
- Client Applications
- Link Address

vi Configure the Server 1 through Server 8 parameters.

vii Configure the interface name for each DHCPv6 server by clicking on the Select button in the Zone Index panel. The Select Zone Index - GrplfDhcpv6RelayCfg form opens with a list of local L3 access interfaces and network interfaces.

viii Choose an interface and click on the OK button. The Select Zone Index - GrplfDhcpv6RelayCfg form closes and the IES Group Interface form refreshes with the interface name.

Note — If you have entered a Unicast address, then the Interface Name parameter is not required.

7 If you enabled the Enable WPP parameter in step 5, configure WPP on the group interface.

i Click on the WPP tab.

ii Configure the Administrative State parameter.

iii Click on the Select button in the WPP Site panel and choose a WPP site from the Select WPP Site form.

iv Configure the Portal Name parameter.

v Click on the Select button beside the Initial Subscriber Profile parameter and choose a subscriber profile from the Select Subscriber Profile form.

vi Click on the Select button beside the Initial SLA Profile parameter and choose an SLA profile from the Select SLA Profile form.

vii Click on the Select button beside the Initial Application Profile parameter and choose an application profile from the Select Application Profile form.

viii Configure the Restore Default Profile On Disconnection parameter.

8 Click on the Anti-Spoofing tab.

9 Configure the ARP Populate parameter.

10 Click on the Subscriber Management tab.

11 Configure the parameters:

- SHCV Enabled
- SHCV Interval (minutes)
- SHCV Source
- SHCV Action
- SHCV Retry Timeout (seconds)
- SHCV Retry Count
- SHCV Family

12 Configure SRRP for the group interface, if required.

i Configure the parameters in the Routing panel:

- Enabled
- Hold Time (seconds)

ii Click on the SRRP tab.

iii Click on the Create button in the SRRP Instance panel. The SRRP Instance (Create) form opens with the General tab displayed.

iv Configure the parameters:

- SRRP ID
- Description
- Administrative State

v Click on the Select button in the Operational Group panel. The Select Monitored Group Name - SRRP Instance form opens.

vi Choose a Monitored Group Name and click on the OK button. The Select Monitored Group Name - SRRP Instance form closes.

vii Configure the Priority Step parameter.

viii Click on the Behavior tab.

ix Configure the General parameters:

- Gateway MAC Address
- Keep Alive Interval
- Priority
- Preempt
- FIB Population Mode
- One Gratuitous ARP Per SAP

x Click on the Select button in the Message Path panel. The Select Message Path Pointer - SRRP Instance form opens, displaying the SAPs available on the site.

xi Select the SAP you need to use for the in-band messaging between the sites and click on the OK button. The Select Message Path Pointer - SRRP Instance form closes.

xii Click on the Select button in the Policy Pointer 1 panel. The Select Policy Pointer 1 - SRRP Instance form opens.

xiii Choose an entry and click on the OK button. The Select Policy Pointer 1 - SRRP Instance form closes.

xiv Click on the Select button in the Policy Pointer 1 panel. The Select Policy Pointer 2 - SRRP Instance form opens.

xv Choose an entry and click on the OK button. The Select Policy Pointer 2 - SRRP Instance form closes.

xvi Click on the OK button. The SRRP Instance (Create) form closes and a dialog box appears.

xvii Click on the OK button.

13 Configure ICMP for the group interface, if required.

i Click on the ICMP tab.

ii Configure the parameters:

- Mask Reply
- Redirects
- Unreachables
- TTL Expired
- Number of Redirects
- Redirects Time (seconds)
- Number of Unreachables
- Unreachables Time (seconds)
- Number of TTL Expired
- TTL Expired Time (seconds)

14 Configure ARP for the group interface, if required.

i Click on the ARP tab. The General tab is displayed.

ii Configure the Timeout (seconds) parameter.

iii Click on the Proxy ARP tab.

iv Configure the parameters:

- Remote Proxy ARP
- Enable Local Proxy ARP
- Proxy ARP Policy 1 through Proxy ARP Policy 5

15 Configure DHCP relay for the group interface, if required.

i Click on the DHCP tab. The General tab is displayed.

ii Configure the parameters:

- Enable DHCP Relay
- Description
- Match Circuit ID
- Trusted
- Lease Populate
- L2 Header
- Anti-Spoof MAC Address

iii Depending on the type and release of device that you are configuring, the Subscriber Authentication Policy panel is present. Choose a Select Subscriber Authentication Policy, if required. Otherwise, go to step xiv.

iv Click on the Select button in the Subscriber Authentication Policy panel. The Select Subscriber Authentication Policy - GrpltfDhcpRelayCfg form opens.

v Configure the filter criteria, and click on the Search button. A list of available subscribers appears.

vi Choose a subscriber authentication policy and click on the OK button. The Select Subscriber Authentication Policy - GrpltfDchpRelayCfg form closes, and the IES Group Interface (Create) form refreshes with the subscriber authentication policy name.

vii Configure the parameters:

- Action
- Circuit ID
- Remote ID
- Remote ID String
- Vendor Specific Options
- Vendor String
- IP address (GI address)
- Use as source
- Relay Unicast Message

Note 1 — The Remote ID String parameter is configurable when the Remote ID is set to Remote IDString.

Note 2 — When the Relay Unicast Message parameter is set to Renew or Release Update Source IP, the GI address parameter can be configured as any local configured address in the same routing instance as the GI address for the DHCP relayed messages. If the Relay Unicast Message parameter is set to None, the GI address is restricted to the IP address configured on the subscriber interface.

viii Click on the Select button in the Local User Database panel to choose a local user database. The Select localUserDbPointer - GrpItfDhcpRelayCfg form opens.

ix Configure the filter criteria, and click on the Search button. A list of available databases appears.

x Choose a database and click on the OK button. The Select localUserDbPointer - GrpItfDhcpRelayCfg form closes, and the IES Group Interface (Create) form reappears with the database name information displayed.

xi Click on the Select button in the DHCP Filter panel to choose a filter policy to bind with the group interface. The Select dhcpFilterPointer - GrpItfDhcpRelayCfg form opens.

xii Configure the filter criteria, and click on the Search button. A list of available filter policies appears.

xiii Choose a filter policy and click on the OK button. The Select dhcpFilterPointer - GrpItfDhcpRelayCfg form closes, and the IES Group Interface (Create) form reappears with the filter policy information displayed.

xiv Click on the Server tab.

xv Configure the parameters:

- Server 1 to Server 8
- Administrative State
- Emulated Server IP Address
- Lease Time
- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time Override

Note — The following parameters are configurable when the Lease Time parameter is set to Specified Time Period.

- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time Override

16 Click on the Default Hosts tab to create a default host where the associated DHCP filter policy is configured with the Bypass Host creation action. See Procedure 44-7 for more information about DHCP filter creation. See step 15 xi for more information about how to bind a DHCP filter with the group interface.

i Click on the Create button. The Default Host (Create) form opens.

ii Click on the Select button in the Default Host Configuration panel to choose the Default Host IP Address parameter value for the DHCP filter policy to associate with the subscriber interface SAP. The Select Default Host Configuration form opens.

iii Configure the filter criteria, and click on the Search button. A list of available DHCP filter policies appears.

iv Choose a DHCP filter policy and click on the OK button. The Select Default Host Configuration form closes, and the Default Host (Create) form reappears with the IP address for the selected DHCP filter policy displayed.

v Configure the Next Hop IP Address parameter.

vi Click on the Apply button. The Default Host (Create) form closes and the default host is added to the Default Hosts list.

17 Click on the Client Applications tab. Configure the Client Applications parameter.

18 Configure PPP for the group interface, if required.

i Click on the PPP tab.

ii Configure the Description and Administrative State parameters in the PPPoE panel.

iii Click on the Select button beside the Policy field in the PPPoE panel and choose a PPPoE policy from the Select Policy form.

iv Click on the Select button beside the Local User DB field in the PPPoE panel and choose a PPPoE Local User DB from the The Select Local User DB form.

v Configure the remaining parameters in the PPPoE panel:

- Session Limit
- Session Limit per SAP
- Anti-Spoofing
- CCAG Use Original SAP
- Vendor Specific Option String

vi Configure the Description and Administrative State parameters in the PPP panel.

vii Click on the Select button beside the Policy field in the PPP panel and choose a PPP policy from the Select Policy form.

viii Click on the Select button beside the Local User DB field in the PPP panel and choose a PPP Local User DB from the The Select Local User DB form.

ix Configure the Session Limit parameter in the PPP panel

19 Configure the ARP host for the group interface, if required.

i Click on the ARP Host Configuration tab.

ii Configure the parameters:

- Administrative State
- ARP Host Limit
- Minimum Authentication Interval (minutes)
- SAP ARP Host Limit

20 Configure local address assignment for the group interface, if required.

i Click on the Local Address Assignment tab.

ii Configure the parameters:

- Administrative State
- Default Pool Name
- Secondary Pool Name

iii On the IPv4 Options panel, configure the PPP-v4 parameter and select a local DHCP server, if required.

iv On the IPv6 Options panel, configure the IPoE WAN and PPP SLAAC parameters and select a local DHCPv6 server, if required.

21 If you set the parameter LNS to TRUE in step 5, perform the following steps to configure LNS for the group interface.

Note — After you create an LNS group interface, you must configure the L2TP tunnel group profile or L2TP tunnel profile to terminate sessions for the LNS group interface; see Procedure 23-34 for more information. You can also configure the termination of sessions on a group interface using a RADIUS server.

i Click on the LNS tab.

ii Configure the Description parameter.

iii Click on the Select button in the Default Subscriber Profile panel. The Select Default Subscriber Profile (Terminate LNS PPP Sessions) form opens.

iv Choose a subscriber profile and click on the OK button. The Select Default Subscriber Profile (Terminate LNS PPP Sessions) form closes and the IES Group Interface (Create) form reappears with the Subscriber Profile displayed.

v Click on the Select button in the Default SLA Profile panel. The Select Default SLA Profile (Terminate LNS PPP Sessions) form opens.

vi Choose an SLA profile and click on the OK button. The Select Default SLA Profile (Terminate LNS PPP Sessions) form closes and the IES Group Interface (Create) form reappears with the SLA Profile displayed.

vii Click on the Select button in the Subscriber Identification Policy panel. The Select Subscriber Identification Policy (Terminate LNS PPP Sessions) form opens.

viii Choose a subscriber identification policy and click on the OK button. The Select Subscriber Identification Policy (Terminate LNS PPP Sessions) form closes and the IES Group Interface (Create) form reappears with the subscriber identification policy displayed.

ix Click on the Select button in the Default Application Profile panel. The Select Default Application Profile (Terminate LNS PPP Sessions) form opens.

x Choose a default application profile and click on the OK button. The Select Default Application Profile (Terminate LNS PPP Sessions) form closes and the IES Group Interface (Create) form reappears with the default application profile displayed.

22 Configure the Default Subscriber Identification Type parameter.

23 Click on the Service Access Points tab to configure SAPs for the group interface.

24 Click on the Create button. The IES Service Access Point (Create) form opens with the General tab displayed.

25 Configure the parameters:

- Name
- Description
- Administrative State
- Calling Station ID

26 Associate a host lockout policy with the group interface, if required. Click on the Select button in the Host Lockout panel to select a policy.

27 Click on the Port tab.

28 Click on the Select button to choose a port for the SAP. The Select Terminating Port - IES Service Access Point form opens.

Caution — The creation of a SAP that uses the same port and encapsulation values as an existing inactive MSAP fails under the following conditions:

- If you try to use the 5620 SAM to create a SAP, the configuration fails and the 5620 SAM displays an error message.
- If you use a CLI to create a SAP in a service other than the service that contains the MSAP, the configuration succeeds but the MSAP is inactive until the regular SAP is deleted. Although the 5620 SAM displays the SAP and MSAP, the MSAP remains inactive and consumes resources.
- If you use a CLI to create a SAP in the service that contains the MSAP, the SAP creation fails.

Alcatel-Lucent recommends that you delete an inactive MSAP from the 5620 SAM if you need to create a regular SAP on the same port using the same encapsulation values. See Procedure 65-34 for more information about deleting MSAPs.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

29 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - IES Service Access Point form closes, and the IES Service Access Point (Create) form displays the port information.

30 Configure the parameters:

- Outer Encapsulation Value
- Inner Encapsulation Value
- Outer Encapsulation Value (VPI)
- Inner Encapsulation Value (VCI)
- SAP Description
- SAP Administrative State

If the port uses dot1q encapsulation, you can enable the Auto-Assign ID parameter to have the Outer Encapsulation Value parameter automatically assigned. The system assigns the lowest unused encapsulation value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter on the User Preferences form. Choose Application→ User Preferences from the main menu.

The Inner Encapsulation Value is configurable only when the port is an Ethernet or frame relay port with QinQ encapsulation.

The Outer Encapsulation Value (VPI) and Inner Encapsulation Value (VCI) parameters are configurable only for ATM ports.

31 Assign ingress and egress QoS policies to the SAP, if required.

Note — Items such as policies, schedulers, and filters can be applied later to multiple service components at once. Choose and right-click the components in the service navigation tree, choose Properties, and configure the parameters on the appropriate tab. This action opens a properties form in a new window for the component that was right-clicked. The navigation tree is not displayed in this new window.

i Click on the QoS tab.

ii Configure the parameters:

- Ingress Match QinQ Dot1P
- Egress Mark QinQ Top Bits Only
- Use SAP ID as Subscriber ID

iii Click on the Select button in the Ingress Policy panel. The Select Ingress Policy - IES Service Access Point form opens.

iv Configure the filter criteria and click on the Search button. A list of available ingress policies appear.

v Choose an ingress QoS policy and click on the OK button. The Select Ingress Policy - IES Service Access Point form closes, and the IES L3 Service Access Point (Create) form reappears with the ingress QoS policy information displayed.

Note — If you select an ingress policy which has a forwarding class mapped to an ingress queue group, you must ensure that the port you selected in step 29 has the access ingress queue group with the same name created on it.

See Procedure 16-1for more information about how to configure Ethernet ports. See chapter 42 for more information about queue group template policies.

vi Click on the Select button in the Egress Policy panel. The Select Egress Policy - IES L3 Service Access Interface form opens.

vii Configure the filter criteria and click on the Search button. A list of available egress policies is displayed.

viii Choose an egress QoS policy and click on the OK button. The Select Egress Policy - IES Service Access Point form closes, and the IES Service Access Point (Create) form reappears with the egress QoS policy information displayed.

Note — If you select an egress policy which has a forwarding class mapped to an egress queue group, you must ensure that the port you selected in step 29 has the access egress queue group with the same name created on it.

See Procedure 16-1 for more information about how to configure Ethernet ports. See chapter 42 for more information about queue group template policies.

32 Click on the Schedulers tab to configure scheduling; otherwise, go to step 34.

Note — The Schedulers tab is displayed only if a port is assigned to the SAP earlier in the procedure.

33 Perform one of the following.

a Specify that an aggregation scheduler policy is not applied to the SAP.

i Set the Aggregation parameter to off.

Note — The Aggregation parameter is not configurable if the port you selected in step 29 is an HSMDA port.

ii Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

Note 1 — The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are displayed only when there is no scheduler specified in the Egress Scheduler panel.

Note 2 — The Frame-Based Accounting parameter is not configurable if the port you selected in step 29 is an HSMDA port.

Note 3 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

iii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - IES Service Access Point form opens.

iv Choose an ingress scheduler and click on the OK button. The Select Ingress Scheduler - IES Service Access Point form closes, and the IES Service Access Point (Create) form refreshes with the ingress scheduler information displayed.

v Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Ingress Policer Control Policy form opens.

vi Choose a policer control policy and click on the OK button. The Select Ingress Policer Control Policy form closes and the IES Service Access Point (Create) form reappears with the ingress policer control policy information displayed.

vii If the port you selected in step 29 is an HSMDA port, go to step 34.

viii Click on the Select button in the Select Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - IES Service Access Point form opens.

ix Choose an egress scheduler and click on the OK button. The Select Egress Scheduler - IES Service Access Point form closes, and the IES Service Access Point (Create) form refreshes with the egress scheduler information displayed.

x Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Egress Policer Control Policy form opens.

xi Choose a policer control policy and click on the OK button. The Select Egress Policer Control Policy form closes and the IES Service Access Point (Create) form reappears with the egress policer control policy information displayed.

xii Go to step 34.

b Specify that an aggregation scheduler policy is applied to the SAP.

Note — You cannot specify an access scheduler policy if the port you selected in step 29 is an HSMDA port. Go to step 34.

i Set the Aggregation parameter to on.

ii Click on the Select button in the Aggregation Scheduler panel to choose an aggregation scheduler. The Select Aggregation Scheduler - IES Service Access Point form opens.

iii Choose an aggregation scheduler and click on the OK button. The Select Aggregation Scheduler - IES Service Access Point form closes, and the IES Service Access Point (Create) form refreshes with the aggregation scheduler information displayed.

34 Assign ingress and egress ACL filters to the SAP, if required.

i Click on the ACL tab.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter from the Select Ingress Filter - IES Service Access Point form.

iii Click on the Select button in the Egress Filter panel to choose an egress ACL filter from the Select Egress Filter - IES Service Access Point form.

35 Click on the Accounting tab to assign an accounting policy to the SAP.

i Click on the Select button to choose an accounting policy. The Select Accounting Policy - IES Service Access Point form opens.

ii Choose an accounting policy and click on the OK button. The Select Accounting Policy - IES Service Access Point form closes, and the IES Service Access Point (Create) form reappears with the accounting policy information displayed.

iii Configure the Collect Accounting Statistics parameter.

36 Click on the Anti-Spoofing tab to configure anti-spoofing for the SAP. The Anti-Spoofing tab opens with the General tab displayed.

i Configure the Anti-Spoofing parameter.

ii Click on the Static Hosts tab to configure a static subscriber host entry for each subscriber host that is not managed by DHCP.

iii Click on the Create button. The Access Interface Anti-Spoofing Static Host Display (Create) form opens.

iv Configure the parameters:

- IP Address
- MAC Address
- Subscriber Identification
- Use SAP ID as Subscriber ID
- ANCP String
- Intermediate Destination ID

v Click on the Select button in the Subscriber Profile panel to choose a subscriber profile for the static host, if required. The Select Subscriber Profile - AntiSpoofingStaticHosts form opens with the list of available subscriber profiles displayed.

vi Choose a subscriber profile and click on the OK button. The Select Subscriber Profile - AntiSpoofingStaticHosts form closes, and the subscriber profile name appears in the Subscriber Profile panel.

vii Click on the Select button in the SLA Profile panel to choose an SLA profile for the static host. The Select SLA Profile - AntiSpoofingStaticHosts form opens with the list of available SLA profiles displayed.

viii Choose an SLA profile and click on the OK button. The Select SLA Profile - AntiSpoofingStaticHosts form closes, and the SLA profile name appears in the SLA Profile panel.

ix Click on the Select button in the Application Profile panel to choose an application profile for the static host. The Select Application Profile - AntiSpoofingStaticHosts form opens with the list of application profiles on the NE displayed.

x Choose an application profile and click on the OK button. The Select Application Profile - AntiSpoofingStaticHosts form closes, and the application profile name appears in the Application Profile panel.

xi Click on the OK button. A dialog box appears.

xii Click on the OK button. The Access Interface Anti-Spoofing Static Host Display (Create) form closes.

37 Assign a DoS protection policy or DDoS protection policy to the SAP, if required.

Note — A default DoS protection policy is automatically assigned to the SAP.

i Click on the Security tab.

ii Click on the Select button in the NE DoS Protection panel and choose a DoS protection policy from the Select NE DoS Protection form.

iii Click on the Select button next to the NE DDoS Protection Policy field and choose a DDoS protection policy from the Select NE DDoS Protection Policy form.

iv Configure the parameters:

- MAC Monitoring
- IP Src Monitoring

38 Associate a MEP to the SAP, if required.

i Click on the MEPs tab.

ii Click on the Create button. The MEP (Create) form opens with the General tab displayed.

iii Click on the Select button to choose a MEG. The Select Maintenance Entity Group form opens.

iv Choose an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Propagation
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)
- CCM Padding Packet Size (Bytes)

Note — The CCM Padding Packet Size (Bytes) parameter cannot be configured when the CCM interval parameter is set to 10 ms or 100 ms.

39 If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab. Otherwise, go to step 43.

40 Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

41 Click on the AIS tab.

42 Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

43 Click on the OK button. The MEP (Create) form displays the SAP information.

44 Click on the OK button. The MEP (Create) form closes.

45 Click on the Subscriber Management tab to configure residential subscriber management on the SAP. The IGMP Host Tracking tab is displayed.

i Click on the Select button to choose the import policy used to filter IGMP packets. The Select SapIgmpHostTracking form opens.

ii Configure the filter parameters and click on the Search button. A list of import policies appears.

iii Choose a policy and click on the OK button. The selected import policy name appears.

iv Configure the parameters:

- Expiry Time (seconds)
- Maximum Number of Groups
- Maximum Number of Sources per Group
- Maximum Number of Group Sources per Group
- Disable Router Alert Check

v You can click on the Host Tracking Info tab to view a list of hosts that are being tracked on this service access point.

vi Click on the Profiles tab.

vii Configure the parameters:

- Admin Status
- Service Model
- Subscriber Limit
- Default Subscriber Identification Type
- Default Subscriber ID
- Default Intermediate Destination Id Type
- Default Intermediate Destination Id
- Profiled Traffic only
- Non-Subscriber Traffic Identification

viii Click on the Select button in the Default Subscriber Profile panel to choose a default subscriber profile for the SAP, if required. The Select Default Subscriber Profile form opens with the list of available subscriber profiles displayed.

ix Choose a subscriber profile and click on the OK button. The Select Default Subscriber Profile form closes, and the subscriber profile name appears in the Default Subscriber Profile panel.

x Click on the Select button in the Default SLA Profile panel to choose a Default SLA profile for the SAP, if required. The Select Default SLA Profile form opens with the list of available SLA profiles displayed.

xi Choose an SLA profile and click on the OK button. The Select Default SLA Profile form closes, and the SLA profile name appears in the Default SLA Profile panel.

xii Click on the Select button in the Subscriber Identification Policy panel to choose a subscriber identification policy for the SAP, if required. The Select Subscriber Identification Policy form opens with the list of available subscriber identification policies displayed.

xiii Choose a subscriber identification policy and click on the OK button. The Select Subscriber Identification Policy form closes, and the subscriber identification policy name appears in the Subscriber Identification Policy panel.

xiv Click on the Select button in the Default Application Profile panel to choose a default application profile for the SAP, if required. The Select Default Application Profile form opens with the list of application profiles on the NE displayed.

xv Choose an application profile and click on the OK button. The Select Default Application Profile form closes, and the application profile name appears in the Default Application Profile panel.

xvi Click on the Select button in the Non-Subscriber Traffic Subscriber Profile panel to choose a non-subscriber subscriber profile for the SAP, if required. The Select Non-Subscriber Traffic Subscriber Profile form opens with the list of available subscriber profiles displayed.

xvii Choose a subscriber profile and click on the OK button. The Select Non-Subscriber Traffic Subscriber Profile form closes, and the subscriber profile name appears in the Non-Subscriber Traffic Subscriber Profile panel.

xviii Click on the Select button in the Non-Subscriber Traffic SLA Profile panel to choose a Non-Subscriber Traffic SLA profile for the SAP, if required. The Select Non-Subscriber Traffic SLA Profile form opens with the list of available SLA profiles displayed.

xix Choose an SLA profile and click on the OK button. The Select Non-Subscriber Traffic SLA Profile form closes, and the SLA profile name appears in the Non-Subscriber Traffic SLA Profile panel.

xx Click on the Select button in the Non-Subscriber Traffic Application Profile panel to choose a non-subscriber traffic application profile for the SAP, if required. The Select Non-Subscriber Traffic Application Profile form opens with the list of application profiles on the NE displayed.

xxi Choose an application profile and click on the OK button. The Select Non-Subscriber Traffic Application Profile form closes, and the application profile name appears in the Non-Subscriber Traffic Application Profile panel.

46 Assign an ANCP policy to the SAP, if required.

i Click on the ANCP Static Map tab.

ii Click on the Create button. The ANCP Static Map (Create) form opens.

iii Configure the ANCP String parameter.

iv Click on the Select button to choose an ANCP Policy. The Select ANCP Policy - ANCP Static Map form opens.

v Choose an ANCP policy and click on the OK button. The Select ANCP Policy - ANCP Static Map form closes and the ANCP Static Map form reappears with the ANCP policy information displayed.

vi Click on the OK button. The ANCP Static Map form closes.

47 Configure ATM on the SAP, if required.

i Click on the ATM tab.

ii Configure the parameters:

- AAL5 Encapsulation
- ATM OAM Alarm Cell Handling
- Periodic ATM OAM Loopback

iii Click on the Select button in the Ingress ATM Policy panel to choose an ingress ATM policy. The Select Ingress ATM Policy - ATM Configuration form opens.

iv Choose an ingress ATM policy and click on the OK button. The Select Ingress ATM Policy - ATM Configuration form closes, and the IES Service Access Point (Create) form refreshes with the ingress ATM policy information displayed.

v Click on the Select button in the Egress ATM Policy panel to choose an egress ATM policy. The Select Egress ATM Policy - ATM Configuration form opens.

vi Choose an egress ATM policy and click on the OK button. The Select Egress ATM Policy - ATM Configuration form closes, and the IES Service Access Point (Create) form refreshes with the egress ATM policy information displayed.

48 Modify PPPoE Sessions that have been generated by the NE, for the group interface, if required. See chapter 65 for more information about viewing and configuring a PPPoE session.

49 Click on the OK button. The IES Service Access Point (Create) form closes, and a dialog box appears.

50 Click on the OK button. The IES Group Interface (Create) form refreshes to display the SAP.

51 To configure additional SAPs in the group interface, go to step 24.

52 Click on the OK button. The IES Group Interface (Create) form closes, and a dialog box appears.

53 Click on the OK button. The IES Service (Edit) form refreshes to display the SAP below the group interface.

54 Click on the OK button. A dialog box appears.

55 Click on the Yes button. The IES Service (Edit) form closes.

56 Close the Manage Services form.

Procedure 70-13 To configure a WLAN GW for an IES group interface

Before you can configure a WLAN GW for an IES group interface, you must configure an IES group interface with the Specific Type parameter set to Soft GRE. See Procedure 70-12.

1 Choose Manage→Service→Services from the navigation tree view selector. The Manage Services form opens.

2 Choose IES Site (IES) from the Object drop-down list.

3 Click on the Search button. A list of IES sites is displayed.

4 Select an IES site with an IES group interface and click on the Properties button. The IES Site form opens with the general tab displayed.

For the purposes of WLAN GW configuration, you must choose a Soft GRE type IES group interface.

5 On the IES Site form navigation tree, expand the Subscriber Interfaces icon.

6 Expand a subscriber interface with an IES group interface.

7 Click on an IES group interface. The general tab is displayed.

8 Click on the WLAN GW tab.

9 Click on the Select button in the WLAN GW Group panel and choose a WLAN GW group form the Select WLAN GW Group form.

10 Click on the Select button in the Tunnel Router Instance panel and choose a tunnel router instance from the Select Tunnel Router Instance form.

11 Configure the WLAN Gateway IPv4 Address and/or WLAN Gateway IPv6 Address parameter.

12 Click on the Select button in the Default Retail Service panel and choose a default retail IES service from the Select Default Retail Service form.

13 Configure the parameters:

- TCP Maximum Segment Size Adjustment
- Data Triggered UE Creation
- Mobility Detection Trigger
- Hold Time

14 Configure egress QoS, if required.

i In the Egress QoS panel, configure the parameters:

- Multi Client Only Shaping
- Shaping
- Hold Time
  Enabling the Infinite check box sets the Hold Time parameter to infinite.

ii Click on the Select button beside the QoS Policy field and choose an access egress policy from the Select QoS - Soft GRE Config form.

iii Click on the Select button beside the Scheduler Policy field and choose a scheduler policy from the Select Scheduler - Soft GRE Config form.

iv Configure the Aggregate Rate Limit parameter. Do not configure this parameter with a positive value if you specified a scheduler policy in step iii.

15 Click on the Select button beside the Authentication Policy field and choose an authentication policy from the Select ISA RADIUS Policies - Soft GRE Config form.

16 Configure an authentication hold time, if required:

i Enable the check box in the Authentication Hold Time panel.

ii Specify an authentication hold time in the Hours, Minutes, and Seconds fields.

17 Configure SAP parameters, as required.

i Click on the SAP Parameters tab.

ii Configure the Description parameter.

iii Click on the Select button beside the Subscriber Profile parameter and choose a subscriber profile from the Select Subscriber Profile form.

iv Click on the Select button beside the SLA Profile parameter and choose an SLA profile from the Select SLA Profile form.

v Click on the Select button beside the Application Profile parameter and choose an application profile from the Select Application Profile form.

vi Click on the Select button beside the Subscriber Identification Policy parameter and choose a subscriber identification policy from the Select Subscriber Identification Policy form.

vii Configure the Default ID Type parameter.

viii If the Default ID Type parameter was set to Use String, configure the Default ID String parameter.

18 Configure DHCP, as required.

i Click on the DHCP tab.

ii Configure the parameters:

- Administrative State
- L2 Aware IP Address
- IP Address Lease Time (Initial State)
  Remove the check mark from the Default check box and configure the Hours, Minutes, and Seconds parameters.
- IP Address Lease Time (Active State)
  Remove the check mark from the Default check box and configure the Hours, Minutes, and Seconds parameters.
- Primary DNS Server
- Secondary DNS Server
- Primary NBNS Server
- Secondary NBNS Server

iii Click on the Select button next to the NAT Policy field and choose a NAT policy from the Select NAT Policy form.

iv Click on the Select button next to the HTTP Redirect Policy field and choose an HTTP redirect policy from the Select HTTP Redirect Policy form.

19 Configure VLAN tag ranges, as required.

i Click on the VLAN Tag Ranges tab.

ii Click on the Create button. The VLAN Tag Range form opens.

iii Configure the parameters:

- Start VLAN Tag
- End VLAN Tag

iv Click on the Select button next to the Retail Service ID field and choose a retail service from the Select Retail Service form.

v Configure the Data Triggered User Equipment Creation parameter.

vi Click on the Select button next to the NAT Policy field and choose a NAT policy from the Select NAT Policy form.

vii Click on the Select button next to the HTTP Redirect Policy field and choose an HTTP redirect policy from the Select HTTP Redirect Policy form.

viii Click on the Select button next to the Authentication Policy field and choose an authentication policy from the Select Authentication Policy form.

ix Configure the Hold Time parameter. Remove the check mark from the Default check box and configure the Hours, Minutes, and Seconds parameters.

x Configure the Routing Instance parameter.

xi Click on the Select button in the RADIUS Proxy Cache panel and choose a RADIUS proxy cache server from the Select RADIUS Proxy Cache form.

xii Configure the MAC Address Format and Show Format parameters.

xiii Configure DHCP, as required.

xiv Click on the DHCP tab.

xv Configure the parameters:

- Administrative State
- L2 Aware IP Address
- IP Address Lease Time (Initial State)
  Remove the check mark from the Default check box and configure the Hours, Minutes, and Seconds parameters.
- IP Address Lease Time (Active State)
  Remove the check mark from the Default check box and configure the Hours, Minutes, and Seconds parameters.
- Primary DNS Server
- Secondary DNS Server
- Primary NBNS Server
- Secondary NBNS Server

xvi Click on the OK button. A dialog box appears.

xvii Click on the OK button. The VLAN Tag Ranges tab is updated with the new VLAN tag range displayed.

20 Click on the OK button. A dialog box appears.

21 Click on the OK button. The IES Site (Edit) form closes.

22 Close the Manage Services form.

Procedure 70-14 To add a TMS interface to an IES

The 7750 SR-7 and 7750 SR-12 devices support the configuration of a TMS interface in an IES.

The following conditions must be met before you can configure a TMS interface.

- You must have one IES configured.The TMS interface is configured on this on-ramp IES.
- You must have one VPRN configured for the off-ramp VPRN.
- Optionally, you can have one VPRN configured for the management VPRN.

- Each service must be associated within the same site on the same NE.
- The ISA-TMS daughter card must be installed.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears at the bottom of the Manage Services form.

3 Choose an IES and click on the Properties button. The IES Service Subscriber (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you need to add the TMS interface; expand the entries for that site.

5 Right-click on the TMS Interfaces icon and choose Create TMS Interface. The TMS Interface (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- IPv6 Allowed

Note — The Name value for a TMS interface must be unique in the context of the IES Site. That is, there cannot be another L3 access interface, subscriber interface, group interface or TMS interface with the same name on the same IES site.

7 Assign an off-ramp VPRN to the TMS interface

i Click on the Select button in the Off-Ramp VPRN panel and select a VPRN from the Select Off-Ramp VPRN - TMS Interface form.

ii Click on the OK button. The Select Off-Ramp VPRN - TMS Interface form closes, and the TMS Interface (Create) form reappears with the VPRN information displayed.

8 Assign a management VPRN to the TMS interface

i Click on the Select button in the Management VPRN panel and select a VPRN from the Select Management VPRN - TMS Interface form.

ii Click on the OK button. The Select Management VPRN - TMS Interface form closes, and the TMS Interface (Create) form reappears with the subscriber information displayed.

9 Associate an ISA-TMS daughter card with the TMS interface.

Note — An ISA-TMS card can only be assigned to one TMS interface.

i Click on the Select button in the TMS Info panel and select an ISA-TMS to associate with the TMS interface from the Select ISA-TMS - TMS Interface form.

ii Click on the OK button. The Select ISA-TMS - TMS Interface form closes, and the TMS Interface (Create) form reappears with the slot name for the daughter card displayed.

10 Configure the ISA-TMS Authentication parameter.

11 Assign an IP address to the TMS interface.

i Click on the Addresses tab.

ii Click on the Create button. The IP Address (Create) form opens.

iii Configure the parameters:

- Address ID
- IP Address
- Prefix Length

iv Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

v Click on the OK button. The TMS Interface (Create) form reappears with the assigned IP addresses displayed.

12 Click on the OK button. The TMS Interface (Create) form closes, and a dialog box appears.

13 Click on the OK button. The IES Service Subscriber (Edit) form reappears with the new TMS interface displayed in the service navigation tree.

14 Click on the OK button. A dialog box appears.

15 Click on the Yes button. The IES Service Subscriber (Edit) form closes, and the Manage Services form reappears.

16 Close the Manage Services form.

Procedure 70-15 To implement dual homing using SRRP

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Specify the pair of sites that are to participate in dual homing.

Note — The sites can be from different services.

5 Ensure that the pair of sites each contains a properly configured subscriber interface and SAPs underneath the group interface that will be participating in the redundant configuration.

6 Ensure that all subscriber interface IP addresses have a gateway address configured on them.

7 Create the Redundant Interface (used for SRRP out-of-band messaging) between the two routers.

i On the navigation tree, click on the site; expand the entries for that site.

ii Right-click on the Redundant Interfaces item for one site of the redundant pair, and choose Create Redundant Interface. The Redundant Interface (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State

iv Click on the Addresses tab.

v Click on the Create button. The IP Address (Create) form opens.

vi Specify IP addresses for the redundant interface on the current and remote sites. Configure the parameters:

- Address ID
- IP Address (in the form d.d.d.d, where d is a value from 0 to 255)
- Prefix Length
- Remote IP Address
- Broadcast Address Format

Note — The remote IP address must be on the same subnet as the current site's redundant interface IP Address. For example, if the current site's IP Address is 7.7.7.7, with a Prefix Length of 24, then the remote site's redundant interface address must be 7.7.7.d, where d is a value from 0 to 255, excluding 7.

vii Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

viii Click on the OK button. The Redundant Interface (Create) form reappears with the assigned redundant interface IP addresses displayed.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Redundant Interface (Create) form for the current site closes.

8 Create an SDP spoke binding between the current and remote sites. The Source Interface is the Redundant Interface you created in step 7 and the Tunnel Termination SIte is the remote site. The Return Tunnel must come from the remote site.

9 Assign the Redundant Interface to the Group Interface for the current site.

i On the navigation tree under Subscriber Interfaces, right-click on the group interface you need to use and choose Properties. The IES Group Interface (Edit) form opens with the General tab displayed.

ii Click on the Select button in the Redundant Interface panel. The Select Redundant Interface - IES Group Interface form opens.

iii Configure the list filter parameters if required and click on the Search button. A list of redundant interfaces on the site appears at the bottom of the form.

iv Select the Redundant Interface you created in step 7 and click on the OK button. The Select Redundant Interface - IES Group Interface form closes and the interface you selected appears in the Redundant Interface field.

v Click on the OK button. The IES Group Interface (Edit) form closes.

10 Create an SRRP Instance for the current site.

i On the navigation tree under group interfaces, right-click on the SRRP Instances item for the current site, and choose Create SRRP Instance. The SRRP Instance (Create) form opens with the General tab displayed.

ii Configure the parameters:

- SRRP ID
- Description
- Administrative State

The SRRP ID must be the same value for both the current and remote sites.

iii Click on the Behavior tab.

iv Configure the parameters:

- Gateway MAC Address
- Keep Alive Interval
- Priority
- FIB Population Mode

v Configure the message path by clicking the Select button in the Message Path panel. The Select Message Path Pointer - SRRP Instance form opens, displaying the SAPs available on the site.

vi Select the SAP you need to use for the in-band messaging between the sites.

vii Click on the OK button. The Select Message Path Pointer - SRRP Instance form closes.

viii Configure policy pointer 1, if required, by clicking the Select button in the Policy Pointer 1 panel. The Select Policy Pointer 1 - SRRP Instance form opens, displaying the pointers available on the site.

ix Select the pointer you need to use.

x Click on the OK button. The Select Policy Pointer 1 - SRRP Instance form closes.

xi Configure policy pointer 2, if required, by clicking the Select button in the Policy Pointer 2 panel. The Select Policy Pointer 2 - SRRP Instance form opens, displaying the pointers available on the site.

xii Select the pointer you need to use.

xiii Click on the OK button. The Select Policy Pointer 2 - SRRP Instance form closes.

xiv Click on the OK button. The SRRP Instance (Create) form closes, and a dialog box appears.

xv Click on the OK button. The IES Service (Edit) form reappears with the SRRP Instance displayed.

11 Click on the Turn Up button to activate the SRRP instance.

12 Repeat steps 7 to 11 for the remote site.

Note 1 — When you repeat steps 7 to 11 for the remote site, that site becomes the current site and the previously configured site is the remote site.

Note 2 — After the two sites have been properly set up, you can examine the SRRP peer associations at any time by right-clicking an SRRP Instance in the service's navigation tree. This opens the SRRP Instance - Edit form, which contains a read-only field called SRRP Peer. The Site ID, Service ID, and Operational State of the associated peer appear in this field.

You can also examine the state of an SRRP Instance by checking the Operational Flags field. The flags indicate specific problems that might occur with the SRRP Instance, as follows:

- Duplicate Subscriber IF Address: one of the local subscriber IP addresses is the same as a subscriber IP address on the remote NE.
- Redundant Interface Mismatch: the local SRRP instance and remote SRRP instance have mismatched redundant interfaces.
- SAP Mismatch: the local SRRP instance is backing a different set of SAPs than the peer.
- Subnet Mismatch: one of the subnets that SRRP is backing up does not have a match with the peer.
- Dual Master: both SRRP instances are master at the same time.
- SAP Tag Mismatch: the local SRRP instance is backing a set of SAPs with different remote and local tags.
- SRRP ID Mismatch: the peer has a different SRRP instance ID backing the same subnet.

13 Click on the OK button. A dialog box appears.

14 Click on the OK button. The IES Service (Edit) form closes.

Procedure 70-16 To configure IGMP host tracking on an IES site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Site icon and choose Properties from the contextual menu. The IES Site (Edit) form opens with the General tab displayed.

6 Click on the Multicast tab.

7 Click on the IGMP Host Tracking tab.

8 Configure the parameters:

- Expiry Time (seconds)
- Administrative State

9 Click on the OK button to close the IES Site (Edit) form.

10 Close the IES Service (Edit) form.

11 Close the Manage Services form.

Procedure 70-17 To configure an L3 access interface on an IES site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 On the navigation tree, click on the site to which you need to add the access interface; expand the entries for that site.

5 Right-click on L3 Access Interfaces and choose Create IES L3 Access Interface. The IES L3 Access Interface (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- MAC Address
- Allow Directed Broadcasts
- Loopback Enabled
- Cflowd Type
- Class
- Trusted
- IPv6 Allowed
- Admin Link Local Address
- Admin Link Local Address Preferred
- Enable Ingress FlowSpec IPv4
- Enable Ingress FlowSpec IPv6
- QoS Route Lookup IPv4
- QoS Route Lookup IPv6
- Calling Station ID
- Enable Ingress Stats
- Enable MAC Accounting Stats
- Configured IP MTU (Octets)
- Unnumbered Type
- IP Address
- Interface Name
- URPF Check State IPv4
- URPF Check Mode IPv4
- URPF Check State IPv6
- URPF Check Mode IPv6
- Tunnel Fault Notification
- PTP HW Assist

The Unnumbered Type parameter is configurable when the Class parameter is set to Unnumbered.

The Unnumbered Type parameter is configurable when the Class parameter is set to Unnumbered.

The IP Address parameter is configurable when the Unnumbered Type parameter is set to IP Address.

The Interface Name parameter is configurable when the Unnumbered Type parameter is set to Name.

The Admin Link Local Address and Admin Link Local Address Preferred parameters are only configurable when the IPv6 Allowed parameter is enabled.

The Enable Ingress FlowSpec IPv4 and Enable Ingress FlowSpec IPv6 parameters appear only when a port is configured on the interface.

The URPF Check State IPv6 and URPF Check Mode IPv6 parameters are only configurable when the IPv6 Allowed parameter is enabled.

The Tunnel Fault Notification parameter is configurable on interfaces where the device has ports configured in access or hybrid mode with QinQ encapsulation.

If you are configuring a tunnel facility MEP, Tunnel Fault Notification must be set to Accept, in order to receive the fault notification from the tunnel facility MEP.

7 If the Loopback Enabled parameter in step 6 is enabled, you cannot associate a port with the L3 interface. Go to step 16.

8 Bind an application profile to the IES L3 access interface, if required:

i Click on the Select button beside the Application Profile parameter in the Application Assurance panel. The Application Profile String: - IES L3 Access Interface list form opens.

ii Choose a profile and click on the OK button. The Application Profile String - IES L3 Access Interface list form closes and the L3 Access Interface (Create) form is refreshed with the Application Profile information.

Note — The Application Profile String: - IES L3 Access Interface list form only displays local profiles that already exist on the NE.

9 Choose one of the following AA transit policy types, if required.

Note 1 — You can only associate one AA transit policy type with a service object.

Note 2 — To bind a transit policy to an L3 access interface, a port must already exist on the interface.

Note 3 — You can bind a transit policy to only one L3 access interface or spoke SDP binding per NE.

Note 4 — The transit policy and the application profile must belong to the same application assurance group or partition.

a Associate an AA transit IP policy with the service object:

i Click on the Select button in the Transit IP Policy panel. The Select Transit IP Policy form opens.

ii Choose a transit IP policy and click on the OK button.

b Associate an AA transit prefix policy with the service object:

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.

ii Choose a transit IP policy and click on the OK button.

10 Associate a host lockout policy with the L3 access interface, if required. Click on the Select button in the Host Lockout panel to select a policy.

11 Click on the Port tab.

12 Click on the Select button to choose a port for the L3 access interface. The Select Terminating Port - IES L3 Access Interface form opens.

Note 1 — The form lists only ports in access or hybrid mode, or PW ports. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. The port is then listed when you click on the Search button.

Note 2 — The form only lists PW ports that are bound to a service tunnel. See Procedure 27-1 for information about creating a service tunnel with a PW port binding.

13 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - IES L3 Access Interface form closes, and the IES L3 Access Interface (Create) form displays the port information.

Once the port is selected, a number of other tabs are also displayed on the form.

14 Configure the parameters:

- Outer Encapsulation Value
- Inner Encapsulation Value
- Outer Encapsulation Value (VPI)
- Inner Encapsulation Value (VCI)
- SAP Description
- SAP Administrative State

If the port uses dot1q encapsulation, you can enable the Auto-Assign ID parameter to have the Outer Encapsulation Value parameter automatically assigned. The system assigns the lowest unused encapsulation value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter on the User Preferences form. Choose Application→ User Preferences from the main menu.

The Inner Encapsulation Value is configurable only when the port is an Ethernet or frame relay port with QinQ encapsulation.

The Outer Encapsulation Value (VPI) and Inner Encapsulation Value (VCI) parameters are configurable only for ATM ports.

15 If the selected port uses FR encapsulation, configure frame relay for the interface.

i Click on the Frame Relay tab.

ii Set the FRF-12 Mode parameter to Enabled.

iii Configure the parameters:

- FRF-12 End-To-End Fragment Threshold
- Scheduling Class
- Fragment Interleave

Note — If a bundle was selected in step 13, only the Scheduling Class parameter are configurable.

16 Click on the OK button. The IES L3 Access Interface (Create) form closes, and the IES Service (Edit) form reappears with the new interface information displayed in the service navigation tree.

17 Close the IES Service (Edit) form.

18 Close the Manage Services form.

Procedure 70-18 To configure custom object attributes for AA reporting to the 5670 RAM on an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the 5670 RAM Parameters tab.

8 Click on the Reporting tab.

9 Click on the Create button. The AA Reporting (Create) form opens.

10 Configure the parameters:

- Customer Name
- Subscriber Name
- Subscriber Class
- Subscriber Type
- Total Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 1 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 2 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 3 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 4 Bandwidth Upstream (Kbps)
- Downstream (Kbps)

11 Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.

12 Close the IES L3 Access Interface (Edit) form.

13 Close the IES Service (Edit) form.

14 Close the Manage Services form.

Procedure 70-19 To bind an IES L3 access interface to a VPLS site or VPLS I-site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Routed VPLS tab.

Note 1 — The operational state of the IP interface binding will not be turned up until the Enable IP Interface Binding parameter is set to true.

Note 2 — You can create and manage a routed VPLS connector from the navigation tree on the Composite Service (Edit) form.

8 Enter a VPLS site name or click on the Select button beside the VPLS Name parameter to choose a VPLS site with a configured site name. The Routed VPLS String - IES L3 Access Interface form opens.

9 Choose a VPLS site and click on the OK button. The VPLS site is displayed.

10 In the Ingress - IPv4 Filter panel, click on the Select button. The Select IPv4 Filter - IES L3 Access Interface form opens.

11 Choose an IPv4 filter and click on the OK button. The IPv4 filter information is displayed.

12 In the Ingress - IPv6 Filter panel, click on the Select button. The Select IPv6 Filter - IES L3 Access Interface form opens.

13 Choose an IPv6 filter and click on the OK button. The IPv6 filter information is displayed.

14 In the Egress - QoS Policy panel, click on the Select button. The Select QoS Policy - IES L3 Access Interface form opens.

15 Choose a QoS Policy and click on the OK button. The QoS Policy information is displayed.

16 Close the IES L3 Access Interface (Edit) form.

17 Close the IES Service (Edit) form.

18 Close the Manage Services form.

Procedure 70-20 To apply OSPF, RIP, or IS-IS to an IES L3 interface

Note — OSPF, RIP, or IS-IS must be enabled at the routing instance level before you can apply OSPF, RIP, or IS-IS to an L3 interface.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria.A list of services appears at the bottom of the Manage Services form.

3 Choose an IES and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Click on the Interfaces tab. The TMS Interfaces tab is displayed.

5 Click on the L3 Access Interfaces tab.

6 Choose an L3 interface in the list and click on the Properties button. The L3 Access Interface (Edit) form opens.

7 Click on the Protocols tab.

8 Click on the Create button. The Create Interface form opens.

9 Specify the interface type by configuring the What type of interface would you like to create? parameter.

10 Click on the OK button. The Interface (Create) form opens. See section 23.2 for information about configuring specific routing protocols.

Procedure 70-21 To assign ingress and egress QoS policies to an IES L3 access interface

Perform this procedure to assign ingress and egress QoS policies to an IES L3 access interface on a 7950 XRS, 7750 SR, 7450 ESS, 7710 SR, or 7705 SAR. See Procedure 70-22 for information on configuring QoS policies for the 7210 SAS.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the QoS tab.

Note — The QoS tab is configurable only if a port is assigned to the interface.

8 Configure the Ingress Match QinQ Dot1P parameter.

9 Click on the Select button in the Ingress Policy panel to choose an ingress QoS policy. The Select Ingress Policy - IES L3 Access Interface form opens.

10 Choose an ingress QoS policy and click on the OK button. The Select Ingress Policy - IES L3 Access Interface form closes. The IES L3 Access Interface (Create) form refreshes with the ingress QoS policy information displayed.

Note — If you select an ingress policy which has a forwarding class mapped to an ingress queue group, you must ensure that the port configured on the interface uses the same access ingress queue group.

See Procedure 16-1 in chapter 16 for information about configuring Ethernet ports. See chapter 42 for information about queue group template policies.

11 Click on the Ingress Queue Group Template Policy Select button in the Forwarding Plane Redirect panel to choose a policy. The Select Forwarding Plane Queue Group Instance form opens.

12 Choose a policy and click on the OK button. The Select Forwarding Plane Queue Group Instance form closes. The IES L3 Access Interface (Create) form refreshes with the Ingress Queue Group Template Policy information displayed.

13 Configure the Instance ID parameter.

14 Configure the Egress Mark QinQ Top Bits Only parameter.

15 Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - IES L3 Access Interface form opens.

16 Choose an egress QoS policy and click on the OK button. The Select Egress Policy - IES L3 Access Interface form closes. The IES L3 Access Interface (Create) form refreshes with the egress QoS policy information displayed.

Note — If you select an egress policy that has a forwarding class mapped to an egress queue group, you must ensure that the port configured on the interface uses the same access egress queue group.

See Procedure 16-1 in chapter 16 for information about configuring Ethernet ports. See chapter 42 for information about queue group template policies.

17 Click on the Select button in the Port Redirect panel to choose an Egress Queue Group Template Policy, if required. The Select Egress Queue Group Template Policy form opens.

Note — Selecting an Egress Queue Group Template Policy here permits the redirection of Ethernet traffic packets to a queue ID specified in the SAP's egress port queue group. The following properties and restrictions apply:

- If an Egress Queue Group Template Policy is specified here, the policy must have port redirection enabled.
- You cannot use policy-based redirection with the queue group when the SAP has SAP-based redirection enabled.
- Port access egress redirection is only supported on Ethernet/LAG ports. It is not supported on SAPs bound on non-Ethernet, Eth-tunnel, or CCAG ports.
- Supported ports include access, hybrid, and HSMDA.
- Queue groups can be applied to SAPs that incorporate LAGs. The LAGs can include port members from just a single card or from multiple cards.
- If you edit a LAG incorporated by the SAP, you cannot remove the last LAG member if a queue group reference exists to the containing SAP.
- You cannot add a secondary LAG member that has a queue group mismatch with primary LAG member.

18 Choose an Egress Queue Group Template Policy and click on the OK button. The Select Egress Queue Group Template Policy form closes, and the IES L3 Access Interface (Create) form refreshes with the Egress Queue Group Template Policy information displayed.

19 If you are configuring an L3 access interface for a 7710 SR or 7705 SAR, or if the port that is configured on the interface is not an HSMDA port, then go to step 26.

20 Configure the Packet Byte Offset (bytes) parameter, if required. You must enable the associated Override check box if you need to configure this parameter.

21 Click on the Select button in the Egress HSMDA Override panel to choose a WRR policy. The Select WRR Policy form opens.

22 Choose a WRR policy and click on the OK button. The Select WRR Policy form closes and the IES L3 Access Interface (Create) form reappears with the WRR policy information displayed.

23 Click on the Select button in the Egress HSMDA Override panel to choose an HSMDA egress secondary shaper policy. The Select Secondary Shaper form opens.

24 Choose a secondary shaper and click on the OK button. The Select Secondary Shaper form closes and the IES L2 Access Interface (Create) form reappears with the secondary shaper information displayed.

25 Configure the parameters:

- Use Shared Queue
- Use Multipoint Shared Queue

26 Close the IES L3 Access Interface (Edit) form.

27 Close the IES Service (Edit) form.

28 Close the Manage Services form.

Procedure 70-22 To assign ingress and egress QoS policies to an IES L3 access interface on the 7210 SAS

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Select button in the 7210 Specific panel to choose a SAS ingress policy. The Select SAS Ingress Policy - L2 Access Interface form opens.

8 Choose a SAS ingress policy and click on the OK button. The Select SAS Ingress Policy - L2 Access Interface form closes and the information is displayed.

Note — To support H-metering, you must choose a SAS ingress policy with all meter rate modes set to trtcm2.

9 Configure the following parameters in the Aggregate Rate Limit panel:

- Ingress Meter
- Ingress Meter Rate (kbps)
- Ingress Meter Burst

Note 1 — You can configure the Ingress Meter parameter only during SAP creation on the 7210 SAS-M and 7210 SAS-X. The parameter must be set to true to support H-metering.

Note 2 — You can configure the Ingress Meter Rate (kbps) and Ingress Meter Burst parameters only after SAP creation on the 7210 SAS-M and 7210 SAS-X.

10 Close the IES L3 Access Interface (Edit) form.

11 Close the IES Service (Edit) form.

12 Close the Manage Services form.

Procedure 70-23 To configure scheduling on an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Schedulers tab.

Note — The Schedulers tab is configurable only if a port is assigned to the SAP.

8 To configure scheduling on a 7705 SAR site, perform the following steps. Otherwise, go to step 9.

Note 1 — For the 7705 SAR, scheduler behavior is determined by the scheduler mode, which is 4-Priority by default. You can only configure the Egress and Ingress Aggregate Rate Limit parameters when the Scheduler Mode parameter is set to 16-Priority. You can set the Scheduler Mode to 16-Priority only when the port is on an MDA that supports 16-Priority. See the 7705 SAR documentation for more information.

Note 2 — If you change the Scheduler Mode parameter from 16-Priority to 4-Priority, the 5620 SAM automatically restores the default settings for the Egress Aggregate Rate Limit and Ingress Aggregate Rate Limit panels when you click on the Apply or OK button.

i In the Egress Scheduler panel, configure the Scheduler Mode parameter.

ii In the Ingress Scheduler panel, configure the Scheduler Mode parameter.

iii If you set the Scheduler Mode parameter to 16-Priority in the Egress Scheduler panel or Ingress Scheduler panel, configure the parameters in the Egress Aggregate Rate Limit panel and Ingress Aggregate Rate Limit panel, as required. Otherwise, go to step 11.

- Assign Aggregate Rate Limit
- Aggregate Rate Limit (kbps)
- Assign Aggregate CIR
- Aggregate CIR (kbps)

iv Go to step 11.

9 Specify that an aggregation scheduler policy is not applied to the interface. Otherwise, go to step 10.

i Set the Aggregation parameter to Off.

Note — The Aggregation parameter is not configurable if the port assigned to the SAP is an HSMDA port.

ii Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

Note 1 — The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are configurable only when there is no scheduler specified in the Egress Scheduler panel.

Note 2 — The Frame-Based Accounting parameter is not configurable if the port assigned to the SAP is an HSMDA port.

Note 3 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

iii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - IES L3 Access Interface form opens.

iv Choose an ingress scheduler and click on the OK button. The Select Ingress Scheduler - L3 Access Interface form closes, and the IES L3 Access Interface (Create) form refreshes with the ingress scheduler information displayed.

v Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Policer Control Policy form opens.

vi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the IES L3 Access Interface (Edit) form reappears with the ingress policer control policy information displayed.

vii If the port assigned to the SAP is an HSMDA port, go to step 11.

viii Click on the Select button in the Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - IES L3 Access Interface form opens.

ix Choose an egress scheduler and click on the OK button. The Select Egress Scheduler - IES L3 Access Interface form closes, and the L3 Access Interface (Create) form refreshes with the egress scheduler information displayed.

x Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Policer Control Policy form opens.

xi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the IES L3 Access Interface (Edit) form reappears with the egress policer control policy information displayed.

xii Go to step 11.

10 Specify that an aggregation scheduler policy is applied to the interface.

Note — You cannot specify an access scheduler policy if the port assigned to the SAP is an HSMDA port. Go to step 11.

i Set the Aggregation parameter to on.

ii Click on the Select button in the Aggregation Scheduler panel to choose an aggregation scheduler. The Select Aggregation Scheduler - IES L3 Access Interface form opens.

iii Choose an aggregation scheduler and click on the OK button. The Select Aggregation Scheduler - IES L3 Access Interface form closes, and the IES L3 Access Interface (Edit) form refreshes with the aggregation scheduler information displayed.

11 Close the IES L3 Access Interface (Edit) form.

12 Close the IES Service (Edit) form.

13 Close the Manage Services form.

Procedure 70-24 To assign ingress and egress ACL filters to an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the ACL tab.

8 Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - IES L3 Access Interface form opens.

9 Choose an ingress ACL filter and click on the OK button. The Select Ingress Filter - IES L3 Access Interface form closes, and the IES L3 Access Interface (Create) form reappears with the ingress ACL filter information displayed.

10 Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - IES L3 Access Interface form opens.

11 Choose an egress ACL filter and click on the OK button. The Select Egress Filter - IES L3 Access Interface form closes, and the IES L3 Access Interface (Create) form reappears with the egress ACL filter information displayed.

12 Click on the Select button in the IPv6 Ingress Filter panel to choose an ingress IPv6 ACL filter. The Select IPv6 Ingress Filter - IES L3 Access Interface form opens.

13 Choose an ingress IPv6 ACL filter and click on the OK button. The Select IPv6 Ingress Filter - IES L3 Access Interface form closes, and the IES L3 Access Interface (Create) form reappears with the ingress IPv6 ACL filter information displayed.

14 Click on the Select button in the IPv6 Egress Filter panel to choose an IPv6 egress ACL filter. The Select IPv6 Egress Filter - IES L3 Access Interface form opens.

15 Choose an IPv6 egress ACL filter and click on the OK button. The Select IPv6 Egress Filter - IES L3 Access Interface form closes, and the IES L3 Access Interface (Create) form reappears with the IPv6 egress ACL filter information displayed.

16 Close the IES L3 Access Interface (Edit) form.

17 Close the IES Service (Edit) form.

18 Close the Manage Services form.

Procedure 70-25 To associate a local DHCPv4 or DHCPv6 server to an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Local DHCP tab and perform one of the following steps.

Note — To associate local DHCPv6 servers, the IPv6 Allowed parameter must be enabled.

a For local DHCPv4 servers, click on the Select button in the Local DHCP Server panel and choose a local DHCP server from the Select Local DHCP Server - IES L3 Access Interface form.

b For local DHCPv6 servers, click on the Select button in the Local DHCPv6 Server panel and choose a local DHCPv6 server from the Select Local DHCPv6 Server - IES L3 Access Interface form.

Note — You cannot associate a local DHCPv4 server to the L3 group Interface if the Administrative State parameter in the Local Proxy Service panel is up.

8 Close the IES L3 Access Interface (Edit) form.

9 Close the IES Service (Edit) form.

10 Close the Manage Services form.

Procedure 70-26 To assign an accounting policy to an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Accounting tab.

8 Configure the Collect Accounting Statistics parameter.

9 Click on the Select button to choose an accounting policy. The Select Accounting Policy - IES L3 Access Interface form opens.

10 Choose an accounting policy and click on the OK button. The Select Accounting Policy - IES L3 Access Interface form closes and the IES L3 Access Interface (Edit) form reappears with the accounting policy information displayed.

11 Close the IES L3 Access Interface (Edit) form.

12 Close the IES Service (Edit) form.

13 Close the Manage Services form.

Procedure 70-27 To assign an ANCP policy to an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the ANCP Static Map tab.

8 Click on the Create button. The ANCP Static Map (Create) form opens with the General tab displayed.

9 Configure the ANCP String parameter.

10 Click on the Select button in the ANCP Policy panel to choose an ANCP policy. The Select ANCP Policy - ANCP Static Map list form opens.

11 Choose an ANCP policy and click on the OK button. The Select ANCP Policy - ANCP Static Map form closes and the ANCP Static Map form reappears with the ANCP policy information displayed.

12 Click on the OK button. A dialog box appears.

13 Click on the OK button. The ANCP Static Map (Create) form closes.

14 Close the IES L3 Access Interface (Edit) form.

15 Close the IES Site (Edit) form.

16 Close the IES Service (Edit) form.

17 Close the Manage Services form.

Procedure 70-28 To assign a time of day suite to an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the TOD Suite tab.

8 Click on the Select button beside the Name parameter. The Select Time Of Day Suite - IES L3 Access Interface list form opens.

9 Choose a time of day suite and click on the OK button. The Select Time Of Day Suite - IES L3 Access Interface list form closes, and the IES L3 Access Interface (Create) form refreshes with the time of day suite name.

Note 1 — You cannot assign a ToD suite to a L3 access interface if accounting statistics collection is enabled on the interface. You must first disable the Collect Accounting Statistics parameter in step 8 of Procedure 70-26.

Note 2 — SapEgrQosPlcyStats and SapIngQosPlcyStats statistics are collected only if a Time Of Day Suite is applied on the SAP.

10 Close the IES L3 Access Interface (Edit) form.

11 Close the IES Service (Edit) form.

12 Close the Manage Services form.

Procedure 70-29 To configure residential subscriber management for an IES L3 access interface

Residential subscriber management is supported on the 7450 ESS in mixed mode, 7750 SR, and 7710 SR.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Subscriber Management tab. The Host Connectivity tab is displayed.

8 Select the SHCV Enabled parameter to enable SHCV.

9 Configure the parameters:

- SHCV Interval (minutes)
- SHCV Source
- SHCV Action
- SHCV Retry Timeout (seconds)
- SHCV Retry Count

10 Close the IES L3 Access Interface (Edit) form.

11 Close the IES Service (Edit) form.

12 Close the Manage Services form.

Procedure 70-30 To assign a DoS protection policy or DDoS protection policy to an IES L3 access interface

Note — A default DoS protection policy is automatically assigned to the interface.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Security tab.

8 Click on the Select button in the NE DoS Protection panel and choose a DoS protection policy from the Select NE DoS Protection form.

9 Click on the Select button next to the NE DDoS Protection Policy field and choose a DDoS protection policy from the Select NE DDoS Protection Policy form.

10 Close the IES L3 Access Interface (Edit) form.

11 Close the IES Service (Edit) form.

12 Close the Manage Services form.

Procedure 70-31 To assign an IP address to an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Addresses tab.

8 Click on the Create button. The IP Address (Create) form opens.

9 Configure the parameters:

- Address ID
- IP Address
- Prefix Length
- Broadcast Address Format
- EUI-64
- IP Address Preferred

The Broadcast Address Format parameter only appears if the IP Address parameter is set to an IPv4 address.

The EUI-64 and IP Address Preferred parameters only appear if the IP Address parameter is set to an IPv6 address.

10 Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

11 Click on the OK button. The IES L3 Access Interface (Edit) form reappears with the assigned IP address displayed.

12 Close the IES L3 Access Interface (Edit) form.

13 Close the IES Service (Edit) form.

14 Close the Manage Services form.

Procedure 70-32 To configure bi-directional forwarding detection for an IES L3 access interface

Note — You cannot configure BFD for an interface if BFD is disabled. See chapter 23 for information about enabling and disabling BFD for routing protocols.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the BFD tab. The General tab is displayed.

8 Set the Administration Status to Up.

9 Configure the parameters:

- Transmit Interval
- Receive Interval
- Echo Interval
- Multiplier
- Termination Type
- Operational State Transition Interval
- Inherit from Network Element

Note — If the IPv6 Allowed parameter in Procedure 70-17 is enabled, you can configure the above BFD parameters for IPv6.

10 To view local and remote session peers that are managed by the 5620 SAM, click on the BFD Session tab. A list of BFD current sessions on a router interface or an L3 interface appears.

11 Click on a session. The properties form for the session opens. View the following:

- BFD status
- protocol used
- local address
- remote address
- operational status and statistics

12 Close the form.

13 Close the IES L3 Access Interface (Edit) form.

14 Close the IES Service (Edit) form.

15 Close the Manage Services form.

Procedure 70-33 To configure IPv4 ICMP for an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the ICMP tab.

8 Configure the parameters:

- Mask Reply
- Redirects
- Number of Redirects
- Redirects Time (seconds)
- Unreachables
- Number of Unreachables
- Unreachables Time (seconds)
- TTL Expired
- Number of TTL Expired
- TTL Expired Time (seconds)

9 Close the IES L3 Access Interface (Edit) form.

10 Close the IES Service (Edit) form.

11 Close the Manage Services form.

Procedure 70-34 To configure IPv6 ICMP on an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Ensure that the IPv6 Allowed parameter is enabled.

8 Click on the ICMPv6 tab.

9 Configure the parameters:

- Redirects
- Number of Redirects
- Redirects Time (seconds)
- Unreachables
- Number of Unreachables
- Unreachables Time (seconds)
- Packet Too Big
- Number of Packet Too Big
- Packet Too Big Time (seconds)
- Param Problem
- Number of Param Problem
- Param Problem Time (seconds)
- Time Exceeded
- Number of Time Exceeded
- Time Exceeded Time (seconds)

10 Close the IES L3 Access Interface (Edit) form.

11 Close the IES Service (Edit) form.

12 Close the Manage Services form.

Procedure 70-35 To configure IPCP for an IES L3 access interface

You can configure IPCP only on the ASAP MDA on the 7750 SR and 7710 SR.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the IPCP tab. The IPCP tab is available when the SAP and port is configured with Null or IPCP encapsulation.

8 Configure the parameters:

- Peer Address
- Primary DNS Address
- Secondary DNS Address

Note — Primary and secondary DNS addresses have similar functionality, although they are assigned independently. When both are present, the primary DNS address is used to resolve address names. If the primary DNS address cannot be used the secondary DNS address is used.

9 Close the IES L3 Access Interface (Edit) form.

10 Close the IES Service (Edit) form.

11 Close the Manage Services form.

Procedure 70-36 To configure ARP for an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the ARP tab. The General tab is displayed.

8 Configure the Timeout (seconds) parameter.

9 Click on the Create button. The Static ARP (Create) form opens.

10 Configure the parameters:

- Unnumbered
- IP Address
- Physical Address

11 Click on the OK button. The Static ARP (Create) form closes.

12 Click on the Proxy ARP tab.

13 Configure the parameters:

- Remote Proxy ARP
- Enable Local Proxy ARP
- Proxy ARP Policy 1
- Proxy ARP Policy 2
- Proxy ARP Policy 3
- Proxy ARP Policy 4
- Proxy ARP Policy 5

14 Close the IES L3 Access Interface (Edit) form.

15 Close the IES Service (Edit) form.

16 Close the Manage Services form.

Procedure 70-37 To configure neighbor discovery on an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The Site L3 Access Interface (Edit) form opens with the General tab displayed.

7 Ensure that the IPv6 Allowed parameter is enabled.

8 Click on the Neighbor Discovery tab.

9 Click on the Create button. The Neighbor Discovery (Create) form opens.

10 Configure the parameters:

- IP Address
- Physical Address

11 Click on the OK button. A dialog box appears.

12 Click on the OK button. The Neighbor Discovery (Create) form closes, and the IES L3 Access Interface (Create) form refreshes with the neighbor entry.

13 Click on the Proxy ND tab.

14 Configure the parameters:

- Enable Local Proxy
- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Note — Do not leave an empty policy parameter between two configured policy parameters. For example, do not configure the Policy 1 and Policy 3 parameters and leave the Policy 2 parameter unconfigured, or the 5620 SAM reorders the policies and moves the policy specified for the Policy 3 parameter to the Policy 2 parameter.

15 Repeat steps 8 to 14 for each neighbor entry you need to create.

16 Close the IES L3 Access Interface (Edit) form.

17 Close the IES Service (Edit) form.

18 Close the Manage Services form.

Procedure 70-38 To configure IPv4 DHCP for an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the DHCP tab. The General tab is displayed.

8 Configure the parameters:

- Enable DHCP Relay
- Description
- Trusted
- Lease Populate
- Enable
- Relay Plain BOOTP
- Use ARP

The Lease Populate parameter is configurable when the Enable parameter is enabled.

9 Depending on the type and release of device that you are configuring, the Subscriber Authentication Policy panel is present. Choose a Subscriber Authentication policy, if required. Otherwise, go to step 14.

10 Click on the Select button in the Subscriber Authentication panel to choose a subscriber authentication policy. The Select Subscriber Authentication Policy - DhcpRelayConfiguration form opens.

11 Configure the filter criteria, if required, and click on the Search button.

12 Choose a subscriber authentication policy and click on the OK button. The Select Subscriber Authentication Policy - DhcpRelayConfiguration form closes, and the IES L3 Access Interface (Edit) form refreshes with the subscriber authentication policy name.

13 Configure the parameters:

- Action
- Circuit ID
- Remote ID
- Remote ID String
- Vendor Specific Options
- Vendor String
- IP address
- Use as source
- Relay Unicast Message

The Remote ID String parameter is configurable when the Remote ID is set to Remote ID String.

When the Relay Unicast Message parameter is set to Renew or Release Update Source IP, the GI address parameter can be configured as any local configured address in the same routing instance as the GI address for the DHCP relayed messages. If the Relay Unicast Message parameter is set to None, the GI address is restricted to the IP address configured on the subscriber interface.

14 Click on the Server tab.

15 Configure the parameters:

- Server 1 through Server 8
- Administrative State
- Emulated Server IP Address
- Lease Time
- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time Override

The Number of Days, Number of Hours, Number of Minutes, Number of Seconds, and Lease Time Override parameters are configurable only when the Lease Time parameter is set to Specified Time Period.

16 Close the IES L3 Access Interface (Edit) form.

17 Close the IES Service (Edit) form.

18 Close the Manage Services form.

Procedure 70-39 To configure ATM on an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The Site L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the ATM tab.

Note — The ATM tab is available when the interface port is an ATM port.

8 Configure the parameters:

- AAL5 Encapsulation
- ATM OAM Alarm Cell Handling
- Periodic ATM OAM Loopback

9 Click on the Select button in the Ingress ATM Policy panel to choose an ingress ATM policy. The Select Ingress ATM Policy - ATM Configuration form opens.

10 Choose an ingress ATM policy and click on the OK button. The Select Ingress ATM Policy - ATM Configuration form closes and the L3 Access Interface form reappears with the ingress ATM policy information displayed.

11 Click on the Select button in the Egress ATM Policy panel to choose an egress ATM policy. The Select Egress ATM Policy - ATM Configuration form opens.

12 Choose an egress ATM policy and click on the OK button. The Select Egress ATM Policy - ATM Configuration form closes and the IES L3 Access Interface (Edit) form reappears with the egress ATM policy information displayed.

13 Close the IES L3 Access Interface (Edit) form.

14 Close the IES Service (Edit) form.

15 Close the Manage Services form.

Procedure 70-40 To create a VRRP instance on an IES L3 access interface for a virtual router

You must know the VRID for an existing virtual router and ensure that the interface is a member of the same subnet as the virtual router.

See chapter 33 for configuration information about VRRP instances and virtual routers.

Note — The following configurations are required for the operation of the IPv6 VRRP instance:

- You can only create an IPv6 VRRP Instance if you enable the IPv6 Allowed parameter on the General tab of the IES L3 Access Interface (Edit) form.
- The Link Local Address on the parent interface must be set to preferred and configured as one of the backup addresses (or same subnet) for the IPv6 VRRP instance. The Admin Link Local Address and Admin Link Local Address Preferred parameters on the General tab of the IES L3 Access Interface (Edit) form must be set accordingly.
- The IPv6 address on the parent interface must be set to preferred to be used as a backup address (on same subnet) for the IPv6 VRRP instance. The IP Address and IP Address Preferred parameters in step 9 of Procedure 70-31 must be set accordingly.
- The Send Advertisement and Use Virtual MAC Address parameters must be enabled in step 9 of Procedure 70-42 for the router advertisement on the parent interface.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the VRRP tab.

8 Click on the Create button. The VRRP Instance (Create) form opens with the General tab displayed.

9 Configure the Virtual Router ID parameter.

10 Perform steps 8 to 15 of Procedure 33-2.

Note — You can use the VR Instances tab to create, modify, and view VR instances.

11 Click on the OK button. The VRRP Instance (Create) closes and the IES L3 Access Interface (Edit) form reappears.

12 Close the IES L3 Access Interface (Edit) form.

13 Close the IES Service (Edit) form.

14 Close the Manage Services form.

Procedure 70-41 To configure anti-spoofing filters for an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Anti-Spoofing tab.

8 Configure the parameters:

- Anti-Spoofing
- ARP Populate

The ARP Populate parameter is configurable when all of the IP addresses of the defined static hosts on the interface are in one of the subnets configured for the interface.

9 Click on the Static Hosts tab to configure static subscriber host entries, if subscriber entries are not available through DHCP lease management.

10 Click on the Create button. The Access Interface Anti-Spoofing Static Host Display (Create) form opens.

11 Configure the parameters:

- IP Address
- MAC Address

Specify at least one IP address or MAC address for each static host. The values specified for the Anti-Spoofing and ARP Populate parameters determine the type of address entry that is required for the static host. For example, when you set the Anti-Spoofing parameter to Source Ip Addr, you must specify at least the IP address for the static host.

Note — You can configure a static host on a SAP only when no static ARP entries exist on the IP interface.

When the ARP Populate parameter is enabled, the IP address of the new static host must be in one of the subnets that is configured for the interface in Procedure 70-31.

12 Click on the Apply button if you need to create additional entries. A dialog box appears. Otherwise, go to step 15.

13 Click on the OK button.

14 Repeat steps 11 to 13 to create additional entries, if required.

15 Click on the OK button. A dialog box appears.

16 Click on the OK button. The Access Interface Anti-Spoofing Static Host Display (Create) form closes and the Static Hosts tab refreshes with the configured static hosts displayed.

17 Close the IES L3 Access Interface (Edit) form.

18 Close the IES Service (Edit) form.

19 Close the Manage Services form.

Procedure 70-42 To configure router advertisement on an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Advertisement tab.

8 Click on the Create button to add a router advertisement entry. The Router Advertisement (Create) form opens.

9 Configure the parameters:

- Send Advertisement
- Min Interval (seconds)
- Reachable Time (milliseconds)
- Managed Address Config
- MTU
- Use Virtual MAC Address
- Max Interval (seconds)
- Retransmit Time (milliseconds)
- Other Stateful Config
- Current Hop Limit
- Lifetime (seconds)

If you are configuring the L3 interface for an IPv6 VRRP instance, then the Send Advertisement and Use Virtual MAC Address parameters must both be enabled.

10 Click on the Prefix tab.

11 Click on the Create button. The Router Advertisement Prefix (Create) form opens.

12 Configure the parameters:

- IPv6 Prefix
- On-Link Determination
- Prefix Length
- Autonomous Address Configuration
- Lifetime (seconds) in Preferred Lifetime panel
- No Expiry in Preferred Lifetime panel
- Lifetime (seconds) in Valid Lifetime panel
- No Expiry in Valid Lifetime panel

13 Click on the OK button. A dialog box appears.

14 Click on the OK button. The Router Advertisement (Create) form reappears.

15 Click on the OK button. A dialog box appears.

16 Click on the OK button. The Router Advertisement (Create) form closes and the IES L3 Access Interface (Edit) form refreshes with the router advertisement entry.

17 Close the IES L3 Access Interface (Edit) form.

18 Close the IES Service (Edit) form.

19 Close the Manage Services form.

Procedure 70-43 To specify queue overrides on an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Override Policy Items tab.

Note — The Override Policy Items tab contains a number of sub-tabs. However, the sub-tabs that are displayed depend on the port type that you have chosen for this interface.

- If you configured a non-HSMDA port, then the Access Ingress Queues, Access Egress Queues, Ingress Policer, and Egress Policer sub-tabs are active.
- If you configured an HSMDA port, then the Access Ingress Queues, Access Egress HSMDA Queues and Ingress Policer sub-tabs are active.

Set the queue overrides, as described in Procedure 43-42.

8 Close the IES L3 Access Interface (Edit) form.

9 Close the IES Service (Edit) form.

10 Close the Manage Services form.

Procedure 70-44 To configure IPv6 DHCP on an IES L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose an IES service and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Site icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The IES L3 Access Interface (Edit) form opens with the General tab displayed.

7 Ensure that the IPv6 Allowed parameter is enabled.

8 Click on the DHCPv6 tab. The General tab is displayed.

9 Configure the parameters:

- Enable DHCPv6 Relay
- Description
- Lease Populate
- Maximum Number of Leases
- Route Populate PD
- Route Populate PD Exclude
- Route Populate NA
- Route Populate TA
- Interface Id Option
- Interface Id String
- Remote ID
- Source IP Address
- Neighbor Resolution
- Prefix Option

10 Click on the Server tab.

11 Configure the Server 1 through Server 8 parameters.

12 Configure the interface name for each DHCPv6 server that you configured in step 11 by clicking on the Select button in the Zone Index panel. The Select Zone Index - DhcpRelayV6Configuration form opens with a list of configured interfaces.

13 Choose an interface and click on the OK button. The Select Zone Index - DhcpRelayV6Configuration list form closes and the IES L3 Access Interface form refreshes with the interface information.

14 Click on the DHCPv6-Prefix tab.

15 Click on the Create button. The DhcpRelayV6PrefixDelegation (Create) form opens.

16 Configure the parameters:

- Prefix Address
- Prefix Length
- Prefix DUID
- Prefix IAID
- Prefix Life Time (seconds)
- Prefix Valid Life Time (seconds)

17 Click on the OK button. A dialog box appears.

18 Click on the OK button. The IES L3 Access Interface (Edit) form reappears.

19 Close the IES L3 Access Interface (Edit) form.

20 Close the IES Service (Edit) form.

21 Close the Manage Services form.

Procedure 70-45 To view the service operational status

The Aggregated Operational State and State Cause indicators on the General tab of the service management form display information about service faults.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose a service and click on the Properties button. The IES Service (Edit) form opens.

4 View the Aggregated Service Site Operational State and State Cause indicators. When the Aggregated Operational State is Down or Partially Down, a check mark beside the appropriate State Cause indicator identifies the type of associated service fault.

5 Click on the appropriate tab to view or edit an object that is identified as faulty by a State Cause indicator.

6 Click on the Faults tab to view the alarms for the object. The Object Alarms tab is displayed.

7 Click on the Aggregated Alarms tab to view the aggregated alarms for the object. The Aggregated Alarms tab is displayed.

8 Close the IES Service (Edit) form.

9 Close the Manage Services form.

Procedure 70-46 To view the service topology

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose an IES and click on the Topology View button. A Topology View dialog box appears.

4 Click on the Yes button to proceed. The Service Topology - map opens.

See chapter 6 for more information about service topology views.

Procedure 70-47 To modify an IES

Caution — Modifying parameters can be service-affecting.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose an IES and click on the Properties button. The IES Service (Edit) form opens with the general properties of the service displayed on the General tab.

The following tabs list the service elements that can be individually or collectively selected and configured:

- General tab — displays general customer and service information
- Sites tab — lists the sites that are included in the service
- Interfaces tab — lists the interfaces, such as L3 access, that are included in the service, and allows the creation and configuration of subscriber, group, and redundant interfaces
- SDP Bindings tab — displays the spoke SDP bindings that are associated with the service
- Addresses tab — lists the IP addresses that are associated with the service

Note — You cannot remove an IP address from an interface when the IP address of a static host is defined in the subnet of the interface IP address and the ARP Populate parameter is enabled on the Anti-Spoofing tab.

- Template tab — displays the template used to create the service, if applicable.
- Faults tab — displays the faults associated with the service

Note — Users with the administrator scope of command role can click on the Select button on the Template tab to associate a service template with the service object, if required.

4 Modify the parameters for the service, as required.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button to confirm the action. The IES Service (Edit) form closes, and the Manage Services form reappears.

7 Click on the Close button to close the Manage Services form.

Procedure 70-48 To modify an IES using the topology view

The topology view for a service provides a graphical representation of the various components and their interconnections. You can also use this view to add, modify, or just navigate to service components. This provides an alternative approach to performing these functions from the navigation tree view.

Working from the topology view can expedite the creation of the components, since many of the fields you would ordinarily have to set in the configuration forms will be automatically populated using this approach. The configuration forms can also be accessed directly at any time from this view by right-clicking a component. This allows quick access to conduct more detailed component configuration.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears at the bottom of the Manage Services form.

3 Choose an IES and click on the Topology View button. The Service Topology map opens.

The remainder of this procedure contains two sub-procedures describing the components that can be created and modified from the topology view. These include:

- Creating a new site. Go to step 4.
- Creating spoke SDP bindings. Go to step 9.

Adding a new site

4 Right-click on any blank space in the service topology map. A contextual menu is displayed. Choose the Create IES Site option.

The Select Network Elements form appears.

5 Select one or more sites to add to the service and click OK. The IES Site (Create) form for the new site is displayed. If you selected more than one site, the IES Site (Multiple Instances) (Create) form for the new sites is displayed.

6 Click on the OK button. The IES Site (Create) (or IES Site (Multiple Instances) (Create)) form closes and the new site (or sites) is displayed on the map.

7 If you need to perform detailed configuration of site properties for the new site, right-click the site icon and select Properties from the contextual menu. The Site (Edit) form opens. See Procedure 70-3 for detailed site configuration information.

8 Go to step 9 if you need to create spoke SDP bindings or go to step 16 to finish.

Creating spoke SDP bindings

9 Select the sites you need to connect in the service topology map and right-click on any one of them. A contextual menu is displayed.

Note — When you create a spoke binding between two sites, the order in which you select them is important. The first site you select will become the source site and the second site will become the destination site. Therefore, it is not recommended that you do a marquee-select in the topology view, since you will not be sure of this hierarchy. Instead, select the sites individually, and hold down the Shift or Ctrl key after your first selection.

10 Select Connect from the contextual menu and choose the Create Spoke SDP Binding option.

The Spoke SDP Binding (Create) form is displayed.

Note — For this function, it is assumed that you clicked on the source site first and then held down the Shift or Ctrl key while right-clicking on the destination site to display the contextual menu.

11 Enable the Auto-Select Transport Tunnel parameter.

12 You can manually configure other parameters here if required, or click on the OK button. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Spoke SDP Binding (Create) form closes and the new binding between the two sites is displayed in the topology view. See Procedure 70-8 for more detailed information on creating and configuring spoke SDP bindings, if required.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. See Chapter 27 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

13 Assuming that the spoke SDP binding was successfully created in step 12, select the same two sites again in the topology view, although this time do so in the opposite order that you originally selected them. This will allow you to create a spoke binding for the return tunnel.

14 Right-click on the second site you selected and choose the Create Spoke SDP Binding ... option from the contextual menu. The Spoke SDP Binding (Create) form is displayed.

15 You can manually configure other parameters here if required, or click on the OK button. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Spoke SDP Binding (Create) form closes and the new return binding between the two sites is displayed in the topology view.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. See Chapter 27 for information on how to create the required tunnel. Once the tunnel is created, you can repeat this sub-procedure.

16 Close the Service Topology form.

17 Close the Manage Services form.

Procedure 70-49 To delete an IES

Warning — Deleting a service may result in a service disruption for customers. Consider the implication of deleting the service before proceeding.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 As required, configure the filter criteria to locate the service or range of services to be deleted. A list of services appears at the bottom of the Manage Services form.

3 Choose a service or a range of services from the list.

4 Click on the Delete button. A warning form appears. This form is dynamic based on the priority of the service. Perform one of the following:

- **a** For services with a low priority, go to Step 5.
- **b** For services with a medium priority, configure the "Enter the highest priority of the service being deleted" text field by typing: Medium. Go to Step 5.
- **c** For services with a high priority, configure the "Enter the highest priority of the service being deleted" text field by typing: High. Go to step 5.

5 For all services regardless of how their priority is configured, acknowledge the check box that prompts you confirm that you understand the implications of deleting the service.

Note — If you select multiple services with different priorities, you must enter the highest priority level of selected services before you can delete the services.

6 Click on the Yes button to confirm the action. The service is deleted and removed from the list.

7 Click on the Close button to close the Manage Services form.

71 — VPRN service management

71.1 VPRN service management overview *71-2*

71.2 Sample VPRN service configuration *71-13*

71.3 Sample hub-and-spoke VPRN configuration *71-16*

71.4 Workflow to create a VPRN service *71-20*

71.5 VPRN service management procedures *71-22*

71.1 VPRN service management overview

The 5620 SAM supports the creation of VPRN services using the 7450 ESS in mixed mode, the 7750 SR, the 7710 SR, the 7705 SAR-H, and the 7950 XRS as a PE and provider core (P) router. VPRNs, also called IP VPNs or BGP/MPLS VPNs, are defined in RFC 2547bis. This standard describes a method of forwarding data and distributing routing information across an IP/MPLS service provider core network.

The 5620 SAM does not support the configuration of CE routers or devices.

VPRN services use BGP to exchange the VPRN routes among the PE routers that participate in the VPRN. This is done in a way that ensures that routes from different VPRNs remain distinct and separate, even if two VPRNs have an overlapping address space. PE routers distribute routes to CE routers in the VPRN. Since the CE routers do not peer with each other, there is no overlay visible to the VPRN's routing algorithm. The PE routers use BGP, RIP, OSPFv2, or OSPFv3 as the IGP to distribute internal routes to the CE routers.

Each route in a VPRN service is assigned an MPLS label. When BGP distributes a VPRN route, it also distributes an MPLS label for that route. Before a customer data packet travels across the backbone network, it is encapsulated with the MPLS label that corresponds, in the customer VPRN, to the route that best matches the destination address of the packet.

The MPLS packet is further encapsulated with either another MPLS label or with an IP or GRE tunnel header, so that it gets tunneled across the backbone to the proper PE router. Each route exchanged by the MP-BGP protocol includes an RD that identifies the VPRN association. Thus the backbone core routers do not need to know the VPRN routes.

The 5620 SAM supports end-to-end VPRN configuration using the following methods:

- Tabbed configuration forms with an embedded navigation tree. The navigation tree provides a logical view of the service and acts as a configuration interface.
- Pre-configured template. A user who is assigned the template management role can create a service template. See "Managing templates" in the *5620 SAM Scripts and Templates Developer Guide* for more information about the administrative tasks associated with service templates.

The 5620 SAM supports the configuration in a VPRN of an L3 aggregation mechanism called routed CO. Routed CO uses DHCP relay to manage dynamic subscriber hosts; the network resources for static subscriber hosts are explicitly provisioned. Routed CO supports all residential subscriber management functions of the 5620 SAM. See chapter 65 for more information about residential subscriber management and routed CO.

Routed CO uses a subscriber interface that defines up to 256 subnets. A subscriber interface has child objects called group interfaces. A group interface supports the configuration of multiple SAPs as child objects. A SAP in a group interface supports all residential subscriber management functions. A group interface does not allow the specification of IP subnets or addresses, but inherits the addressing scheme of the parent subscriber interface. The 5620 SAM service topology map displays VPRN subscriber interfaces, group interfaces, and the associated SAPs.

You can configure NAT for dynamic subscriber hosts in a routed CO deployment. NAT implementation in a VPRN service requires a NAT configuration on the VPRN routing instance and a NAT policy that is associated with a subscriber profile. See chapter 24 for information about configuring and deploying NAT, and about configuring a NAT policy. See Procedure 54-18 for information about associating a NAT policy with a subscriber profile. See Procedure 71-3 for information about configuring NAT on a VPRN routing instance.

A VPRN routed CO allows a service provider to resell wholesale carrier services while providing direct DSLAM connectivity. You can create a VPRN service for the retailer and also define subscriber access and configuration information for the retailer network. See Procedure 71-60 for more information on how to define a wholesale and retail VPRN configuration.

IPCP extensions allow you to configure IP addresses and DNS names of remote devices to enable inter-operability with other networks. Specifically setting an IPCP extension is necessary to connect to a mobile service provider network. Routers for mobile services rely on other network routers to provide IP addresses and DNS names (primary and secondary) for a PPP link.

When an IPCP extension is configured, an edge device configured with PPP/MLPPP can signal a far end device.

The General tab of the 5620 SAM service management form displays useful information about the operational state of the service and its sites through the Aggregated Operational State and State Cause indicators.

The 5620 SAM provides OAM tools for service validation and for troubleshooting service and network transport issues. You can run an OAM Validation test suite for the service by clicking on the Validate button, or by clicking on the More Actions button and choosing Validate. Alternatively, you can also perform a One Time Validation. If a check mark appears beside the OAM Validation Failed state cause indicator, the test has failed. The Tested Entity Result tab on the Tests tab displays detailed information about the OAM test result. See chapter 32 for general information about fault management using OAM tools. See chapter 77 for more information about how to configure OAM validation test suites.

The Aggregated Operational State indicator has four possible values: Up, Down, Partially Down, and Unknown. The value is derived from the operational states of the sites that are part of the service, as follows:

- Up—all sites are operationally up
- Partially Down—at least one site is operationally down
- Down—all sites are operationally down
- Unknown—the service has no provisioned sites

When the Aggregated Service Site Operational State is Partially Down or Down, a check mark appears beside the appropriate State Cause indicator to identify the type of fault to the 5620 SAM operator. You can view alarms on the Faults page.

When the Aggregated Operational State is Partially Down or Down, a check mark appears beside the appropriate State Cause indicator to identify the type of fault to the 5620 SAM operator.

When you use the 5620 SAM to create or discover a service, the 5620 SAM assigns a default Service Tier value to the service. The Service Tier parameter value is relevant only in the context of composite service topology views. See chapter 74 for more information about the hierarchical organization of composite services.

Common to all device services, such as VPRN, are policies that are assigned to the service. Policies are defined at a global level and can then be applied to components of the service, such as interfaces or circuits, when the service is configured or modified. The following policies are common to all device services:

- QoS policies define ingress classification, policing, shaping, and marking on the ingress side of the interface. QoS policies are configured using the Access Ingress Policy form, the Access Egress Policy form, and the ATM QoS Policy form.
- Policer control policies to control access ingress policers and access egress policers under a common hierarchy. Policer control policies are configured using the Policer Control Policy Manager.
- Scheduling policies define hierarchical rate limiting and scheduling to govern the scheduling of queues. Scheduler policies are configured using the Scheduler Policy and HSMDA Scheduler Policy forms.
- Port scheduler policies define hierarchical bandwidth allocation and scheduling at the egress port level. Port scheduler policies are configured using the Port Scheduler Policy form.
- Filter policies control network traffic into or out of an interface or circuit based on DHCP, IP, or MAC matching criteria. Filter policies are configured using the ACL IP Filter form, the ACL MAC Filter form, and the DHCP Filter form.
- Accounting policies measure the traffic on a service to ensure proper billing and enforcement of SLAs. Accounting policies are configured using the Accounting Policy form.
- ANCP policies provide status and control information based on port-up and port-down messages and current line rate changes between the edge device and the access node. ANCP policies are configured using the Manage Subscriber Policies form.
- Routing policies control the size and content of the routing tables, the routes that are advertised, and the best route to take to reach a destination. Routing policies are configured using the Routing Policy Manager.

See chapter 42 for more information about policies.

VPRN service routers

A VPRN service consists of CE routers or devices connected to PE routers. PE routers connected to P routers transport data across the IP/MPLS provider core network in service tunnels.

Packets that arrive at an edge 7450 ESS, 7705 SAR-H, 7710 SR, 7750 SR, or 7950 XRS are associated with a VPRN service based on the access interface on which they arrive. An access interface is uniquely identified by the following parameters:

- physical Ethernet port or POS port and channel
- encapsulation type
- encapsulation identifier (if required)

Table 71-1 describes the general functions performed by PE, P, and CE routers in a VPRN. See Figure 71-4 in this chapter for a sample VPRN. See the appropriate hardware services guide for more detailed information about VPRN functionality on the supported managed devices.

Table 71-1 VPRN router functionality

Router type	Functionality
PE	• Are directly connected to PE, CE, and P routers • Learn VPRN routes from CE devices using e-BGP, RIP, OSPFv2 or OSPFv3, or static routes • Maintain a separate routing table, called a VRF, for each service • Exchange multicast VPRN route information with PE routers in other autonomous systems using MP-BGP • Distribute MPLS inner labels using MP-BGP. Before data traverses the IP/MPLS backbone, it is encapsulated with the MPLS label that corresponds, within the VPRN, to the route that best matches the packet's destination address. • Distribute MPLS outer labels using RSVP-TE or LDP. Before the MPLS packet traverses the IP/MPLS backbone, it is further encapsulated with either another MPLS label or with a GRE or MPLS LSP service tunnel header, so that it is tunneled across the backbone to the appropriate PE router. • Use RDs to identify the VPRN associations • Use RTs to determine when a received route is destined for a VPRN • Terminate RFC 2684-encapsulated IPv4 traffic from ATM access network on SAPs
P	• Are directly connected to PE and P routers • Act as transit LSRs • Maintain routes to PE routers and are unaware of specific VPRN routing information
CE	• Are directly connected to PE routers • Provide customer access to the VPRN

Inter-AS connections

You can connect VPRN service sites (or VRFs) on multiple ASs using EBGP. ASs set up mutual connections by exchanging routing information, such as routes and labels. Labeled VPN-IPv4 routes are distributed within an AS on a PE router using IGBP and between ASs using EGBP on an ASBR. The ASBR redistributes VPN-IPv4 routes to an ASBR in another AS, which in turn distributes the routes to PE routers in its own AS or to an ASBR.

When a VPRN inter-AS connection is between two service providers, the ASs must be on private peering points. For an LSP to operate between ASBRs on the AS borders, EBGP peering must be set up between the ASBRs and MPLS label exchange must be supported. Furthermore, an LSP must run from a packet's ingress PE router to its egress PE router.

You can enable inter-AS connections from the BGP settings in Procedure 71-50.

MP-BGP Multicast IPv4

The MP-BGP multicast extension allows for a network topology that supports both multicast and unicast routing. Routes from the unicast routing table can be imported into the multicast routing table, and routes from the multicast routing table can be imported into the unicast routing table. An ASBR can be configured to advertise VPRN routes to peers in other ASs, redistributing unicast routes learned by BGP into MP-BGP routes, and MP-BGP routes into unicast routes. This configuration enables the support of the two sets of routing information.

The MP-BGP multicast extension specifies that BGP can exchange routing information for the multicast IPv4 address family within and between BGP ASs. All configurations entered in a multicast IPv4 address family for a BGP instance affect multicast services and are applied to the multicast routing table. See chapter 23 for more information about the configuration of BGP and the MP-BGP multicast extension.

IPv6 support

The 5620 SAM supports IPv6 configuration of the following functions in VPRN services on the 7710 SR, 7750 SR, and 7950 XRS, and on the 7450 ESS in mixed mode:

- addressing for static routes, L3 access interfaces, and BGP peerings
- router advertisement, ICMP, DHCP, neighbor discovery, and ACL filtering

Note — DHCP is not supported on the 7950 XRS.

To configure IPv6 in a VPRN, you must first enable VPN IPv6 for BGP on the base routing instance of each device that acts as a site in the VPRN.

A customer can use an SNMP utility to manage the IPv6 objects in a VPRN service. SNMP mediation of VPRN objects requires the configuration of a community string on each site in the VPRN, regardless of the IP or SNMP version. SNMPv3 mediation of VPRN IPv6 objects, however, requires the additional configuration of an SNMP context for the VPRN using a CLI. See chapter 10 for information about configuring an SNMPv3 context for a VPRN.

PIM for VPRN

The PIM protocol can be applied to a VPRN service to create a private multicast distribution network. PIM uses an MDT group address to identify multicast traffic for the VPRN instance to prevent flooding of multicast packets to PE devices in the VPRN. VRFs with the same MDT address are members of that group and receive multicast traffic from each other. The MDT address cannot be in the SSM range.

By default, the PIM protocol only uses the information in the unicast routing table to determine the RPF interface. PIM can be configured to use the separate multicast and unicast routing tables built by MP-BGP to perform RPF lookups for multicast-capable sources to build and maintain distribution trees for multicast traffic forwarding. See chapter 23 for more information about configuring PIM to use multicast or unicast routing tables in RPF lookups.

Data-MDT

A data-MDT is a tunnel for high-bandwidth source traffic through the P-network to interested PE routers. Data-MDTs do not broadcast customer multicast traffic to all PE routers in a multicast domain.

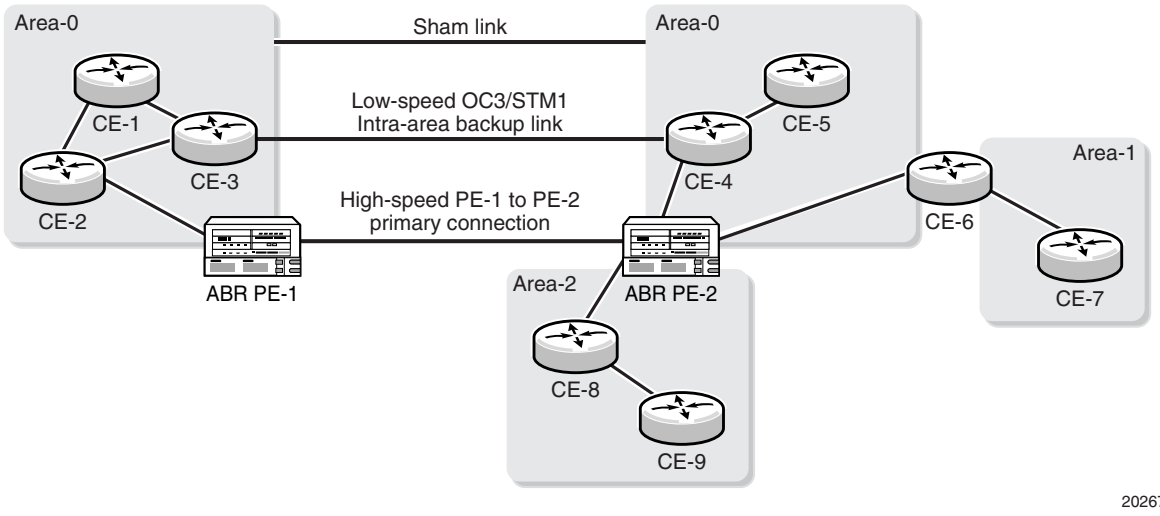
Note — Data-MDTs are only supported for VPRN services.

Multicast data transmission from a CE router is typically delivered to all CE routers in the same multicast group. Some CE routers do not require the delivery of a specific multicast stream because there no downstream receivers for the multicast group. You can prune a PE router from the MDT if the router does not deliver multicast traffic to the attached CE routers. This task is beneficial for high-traffic multicast applications.

A data-MDT allows you to configure a traffic threshold in Kb/s. The 5620 SAM signals the data-MDTs when the bandwidth for the SSM group exceeds the configured threshold. The PE router sends an MDT join TLV, at 60 s intervals, over the default MDT to all PE routers. The routers respond with the following actions:

- PE routers that require the SSM group specified in the MDT join TLV; join the data-MDT used by the PE router to transmit the SSM group
- PE routers that do not require the SSM group specified in the MDT join TLV; do not join the data-MDT, pruning the PEs from the MDT

The transmitting PE router switches the multicast stream to the data-MDT after allowing the PE routers to join the data MDT. You can configure the data-MDT delay interval using the 5620 SAM.



The PE router stops sending the MDT join TLV when the transmission bandwidth no longer exceeds the configured threshold. The PE routers using the data-MDT leave the group and transmission resumes over the default MDT.

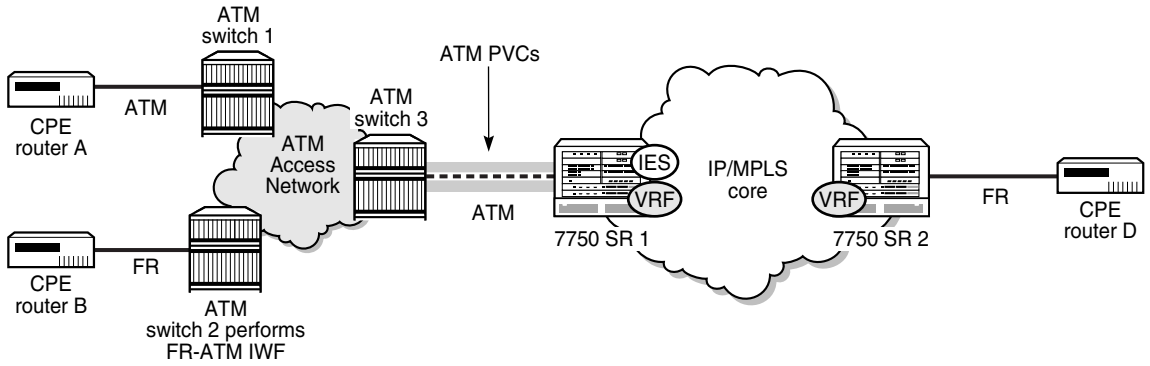
OSPF sham link support

You can use the OSPF protocol to connect CE routers to PE routers over an MPLS VPN backbone. This can be useful for customers who subscribe to a VPN service and need to use OSPF as their intra-site routing protocol to exchange routing information between their sites. However, there is a potential configuration issue associated with this approach.

OSPF PE-CE connections assume that the only path between two client sites is across the MPLS VPN backbone. OSPF treats a link through a Layer 3 VPN as an inter-area link. However, other paths between VPN sites may also exist. For example, in Figure 71-1, the link between CE-3 and CE-4 (two CE routers in the same OSPF area) might be a low-speed OC3/STM1 intra-area backup link. OSPF preferentially utilizes intra-area links over inter-area links, and since it establishes an intra-area route connection between CE-3 and CE-4, the potentially high-speed PE-1 to PE-2 primary connection is not utilized.

Figure 71-1 Sham link configuration example

OSPF sham links can be created to resolve this problem. By creating and configuring a sham link as an intra-area link between PE-1 and PE-2, a normal OSPF adjacency is formed, and the link-state database is exchanged across the MPLS VPN. As a result, the desired intra-area connectivity is created between PE-1 and PE-2. In addition, the cost of the CE-3/CE-4 and PE-1/PE-2 links can be managed by the use of a numerical metric. You could then configure the service so that the CE-3/CE-4 link becomes a standby link only in event that the VPN fails.



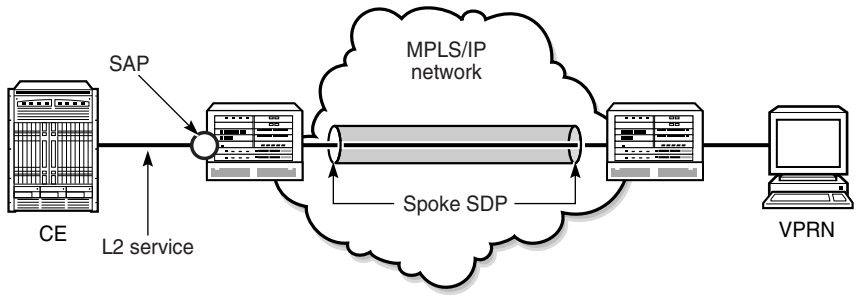
The use of OSPF sham links in VPRNs is supported only on the 7450 ESS, 7710 SR, 7750 SR, and 7950 XRS.

ATM SAP terminations for VPRN

CE routers that have access to an ATM network can connect with a VPRN using ATM SAP terminations on a 7750 SR or 7710 SR. The interconnection between ATM point-to-point and L3 services uses RFC 2684-encapsulated IPv4 traffic over an ATM PVC that terminates on a specially configured SAP. All RFC 2684-encapsulated traffic can be routed over ATM networks, frame relay, or directly through ATM connections.

Figure 71-2 shows how CPE Router A in an ATM network can access L3 IP services, such as a VPRN, using a statically configured ATM PVC on a 7750 SR (SR#1). A SAP is configured on SR #1 to serve a specific VPRN as identified by the VRF. Destination CPE router D can receive RFC 2684-encapsulated traffic over an IP network through a frame relay over 7750 SR 2.

Figure 71-2 ATM SAP network connection to a VPRN



The two connection methods used between ATM and VPRN, which appear in 5620 SAM as AAL5 Encapsulation parameters: LLC/SNAP encapsulation and VC-multiplexing.

Epipe SDP spoke termination on VPRN services

A VLL Epipe service can terminate directly on a VPRN service using an SDP spoke on the 7750 SR, 7450 ESS, 7710 SR, or 7950 XRS. Traffic that terminates on a VPRN service is identified by the interface ID of the SDP on the L2 access router and the VC ID label in the service packet. All routing protocols supported by VPRN are also supported for spoke SDP termination.

Figure 71-3 shows a spoke SDP terminating directly on a VPRN. The spoke SDP could be tied to an Epipe or VPLS. No configuration is required for the CE-to-PE connection on the SAP.

Figure 71-3 SDP spoke termination on an L2 service

Routed CO dual homing using SRRP

Subscriber Router Redundancy Protocol (SRRP) allows two separate connections to an access NE such as DSLAM to operate in an active/standby configuration similar to the way in which VRRP interfaces operate. SRRP is a collection of functions and messaging protocols that allows a system to create a set of redundant gateway IP addresses that are shared by a local and remote NE.

Each SRRP instance is created within the context of a subscriber group IP interface and is identified by a unique SRRP instance ID, which must be unique within the NE. This SRRP instance controls the redundant routing for all subscriber subnets configured or associated with the group interface. One SRRP instance is supported for each group interface and the SRRP ID must be the same as the SRRP instance ID on the group IP interface on the redundant NE.

A subscriber subnet redundant gateway IP host address is assigned at the subscriber IP interface level and is used for each SRRP instance associated with the subscriber subnet. The redundant IP host address must be configured for a subscriber subnet before it can be associated with an SRRP instance.

When SRRP is active on a group interface, the SRRP instance advertises to a remote NE using in-band messaging on the group-interface SAPs and out-of-band messaging on the group-interface redundant interface. If the remote NE uses the same SRRP instance ID, one NE enters a master state, while the other NE enters a backup state. Since the NEs share a common SRRP gateway MAC address (used for the SRRP gateway IP address and for proxy ARP functions), either NE can act as the default gateway for the attached subscriber hosts. This functionality helps to preserve subscriber QoS enforcement. The master state allows routing to and from the subscriber hosts associated with the group IP interface. The backup state stops ingress forwarding for packets destined to the SRRP gateway MAC and causes all packets destined to subscriber hosts on the group IP interface to be forwarded to a redundant IP interface associated with the group IP interface.

Normally, when anti-spoofing is enabled on a group-interface SAP, the SAP drops SRRP packets because they do not contain a subscriber MAC or IP address. However, you can use a configuration option to enable anti-spoofing for subscriber hosts on a group-interface SAP that participates in SRRP advertisements.

The underlying mechanism that controls state transitions is based on a dynamic priority level that an SRRP instance maintains. The SRRP instance with the highest priority level assumes the master operating state. An SRRP instance with a higher current priority level always preempts an SRRP instance with a lower priority level. If the priority levels are equal, the SRRP instance with the lowest source SRRP host IP address assumes the master state. The local SRRP instance priority may also be controlled by associating the instance with an existing VRRP policy.

To prevent a flood of AccessInterfaceDown alarms that an SRRP fault or link failure may generate for LAG-based MSAPs, the 5620 SAM performs alarm suppression. See chapter 65 for more information.

The redundant IP interface is a special interface that connects two systems with one or more common SRRP instances. The interface is configured with a /31 address and a spoke SDP binding, creating an Ethernet pseudowire shortcut between the redundant NEs. When the SRRP instance is in backup state, the group interface associated with this instance is not allowed to forward or route traffic downstream towards the subscriber. As a result of this, the packets are shunted across the redundant interface so that the active group interface does the forwarding or routing.

If the redundant IP interface goes down, the system allows the group IP interfaces associated with the down interface to forward locally downstream, when they are in the backup SRRP state. While forwarding downstream in the backup state, the system uses the MAC address associated with the group IP interface, not the SRRP redundant gateway MAC address.

SRRP is supported on the 7450 ESS in mixed mode, 7710 SR and 7750 SR.

DoS protection

To protect a VPRN from a high incoming packet rate that characterizes a DoS attack, you can use the 5620 SAM to create DoS protection policies for the VPRN L3 access interfaces. A DoS protection policy limits the number of control-plane packets that an interface receives each second, and optionally logs a violation notification if a policy limit is exceeded. You can use the NE System Security form to view the violations for a specific NE.

You can configure a DoS protection policy to control the following on a VPRN L3 access interface:

- the control-plane packet arrival rate per subscriber host on the interface
- the overall control-plane packet arrival rate for the interface
- whether an NE sends a notification trap if a policy limit is exceeded

Each VPRN L3 access interface on an NE that supports DoS protection is automatically assigned a default DoS protection policy. This default policy limits only the overall packet arrival rate for the interface, and cannot be deleted or modified. See "To configure an NE DoS protection policy" in the *5620 SAM System Administrator Guide* for information about creating a DoS protection policy.

DDoS protection

To protect a VPRN from a high incoming packet rate that characterizes a DDoS attack, you can use the 5620 SAM to configure TMS interfaces to route malicious traffic through the ISA-TMS MDA where the malicious traffic is cleaned before being released to the network.

The TMS interface on a VPRN consists of three VPRNs as follows:

- The management VPRN communicates with the TMS server to determine whether incoming packets are malicious. Configuration of this VPRN is optional.
- The Off-Ramp VPRN receives the malicious traffic and routes it through the ISA-TMS MDA where the traffic is scrubbed. Configuration of this VPRN is optional.
- The On-Ramp VPRN returns the cleaned traffic to the network. Configuration of this VPRN is mandatory.

See Procedure 71-64 for information about creating a TMS interface.

You can configure a DDoS protection policy on a VPRN group interface SAP, network interface, or L3 access interface. See "To configure an NE DDoS protection policy" in the *5620 SAM System Administrator Guide* for more information.

Local DHCP servers

A local DHCP server can be associated with an L3 access interface on a VPRN service. See section 65.4.

Local user database

A local user database can be associated with a local DHCP server and PPPoE configurations on group interfaces. See section 65.4.

PPPoE protocol on VPRN services

A VPRN service can be configured to run PPPoE protocol. PPPoE is used in subscriber networks to encapsulate PPP frames inside Ethernet frames. PPPoE combines the point-to-point protocol used with DSL sessions with the Ethernet protocol used to support multiple subscribers in a local area network. From the group interface configuration form you can assign a PPPoE policy and a local user database to authenticate PPPoE subscribers.

PPPoE termination in a business VPRN environment is also supported. This ability targets applications such as PPPoE VPRN with IP overlap, where there are two participants in the service:

- The “Wholesale VPRN”, which is a VPRN that provides access to the SAP.
- The “Retail VPRN”, which is a business VPRN that routes the packets belonging to the PPPoE sessions terminating in it. The Retail VPRNs may have overlapping IP addresses.

In this configuration, the PPPoE subscriber host terminates in a Retail VPRN and provides a routed path to the customer site. The VPRN service-id that carries it is determined by the service configuration, specifically:

- If a local user database is used, the Retail Service ID property that you specify in the PPPoE host configuration provides a reference to the VPRN service-id that should be used.
- If RADIUS is used for authentication, the retailer service-id is provided by an Alcatel-Lucent VSA.
- If MSAP is used, the SAP is created in the wholesale VPRN using the information from RADIUS.

The PPPoE session is negotiated with the parameters defined by the Wholesale VPRN interface. Since the IP address space of the subscriber management host may overlap between VPRN services, the node anti-spoofs the packets at access ingress with the session-id.

L2TP on VPRN services

The 5620 SAM supports the configuration of L2TP on a 7710 SR, 7750 SR, or 7950 XRS, and on the 7450 ESS in mixed mode. L2TP is a session-layer protocol that extends the PPP model by allowing L2 and PPP endpoints to reside on different devices that are interconnected by a PSN. L2TP extends the PPP sessions between the CPE and PPP/L2TP termination points on the L2TP network server (LNS), via an intermediate L2TP access concentrator (LAC). The LAC is the initiator of session-generated L2TP tunnels; the LNS is the server that waits for new tunnels. Manually configured and initiated L2TP tunnels can be initiated or stopped from either the LNS or LAC.

At least one ISA-LNS group must be configured for the LNS NE.

On an LNS NE, L2TP destinations configured for L2TP tunnel profiles can include the following:

- loopback L3 access interfaces for a VPRN or IES service
- loopback interfaces configured for a base routing instance

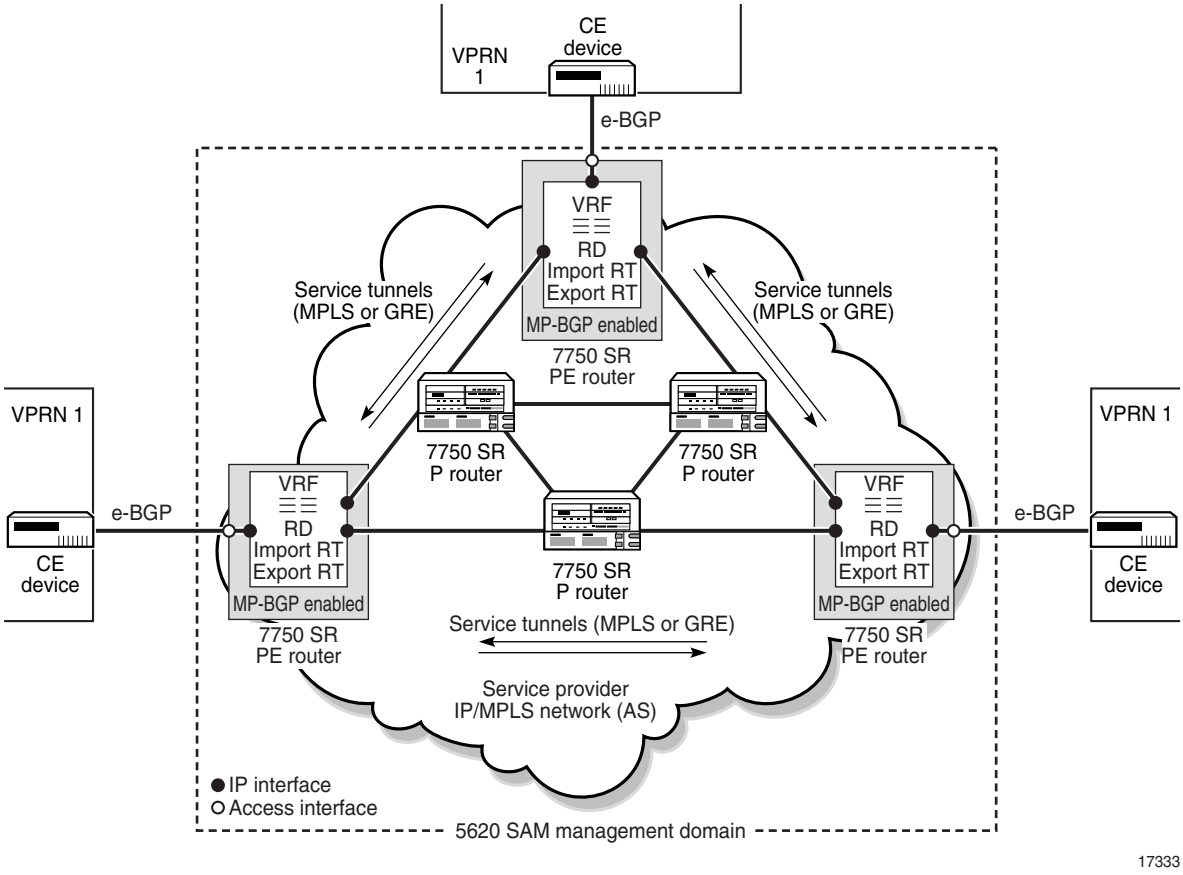
See chapter 14 for more information about ISA-LNS groups. See Procedure 14-6 for information about how to create and configure an ISA-LNS group. See chapter 23 for more information about L2TP.

See Procedure 71-50 for information about enabling L2TP on a VPRN router instance site. See Procedure 71-60 for information about configuring a VPRN group interface to terminate LNS PPP sessions.

IPsec

You can configure a VPRN with a tunnel interface for secure and encrypted tunneling between sites. An IPsec VPRN allows you to share secure and encrypted VPN traffic among multiple sites.

IPsec VPRN services include:



- NAT traversal
- DES, 3DES, AES-128, AES-192 and AES-256 encryption methods
- HMAC-MD5 and HMAC-SHA1 authentication and hashing methods
- Diffie-Hellman key generation algorithms
- Pre-shared keys and IKE shared secret with PFS key management authentication methods

See chapter 29 for more information about IPsec configuration.

71.2 Sample VPRN service configuration

Figure 71-4 shows a sample VPRN service configuration.

Figure 71-4 Sample VPRN Configuration

Assuming the core IP/MPLS or GRE network is already configured, Table 71-2 lists the high-level tasks that are required to configure the sample VPRN service.

Table 71-2 Sample VPRN service configuration

Task	Description

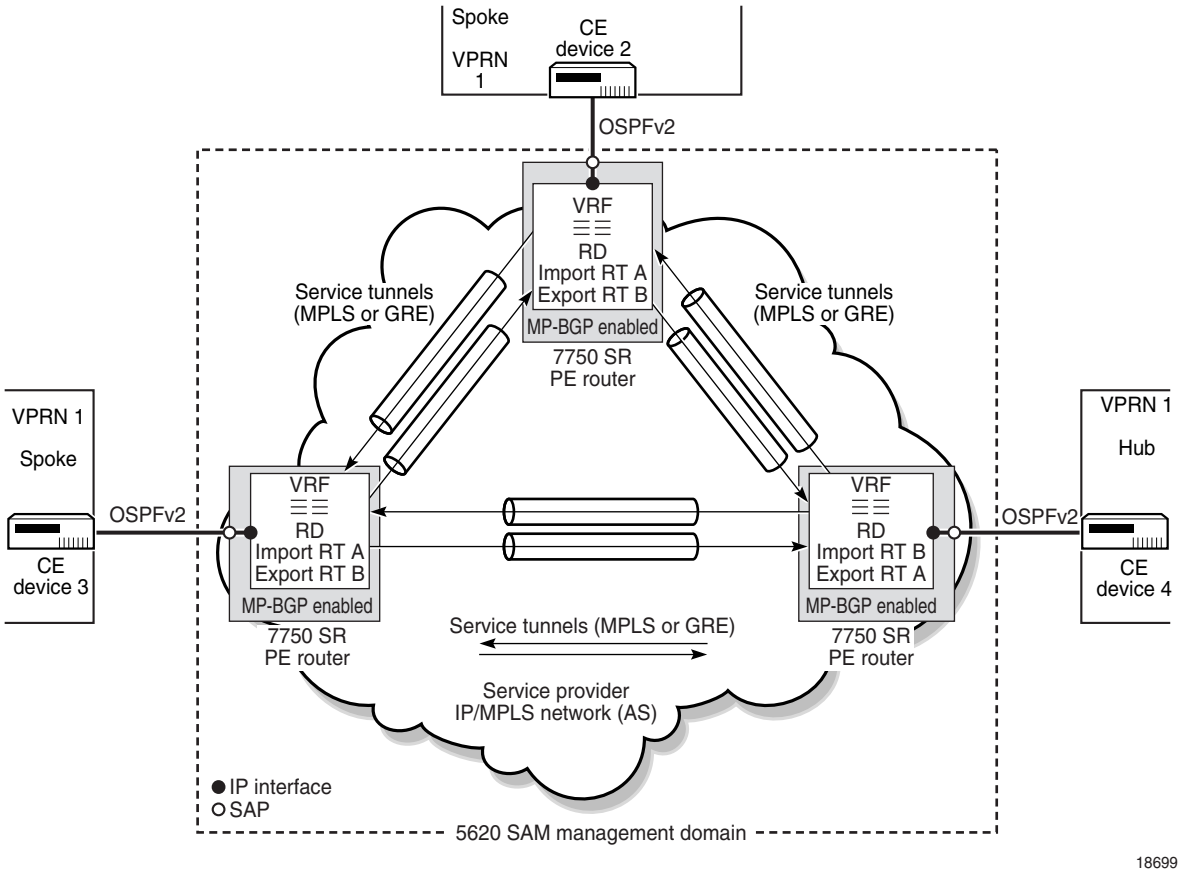
1. Configure policies as required	Policies should be configured before you create a service. Participation in policies is defined when you configure or modify resources, such as access interfaces or circuits, during service creation or modification. The following key policies can be applied to resources that are part of a VPRN.
	• Routing policies.
	  • Choose Policies→Routing→Statement to open the routing policy-statements form.
	  • Choose Policies→Routing→Prefix List to open the routing policy-prefix lists form.
	  • Choose Policies→Routing→Community to open the routing policy-communities form.
	  • Choose Policies→Routing→Damping to open the routing policy-dampings form.
	  • Choose Policies→Routing→AS Path to open the routing policy-AS paths form.
	• Access ingress and egress interface policies. Choose Policies→QoS→SROS QoS→Access Ingress or Access Egress, then the name of the form you need to configure, to open these forms.
	• Scheduler policies. Choose Policies→QoS→SROS QoS→Scheduler, then the name of the form you need to configure, to open the scheduler policy forms.
	• ACL IP filter policies. Choose Policies→Filter→ACL IP Filter to open the ACL form.
	• Accounting policy. Choose Tools→Statistics→Accounting Policies to open the accounting policy form.
	• ANCP policy. Choose Policies→Residential Subscriber to open the Manage Subscriber Policies form.

2. Configure ports as access ports for use in the service	Right-click on a port from the equipment navigation tree and choose Properties. Specify the port as an access port and optionally specify an encapsulation type.
3. Configure service tunnels as required	Choose Manage→Service Tunnels to create service tunnels. Service tunnels carry service traffic between edge-managed routers by circuits aggregated in unidirectional service tunnels. Circuits can be associated with service tunnels during service configuration.
4. Configure MP-BGP for PE-to-PE routing.	Perform the following steps. See chapter 23 for more information about protocol configuration. • Right-click on a router instance in the Routing view of the network navigation tree and choose Properties. In the Properties form that opens, click on the Routing tab, and select the BGP check mark box on the Protocols tab. • Right-click on the BGP instance in the Routing view of the network navigation tree and choose Properties. In the Properties form that opens, click on the VPN tab and enable VPN IPv4 or VPN IPv6 as required. Enable Multicast IPv4 or Multicast IPv6 to apply a multicast definition to this BGP routing instance. Click on the Behavior tab and set the Enable Inter AS VPRN parameter to true. • Right-click on the BGP Peer Group instance in the Routing view of the network navigation tree and choose Create Peer. In the Peer form that opens, configure the Peer Address and other parameters.
5. Create and configure customers	Choose Manage→Service→Customers to open the customer manager form and create a customer.

(1 of 2)

Task	Description

6. Create and configure VPRN 1.	Ensure that the operator creating the service has Service Mgmt and Interface Mgmt user group privileges. See "5620 SAM user security tasks" in the *5620 SAM System Administrator Guide* for more information about user and user group privileges.
	Choose Create→Service→VPRN. Use the tabbed form and embedded navigation tree to configure the service. You configure the following key elements when you configure VPRN 1.
	• Specify the newly created customer as the customer for the VPRN 1.
	• Specify and configure the VPRN service sites. Perform the following for each VRF:
	  • Configure autobinding to specify that the service is automatically bound to service tunnels.
	  • Configure routing properties.
	  • Configure the route distinguisher.
	  • Configure VRF targets.
	  • Configure import and export route targets.
	  • Configure import and export routing policies.
	  • Configure BGP on the PE VPRN sites for PE-to-CE routing. See chapter 23 for information about routing protocol configuration.
	  • If required, configure a GSMP group and a GSMP group neighbor
	  • If required, configure PIM to create a multicast domain within the VPRN.
	  • If required, configure the RPF Lookup Sequence parameter to specify which routing tables PIM uses for standard multicast and unicast RPF lookups.
	  • If required, configure an override source IP address or L3 interface used by IP applications to communicate with the site.
	• Create and configure an access interface on each VPRN service site.
	  • Configure general parameters such as a name, ID, and MAC address.
	  • Assign an application profile, if required.
	  • Assign an AA transit IP or transit prefix policy, if required.
	  • Specify a port that is in access or hybrid mode.
	  • Assign ingress and egress QoS policies as required.
	  • Assign an aggregation scheduler for traffic rate limiting across the card or port, if required. Otherwise, assign ingress and egress scheduler policies.
	  • Assign ACL filter policies as required.
	  • Assign an accounting policy, if required.
	  • Specify a local DHCP server, if required.
	  • Specify a ToD suite, if required.
	  • Configure subscriber management parameters, if required.
	  • Specify a DoS protection policy, if required.
	  • Configure a local IP address.
	  • Configure the ARP timeout and proxy ARP settings, if required.
	  • Configure ICMP parameters, if required.
	  • Configure IPCP parameters, if required.
	  • Configure DHCP parameters, if required.
	  • Configure VRRP parameters, if required.
	  • Configure anti-spoofing parameters, if required.
	  • Configure VRRP parameters, if required.
	  • Configure router advertisement parameters.
	  • Configure ANCP parameters, if required.



(2 of 2)

71.3 Sample hub-and-spoke VPRN configuration

In a hub-and-spoke VPRN, the majority of the traffic is exchanged between the hub (for example, headquarters) and spoke sites (for example, branches). Traffic between spoke sites passes through the hub site. Spoke sites advertise their routes to the hub site, which in turn advertises these routes to the other spoke sites.

Figure 71-5 shows a sample hub-and-spoke VPRN service configuration. Your configuration will vary depending on your network requirements.

Figure 71-5 Sample hub-and-spoke VPRN Configuration

Assuming the core IP/MPLS or GRE network is already configured, Table 71-3 lists the high-level tasks that are required to configure this sample hub-and-spoke VPRN service.

Table 71-3 Sample hub-and-spoke VPRN service configuration

Task	Description

1. Configure policies as required	Policies should be configured before you create a service. Participation in policies is defined when you configure or modify resources, such as access interfaces or circuits, during service creation or modification. The following key policies can be applied to resources that are part of a VPRN.
	• Routing policies.
	  • Choose Policies→Routing→Statement to open the routing policy-statements form.
	  • Choose Policies→Routing→Prefix List to open the routing policy-prefix lists form.
	  • Choose Policies→Routing→Community to open the routing policy-communities form.
	  • Choose Policies→Routing→Damping to open the routing policy-dampings form.
	  • Choose Policies→Routing→AS Path to open the routing policy-AS paths form.
	• Access ingress and egress interface policies. Choose Policies→QoS→SROS QoS→Access Ingress or Access Egress, then the name of the form you need to configure, to open these forms.
	• Scheduler policies. Choose Policies→QoS→SROS QoS→Scheduler, then the name of the form you need to configure, to open the scheduler policy forms.
	• ACL IP filter policies. Choose Policies→Filter→ACL IP Filter to open the ACL form.
	• Accounting policy. Choose Tools→Statistics→Accounting Policies to open the accounting policy form.
	• ANCP policy. Choose Policies→Residential Subscriber to open the Manage Subscriber Policies form.
	• DoS protection policy. Choose Administration→Security→NE DoS Protection to open the NE DoS protection form.

2. Configure ports as access ports for use in the service	Right-click on a port in the equipment navigation tree and choose Properties. Specify the port as an access port and specify an encapsulation type, if required.
3. Configure service tunnels as required	Choose Manage→Service Tunnels to create service tunnels. Service tunnels carry service traffic between edge-managed routers by circuits aggregated in unidirectional service tunnels. Circuits can be associated with service tunnels during service configuration.
4. Configure MP-BGP for PE-to-PE routing.	Perform the following steps. See chapter 23 for more information about protocol configuration. • Right-click on a router instance in the Routing view of the network navigation tree and choose Properties. In the Properties form that opens, click on the Routing tab and select the BGP check mark box on the Protocols tab. • Right-click on the BGP instance in the Routing view of the network navigation tree and choose Properties. In the Properties form that opens, click on the VPN tab and enable VPN IPv4 or VPN IPv6 as required. Enable Multicast IPv4 or Multicast IPv6 to apply a multicast definition to this BGP routing instance. Click on the Behavior tab and set the Enable Inter AS VPRN parameter to true. • Right-click on the BGP Peer Group instance in the Routing view of the network navigation tree and choose Create Peer. In the Peer form that opens, configure the Peer Address and other parameters.
5. Create and configure customers	Choose Manage→Service→Customers to open the customer manager form and create a customer.

(1 of 2)

Task	Description

6. Create and configure VPRN 1	Ensure that the operator creating the service has Service Mgmt and Interface Mgmt user group privileges. See "5620 SAM user security tasks" in the *5620 SAM System Administrator Guide* for more information about user and user group privileges.
	Choose Create→Service→VPRN. Use the tabbed form and embedded navigation tree to configure the service. You configure the following key elements when you configure VPRN 1.
	• Specify the newly created customer as the customer for the VPRN 1.
	• Specify and configure the sites for VPRN 1. For each VRF:
	  • Configure autobinding to specify that the service is automatically bound to service tunnels.
	  • Configure routing properties.
	  • Configure the route distinguisher.
	  • Configure VRF targets.
	  • Configure import and export route targets.
	  • Configure import and export routing policies.
	  • Configure BGP on the PE VPRN sites for PE-to-CE routing. See chapter 23 for information about routing protocol configuration.
	  • Configure other routing protocols on the sites, as required.
	  • If required, configure a GSMP group and a GSMP group neighbor
	  • If required, configure PIM to create a multicast domain within the VPRN.
	  • If required, configure the RPF Lookup Sequence parameter to specify which routing tables PIM uses for standard multicast and unicast RPF lookups. See chapter 23 for more information about protocol configuration.
	  • If required, configure an override source IP address or L3 interface used by IP applications to communicate with the site.
	• Create and configure one or more access interface on each VPRN service site.
	  • Configure general parameters such as a name, ID, and MAC address.
	  • Assign an application profile, if required.
	  • Assign an AA transit IP or transit IP policy, if required.
	  • Specify a port that is in access or hybrid mode.
	  • Assign ingress and egress QoS policies as required.
	  • Assign an aggregation scheduler for traffic rate limiting across the card or port, if required. Otherwise, assign ingress and egress scheduler policies.
	  • Assign ACL filter policies as required.
	  • Assign an accounting policy, if required.
	  • Specify a local DHCP server, if required.
	  • Specify a ToD suite, if required.
	  • Configure subscriber management parameters, if required.
	  • Specify a DoS protection policy, if required.
	  • Configure a local IP address.
	  • Configure the ARP timeout and proxy ARP settings, if required.
	  • Configure ICMP parameters, if required.
	  • Configure IPCP parameters, if required.
	  • Configure DHCP parameters, if required.
	  • Configure VRRP parameters, if required.
	  • Configure anti-spoofing parameters, if required.
	  • Configure VRRP parameters, if required.
	  • Configure router advertisement parameters.
	  • Configure ANCP parameters, if required.

(2 of 2)

71.4 Workflow to create a VPRN service

The following workflow lists the high-level steps required to create a VPRN service. As a prerequisite for creating a VPRN service, this workflow assumes the following:

- a group or customer with the required user access privileges has been configured.
- the IP or IP/MPLS core network exists.
- any required service tunnels are created including the static or dynamic LSP required to create the service tunnel; see Procedure 27-1 for more information.
- the access ports for the service are created; see chapter 16 for more information.
- any required pre-defined routing, QoS, scheduling, filter, accounting, and time of day suite policies are created; see chapter 42 for more information. You do not have to create pre-defined policies if policies are created on a per-service basis.
- any required MP-BGP for PE-to-PE routing is configured; see chapter 23 for more information about protocol configuration.

1 Create the VPRN service; see Procedure 71-1 for more information.

i Choose a customer to associate with the VPRN service.

ii Define the general properties for the VPRN service.

iii Configure NAT on the VPRN Site.

iv Configure multicasting for the VPRN service, if required.

v Enable one or more routing protocols on the VPRN site.

vi Configure a GSMP group on the site, if required.

vii Configure a local DHCPv4 server or local DHCPv6 server on the VPRN site, if required. See Procedures 71-14 and 71-15.

viii Turn up the VPRN service.

2 As required, configure AA reporting to the 5670 RAM; see Procedure 71-2 for more information.

3 As required, create a VPRN site; see Procedure 71-3 for more information.

4 As required, perform one or more of the following on a VPRN site.

a Configure NAT on the VPRN site; see Procedure 24-3 for more information.

b Configure RADIUS servers on the VPRN site; see Procedure 22-7 for more information.

c Configure RADIUS proxy servers on the VPRN site; see Procedure 22-8 for more information.

d Configure NTP on the VPRN site; see Procedure 71-23 for more information.

e create an L3 access interface for the VPRN site; see Procedure 71-22 for more information

f create an L3 network interface for the VPRN site; see Procedure 71-48 for more information

g add a GNE site and GNE service interfaces to an existing VPRN service; see Procedure 71-49 for more information

h configure BGP, OSPFv2, OSPFv3, PIM, IGMP, RIP or L2TP in the VPRN routing instance; see Procedure 71-50 for more information

i configure IGMP on a VPRN routing instance; see Procedure 71-52 for more information

j add a Global Route Table to a VPRN site; see Procedure 71-53 for more information

k add a PIM interface to the VPRN; see Procedure 71-54 for more information

l add an IGMP interface to the VPRN; see Procedure 71-55 for more information

m create a VPRN spoke SDP binding; see Procedure 71-56 for more information

n create an L2 SDP spoke termination on a VPRN service; see Procedure 71-57 for more information

o add a subscriber interface to the VPRN; see Procedure 71-59 for more information

p add a group interface to the VPRN (only the 7450 ESS in mixed mode, 7710 SR and 7750 SR support the configuration of a group interface in a VPRN); see Procedure 71-60 for more information

q collect and view PPP ATM SAP statistics and information for a VPRN group interface; see Procedure 71-61 for more information

r configure WLAN GW for a VPRN group interface; see Procedure 71-62 for more information

s add an IP mirror interface to the VPRN; see Procedure 71-63 for more information

t add a TMS interface to the VPRN; see Procedure 71-64 for more information

u to implement dual homing using SRRP; see Procedure 71-65 for more information

v create an intra-area OSPF sham link between two VPRN sites; see Procedure 71-66 for more information

w add a tunnel interface to a VPRN; see Procedure 29-6 for more information

x Create and enable a video interface for the VPRN, if required. See Procedure See Procedure 30-1 for more information

5 As required, run an OAM validation test for a VPRN. See Procedure 71-67 for more information.

6 As required, view VPRN service information:

a view the service topology map associated with a VPRN service; see Procedure 71-68 for more information

b view the VPRN service operational status; see Procedure 71-69 for more information

c view the DHCPv6 prefixes that the server has given out; see Procedure 71-70 for more information

d view the lease not owner and pool unknown log events for local DHCPv6 servers; see Procedure 71-71 for more information

7 As required, modify a VPRN service:

a using the Manage Services form; see Procedure 71-72 for more information

b using the topology view; see Procedure 71-73 for more information

8 As required, delete a VPRN service. See Procedure 71-74 for more information.

71.5 VPRN service management procedures

Use the following procedures to perform VPRN creation and management tasks.

Procedure 71-1 To create a VPRN service

1 Choose Create→Service→VPRN from the 5620 SAM main menu. The VPRN Services (Create) form opens with the General tab displayed.

2 Click on the Select button to choose a customer to associate with the VPRN. The Select Customer - VPRN Service form opens.

3 Choose a customer for the VPRN and click on the OK button. The Select Customer - VPRN Service form closes and the VPRN Services (Create) form refreshes with the customer information.

4 Configure the parameters:

- Service ID
- Auto-Assign ID
- SVC Mgr Service ID
- Service Name
- Description
- Service Tier
- Service Priority
- Administrative State
- Automatic SDP Binding Creation
- IP Address Overlap Avoidance Enabled
- Profile Name
- Current OLC State
- Revert OLC State

The SVC Mgr Service ID parameter is configurable when the Auto-Assign ID parameter is disabled.

The Profile Name parameter is configurable when the Automatic SDP Binding Creation parameter is enabled.

The Current OLC State and Revert OLC State parameters are configurable when you click on the Apply button.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button to confirm the action. The VPRN Service (Create) form closes.

Procedure 71-2 To configure AA reporting to the 5670 RAM

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service.

4 Click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

5 Click on the Application Assurance tab. The 5670 RAM Parameters tab is displayed.

6 Configure the parameters:

- Enable Application Performance Reporting
- Report Customer Name
- Number Of IP Detail Addresses

7 As required, perform Procedure 76-19 to configure a custom DCP subnet group.

8 Click on the OK button. A dialog box appears.

9 Click on the Yes button to confirm the action. The VPRN Service (Create) form closes.

Procedure 71-3 To configure a VPRN site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Perform one of the following.

a Create a VPRN site:

i On the navigation tree, right-click on the Site icon and choose Create VPRN Site. The Select Network Elements - VPRN Service form opens with a list of available sites displayed.

ii Choose a site and click on the OK button. The VPRN Site (Create) form opens with the General tab displayed.

b Configure an existing VPRN site:

i Expand the Sites icon in the service navigation tree.

ii Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Name
- Description
- Administrative State
- Monitor Access Interface Operational State
- GSMP Administrative State
- Tunnel Fault Notification
- Current OLC State
- Revert OLC State

Tunnel Fault Notification is configurable on sites where the device has ports configured in access or hybrid mode with QinQ encapsulation.

If you are configuring a tunnel facility MEP, Tunnel Fault Notification must be set to Accept, in order to receive the fault notification from the tunnel facility MEP.

6 Configure the NE-specific parameters, as listed in Table 71-4.

Table 71-4 NE-specific parameters

NE	Parameters	Dependencies	Go To
7750 SR-c4, 7750 SR-7, 7750 SR-12, 7450 ESS, 7710 SR, 7950 XRS	• Enable Hash Label	—	—
7750 SR-7, 7750 SR-12, 7450 ESS	• Reassembly Group	—	—

7 Click on the OK button. A dialog box appears.

8 Click on the OK button. The Site (Create) form closes, and the VPRN Service (Edit) form reappears with the new site information displayed in the service navigation tree.

9 Click on the OK button. A dialog box appears.

10 Click on the Yes button to confirm the action. The VPRN Service (Edit) form closes.

Procedure 71-4 To configure an SNMP community for mediating the IPv6 objects on a VPRN site

If the VPRN site is to support IPv6 addressing (for router advertisement or neighbor discovery) or VRRP objects, perform the following procedure to configure an SNMP community for mediating the IPv6 objects.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the SNMP Community tab.

7 Click on the Create button. The SNMP Community (Create) form opens.

8 Configure the SNMP Community String parameter.

9 Click on the OK button. The SNMP community string entry is displayed on the Site (Edit) form and a dialog box appears.

10 Click on the OK button. The SNMP Community (Create) form closes.

Note — When the 5620 SAM uses SNMPv2 for device mediation, you must configure one and only one SNMP community string for the VPRN site. Otherwise, there is no mediation of the VPRN IPv6 objects on the site, and the 5620 SAM raises an alarm. The alarm is cleared and mediation resumes after the configuration is modified so that exactly one SNMP community string is associated with the VPRN site.

11 Click on the OK button to close the VPRN Site (Edit) form.

12 Close the VPRN Service (Edit) form.

13 Close the Manage Services form.

Procedure 71-5 To configure an MVPN VRF instance on a VPRN site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the Multicast tab. The MVPN tab is displayed.

7 Configure the MVPN VRF Target Type parameter on the Routing tab:

Note 1 — Route targets are used to identify the VRFs of a VPRN. A PE router that is not a route reflector or an AS border router installs a VPRN route only when its import target matches the target of the route.

Note 2 — A fully-meshed VPRN requires one target for all participating VRFs. A hub-and-spoke VPRN requires VRF import and export targets. The export target of the hub VRF must be the same as the import target of the spoke VRFs. The import target of the hub VRF must be the same as the export target of the spoke VRF. VPRN VRF targets must not overlap.

a If you do not need to specify a VRF target for the site, set the MVPN VRF Target Type parameter to None. Go to step 11.

b If you need to specify a default VRF target for the site, set the MVPN VRF Target Type. Go to step 8.

c If you need to specify import and export VRF targets for the service site, set the MVPN VRF Target Type parameter to Define Import and Export. Go to step 9.

8 Configure the Target Format parameter by performing one of the following steps:

a Specify a two-byte AS number for the default target, if required:

i Configure the parameters:

- Target AS Value
- Target Extended Community Value

The Target AS Value is the Autonomous System number of the PE node. For the Target Extended Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 18.

b To specify an IP Address for the default target, if required:

i Configure the parameters:

- Target IP Address
- Target Community Value

ii Go to step 17.

c Specify a four-byte AS number for the default target, if required:

i Configure the parameters:

- Target AS Value (4Byte)
- Target Community Value

The Target AS Value (4Byte) is the Autonomous System number of the PE node. For the Target Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 17.

9 Configure the Import Target Format parameter by performing one of the following steps:

a Choose None to specify no VRF import target format for the site, then go to step 10.

b Choose AS as the two-byte import target format for the site.

i Configure the parameters:

- Import Target AS Value
- Import Target Extended Community Value

The Import Target AS Value is the two-byte Autonomous System number of the PE node. For the Import Target Extended Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 10.

c Choose IP Address as the import target format for the site.

i Configure the parameters:

- Import Target IP Address
- Import Target Community Value

ii Go to step 10.

d Choose AS-4Byte as the four-byte import target format for the site.

i Configure the parameters:

- Import Target AS Value (4Byte)
- Import Target Community Value

The Import Target AS Value (4Byte) is the four-byte Autonomous System number of the PE node. For the Import Target Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 10.

10 Configure the Export Target Format parameter by performing one of the following steps:

a Choose None to specify no VRF export target format for the site, then go to step 11.

b Choose AS as the two-byte export target format for the site.

i Configure the parameters:

- Export Target AS Value
- Export Target Extended Community Value

The Export Target AS Value parameter is the two-byte Autonomous System number of the PE node. For the Export Target Extended Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 11.

c Choose IP Address as the export target format for the site.

i Configure the parameters:

- Export Target IP Address
- Export Target Community Value

ii Go to step 11.

d Choose AS-4Byte as the four-byte export target format for the site.

i Configure the parameters:

- Export Target AS Value (4Byte)
- Export Target Community Value

The Export Target AS Value (4Byte) parameter is the four-byte Autonomous System number of the PE node. For the Export Target Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 11.

11 Click on the Import Policies tab.

12 Configure the Import Unicast parameter. If you set the parameter to True, go to step 14.

13 Specify the required Unicast import policies by using the Select button to choose a policy from the filtered list.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Policy 6
- Policy 7
- Policy 8
- Policy 9
- Policy 10
- Policy 11
- Policy 12
- Policy 13
- Policy 14
- Policy 15

14 Click on the Export Policies tab.

15 Configure the Export Unicast parameter. If you set the parameter to True, go to step 18.

16 Specify the required VRF export policies by using the Select button to choose a policy from the filtered list.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Policy 6
- Policy 7
- Policy 8
- Policy 9
- Policy 10
- Policy 11
- Policy 12
- Policy 13
- Policy 14
- Policy 15

17 Click on the OK button to close the VPRN Site (Edit) form.

18 Close the VPRN Service (Edit) form.

19 Close the Manage Services form.

Procedure 71-6 To enable routing protocols on a VPRN site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the Routing tab. The Protocols tab is displayed.

7 Configure the parameters on the Protocols tab:

- BGP Enabled
- OSPFv2 Enabled
- OSPFv3 Enabled
- RIP Enabled
- MPLS-TP Enabled
- L2TP Enabled
- WPP Enabled

When you choose a protocol, the site and the protocols that are enabled on the site appear in the list panel.

Note — If both the OSPFv2 Enabled parameter and the OSPFv3 Enabled parameter are disabled, navigate to the Components view of the VPRN, right-click on Protocols, then select Create OSPF Site. The OSPF Site (Create) form opens with the General tab displayed. In the OSPF Instance panel, configure the Version parameter.

8 Click on the Multicast tab to configure multicast for the site, if required.

9 Configure the parameters:

- PIM Enabled
- IGMP Enabled

When you choose a protocol, the site and the protocols that are enabled on the site appear in the list panel.

10 Click on the OK button to close the VPRN Site (Edit) form.

11 Close the VPRN Service (Edit) form.

12 Close the Manage Services form.

Procedure 71-7 To resync soft GRE tunnels on a VPRN site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the Soft GRE Tunnels tab.

7 Click on the Resync Soft GRE Tunnels button.

8 Close the VPRN Site (Edit) form.

9 Close the VPRN Service (Edit) form.

10 Close the Manage Services form.

Procedure 71-8 To configure a BGP confederation on a VPRN site

Perform this procedure to configure a BGP confederation on a VPRN site. A BGP confederation allows for the full distribution of external routing information within an AS.

Note 1 — You cannot configure BGP confederations when:

- VRF import or export policies are configured on the VPRN site
- a VRF target is configured on the VPRN site
- VPRN GRT lookup or export policies are configured on the VPRN site

Note 2 — You cannot configure VRF import or export policies, VRF target, or GRT lookup or export policies when a BGP confederation is configured.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the Routing tab. The General tab is displayed.

7 Configure the Confederation Autonomous System parameter. When you set the Confederation Autonomous System to a value other than 0, the BGP Confederations tab appears.

8 Click on the BGP Confederations tab.

9 Click on the Create button. The Confederation (Create) form opens with the General tab displayed.

10 Click on the Members tab.

11 Click on the Create button. The Confederation Member (Create) form opens.

12 Configure the Member AS parameter.

13 Click on the OK button. The Confederation Member (Create) form closes and a dialog box appears.

14 Click on the OK button.

15 Repeat steps 11 to 14 to create additional confederation members.

16 Click on the OK button. The Confederation (Create) form closes and a dialog box appears.

17 Click on the OK button.

18 Click on the OK button to close the VPRN Site (Edit) form.

19 Close the VPRN Service (Edit) form.

20 Close the Manage Services form.

Procedure 71-9 To configure a routing instance on a VPRN site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the Routing tab. The General tab is displayed.

7 Configure the parameters:

- Router ID
- Maximum Number Of Equal Cost Routes
- Autonomous System
- FIB Priority
- Route Distinguisher Type
- Confederation Autonomous System
- Type
- Ignore NH Metric
- Label Mode
- Carrier Carrier VPN

Note 1 — You cannot configure the Carrier Carrier VPN parameter on a VPRN site if interfaces are configured on the site.

Note 2 — When you set the Route Distinguisher Type parameter to Type 0, the following configurable parameters appear:

- Type 0 Administrative Value
- Type 0 Assigned Value

You can click on the Suggest Value button to let the 5620 SAM assign these values. Choose Generate Unique RD from the drop-down menu.

The Type 0 Administrative Value parameter is the Autonomous System (AS) number of the PE node. For the Type 0 Assigned Value parameter, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

Note 3 — When you set the Route Distinguisher Type parameter to Type 1, the following configurable parameters appear:

- Type 1 IP Address
- Type 1 Assigned Value

When you set the Route Distinguisher Type parameter to Type 2, the following configurable parameters appear:

- Type 2 Administrative Value
- Type 2 Assigned Value

8 Configure the parameters in the GRT panel:

- Enable GRT Lookup
- Allow Local Management

9 Configure the Enforce Maximum Number Of Routes parameter in the Maximum Number Of Routes panel.

Note — When you select the Enforce Maximum Number Of Routes parameter, the following parameters appear:

- Maximum Number Of Routes
- Log Only
- Threshold (%)

10 Configure the Enforce Maximum Number Of IPv6 Routes parameter in the Maximum Number Of IPv6 Routes panel.

Note — When you select the Enforce Maximum Number Of IPv6 Routes parameter, the following parameters appear:

- Maximum Number Of IPv6 Routes
- Log Only
- Threshold (%)

11 Configure the parameters:

- Single SFM Overload Admin State
- Hold-Off Time (seconds)

The Hold-Off Time (seconds) parameter and read-only attributes Overload State, Overload Start, and Overload Duration are only displayed when the Single SFM Overload Admin State parameter is set to Up.

12 Configure the Enforce Maximum Number Of Multicast Routes parameter in the Maximum Number Of Multicast Routes panel.

Note — When you enable the Enforce Maximum Number Of Multicast Routes parameter, the following configurable parameters appear:

- Maximum Number Of Multicast Routes
- Log Only
- Threshold (%)

13 Click on the VRF Target to configure a VRF instance.

14 Configure the VRF Target Type parameter:

Note 1 — Route targets are used to identify the VRFs of a VPRN. A PE router that is not a route reflector or an AS border router installs a VPRN route only when its import target matches the target of the route.

Note 2 — A fully-meshed VPRN requires one target for all participating VRFs. A hub-and-spoke VPRN requires VRF import and export targets. The export target of the hub VRF must be the same as the import target of the spoke VRFs. The import target of the hub VRF must be the same as the export target of the spoke VRF. VPRN VRF targets must not overlap.

a Specify None if you do not need to specify a VRF target for the site. Go to step 18.

b Specify Define Default if you need to specify a default VRF target for the site. Go to step 15.

c Specify Define Import and Export if you need to specify import and export VRF targets for the service site. Go to step 16.

15 Configure the Target Format parameter by performing one of the following steps:

a To specify a two-byte AS number for the default target, if required:

i Configure the parameters:

- Target AS Value
- Target Extended Community Value

You can click on the Suggest Value button to let the 5620 SAM assign these values. Choose Generate Unique VRF Target from the drop-down menu.

The Target AS Value parameter is the Autonomous System number of the PE node. For the Target Extended Community Value parameter, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 18.

b To specify an IP Address for the default target, if required:

i Configure the parameters:

- Target IP Address
- Target Community Value

ii Go to step 18.

c To specify a four-byte AS number for the default target, if required:

i Configure the parameters:

- Target AS Value (4Byte)
- Target Community Value

You can click on the Suggest Value button to let the 5620 SAM assign these values. Choose Generate Unique VRF Target from the drop-down menu.

The Target AS Value (4Byte) is the Autonomous System number of the PE node. For the Target Community Value parameter, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 18.

16 Configure the Import Target Format parameter by performing one of the following steps:

a Choose None to specify no VRF import target format for the site, then go to step 17.

b Choose AS as the two-byte import target format for the site.

i Configure the parameters:

- Import Target AS Value
- Import Target Extended Community Value

You can click on the Suggest Value button to let the 5620 SAM assign these values. Choose Generate Unique VRF Target from the drop-down menu.

The Import Target AS Value parameter is the two-byte Autonomous System number of the PE node. For the Import Target Extended Community Value, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 17.

c Choose IP Address as the import target format for the site.

i Configure the parameters:

- Import Target IP Address
- Import Target Community Value

ii Go to step 17.

d Choose AS-4Byte as the four-byte import target format for the site.

i Configure the parameters:

- Import Target AS Value (4Byte)
- Import Target Community Value

You can click on the Suggest Value button to let the 5620 SAM assign these values. Choose Generate Unique VRF Target from the drop-down menu.

The Import Target AS Value (4Byte) is the four-byte Autonomous System number of the PE node. For the Import Target Community Value parameter, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 17.

17 Configure the Export Target Format parameter by performing one of the following steps:

a Choose None to specify no VRF export target format for the site, then go to step 18.

b Choose AS as the two-byte export target format for the site.

i Configure the parameters:

- Export Target AS Value
- Export Target Extended Community Value

The Export Target AS Value parameter is the two-byte Autonomous System number of the PE node. For the Export Target Community Value parameter, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 18.

c Choose IP Address as the export target format for the site.

i Configure the parameters:

- Export Target IP Address
- Export Target Community Value

ii Go to step 18.

d Choose AS-4Byte as the four-byte export target format for the site.

i Configure the parameters:

- Export Target AS Value (4Byte)
- Export Target Community Value

The Export Target AS Value (4Byte) is the four-byte Autonomous System number of the PE node. For the Export Target Community Value parameter, the 5620 SAM assigns the next unused number within the valid range. When all of the numbers within the valid range have been used once, the system starts at the beginning of the range and assigns the next available number.

ii Go to step 18.

18 Configure ingress multicast forwarding, if required.

i Click on the Mcast Path Mgmt .

ii Click on the Select button beside the Name parameter. The Select Ingress Info Policy - Service L3 Routing list form opens.

iii Choose an ingress info policy and click on the OK button. The Select Ingress Info Policy - Service L3 Routing list form closes.

Note — The Mcast Path Mgmt Channels tab displays data on the operational channels after actual traffic from a specific multicast source for a specific multicast group passes through the virtual router. You must click on the Search button to refresh the data. See chapter 42 for a listing of the displayed operational channel parameters.

19 Click on the OK button to close the VPRN Site (Edit) form.

20 Close the VPRN Service (Edit) form.

21 Close the Manage Services form.

Procedure 71-10 To bind a VPRN site to service tunnels

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the SDP Binding tab. The Spoke SDP Bindings tab is displayed.

7 Click on the Auto-Bind tab to configure the binding of the site to service tunnels.

8 Configure the Transport parameter.

a Choose None to explicitly specify service tunnels and circuits for the service.

b Choose LDP for the service to be automatically bound to MPLS service tunnels utilizing LDP.

Note — To use MPLS as the transport type, you must bind LSPs to service tunnels during service tunnel configuration. See Procedure 27-1 for more information.

c Choose RSVP-LSP for the service to be automatically bound to MPLS service tunnels utilizing RSVP-LSP.

Note — The RSVP-LSP option is available only on the 7450 ESS in mixed mode, the 7710 SR, 7750 SR, and 7950 XRS.

d Choose RSVP or LDP for the service to be bound to MPLS service tunnels using RSVP or LDP.

This choice provides the ability to simultaneously support both tunnel options, in networks that have a mixture of LDP and RSVP-TE in place. 5620 SAM always tries to resolve the VPN route by using RSVP-LSP tunnels first (lowest metric). If no RSVP-LSP service tunnels are available, then tunnels configured for LDP are used. If RSVP-LSP tunnels subsequently become available again, then the route resolution automatically returns to RSVP-LSP.

Note — The RSVP or LDP option is available only on the a 7450 ESS in mixed mode, and on a 7710 SR, 7750 SR, or 7950 XRS.

e Choose GRE for the service to be automatically bound to GRE service tunnels.

9 Click on the OK button to close the VPRN Site (Edit) form.

10 Close the VPRN Service (Edit) form.

11 Close the Manage Services form.

Procedure 71-11 To configure VRF import and export policies on a VPRN site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the VRF Import Policies tab.

7 Specify the required VRF import policies by using the Select button to choose a policy from the filtered list form.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Policy 6
- Policy 7
- Policy 8
- Policy 9
- Policy 10
- Policy 11
- Policy 12
- Policy 13
- Policy 14
- Policy 15

8 Click on the OK button. The filtered list form closes.

9 Click on the VRF Export Policies tab.

10 Specify the required VRF export policies by using the Select button to choose a policy from the filtered list form.

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Policy 6
- Policy 7
- Policy 8
- Policy 9
- Policy 10
- Policy 11
- Policy 12
- Policy 13
- Policy 14
- Policy 15

11 Click on the OK button. The filtered list form closes.

12 Click on the OK button to close the VPRN Site (Edit) form.

13 Close the VPRN Service (Edit) form.

14 Close the Manage Services form.

Procedure 71-12 To configure static routes on a VPRN site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the Routing tab. The General tab is displayed.

7 Click on the Static Routes tab.

8 Click on the Create button to define a static route that the PE VRF is to exchange with the CE. The Static Route (Create) form opens.

9 Configure the parameters:

- Auto-Assign ID
- Static Route ID
- BFD Enabled
- Forwarding Class Name
- Forwarding Class Priority
- Community
- Description

10 Configure the parameters in the Destination panel:

- Destination
- Multicast Capable Peers
- Prefix Length
- Type
- IP Address

The IP Address parameter is configurable when the Type parameter is set to an option other than Black Hole.

11 Configure the parameters in the Other panel:

- Preference
- Metric
- Administrative State
- Tag

12 Configure the parameters in the CPE Check panel:

- Enable CPE Check
- Target IP Address
- Interval (seconds)
- Drop Count
- Log

The Target IP Address, Interval (seconds), Drop Count, and Log parameters are configurable only when the Enable CPE Check parameter is enabled.

13 Click on the Select button next to the Prefix List Name in the Prefix List panel. The Select...-Static Route list form opens.

14 Choose a prefix list name and click on the OK button. The Select...-Static Route list form closes.

Note — You cannot specify a Prefix List if BFD Enabled or Enable CPE Check parameters are enabled for the static route.

15 Configure the Prefix List Flag parameter. The Prefix List Flag parameter is configurable only when you choose a prefix list.

16 Click on the OK button. The Static Route (Create) form closes and the VPRN Site (Edit) form reappears.

17 Click on the OK button to close the VPRN Site (Edit) form.

18 Close the VPRN Service (Edit) form.

19 Close the Manage Services form.

Procedure 71-13 To configure a GSMP group on a VPRN site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the GSMP tab.

7 Click on the Create button. The GSMP Group (Create) form opens with the General tab displayed.

8 Configure the following parameters:

- Displayed Name
- Description
- Administrative State
- Keep-Alive (seconds)
- Hold Multiplier
- Enable Idle Filter
- Enable Persistency Database
- OAM Administrative State
- Dynamic Topology Discovery

9 Click on the GSMP Group Neighbor tab.

10 Click on the Create button. The GSMP (Create) form opens with the General tab displayed.

11 Configure the following parameters:

- IP Address
- Description
- Administrative State
- Local Address
- Priority Type
- Priority Precedence
- Priority Dscp

The Priority Dscp parameter is configurable when you set the Priority Type to Dscp.

The Priority Precedence parameter is configurable when you set the Priority Type to Precedence.

12 Click on the OK button. The GSMP (Create) form closes.

13 Click on the OK button. The GSMP Group (Create) form closes.

14 Click on the OK button to close the VPRN Site (Edit) form.

15 Close the VPRN Service (Edit) form.

16 Close the Manage Services form.

Procedure 71-14 To configure a local DHCPv4 server on a VPRN site

Note — To configure a local DHCPv6 server on a VPRN site go to Procedure 71-15.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the RADIUS/DHCP/Diameter tab. The Local DHCP Servers tab is displayed.

7 Configure a local DHCPv4 server on the routing instance as described in Procedure 22-2, steps 5 to 19.

8 Click on the OK button. The Local DHCP Server (Create) form closes and a dialog box appears.

9 Click on the OK button. The VPRN Site (Edit) form reappears.

10 Click on the OK button to close the VPRN Site (Edit) form.

11 Close the Manage Services form.

Procedure 71-15 To configure a local DHCPv6 server on a VPRN site

Note — To configure a local DHCPv4 server on a VPRN site go to Procedure 71-14.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with General tab displayed.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the RADIUS/DHCP/Diameter tab. The Local DHCP Servers tab is displayed.

7 Configure a local DHCPv6 server on the routing instance as described in Procedure 22-3, steps 5 to 15.

8 Click on the OK button. The Local DHCP Server (Create) form closes and a dialog box appears.

9 Click on the OK button. The VPRN Site (Edit) form reappears.

10 Click on the OK button to close the VPRN Site (Edit) form.

11 Close the Manage Services form.

Procedure 71-16 To configure DSCP on a VPRN site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the Self Generated Traffic tab. The DSCP Marking tab is displayed with a list of all the applications for which the DSCP can be set.

- **i** Choose an application to view or edit the DSCP setting.
- **ii** Click on the Properties button. An Application DSCP Marking form opens.
- **iii** Configure the DSCP parameter.
- **iv** Click on the Apply button. A dialog box appears. Click on the OK button.
- **v** Click on the DSCP Mapping tab. A list of DSCP types and corresponding forwarding classes is displayed.
- **vi** Choose a DSCP to view or edit the forwarding class.
- **vii** Click on the Properties button. An Application DCSP Marking form opens.
- **viii** Configure the Forwarding Class parameter.
- **ix** Click on the Apply button. A dialog box appears. Click on the OK button.
- **x** Click on the Dot1p Marking tab. A list of applications for which the dot1p can be set is displayed.

xi Choose a dot1p to view or edit the setting and then click on the Properties button. An Application Dot1p Marking form opens.

xii Configure the dot1p parameter.

xiii Click on the OK button. A dialog box appears. Click on the OK button.

7 Click on the OK button to close the VPRN Site (Edit) form.

8 Close the VPRN Service (Edit) form.

9 Close the Manage Services form.

Procedure 71-17 To configure an override source IP address or L3 interface on a VPRN site

Perform the following procedure to configure an override source IP address or L3 interface for use by a selected IP application, if required.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the Source Addresses tab.

7 Click on the Create button. The Source Address (Create) form opens.

8 Configure the Source IP Application parameter.

9 Specify the source address for the IP application server by performing one of the following:

Note — If you choose the interface index option, the router used for this VPRN must already have an access interface created for its routing instance.

a Specify the source IP address of the IP application server:

i Set the Source Address Termination parameter to IP Address.

ii Configure the Source IP Address parameter. Enter a valid IP address that the VPRN virtual routing instance will identify.

iii Go to step 10.

Note 1 — An IPv6 address option for the Source IP Address parameter is available when the IPv6 Allowed parameter is set during network interface creation. See chapter 22 for more information about creating a network interface.

Note 2 — You must select an IPv6 Source IP Address before you can select IPv6 Source IP Applications.

b Specify the primary address of the L3 network interface as the source address of the IP application server:

i Set the Source Address Termination parameter to Interface Index.

ii Click on the Select button to choose an interface. The Select Source Address VPRN Interface - Source Address form opens.

iii Choose an interface and click on the OK button. The IP address and Interface ID of the L3 interface appear on the form.

10 Click on the OK button. The Source Address (Create) form closes and the VPRN Site (Edit) form reappears. The IP application source address and parameters appear on the form.

11 Click on the OK button to close the VPRN Site (Edit) form.

12 Close the VPRN Service (Edit) form.

13 Close the Manage Services form.

Procedure 71-18 To configure IGMP host tracking on a VPRN site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the IGMP Host Tracking tab.

7 Configure the parameters:

- Expiry Time (seconds)
- Administrative State

8 Click on the OK button to close the VPRN Site (Edit) form.

9 Close the VPRN Service (Edit) form.

10 Close the Manage Services form.

Procedure 71-19 To configure WLAN gateway functionality on a VPRN site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the General tab and configure the Enable WLAN GW parameter.

7 Click on the WLAN GW tab. The General tab is displayed.

8 Configure the APN Network Identifier parameter.

9 Click on the Mobile GW Address Map tab, and click on the Create button. The Mobile Gateway Address Map (Create) form opens.

10 Configure the Mobile Gateway Address Prefix and Prefix Length parameters.

11 Click on the Select button beside the Mobile Gateway Profile field to specify a mobile gateway profile policy.

12 Click on the OK button. The Mobile Gateway Address Map (Create) form closes.

13 Click on the OK button to close the VPRN Site (Edit) form.

14 Close the VPRN Service (Edit) form.

15 Close the Manage Services form.

Procedure 71-20 To configure DNS for a VPRN site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Configure the Enable DNS parameter.

7 Click on the DNS tab and configure the parameters:

- Administrative State
- Primary Address
- Secondary Address
- Tertiary Address
- IPv4 Source Address
- IPv6 Source Address

8 Click on the OK button to close the VPRN Site (Edit) form.

9 Close the VPRN Service (Edit) form.

10 Close the Manage Services form.

Procedure 71-21 To configure route aggregates on a VPRN site

Route aggregation allows you to group a number of routes with common IP prefixes into a single entry in the routing table. This reduces the number of routes that need to be advertised by the hosting router and reduces the number of routes in the routing tables of downstream routers.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Right-click on a Routing Instance icon and choose Properties from the contextual menu. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the Routing tab. The General tab is displayed.

7 Click on the Route Aggregation tab.

Note — Route aggregation for VPRN sites is supported on 7450 ESS in mixed mode, 7750 SR, 7710 SR, and 7950 XRS nodes.

8 Click on the Create button. The Aggregation (Create) form opens.

9 Configure the parameters:

- IP Address Prefix
- Mask
- Summary Only
- As Set
- Aggregator
- Next Hop Type
- Community
- Aggregator AS
- Aggregator IP Address
- Indirect Address

The IP Address Prefix you enter must be an IPv4 address in the form x.x.x.0, where the last integer is the host bits and must have a value of 0.

The Next Hop Type parameter is configurable only on a Release 10.0 R4 or later 7450 ESS, 7710 SR, or 7750 SR.

The Aggregator AS and Aggregator IP Address parameters are configurable when the Aggregator parameter value is set to True. The Indirect Address parameter is configurable when the Next Hop Type parameter is set to Indirect.

10 Click on the OK button to close the VPRN Site (Edit) form.

11 Close the VPRN Service (Edit) form.

12 Close the Manage Services form.

Procedure 71-22 To configure an L3 access interface on a VPRN site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service.

4 Click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

5 On the navigation tree, expand the Sites icon and the site on which you need to configure the access interface. For information about how to add a GNE service interface to a VPRN service, see Procedure 71-49.

6 Perform one of the following.

a Create an L3 access interface on the site:

i Right-click on Access Interfaces and choose Create L3 Access Interface. The VPRN L3 Access Interface (Create) form opens with the General tab displayed.

ii Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Admin Link Local Address
- Admin Link Local Address Preferred

The Admin Link Local Address and Admin Link Local Address Preferred parameters are only configurable when the IPv6 Allowed parameter is enabled.

b Configure an existing VPRN L3 access interface:

i Expand the Sites icon in the service navigation tree.

ii Expand the Routing Instance icon.

iii Expand the L3 Access Interfaces icon, right-click on the L3 access interface you need to configure and choose Properties from the contextual menu. The VPRN L3 Access Interfaces (Edit) form opens with the General tab displayed.

7 Configure the parameters:

- Description
- Administrative State
- MAC Address
- Allow Directed Broadcasts
- Loopback Enabled
- Cflowd Type
- Trusted
- Class
- IPv6 Allowed
- Enable Ingress FlowSpec IPv4
- Enable Ingress FlowSpec IPv6
- QoS Route Lookup IPv4
- QoS Route Lookup IPv6
- Calling Station ID
- Enable Ingress Stats
- Enable MAC Accounting Stats
- Configured IP MTU (Octets)
- URPF Check State IPv4
- URPF Check Mode IPv4
- URPF Check State IPv6
- URPF Check Mode IPv6
- Unnumbered Type
- IP Address
- Interface Name
- Tunnel Fault Notification

The Enable Ingress FlowSpec IPv4 and Enable Ingress FlowSpec IPv6 parameters appear only if a port is assigned to the L3 access interface.

The Unnumbered Type parameter is configurable when the Class parameter is set to Unnumbered.

The IP Address parameter is configurable when the Unnumbered Type parameter is set to IP Address.

The Interface Name parameter is configurable when the Unnumbered Type parameter is set to Name.

The URPF Check State IPv6 and URPF Check Mode IPv6 parameters are only configurable when the IPv6 Allowed parameter is enabled.

The Tunnel Fault Notification parameter is configurable on interfaces where the device has ports configured in access or hybrid mode with QinQ encapsulation.

If you are configuring a tunnel facility MEP, Tunnel Fault Notification must be set to Accept, in order to receive the fault notification from the tunnel facility MEP.

8 If the Loopback Enabled parameter in step 7 is enabled, you cannot associate a port with the L3 access interface. Go to step 18.

9 Bind an application profile to the VPRN L3 access interface, if required:

i Click on the Select button beside the Application Profile parameter in the Application Assurance panel. The Application Profile String: - VPRN L3 Access Interface list form opens.

ii Choose a profile and click on the OK button. The Application Profile String - VPRN L3 Access Interface list form closes and the L3 Access Interface (Create) form is refreshed with the Application Profile information.

Note — The Application Profile String: - VPRN L3 Access Interface list form only displays local profiles that already exist on the NE.

10 Choose one of the following AA transit policy types, if required.

Note 1 — You can only associate one AA transit policy type with a service object.

Note 2 — To bind a transit policy to an L3 access interface, a port must already exist on the interface.

Note 3 — You can bind a transit policy to only one L3 access interface or spoke SDP binding per NE.

Note 4 — The transit policy and the application profile must belong to the same application assurance group or partition.

a Associate an AA transit IP policy with the service object:

i Click on the Select button in the Transit IP Policy panel. The Select Transit IP Policy form opens.

ii Choose a transit IP policy and click on the OK button.

b Associate an AA transit prefix policy with the service object:

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.

ii Choose a transit IP policy and click on the OK button.

11 Associate a host lockout policy with the L3 access interface, if required. Click on the Select button in the Host Lockout panel to select a policy.

12 Click on the Port tab.

13 Click on the Select button to choose a port for the L3 access interface. The Select Terminating Port - VPRN L3 Access Interface form opens.

Note 1 — The form lists only ports in access or hybrid mode, or PW ports. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. The port is then listed when you click on the Search button.

Note 2 — The form only lists PW ports that are bound to a service tunnel. See Procedure 27-1 for information about creating a service tunnel with a PW port binding.

14 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - VPRN L3 Access Interface form closes, and the VPRN L3 Access Interface (Create) form displays the port information.

Once the port is selected, a number of other tabs are also displayed on the form.

15 Configure the parameters:

- Auto-Assign ID
- Outer Encapsulation Value
- Inner Encapsulation Value
- Outer Encapsulation Value (VPI)
- Inner Encapsulation Value (VCI)
- SAP Description
- SAP Administrative State

The Auto-Assign ID parameter is configurable if the port uses dot1q encapsulation. When the parameter is enabled, the 5620 SAM automatically configures the Outer Encapsulation Value parameter using the lowest unassigned value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter on the User Preferences form. Choose Application→ User Preferences from the main menu.

The Inner Encapsulation Value is configurable only when the port is an Ethernet or frame relay port with QinQ encapsulation.

The Outer Encapsulation Value (VPI) and Inner Encapsulation Value (VCI) parameters are configurable only for ATM ports.

16 If the selected port uses FR encapsulation, configure Frame Relay for the interface. Otherwise, go to step 17.

i Click on the Frame Relay tab.

ii Set the FRF-12 Mode parameter to Enabled.

iii Configure the parameters:

- FRF-12 End-To-End Fragment Threshold
- Scheduling Class
- Fragment Interleave

Note — If a bundle is selected in step 14, only the Scheduling Class parameter is configurable.

17 The ATM tab is configurable when the interface port is an ATM port. Specify OAM functionality and assign ingress and egress ATM policies to the interface, if required. Otherwise, go to step 18.

i Click on the ATM tab.

ii Configure the parameters:

- AAL5 Encapsulation
- ATM OAM Alarm Cell Handling
- Periodic ATM OAM Loopback

iii Click on the Select button in the Ingress ATM Policy panel to choose an ingress ATM policy. The Select Ingress ATM Policy - ATM Configuration form opens.

iv Choose an ingress ATM policy and click on the OK button. The Select Ingress ATM Policy - ATM Configuration form closes and the L3 Access Interface form reappears with the ingress ATM policy information displayed.

v Click on the Select button in the Egress ATM Policy panel to choose an egress ATM policy. The Select Egress ATM Policy - ATM Configuration form opens.

vi Choose an egress ATM policy and click on the OK button. The Select Egress ATM Policy - ATM Configuration form closes and the L3 Access Interface (Edit) form reappears with the egress ATM policy information displayed.

18 Click on the OK button. The VPRN L3 Access Interface (Create) form closes, and the VPRN Site (Edit) form reappears with the new interface information displayed in the service navigation tree.

Repeat steps 6 to 18 to create another L3 access interface for the site in the VPRN service.

Procedure 71-23 To configure NTP on a VPRN site

Note — NTP must be enabled on the base router before it can be configured on a VPRN site. See Procedure 15-10 for information about configuring NTP on the 7705 SAR, 7750 MG, and 7750 SR.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree. A list of service sites appears.

5 Choose a site from the list. The properties of the site are displayed in the right panel.

6 In the General tab, set the value of the NTP State parameter to Enabled.

7 Click on the NTP tab.

8 Configure the parameters:

- Authentication Check
- Admin State
- Server Authenticate

9 As required, create an authentication key by performing the following:

i Click on the Authentication tab.

ii Click on the Create button. The Network Time Protocol Authentication (New Instance) form opens.

iii Configure the parameters:

- Authentication Key ID
- Authentication Key
- Authentication Key Type

iv Click on the OK button. The new authentication key appears in the list.

10 As required, configure an NTP broadcast source by performing the following:

i Click on the Broadcast tab.

ii Click on the Create button. The NTP Broadcast (New Instance) form opens.

iii Click on the Select button. The Select Source Interface (NTP Broadcast) form opens.

iv Configure the filters, and click on the Search button. A list of available source interfaces appears.

v Select a source interface and click on the OK button.

vi Configure the parameters:

- Direction
- Authentication Key ID
- NTP Version
- Time To Live

vii Click on the OK button. The new source interface appears in the list.

11 Click on the OK button. The VPRN Service (Edit) form closes.

Procedure 71-24 To configure custom object attributes for AA reporting to the 5670 RAM on a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the 5670 RAM Parameters tab.

8 Click on the Reporting tab.

9 Click on the Create button. The AA Reporting (Create) form opens.

10 Configure the parameters:

- Customer Name
- Subscriber Name
- Subscriber Class
- Subscriber Type
- Total Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 1 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 2 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 3 Bandwidth Upstream (Kbps)
- Downstream (Kbps)
- Class of Service 4 Bandwidth Upstream (Kbps)
- Downstream (Kbps)

11 Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.

12 Close the VPRN L3 Access Interface (Edit) form.

13 Click on the OK button to close the VPRN Site (Edit) form.

14 Close the VPRN Service (Edit) form.

15 Close the Manage Services form.

Procedure 71-25 To assign ingress and egress QoS policies to a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the QoS tab.

Note — The QoS tab is configurable only if a port is assigned to the interface.

8 Configure the Ingress Match QinQ Dot1P parameter.

The Ingress Match QinQ Dot1P parameter is configurable only when the encapsulation type of the port is BCP dot1q, dot1q, or QinQ.

9 Click on the Select button in the Ingress Policy panel to choose an ingress QoS policy. The Select Ingress Policy - L3 Access Interface form opens.

10 Use the configurable filter and Search button to choose a policy, and click on the OK button. The Select Ingress Policy - L3 Access Interface form closes and the L3 Access Interface (Edit) form reappears with the ingress QoS policy information displayed.

Note — If you select an ingress policy which has a forwarding class mapped to an ingress queue group, you must ensure that the port you selected in step 14 of Procedure 71-22 has the access ingress queue group with the same name created on it.

See Procedure 16-1 for more information about how to configure Ethernet ports. See chapter 42 for more information about queue group template policies.

11 Click on the Ingress Queue Group Template Policy Select button in the Forwarding Plane Redirect panel to choose a policy. The Select Forwarding Plane Queue Group Instance form opens.

12 Choose a policy and click on the OK button. The Select Forwarding Plane Queue Group Instance form closes. The VPRN L3 Access Interface (Create) form refreshes with the Ingress Queue Group Template Policy information displayed.

13 Configure the Instance ID parameter.

14 Configure the Egress Mark QinQ Top Bits Only parameter.

The Egress Mark QinQ Top Bits Only parameter is configurable only when the encapsulation type of the port is BCP dot1q, dot1q, or QinQ.

15 Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - L3 Access Interface form opens.

16 Use the configurable filter and Search button to choose a QoS policy, and click on the OK button. The Select Egress Policy - L3 Access Interface form closes and the L3 Access Interface (Edit) form refreshes with the egress QoS policy information displayed.

Note 1 — If you select an egress policy which has a forwarding class mapped to an egress queue group, you must ensure that the port you selected in step 14 of Procedure 71-22 has the access egress queue group with the same name created on it.

See Procedure 16-1 for more information about how to configure Ethernet ports. See chapter 42 for more information about queue group template policies.

Note 2 — Queue Group Template policies are not applicable to L3 interfaces associated with HSMDA ports.

17 Click on the Select button in the Port Redirect panel to choose an Egress Queue Group Template Policy, if required. The Select Egress Queue Group Template Policy form opens.

Note — Selecting an Egress Queue Group Template Policy here permits the redirection of Ethernet traffic packets to a queue ID specified in the SAP's egress port queue group. The following properties and restrictions apply:

- If an Egress Queue Group Template Policy is specified here, the policy must have port redirection enabled.
- You cannot use policy-based redirection with the queue group when the SAP has SAP-based redirection enabled.
- Port access egress redirection is only supported on Ethernet/LAG ports. It is not supported on SAPs bound on non-Ethernet, Eth-tunnel, or CCAG ports.
- Supported ports include access, hybrid, and HSMDA.
- Queue groups can be applied to SAPs that incorporate LAGs. The LAGs can include port members from just a single card or from multiple cards.
- If you edit a LAG incorporated by the SAP, you cannot remove the last LAG member if a queue group reference exists to the containing SAP.
- You cannot add a secondary LAG member that has a queue group mismatch with primary LAG member.

18 Choose an Egress Queue Group Template Policy and click on the OK button. The Select Egress Queue Group Template Policy form closes, and the L3 Access Interface (Create) form refreshes with the Egress Queue Group Template Policy information displayed.

19 If you are configuring an L3 access interface for a 7710 SR or 7705 SAR, or if the port you selected in step 14 of Procedure 71-22 is not an HSMDA port, then go to step 26.

20 Configure the Packet Byte Offset (bytes) parameter, if required. You must enable the associated Override check box if you need to configure this parameter.

21 Click on the Select button in the Egress HSMDA Override panel to choose a WRR policy. The Select WRR Policy form opens.

22 Choose a WRR policy and click on the OK button. The Select WRR Policy form closes and the VPRN L3 Access Interface (Edit) form reappears with the WRR policy information displayed.

23 Click on the Select button in the Egress HSMDA Override panel to choose an HSMDA egress secondary shaper policy. The Select Secondary Shaper form opens.

24 Choose a secondary shaper and click on the OK button. The Select Secondary Shaper form closes and the VPLS L2 Access Interface (Create) form reappears with the secondary shaper information displayed.

25 Configure the parameters:

- Use Shared Queue
- Use Multipoint Shared Queue

26 Close the VPRN L3 Access Interface (Edit) form.

27 Click on the OK button to close the VPRN Site (Edit) form.

28 Close the VPRN Service (Edit) form.

29 Close the Manage Services form.

Procedure 71-26 To configure scheduling on a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Schedulers tab.

Note — The Schedulers tab is configurable only if a port is assigned to the SAP in Procedure 71-22.

8 To configure scheduling on a 7705 SAR site, perform the following steps. Otherwise, go to step 9.

Note 1 — For the 7705 SAR, scheduler behavior is determined by the scheduler mode, which is 4-Priority by default. You can only configure the Egress and Ingress Aggregate Rate Limit parameters when the Scheduler Mode parameter is set to 16-Priority. You can set the Scheduler Mode to 16-Priority only when the port is on an MDA that supports 16-Priority. See the 7705 SAR documentation for more information.

Note 2 — If you change the Scheduler Mode parameter from 16-Priority to 4-Priority, the 5620 SAM automatically restores the default settings for the Egress Aggregate Rate Limit and Ingress Aggregate Rate Limit panels when you click on the Apply or OK button.

i In the Egress Scheduler panel, configure the Scheduler Mode parameter.

ii In the Ingress Scheduler panel, configure the Scheduler Mode parameter.

iii If you set the Scheduler Mode parameter to 16-Priority in the Egress Scheduler panel or Ingress Scheduler panel, configure the parameters in the Egress Aggregate Rate Limit panel and Ingress Aggregate Rate Limit panel, as required. Otherwise, go to step 11.

- Assign Aggregate Rate Limit
- Aggregate Rate Limit (kbps)
- Assign Aggregate CIR
- Aggregate CIR (kbps)

iv Go to step 11.

9 Specify that an aggregation scheduler policy is not applied to the interface. Otherwise, go to step 10.

i Set the Aggregation parameter to off.

Note — The Aggregation parameter is not configurable if the port you selected in step 14 of Procedure 71-22 is an HSMDA port.

ii Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

Note 1 — The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are configurable only when there is no scheduler specified in the Egress Scheduler panel.

Note 2 — The Frame-Based Accounting parameter is not configurable if the port you selected in step 14 of Procedure 71-22 is an HSMDA port.

Note 3 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

iii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - VPRN L3 Access Interface form opens.

iv Choose an ingress scheduler and click on the OK button. The Select Ingress Scheduler - L3 Access Interface form closes, and the VPRN L3 Access Interface (Create) form refreshes with the ingress scheduler information displayed.

v Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Policer Control Policy form opens.

vi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPRN L3 Access Interface (Edit) form reappears with the ingress policer control policy information displayed.

vii If the port you selected in step 14 of Procedure 71-22 is an HSMDA port, go to step 11.

viii Click on the Select button in the Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - L3 Access Interface form opens.

ix Choose an egress scheduler and click on the OK button. The Select Egress Scheduler - L3 Access Interface form closes, and the L3 Access Interface (Create) form refreshes with the egress scheduler information displayed.

x Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Policer Control Policy form opens.

xi Choose a policer control policy and click on the OK button. The Select Policer Control Policy form closes and the VPRN L3 Access Interface (Edit) form reappears with the egress policer control policy information displayed.

xii Go to step 11.

10 Specify that an aggregation scheduler policy is applied to the interface.

Note — You cannot specify an access scheduler policy if the port you selected in step 14 of Procedure 71-22 is an HSMDA port. Go to step 11.

i Set the Aggregation parameter to on.

ii Click on the Select button in the Aggregation Scheduler panel to choose an aggregation scheduler. The Select Aggregation Scheduler - L3 Access Interface form opens.

iii Choose an aggregation scheduler and click on the OK button. The Select Aggregation Scheduler - L3 Access Interface form closes, and the L3 Access Interface (Create) form refreshes with the aggregation scheduler information displayed.

11 Close the VPRN L3 Access Interface (Edit) form.

12 Click on the OK button to close the VPRN Site (Edit) form.

13 Close the VPRN Service (Edit) form.

14 Close the Manage Services form.

Procedure 71-27 To assign ingress and egress ACL filters to a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the ACL tab.

8 Click on the Select button in the Ingress Filter panel to choose an ingress IPv4 ACL filter. The Select Ingress Filter - L3 Access Interface form opens.

9 Choose an ingress ACL filter and click on the OK button. The Select Ingress Filter - L3 Access Interface form closes and the L3 Access Interface (Edit) form reappears with the ingress IPv4 ACL filter information displayed.

10 Click on the Select button in the Egress Filter panel to choose an egress IPv4 ACL filter. The Select Egress Filter - L3 Access Interface form opens.

11 Choose an egress ACL filter and click on the OK button. The Select Egress Filter - L3 Access Interface form closes and the L3 Access Interface (Edit) form reappears with the egress IPv4 ACL filter information displayed.

12 If the L3 Access Interface supports IPv6 addressing, perform the following steps. Otherwise, go to step 17.

13 Click on the Select button in the IPv6 Ingress Filter panel to choose an ingress IPv6 ACL filter. The Select IPv6 Ingress Filter - L3 Access Interface form opens.

14 Choose an ingress ACL filter and click on the OK button. The Select IPv6 Ingress Filter - L3 Access Interface form closes and the L3 Access Interface (Edit) form reappears with the ingress IPv6 ACL filter information displayed.

15 Click on the Select button in the IPv6 Egress Filter panel to choose an egress IPv6 ACL filter. The Select IPv6 Egress Filter - L3 Access Interface form opens.

16 Choose an egress ACL filter and click on the OK button. The Select IPv6 Egress Filter - L3 Access Interface form closes and the L3 Access Interface (Edit) form reappears with the egress IPv6 ACL filter information displayed.

17 Close the VPRN L3 Access Interface (Edit) form.

18 Click on the OK button to close the VPRN Site (Edit) form.

19 Close the VPRN Service (Edit) form.

20 Close the Manage Services form.

Procedure 71-28 To assign an accounting policy to a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Accounting tab.

8 Configure the Collect Accounting Statistics parameter.

9 Click on the Select button to choose an accounting policy. The Select Accounting Policy - L3 Access Interface form opens.

10 Choose an accounting policy and click on the OK button. The Select Accounting Policy - L3 Access Interface form closes and the L3 Access Interface (Edit) form reappears with the accounting policy information displayed.

11 Close the VPRN L3 Access Interface (Edit) form.

12 Click on the OK button to close the VPRN Site (Edit) form.

13 Close the VPRN Service (Edit) form.

14 Close the Manage Services form.

Procedure 71-29 To assign a time of day suite to a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the TOD Suite tab.

8 Click on the Select button beside the Name parameter. The Select Time Of Day Suite - L3 Access Interface list form opens.

9 Choose a time of day suite and click on the OK button. The Select Time Of Day Suite - L3 Access Interface list form closes, and the L3 Access Interface (Create) form refreshes with the time of day suite name.

Note 1 — You cannot assign a ToD suite to a L3 access interface if accounting statistics collection is enabled on the interface. You must first disable the Collect Accounting Statistics parameter in step 8 of Procedure 71-28.

Note 2 — SapEgrQosPlcyStats and SapIngQosPlcyStats statistics are collected only if a Time Of Day Suite is applied on the SAP.

10 Close the VPRN L3 Access Interface (Edit) form.

11 Click on the OK button to close the VPRN Site (Edit) form.

12 Close the VPRN Service (Edit) form.

13 Close the Manage Services form.

Procedure 71-30 To bind a VPRN L3 access interface to a VPLS site or VPLS I-site

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Routed VPLS tab.

Note 1 — The operational state of the IP interface binding will not be turned up until the Enable IP Interface Binding parameter is set to true.

Note 2 — You can create and manage a routed VPLS connector from the navigation tree on the Composite Service (Edit) form.

8 Enter a VPLS site name or click on the Select button beside the VPLS Name parameter to choose a VPLS site. The Routed VPLS String - VPRN L3 Access Interface form opens.

9 Choose a VPLS site and click on the OK button. The Routed VPLS String - VPRN L3 Access Interface form closes.

10 In the Ingress - IPv4 Filter panel, click on the Select button. The Select IPv4 Filter - VPRN L3 Access Interface form opens.

11 Choose an IPv4 filter and click on the OK button. The Select IPv4 Filter - VPRN L3 Access Interface form closes and the IPv4 filter information is displayed.

12 In the Ingress - IPv6 Filter panel, click on the Select button. The Select IPv6 Filter - VPRN L3 Access Interface form opens.

13 Choose an IPv6 filter and click on the OK button. The Select IPv6 Filter - VPRN L3 Access Interface form closes and the IPv6 filter information is displayed.

14 In the Egress - QoS Policy panel, click on the Select button. The Select QoS Policy - VPRN L3 Access Interface form opens.

15 Choose a QoS Policy and click on the OK button. The Select QoS Policy - VPRN L3 Access Interface form closes and the QoS Policy information is displayed.

16 Close the VPRN L3 Access Interface (Edit) form.

17 Click on the OK button to close the VPRN Site (Edit) form.

18 Close the VPRN Service (Edit) form.

19 Close the Manage Services form.

Procedure 71-31 To associate a local DHCPv4 or DHCPv6 server with a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Local DHCP tab and perform one of the following steps.

Note — To associate local DHCPv6 servers the IPv6 Allowed parameter must be enabled.

a For local DHCPv4 servers

i Click on the Select button in the Local DHCP Server panel to choose a local DHCP server. The Select Local DHCP Server - L3 Access Interface form opens.

ii Choose a local DHCP server and click on the OK button. The Select Local DHCP Server - L3 Access Interface form closes, and the L3 Access Interface (Edit) form reappears with the local DHCP server information displayed.

b For local DHCPv6 servers

i Click on the Select button in the Local DHCPv6 Server panel to choose a local DHCPv6 server. The Select Local DHCPv6 Server - L3 Access Interface form opens.

ii Choose a local DHCPv6 server and click on the OK button. The Select Local DHCPv6 Server - L3 Access Interface form closes, and the L3 Access Interface (Edit) form reappears with the local DHCPv6 server information displayed.

Note — You cannot associate a local DHCPv4 server to the L3 group Interface if the Administrative State parameter in the Local Proxy Service panel is up. Go to step 15 of Procedure 71-41 to set the Administrative State.

8 Close the VPRN L3 Access Interface (Edit) form.

9 Click on the OK button to close the VPRN Site (Edit) form.

10 Close the VPRN Service (Edit) form.

11 Close the Manage Services form.

Procedure 71-32 To assign an NE DoS protection policy or NE DDoS protection policy to a VPRN L3 access interface

Note — A default DoS protection policy is automatically assigned to the interface.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Port tab.

8 Click on the Select button in the NE DoS Protection Policy panel and choose a DoS protection policy from the select NE DoS Protection form.

9 Click on the Select button next to the NE DDoS Protection Policy field and choose a DDoS protection policy from the select NE DDoS Protection form.

10 Close the VPRN L3 Access Interface (Edit) form.

11 Click on the OK button to close the VPRN Site (Edit) form.

12 Close the VPRN Service (Edit) form.

13 Close the Manage Services form.

Procedure 71-33 To configure residential subscriber management for a VPRN L3 access interface

Residential subscriber management is supported on the 7450 ESS in mixed mode, 7750 SR, and 7710 SR.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Subscriber Management tab. The Host Connectivity tab is displayed.

8 Select the SHCV Enabled parameter to enable SHCV.

9 Configure the parameters:

- SHCV Interval (minutes)
- SHCV Source
- SHCV Action

10 Close the VPRN L3 Access Interface (Edit) form.

11 Click on the OK button to close the VPRN Site (Edit) form.

12 Close the VPRN Service (Edit) form.

13 Close the Manage Services form.

Procedure 71-34 To assign an IP address to a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Addresses tab.

8 Click on the Create button. The IP Address (Create) form opens.

9 Configure the parameters:

- Address ID
- IP Address
- Prefix Length
- Broadcast Address Format
- EUI-64
- IP Address Preferred

The Broadcast Address Format parameter only appears if the IP Address parameter is set to an IPv4 address.

The EUI-64 IP Address Preferred parameters only appear if the IP Address parameter is set to an IPv6 address.

10 Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

11 Click on the OK button. The VPRN L3 Access Interface (Edit) form reappears with the assigned IP addresses displayed.

12 Close the VPRN L3 Access Interface (Edit) form.

13 Click on the OK button to close the VPRN Site (Edit) form.

14 Close the VPRN Service (Edit) form.

15 Close the Manage Services form.

Procedure 71-35 To configure IPv4 ICMP for a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the ICMP tab.

8 Configure the parameters:

- Mask Reply
- Redirects
- Number of Redirects
- Redirects Time (seconds)
- Unreachables
- Number of Unreachables
- Unreachables Time (seconds)
- TTL Expired
- Number of TTL Expired
- TTL Expired Time (seconds)

9 Close the VPRN L3 Access Interface (Edit) form.

10 Click on the OK button to close the VPRN Site (Edit) form.

11 Close the VPRN Service (Edit) form.

12 Close the Manage Services form.

Procedure 71-36 To configure IPv6 ICMP on a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Ensure that the IPv6 Allowed parameter is enabled.

8 Configure the parameters:

- Redirects
- Number of Redirects
- Redirects Time (seconds)
- Unreachables
- Number of Unreachables
- Unreachables Time (seconds)
- Packet Too Big
- Number of Packet Too Big
- Packet Too Big Time (seconds)
- Param Problem
- Number of Param Problem
- Param Problem Time (seconds)
- Time Exceeded
- Number of Time Exceeded
- Time Exceeded Time (seconds)

9 Close the VPRN L3 Access Interface (Edit) form.

10 Click on the OK button to close the VPRN Site (Edit) form.

11 Close the VPRN Service (Edit) form.

12 Close the Manage Services form.

Procedure 71-37 To configure IPCP for a VPRN L3 access interface

You can configure IPCP only on the ASAP MDA on the 7750 SR and 7710 SR.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the IPCP tab. The IPCP tab is available when the SAP and port is configured with Null or IPCP encapsulation.

8 Configure the parameters:

- Peer Address
- Primary DNS Address
- Secondary DNS Address

Note — Primary and secondary DNS addresses have similar functionality, although they are assigned independently. When both are present, the primary DNS address is used to resolve address names. If the primary DNS address cannot be used the secondary DNS address is used.

9 Click on the OK button. A dialog box appears.

10 Click on the OK button to confirm the action.

11 Close the VPRN L3 Access Interface (Edit) form.

12 Click on the OK button to close the VPRN Site (Edit) form.

13 Close the VPRN Service (Edit) form.

14 Close the Manage Services form.

Procedure 71-38 To configure Bi-directional Forwarding Detection for a VPRN L3 access interface

Note 1 — You cannot configure BFD for an interface if BFD is disabled. See chapter 23 for information about enabling and disabling BFD for routing protocols.

Note 2 — If the IPv6 Allowed parameter in step 7 of Procedure 71-22 is enabled, you can configure the above BFD parameters for IPv6.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the BFD tab. The General tab is displayed.

8 In the IPv4 BFD Configuration panel, set the Admin Status to Up.

9 Configure the parameters:

- Transmit Interval
- Receive Interval
- Echo Interval
- Multiplier
- Termination Type
- Operational State Transition Interval
- Inherit from Network Element

10 In the IPv6 BFD Configuration panel, set the Admin Status to Up.

11 Configure the parameters:

- Transmit Interval
- Receive Interval
- Echo Interval
- Multiplier
- Termination Type
- Operational State Transition Interval
- Inherit from Network Element

12 To view local and remote session peers that are managed by the 5620 SAM, click on the BFD Session tab. A list of BFD current sessions on a router interface or an L3 interface appears.

13 Click on a session. The properties form for the session opens. View the following:

- BFD status
- protocol used
- local address
- remote address
- operational status and statistics

14 Close the form.

15 Close the VPRN L3 Access Interface (Edit) form.

16 Click on the OK button to close the VPRN Site (Edit) form.

17 Close the VPRN Service (Edit) form.

18 Close the Manage Services form.

Procedure 71-39 To configure ARP for a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the ARP tab. The General tab is displayed.

8 Configure the Timeout (seconds) parameter.

9 Click on the Create button. The Static ARP (Create) form opens.

10 Configure the parameters:

- Unnumbered
- IP Address
- Physical Address

11 Click on the OK button. The Static ARP (Create) form closes.

12 Click on the Proxy ARP tab.

13 Configure the parameters:

- Remote Proxy ARP
- Enable Local Proxy ARP
- Proxy ARP Policy 1
- Proxy ARP Policy 2
- Proxy ARP Policy 3
- Proxy ARP Policy 4
- Proxy ARP Policy 5

14 Close the VPRN L3 Access Interface (Edit) form.

15 Click on the OK button to close the VPRN Site (Edit) form.

16 Close the VPRN Service (Edit) form.

17 Close the Manage Services form.

Procedure 71-40 To configure neighbor discovery on a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Set the IPv6 Allowed parameter to enabled.

8 Click on the Neighbor Discovery tab.

9 Click on the Create button. The Neighbor Discovery (Create) form opens.

10 Configure the parameters:

- IP Address
- Physical Address

11 Click on the OK button. A dialog box appears.

12 Click on the OK button. The Neighbor Discovery (Create) form closes, and the L3 Access Interface (Create) form refreshes with the neighbor entry.

13 Click on the Proxy ND tab.

14 Configure the parameters:

- Enable Local Proxy
- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5

Note — Do not leave an empty policy parameter between two configured policy parameters. For example, do not configure the Policy 1 and Policy 3 parameters and leave the Policy 2 parameter unconfigured, or the 5620 SAM reorders the policies and moves the policy specified for the Policy 3 parameter to the Policy 2 parameter.

15 Repeat steps 8 to 14 for each neighbor entry you need to create.

16 Close the VPRN L3 Access Interface (Edit) form.

17 Click on the OK button to close the VPRN Site (Edit) form.

18 Close the VPRN Service (Edit) form.

19 Close the Manage Services form.

Procedure 71-41 To configure IPv4 DHCP for a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the DHCP tab. The General tab is displayed.

8 Configure the parameters:

- Enable DHCP Relay
- Description
- Trusted
- Lease Populate
- Enable
- Relay Plain BOOTP
- Use ARP

The Lease Populate parameter is configurable when the Enable parameter is enabled.

9 Depending on the type and release of device that you are configuring, the Subscriber Authentication Policy panel is present. Choose a Subscriber Authentication policy, if required. Otherwise, go to step 14.

10 Click on the Select button in the Subscriber Authentication panel to choose a subscriber authentication policy. The Select Subscriber Authentication Policy - DhcpRelayConfiguration form opens.

11 Click on the Search button.

12 Choose a subscriber authentication policy and click on the OK button. The Select Subscriber Authentication Policy - DhcpRelayConfiguration form closes, and the L3 Access Interface (Create) form refreshes with the subscriber authentication policy name.

13 Configure the parameters:

- Action
- Circuit ID
- Remote ID
- Remote ID String
- Vendor Specific Options
- Vendor String
- IP address
- Use as source
- Relay Unicast Message

The Remote ID String parameter is configurable when the Remote ID is set to Remote ID String.

When the Relay Unicast Message parameter is set to Renew or Release Update Source IP, the GI address parameter can be configured as any local configured address in the same routing instance as the GI address for the DHCP relayed messages. If the Relay Unicast Message parameter is set to None, the GI address is restricted to the IP address configured on the subscriber interface.

14 Click on the Server tab.

15 Configure the parameters:

- Server 1 through Server 8
- Administrative State
- Emulated Server IP Address
- Lease Time
- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time Override

The Number of Days, Number of Hours, Number of Minutes, Number of Seconds, and Lease Time Override parameters are configurable only when the Lease Time parameter is set to Specified Time Period.

16 Close the VPRN L3 Access Interface (Edit) form.

17 Click on the OK button to close the VPRN Site (Edit) form.

18 Close the VPRN Service (Edit) form.

19 Close the Manage Services form.

Procedure 71-42 To create a VRRP instance on a VPRN L3 access interface for a virtual router

You must know the VRID for an existing virtual router and ensure that the interface is a member of the same subnet as the virtual router.

See chapter 33 for configuration information about VRRP instances and virtual routers.

Note — The following configurations are required for the operation of the IPv6 VRRP instance:

- Two tabs are available under the VRRP tab, one for IPv4 instances and the other for IPv6 instances. You can only create an IPv6 VRRP Instance if you enable the IPv6 Allowed parameter on the General tab of the VPRN L3 Access Interface (Edit) form.
- The Link Local Address on the parent interface must be set to preferred and configured as one of the backup addresses (or same subnet) for the IPv6 VRRP instance. The Admin Link Local Address and Admin Link Local Address Preferred parameters on the General tab of the VPRN L3 Access Interface (Edit) form must be set accordingly.
- The IPv6 address on the parent interface must be set to preferred to be used as a backup address (on same subnet) for the IPv6 VRRP instance. The IP Address and IP Address Preferred parameters in step 9 of Procedure 71-34 must be set accordingly.
- The Send Advertisement and Use Virtual MAC Address parameters must be enabled in step 9 of Procedure 71-44 for the router advertisement on the parent interface.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the VRRP tab.

8 Click on the Create button. The VRRP Instance (Create) form opens with the General tab displayed.

9 Configure the Virtual Router ID parameter.

10 Perform steps 8 to 15 of Procedure 33-2.

Note — You can use the VR Instances tab to create, modify, and view VR instances.

11 Click on the OK button. The VRRP Instance (Create) closes and the L3 Access Interface (Edit) form reappears.

12 Close the VPRN L3 Access Interface (Edit) form.

13 Click on the OK button to close the VPRN Site (Edit) form.

14 Close the VPRN Service (Edit) form.

15 Close the Manage Services form.

Procedure 71-43 To configure anti-spoofing filters for a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Anti-Spoofing tab.

8 Configure the parameters:

- Anti-Spoofing
- ARP Populate

The ARP Populate parameter is configurable when all of the IP addresses of the defined static hosts on the interface are in one of the subnets configured for the interface.

9 Click on the Static Hosts tab to configure static subscriber host entries, if subscriber entries are not available through DHCP lease management.

10 Click on the Create button. The Access Interface Anti-Spoofing Static Host Display (Create) form opens.

11 Configure the parameters:

- IP Address
- MAC Address

Specify at least one IP address or MAC address for each static host. The values specified for the Anti-Spoofing and ARP Populate parameters determine the type of address entry that is required for the static host. For example, when you set the Anti-Spoofing parameter to Source Ip Addr, you must specify at least the IP address for the static host.

Note — You can configure a static host on a SAP only when no static ARP entries exist on the IP interface.

When the ARP Populate parameter is enabled, the IP address of the new static host must be in one of the subnets that is configured for the interface in Procedure 71-34.

12 Click on the Apply button if you need to create additional entries. A dialog box appears. Otherwise, go to step 15.

13 Click on the OK button.

14 Repeat steps 11 to 13 to create additional entries, if required.

15 Click on the OK button. A dialog box appears.

16 Click on the OK button. The Access Interface Anti-Spoofing Static Host Display (Create) form closes and the Static Hosts tab refreshes with the configured static hosts displayed.

17 Close the VPRN L3 Access Interface (Edit) form.

18 Click on the OK button to close the VPRN Site (Edit) form.

19 Close the VPRN Service (Edit) form.

20 Close the Manage Services form.

Procedure 71-44 To configure router advertisement on a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Advertisement tab.

8 Click on the Create button to add a router advertisement entry. The Router Advertisement (Create) form opens.

9 Configure the parameters:

- Send Advertisement
- Min Interval (seconds)
- Reachable Time (milliseconds)
- Managed Address Config
- MTU
- Use Virtual MAC Address
- Max Interval (seconds)
- Retransmit Time (milliseconds)
- Other Stateful Config
- Current Hop Limit
- Lifetime (seconds)

If you are configuring the L3 interface for an IPv6 VRRP instance, then the Send Advertisement and Use Virtual MAC Address parameters must both be enabled.

10 Click on the Prefix tab.

11 Click on the Create button. The Router Advertisement Prefix (Create) form opens.

12 Configure the parameters:

- IPv6 Prefix
- On-Link Determination
- Prefix Length
- Autonomous Address Configuration
- Lifetime (seconds) in Preferred Lifetime panel
- No Expiry in Preferred Lifetime panel
- Lifetime (seconds) in Valid Lifetime panel
- No Expiry in Valid Lifetime panel

13 Click on the OK button. A dialog box appears.

14 Click on the OK button. The Router Advertisement (Create) form reappears.

15 Click on the OK button. A dialog box appears.

16 Click on the OK button. The Router Advertisement (Create) form closes and the VPRN L3 Access Interface (Edit) form refreshes with the router advertisement entry.

17 Close the VPRN L3 Access Interface (Edit) form.

18 Click on the OK button to close the VPRN Site (Edit) form.

19 Close the VPRN Service (Edit) form.

20 Close the Manage Services form.

Procedure 71-45 To assign an ANCP policy to a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the ANCP Static Map tab.

8 Click on the Create button. The ANCP Static Map (Create) form opens with the General tab displayed.

9 Configure the ANCP String parameter.

10 Click on the Select button in the ANCP Policy panel to choose an ANCP policy. The Select ANCP Policy - ANCP Static Map list form opens.

11 Choose an ANCP policy and click on the OK button. The Select ANCP Policy - ANCP Static Map form closes and the ANCP Static Map form reappears with the ANCP policy information displayed.

12 Click on the OK button. A dialog box appears.

13 Click on the OK button. The ANCP Static Map (Create) form closes.

14 Close the VPRN L3 Access Interface (Edit) form.

15 Click on the OK button to close the VPRN Site (Edit) form.

16 Close the VPRN Service (Edit) form.

17 Close the Manage Services form.

Procedure 71-46 To specify queue overrides on a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Click on the Override Policy Items tab.

Note — The Override Policy Items tab contains a number of tabs. However, the tabs that are displayed depend on the port type that you have chosen for this interface.

- If you configured a non-HSMDA port, then the Access Ingress Queues, Access Egress Queues, Ingress Policer, and Egress Policer tabs are active.
- If you configured an HSMDA port, then the Access Ingress Queues, Access Egress HSMDA Queues and Ingress Policer tabs are active.

Set the queue overrides, as described in Procedure 43-42.

8 Close the VPRN L3 Access Interface (Edit) form.

9 Click on the OK button to close the VPRN Site (Edit) form.

10 Close the VPRN Service (Edit) form.

11 Close the Manage Services form.

Procedure 71-47 To configure IPv6 DHCP on a VPRN L3 access interface

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Expand the Sites icon in the service navigation tree.

5 Expand the Routing Instance icon in the service navigation tree on which you need to configure the L3 access interface.

6 Right-click on the L3 Access Interface icon and choose Properties from the contextual menu. The VPRN L3 Access Interface (Edit) form opens with the General tab displayed.

7 Set the IPv6 Allowed parameter to enabled.

8 Click on the DHCPv6 tab. The General tab is displayed.

9 Configure the parameters:

- Enable DHCPv6 Relay
- Description
- Lease Populate
- Maximum Number of Leases
- Route Populate PD
- Route Populate PD Exclude
- Route Populate NA
- Route Populate TA
- Interface Id Option
- Interface Id String
- Remote ID
- Source IP Address
- Neighbor Resolution
- Prefix Option

10 Click on the Server tab.

11 Configure the Server 1 through Server 8 parameters.

12 Configure the interface name for each DHCPv6 server that you configured in step 11 by clicking on the Select button in the Zone Index panel. The Select Zone Index - DhcpRelayV6Configuration form opens with a list of configured interfaces.

13 Choose an interface and click on the OK button. The Select Zone Index - DhcpRelayV6Configuration list form closes and the L3 Access Interface form refreshes with the interface information.

14 Click on the DHCPv6-Prefix tab.

15 Click on the Create button. The DhcpRelayV6PrefixDelegation (Create) form opens.

16 Configure the parameters:

- Prefix Address
- Prefix Length
- Prefix DUID
- Prefix IAID
- Prefix Life Time (seconds)
- Prefix Valid Life Time (seconds)

17 Click on the OK button. A dialog box appears.

18 Click on the OK button. The VPRN L3 Access Interface (Edit) form reappears.

19 Close the VPRN L3 Access Interface (Edit) form.

20 Click on the OK button to close the VPRN Site (Edit) form.

21 Close the VPRN Service (Edit) form.

22 Close the Manage Services form.

Procedure 71-48 To configure a VPRN network interface

Note — You cannot configure at network interface on a VPRN service if there are any pre-existing interfaces configured on the service. Once a network interface is configured on a VPRN service, no other interface types can be configured on the service.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service.

4 Click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

5 Click on the Sites tab.

6 Choose a VPRN site and then click on the Properties button. The VPRN Site (Edit) form opens with the General tab displayed.

7 Click on the Routing tab. The General tab is displayed.

8 Configure the Carrier Carrier VPN parameter.

The Carrier Carrier VPN parameter is only available if there are no other interfaces configured on the site.

9 Click OK on the VPRN Site (Edit) form. The VPRN Site (Edit) form closes and the VPRN Service (Edit) form reappears.

10 Click on the Network Interfaces tab and then click on the Create button. The Network Interface (Create) form opens with the General tab displayed.

11 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- MAC Address
- Allow Directed Broadcasts
- Class
- Loopback Enabled
- PIM RP Delayed Up Period
- Cflowd Type
- Trusted
- Enable Ingress Flowspec
- Enable Ingress Stats
- LSR IP Load Balancing
- URPF Check State IPv4
- URPF Check Mode IPv4
- URPF Check State IPv6
- URPF Check Mode IPv6
- Broadcast

The URPF Check State IPv6 and URPF Check Mode IPv6 parameters are only configurable when the IPv6 Allowed parameter is enabled.

Note — When the Broadcast parameter is enabled, a time protocol such as NTP or SNTP must be enabled and configured on the device, or the device ignores broadcast time packets received on the interface. See chapter 9 for information about configuring NTP or SNTP on a device.

12 Click on the Port tab.

Note — If the Loopback Enabled parameter is selected on the General tab, the Port port tab does not appear. Skip to step 15.

13 Click on the Select button and select a terminating port for the interface from the Select Terminating Port form.

14 Configure the parameters:

- Outer Encapsulation Value
- Auto-Assign ID
- Inner Encapsulation Value

Note — If you Clear or change the port associated with an existing Network Interface, the Network Policy associated to the Network Interface will remain but all the redirect information will be cleared. This includes the Egress Queue Group Template Policy and its Egress Queue Group Instance ID, as well as the Ingress Queue Group Template Policy and its Ingress Queue Group Instance ID. These will subsequently need to be reconfigured if required.

15 Click on the Policies tab.

i In the Network Policy panel, click on the Select button in the Network Policy panel to list and choose a network policy for the interface. Network policies are used to determine QoS settings based on the packet DSCP bits on the ingress and egress of the network.

Note 1 — If you select a network policy with a forwarding class mapped to a queue group queue ID, you must ensure that the mapping queue group queue ID is in the selected Queue Group Template Policy.

See Procedure 16-1 for more information about how to configure Ethernet ports. See chapter 42 for more information about queue group template policies.

Note 2 — If you need to add a Port Redirect Group (policer) to any of the Ingress Forwarding Classes in the the global copy of the Network Policy, you must first define the policer in the global copy of the Ingress Queue Group Template Policy.

Note 3 — If you need to add a Port Redirect Group (queue or policer) to any of the Egress Forwarding Classes in the the global copy of the Network Policy, you must first define the queue or policer in the global copy of the Egress Queue Group Template Policy.

ii In the Ingress Forwarding Plane Redirect panel, click on the Select button to choose a queue group template policy for the interface's ingress forwarding plane redirection. Only global Ingress Queue Group Template Policies that have already been defined can be chosen. Queue group template policies allow SAP or IP interface forwarding classes to be redirected from the typical queue mapping to a shared queue.

iii Configure the Queue Group Instance ID parameter.

Note 1 — You must ensure that the port you selected in step 13 has a network egress queue group with the same name as the Queue Group Template policy created on it.

Note 2 — If the Network Policy you selected in step i has Port Redirect Groups on its Ingress Forwarding Classes, you must specify both an Ingress Queue Group Template Policy and Instance ID.

Note 3 — If the Network Policy you selected in step i has Port Redirect Groups on its Ingress Forwarding Classes, these must already be defined within the Ingress Queue Group Template Policy you select.

Note 4 — If you need to remove an existing Port Redirect Group (policer) from any of the Ingress Forwarding Classes in the the global copy of the Ingress Queue Group Template Policy, you must first remove the policer in the global copy of the Network Policy.

Note 5 — Queue Group Template policies are not applicable to L3 interfaces associated with HSMDA ports.

See Procedure 16-1 for more information about how to configure Ethernet ports. See chapter 42 for more information about queue group template policies.

iv In the Egress Port Redirect panel, click on the Select button to choose a queue group template policy for the interface's egress port redirection. Only local Egress Queue Group Template Policies which have a Network Egress Queue Group Instance defined on the associated port can be chosen.

v Configure the Queue Group Instance ID parameter.

Note 1 — If the Network Policy you selected in step i has Port Redirect Groups on its Egress Forwarding Classes, you must specify both an Egress Queue Group Template Policy and Instance ID.

Note 2 — If the Network Policy you selected in step i has Port Redirect Groups on its Egress Forwarding Classes, these must already be defined within the Egress Queue Group Template Policy you select. The default policy does not contain any redirects.

Note 3 — If you need to remove an existing Port Redirect Group (queue or policer) from any of the Egress Forwarding Classes in the the global copy of the Egress Queue Group Template Policy, you must first remove the queue or policer in the global copy of the Network Policy.

Note 4 — Queue Group Template policies are not applicable to L3 interfaces associated with HSMDA ports.

See Procedure 16-1 for more information about how to configure Ethernet ports. See chapter 42 for more information about queue group template policies.

vi Click on the Select buttons to list and choose Ingress and Egress ACL filters for the interface. ACL filters are used to filter out IP traffic that matches user-defined criteria.

16 Assign a DoS protection policy or DDoS protection policy to the interface, if required.

Note — A default DoS protection policy is automatically assigned to the interface.

i Click on the Security tab.

ii Click on the Select button beside the DoS Policy ID field and select a policy from the Select NE DoS Protection form.

iii Click on the Select button beside the NE DDoS Protection Policy field and select a policy from the Select NE DDoS Protection Policy form.

17 Configure Bi-directional Forwarding Detection for the interface, if required.

i Click on the BFD tab.

ii Configure the parameters:

- Administrative State
- Transmit Interval
- Receive Interval
- Echo Interval
- Multiplier
- Termination Type
- Operational State Transition Interval
- Inherit from Network Element

The Transmit Interval, Receive Interval, Receive Interval, Echo Interval, Multiplier, Termination Type, Operational State Transition Interval, and Inherit from Network Element parameters are configurable only when the Administrative State parameter is set to Up.

iii To view local and remote session peers that are managed by the 5620 SAM. Click on the BFD Session tab. A list of BFD current sessions on the interface appears.

iv Click on a session. The properties form for the session opens. View the following:

- BFD status
- protocol used
- local address
- remote address
- operational status and statistics

v Close the form.

Note — You cannot configure BFD for an interface if BFD is disabled. See chapter 23 for information about enabling and disabling BFD for routing protocols.

18 Click on the ARP tab.

i Configure the Timeout (seconds) parameter.

ii Click on the Create button to statically associate an IP or MAC address to the interface. The Static ARP (Create) form opens.

Configure the parameters:

- IP Address
- Physical Address

iii Click on the OK button. The Static ARP (Create) form closes.

19 Click on the Addresses tab to assign IP addresses to the interface:

i Click on the Create button. The IP Address, Routing Instance (Create) form opens.

ii Configure the parameters:

- Address ID
- IP Address
- Prefix Length
- IGP Inhibit
- Broadcast Address Format

iii Click on the OK button to save the changes. A dialog appears.

iv Click on the OK button. The IP Address, Routing Instance (Create) form closes. The Network Interface (Create) form reappears with the assigned IP addresses displayed.

20 Click on the ICMP tab and configure the parameters:

- Mask Reply
- Redirects
- Unreachables
- TTL Expired
- Number of Redirects
- Redirects Time (seconds)
- Number of Unreachables
- Unreachables Time (seconds)
- Number of TTL Expired
- TTL Expired Time (seconds)

21 Click on the OK button. The Network Interface [Create] form closes. The VPRN Service (Create) form reappears with the assigned network interface displayed.

Procedure 71-49 To configure a GNE site on a VPRN service

Use this procedure to add a GNE site and GNE service interfaces to an existing VPRN service.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

4 On the component tree, right-click on VPRN Service and choose Create GNE Site. The Select Network Elements - VPRN Service form opens with a list of available sites.

5 Choose a site and click on the OK button. The GNE Site (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Name
- Description

7 Click on the Apply button.

8 To configure an interface for the GNE site, perform the following steps:

i Click on the GNE Service Interfaces tab and then click on the Create button. The GNE Service Interface (Create) form opens with the general tab displayed.

ii Configure the parameters:

- Name
- Description
- Type

iii Click on the Ports tab and then click on the Select button beside the Interface Index field. The Select Generic NE Interface form opens.

iv Choose an interface and click on the OK button. The GNE Service Interface (Create) form reappears with the interface information displayed.

v Configure the parameters:

- Encapsulation Type
- Outer Encapsulation Value
- Inner Encapsulation Value

vi Click on the OK button. The GNE Site (Create) form reappears with the interface information displayed in the service component tree.

9 Click on the Scripts tab to attach or execute configuration scripts on the GNE site.

The Scripts tab displays the script instances and versions that are applied to the device. See “Script management” in the *5620 SAM Scripts and Templates Developer Guide* for more information.

10 Click on the OK button. The VPRN Service (Edit) form reappears with the new information displayed in the service component tree.

11 Click on the OK button. The VPRN Service (Edit) form closes.

You can use the topology maps to view the service. See chapter 6 for more information about service topology maps.

Procedure 71-50 To configure OSPFv2, OSPFv3, PIM, RIP, L2TP, or MLD on a VPRN routing instance

Note 1 — To configure BGP on a VPRN routing instance, see Procedure 71-51.

Note 2 — To configure IGMP on a VPRN routing instance, see Procedure 71-52.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service.

4 Click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

5 On the navigation tree, click on the site to which you need to add the routing instance; expand the entries for that site.

6 Expand the Routing Instance - NE System ID icon.

7 Expand the Routing Instance icon.

8 Right-click on the Protocols icon and perform one of the following from the contextual menu:

   a Choose Create OSPF Site to configure OSPFv2 on the VPRN routing instance, and perform steps 4 to 18 of Procedure 23-30.

   b Choose Create OSPF Site to configure OSPFv3 on the VPRN routing instance, and perform steps 4 to 10 and steps 12 to 18 in Procedure 23-30.

   c Choose Create PIM Site to configure PIM on the VPRN routing instance, and perform steps 9 to 83 in Procedure 23-41.

   d Choose Create RIP Site to configure RIP on the VPRN routing instance, and perform steps 4 to 15 in Procedure 23-9.

   e Choose Create L2TP Site to configure L2TP on the VPRN routing instance, and perform steps 3 to 14 in Procedure 23-34.

   f Choose Create MLD Site to configure MLD on the VPRN routing instance, and perform steps 2 to 6 in Procedure 23-59.

Note — You must ensure that the VPRN routing instance has an associated L3 access interface, and that the IPv6 Allowed parameter on the interface is enabled. You must add an IPv6 address to the L3 access interface. See Procedures 71-22 and 71-34.

9 Click on the OK button. The protocol configuration form closes, and a dialog box appears.

10 Click on the OK button. The VPRN Service (Edit) form reappears.

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button to confirm the action. The VPRN Service (Edit) form closes.

13 Close the Manage Services form.

Procedure 71-51 To configure BGP on a VPRN routing instance

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service.

4 Click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

5 Expand the Routing Instance icon in the navigation tree.

6 Right-click on the site on which you need to configure BGP and choose Properties from the contextual menu.

7 Click on the Routing tab. The Protocols tab is displayed.

8 Enable the BGP Enabled parameter on the Protocols tab. A list of BGP routing instances appears.

9 Choose a routing instance and click on the Properties button. The BGP Site, Routing Instance (Create) form opens with the General tab displayed.

10 Configure the parameters:

- Description
- Router ID
- Administrative State
- Cluster ID

11 Assign a TCP key chain, if required.

Note — You can assign a TCP key chain to a BGP site, group, or peer on a 7950 XRS, 7750 SR, or on a 7450 ESS in mixed mode.

i Click on the Select button in the KeyChain panel. The Select BGP Site Keychain - BGP form opens.

ii Choose a key chain in the list and click on the OK button. The Select BGP Site Keychain - BGP form closes. The 5620 SAM assigns the key chain to the BGP instance.

12 Configure the parameters in the Graceful Restart panel:

- Graceful Restart
- Stale Routes Time (seconds)
- Enable Notification

The graceful restart parameters are configurable when you enable the Graceful Restart parameter.

13 Configure the parameters in the MED panel:

- MED Source
- MED Value

These parameters are used to find a way to leave the AS when there are multiple methods of leaving the AS.

14 Configure the parameters in the MultiPath panel:

- Multi Path
- IBGP MultiPath

Set the Multi Path parameter to 1 to disable. When set from 2 to 16, multipath is enabled and BGP load shares traffic across the number of links specified. If the equal cost routes available are greater than the configured value, then routes with the lowest next hop IP address are chosen.

15 Configure the EIBGP Load Balance parameter in the EIBGP LoadBalance panel.

16 Configure the Backup Path parameter in the Backup Path panel.

17 Configure the parameters in the Best Path Selection panel:

- Ignore Next Hop Metric
- Ignore Router Id
- MED Compare
- Deterministic MED
- Strict

When you set the MED Compare parameter to off, the Strict parameter is set to true and is not configurable. When you set the MED Compare parameter to on, the Strict parameter is set to false and is not configurable.

18 Click on the Behavior tab.

19 Configure the parameters:

- Preference
- Local Preference
- Multi Hop
- Loop Detect
- Aggregator ID Zero
- Damping
- Disable Client Reflect
- Min. Route Advertisement
- Disable Standard Communities
- Disable Extended Communities
- Disable Fast External Failover
- Advertise Inactive Routes
- Enable Rapid Withdrawal
- Enable Peer Tracking
- BFD Enabled
- FlowSpec Validate Enabled
- Connect Retry Time (seconds)
- Keep Alive (seconds)
- Transport Tunnel
- Path MTU Discovery Enabled
- Split Horizon

20 Configure the Policy parameter in the Next-Hop Resolution panel.

21 Configure the parameters in the Hold Time panel:

- Hold Time (seconds)
- Minimum Hold Time (seconds)

22 Configure the Fault Tolerance parameter in the Error Handling panel. The Fault Tolerance parameter allows BGP routers to be more tolerant of some Update message errors, use less disruptive error recovery mechanisms, and provide better operational and diagnostics information.

23 Configure the parameters in the Damp Peer Oscillations panel:

- Enable Damp Peer Oscillation
- Initial Wait Time (minutes)
- Second Wait Time (minutes)
- Maximum Wait Time (minutes)
- Error Interval (minutes)

24 Click on the AS Properties tab.

25 Configure the parameters:

- Min AS Origination (seconds)
- Disable 4Byte ASN

26 Configure the parameters in the Local AS panel:

- Local AS
- Private
- No Prepend Global AS

The No Prepend Global AS is configurable only if you set the Local AS parameter to a value other than 0.

The Local AS parameters are used to configure a virtual AS. A virtual AS is used when a router (RTA) is moved from one AS (AS1) to another AS (AS2). However, the customer router (CR1) is configured to belong to the AS1. To avoid reconfiguring CR1 to belong to AS2, CR1 can continue to belong to AS1, but RTA has its local AS value set to AS1. RTA can advertise AS1 for routes advertised to CR1.

27 Configure the parameters in the Remove Private AS panel:

- Remove Private AS
- Limited

28 Click on the VPN tab.

29 Configure the parameters:

- Family
- Apply Import Route Policies
- Apply Export Route Policies

Note 1 — The Apply Import Route Policies and Apply Export Route Policies parameters are not supported on a VPRN BGP instance.

Note 2 — The Apply Import Route Policies and Apply Export Route Policies parameters specify whether to apply the existing import and export route policies configured on the Import Policies and Export Policies tabs.

30 Add a group, if required.

i Click on the Group tab.

ii Click on the Create button. The Peer Group (Create) form opens with the General tab displayed.

iii Perform steps 4 to 31 of Procedure 23-4.

31 Add a peer, if required.

i Click on the Peer tab.

ii Click on the Create button. The Peer (Create) form opens.

iii Perform steps 4 to 31 of Procedure 23-5.

32 Click on the Import Policies tab.

33 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Policy 6
- Policy 7
- Policy 8
- Policy 9
- Policy 10
- Policy 11
- Policy 12
- Policy 13
- Policy 14
- Policy 15

Configure the import route policies to determine which routes are accepted from peers. These policies should match the policies you configure using the Routing Policy Manager, as described in chapter 22. The router does not validate to ensure that the policies match.

34 Click on the Export Policies tab.

35 Configure the parameters:

- Policy 1
- Policy 2
- Policy 3
- Policy 4
- Policy 5
- Policy 6
- Policy 7
- Policy 8
- Policy 9
- Policy 10
- Policy 11
- Policy 12
- Policy 13
- Policy 14
- Policy 15

Configure the export route policies to determine which routes are advertised to peers. These policies should match the policies you configure using the Routing Policy Manager, as described in chapter 22. The router does not validate to ensure that the policies match.

36 Click on the Authentication tab.

37 Configure the parameters:

- Type
- Key

38 Click on the OK button. A dialog box appears.

39 Click on the Yes button. The VPRN Site (Edit) form reappears.

40 Click on the OK button. A dialog box appears.

41 Click on the Yes button. The VPRN Service (Edit) form closes.

42 Close the Manage Services form.

Procedure 71-52 To configure IGMP on a VPRN routing instance

Note — PIM-SSM for IPv6 is currently not supported in VPRN services.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service.

4 Click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

5 On the navigation tree, click on the site to which you need to add the routing instance; expand the entries for that site.

6 Expand the Routing Instance icon.

7 Right-click on the Protocols icon and choose Create IGMP Site from the contextual menu. The IGMP Site (Edit) form opens with the General tab displayed.

8 Configure the parameters:

- Administrative State
- Query Interval (seconds)
- Last Member Query Interval (seconds)
- Query Response Interval (seconds)
- Robust Count
- Group Interface Query Source IP

9 Click on the SSM Translation tab to configure SSM, if required.

i Click on the Create button to create a new entry. The SSM Translation (Create) form opens.

ii Configure the parameters:

- Start Mcast Address
- End Mcast Address
- Configured Source

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The new SSM entry appears on the form.

10 Click on the Interfaces tab to add an interface, if required.

i Click on the Create button.

ii Perform steps 4 to 14 of Procedure 23-48.

iii Click on the OK button. The new interface entry appears on the form.

11 Click on the Group Interfaces tab to identify an IGMP group interface for a VPRN service, if required.

i Click on the Create button. The IGMP Group Interface - Routing Instance (Create) form opens with the General tab displayed.

ii Configure the parameters:

- Description
- Query Source IP
- Administrative State
- Administrative Version
- Forwarding Service ID

iii Click on the Select button beside the Interface ID field in the IGMP Group Interface panel to choose an IGMP group interface.

iv Choose an IGMP group interface and click on the OK button. The Select IGMP Group Interface form closes and the IGMP Group Interface - Routing Instance (Create) form reappears.

v Configure the parameters:

- Maximum Number of Groups
- Maximum Number of Sources
- Maximum Number of Group Sources

vi Click on the Multicast CAC tab, if required. The General tab is displayed.

vii Click on the Select button in the Multicast CAC Policy panel. The Select Multicast CAC Policy - IGMP Interface Group form opens.

viii Choose a multicast CAC policy and click on the OK button. The Select Multicast CAC Policy - IGMP Group Interface form closes and the IGMP Interface, Routing Instance (Create) form opens.

ix Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)
- Constraint Admin State

x Click on the OK button to close the IGMP Group Interface - Routing Instance (Create) form. The Group Interfaces tab reappears.

12 Click on the following tabs to view and edit information.

- Multicast Group/Source
- Statistics
- Faults

13 Click on the OK button. The protocol configuration form closes, and a dialog box appears.

14 Click on the OK button. The VPRN Service (Edit) form reappears.

15 Click on the OK button. A dialog box appears.

16 Click on the Yes button to confirm the action. The VPRN Service (Edit) form closes.

17 Close the Manage Services form.

Procedure 71-53 To add a Global Route Table to a VPRN site

Packets within a VRF are able to perform a parallel lookup against a Global Route Table (GRT), as well as within the local VRF. A successful routing table match found in the local VRF is typically preferred over any match found in the GRT. However, a static route can be used to allow for specific prefixes covered by the static route to fail the lookup in the local VRF table, thus resulting in the guaranteed use of a route from the GRT.

The GRT is populated by defining export policies for each participating VPRN service, and the maximum number of routes that are exported from a specific VRF can be limited.

Note — The addition of a GRT to a VPRN service is supported on the 7450 ESS in mixed mode, 7710 SR, and 7750 SR.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose the required VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you need to add the GRT; expand the entries for that site.

5 Right-click on the routing instance to which you need to add the GRT and select Properties. The VPRN Site (Edit) form opens with the General tab displayed.

6 Click on the Routing tab. The General tab is displayed.

7 Configure the Enable GRT Lookup parameter.

8 Click on the GRT Export Policies .

9 Configure the parameters:

- Max Number of Exported Routes
- Max Number of IPv6 Exported Routes

10 Specify up to five export policies by using the Select button to choose policies from the filtered list and then clicking on the OK button.

11 Click on the OK button. A dialog box appears.

12 Click on the OK button. The VPRN Site (Edit) form closes and a dialog box appears.

13 Click on the OK button. The VPRN Service (Edit) form closes.

14 Close the Manage Services form.

Procedure 71-54 To add a PIM interface to a VPRN

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service.

4 Click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

5 On the navigation tree, click on the site to which you need to add the PIM; expand the entries for that site.

6 Expand the Routing Instance icon.

7 Expand the Protocols icon.

8 Right-click on a PIM instance in the service navigation tree and choose Create PIM Interface. The PIM Interface, Routing Instance (Create) form opens.

9 Assign an L3 access interface to the PIM interface by clicking on the Select button in the Interface panel. The Select Interface - PIM Interface form opens.

10 Configure the filter criteria. A list of available L3 access interfaces appears at the bottom of the Select Interface - PIM Interface form.

11 Choose an interface and click on the OK button. The Select Interface - PIM Interface form closes and the PIM Interface, Routing Instance (Create) form refreshes with the L3 access interface information.

12 Configure the parameters:

- Description
- Administrative State
- BFD Enabled

13 Click on the Behavior tab.

14 Configure the parameters:

- Hello Interval (seconds)
- Tracking Support
- BSM Check Router Alert
- Improved assert
- Max Groups
- Three Way Hello
- Multicast Senders
- Hello Multiplier
- Assert Period
- DR Priority
- Sticky DR
- Sticky DR Priority
- P2MP to LDP Tree Join Enabled

The Sticky DR Priority parameter is configurable when the Sticky DR parameter is enabled.

15 Click on the Multicast CAC tab to add a multicast CAC policy, if required. The General tab is displayed.

16 Click on the Select button in the Multicast CAC Policy panel to choose a multicast CAC policy. The Select Multicast CAC Policy - PIM Interface form opens.

17 Choose a multicast CAC policy and click on the OK button. The Select Multicast CAC Policy - PIM Interface form closes and the PIM Interface, Routing Instance (Create) form refreshes with the multicast CAC policy information.

18 Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)
- Constraint Admin State

19 Click on the OK button. A dialog box appears.

20 Click on the OK button.

21 Click on the OK button to close the VPRN Service (Edit) form. A dialog box appears.

22 Click on the Yes button to confirm the action. The VPRN Service (Edit) form closes.

23 Click on the Close button to close the Manage Services form.

Procedure 71-55 To add an IGMP interface to a VPRN

Note — IGMP must be enabled at the routing instance level before you can create an IGMP interface.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you need to add the IGMP interface; expand the entries for that site.

5 Right-click on an IGMP instance and choose Create IGMP Interface. The IGMP interface, Routing Instance (Create) form opens with the General tab displayed.

6 Assign an L3 access interface to the PIM interface by clicking on the Select button in the Interface panel. The Select Interface - PIM Interface form opens.

7 Configure the filter criteria. A list of available L3 access interfaces appears at the bottom of the Select Interface - PIM Interface form.

8 Choose an interface and click on the OK button. The Select Interface - PIM Interface form closes and the PIM Interface, Routing Instance (Create) form refreshes with the L3 access interface information.

9 Configure the parameters:

- Description
- Administrative State
- Administrative Version

10 Click on the Behavior tab.

11 Configure the parameters:

- Import Policy
- Maximum Number of Groups
- Maximum Number of Sources
- Maximum Number of Group Sources
- Subnet Check
- Disable Router Alert Check
- Sub Hosts Only

12 Click on the Multicast CAC tab to add a multicast CAC policy, if required.

13 Click on the Select button in the Multicast CAC Policy panel to choose a multicast CAC policy. The Select Multicast CAC Policy - IGMP Interface form opens.

14 Choose a multicast CAC policy and click on the OK button. The Select Multicast CAC Policy - IGMP Interface form closes and the IGMP Interface, Routing Instance (Create) form refreshes with the multicast CAC policy information.

15 Configure the parameters:

- Unconstrained Bandwidth (kbps)
- Mandatory Bandwidth (kbps)
- Constraint Admin State

16 Click on the Static Group/Source tab to add a static multicast group or source, if required.

17 Click on the Create button to add a new entry. The StaticGrpSrc, Routing Instance (Create) form opens.

18 Configure the parameters:

- Static Multicast Group
- Static Source

19 Click on the OK button. The StaticGrpSrc, Routing Instance (Create) form closes and a dialog box appears.

20 Click on the OK button to confirm the action.

21 Click on the OK button to close the IGMP Interface, Routing Instance (Create) form. A dialogue box opens.

22 Click on the OK button to confirm the action. The VPRN Service (Edit) form reappears.

23 Click on the OK button to close the VPRN Service (Edit) form. A dialog box appears.

24 Click on the Yes button to confirm the action. The VPRN Service (Edit) form closes and the Manage Services form reappears.

25 Close the Manage Services form.

Procedure 71-56 To create a VPRN spoke SDP binding

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN and click on the Properties button. The VPRN Service (Edit) form opens.

4 On the navigation tree, click on the site to which you need to add the spoke SDP binding; expand the entries for that site.

5 Right-click on Spoke SDP Bindings and choose Create Spoke SDP Binding from the contextual menu. The Spoke SDP Binding (Create) form opens with the General tab displayed.

6 Specify a source interface for the SDP binding:

i Click on the Select button in the Source Interface panel. The Select Source Interface - Spoke SDP Binding form opens.

ii Configure the filter criteria. A list of interfaces appears at the bottom of the form.

iii Choose an interface and click on the OK button. The Select Source Interface - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the source interface information.

After you choose the interface, other tabs are also displayed on the form.

7 Configure the parameters:

- VC ID
- Auto-Assign ID
- VC Type
- Enable Ingress FlowSpec IPv4
- Enable Ingress FlowSpec IPv6

These parameters appear only when a source interface is assigned to the spoke SDP binding.

8 Configure the parameters in the Hash Label panel:

- Enable Hash Label
- Enable Signal Capability

The Enable Hash Label and Enable Signal Capability parameters can only be configured for spoke-SDP bindings that are access interface terminated.

9 Specify a destination node for the spoke SDP binding:

a If the destination node is a managed NE:

i Click on the Select button beside the Tunnel Termination Site parameter. The Select Destination Network Element - Spoke SDP Binding form opens.

ii Choose a destination node and click on the OK button. The Select Destination Network Element - Spoke SDP Binding form closes and the Spoke SDP Binding form refreshes with the tunnel termination site (the destination node) identifier displayed.

b If the destination node is an unmanaged NE, specify its system ID in the Tunnel Termination Site parameter.

10 Configure the Description parameter.

11 Perform one of the following to specify a transport tunnel for the spoke SDP binding:

a For the 5620 SAM to configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure the Profile Name or the Tunnel Auto-Selection Transport Preference parameter.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Spoke SDP Binding form opens.

ii Choose a service tunnel for the spoke SDP binding and click on the OK button. The Select Tunnel - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the service tunnel identifier.

c Configure an MPLS-TP transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Spoke SDP Binding form opens.

ii Select an MPLS-TP service tunnel for the spoke SDP binding and click on the OK button. The Select Tunnel - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the service tunnel identifier. See Procedure 27-1 for more information about how to create an MPLS-TP service tunnel.

12 Specify an application profile for the spoke SDP binding.

i Click on the Select button beside the Application Profile parameter. The Application Profile String: - Spoke SDP Binding form opens.

ii Configure the filter criteria. A list of application profiles appears.

iii Choose an application profile and click on the OK button. The Application Profile String: - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form opens.

Note — The Application Profile String: - Spoke SDP Binding - VPRN service form displays only local profiles on the NE.

13 Choose one of the following AA transit policy types, if required.

Note 1 — You can only associate one AA transit policy type with a service object.

Note 2 — You can bind a transit policy to only one L3 access interface or spoke SDP binding per node.

Note 3 — The transit policy and the application profile must belong to the same application assurance group or partition.

a Associate an AA transit IP policy with the service object:

i Click on the Select button in the Transit IP Policy panel. The Select Transit IP Policy form opens.

ii Choose a transit IP policy and click on the OK button.

b Associate an AA transit prefix policy with the service object:

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.

ii Choose a transit IP policy and click on the OK button.

14 To configure custom object attributes for AA reporting to the 5670 RAM, perform the following steps:

i Click on the 5670 RAM Parameters tab.

ii Click on the Reporting tab.

iii Click on the Create button. The AA Reporting (Create) form opens.

iv Configure the parameters:

- Customer Name
- Subscriber Class
- Total Bandwidth Upstream (Kbps)
- Class of Service 1 Bandwidth Upstream (Kbps)
- Class of Service 2 Bandwidth Upstream (Kbps)
- Class of Service 3 Bandwidth Upstream (Kbps)
- Class of Service 4 Bandwidth Upstream (Kbps)
- Subscriber Name
- Subscriber Type
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)

v Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.

vi Click on the General tab.

15 Perform one of the following to specify a transport tunnel for the Return SDP binding, if required.

Note — You can create a return tunnel only between sites that are within the same service. If the sites are not in the same service, the Return tab does not appear.

a Let the 5620 SAM configure the transport tunnel automatically.

i Click on the Return tab.

ii Enable the Auto Select Return Transport Tunnel parameter.

iii Configure the Profile Name or the Return Tunnel Auto-Selection Transport Preference parameter.

b Configure the transport tunnel manually.

i Click on the Return tab.

ii Click on the Select button in the Return Tunnel panel. The Select Return Tunnel - Spoke SDP Binding form opens.

iii Choose a service tunnel for the spoke SDP binding and click on the OK button. The Select Return Tunnel - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the service Tunnel ID, Name, and Underlying Transport displayed in the Tunnel panel.

16 Associate a MEP to the spoke SDP binding, if required.

i Click on the MEPs tab.

ii Click on the Create button. The MEP (Create) form opens with the General tab displayed.

iii Click on the Select button to choose a MEG. The Select Maintenance Entity Group form opens.

iv Choose an entry and click on the OK button. The Select Maintenance Entity Group form closes.

v Configure the parameters:

- Auto-Assign ID
- ID
- Direction
- Administrative State
- CCM Messages Enabled
- Priority Level for CCM Messages
- Low-priority Defect
- MAC Address
- Fault Propagation
- Fault Alarm Time (centiseconds)
- Fault Reset Time (centiseconds)
- CCM Padding Packet Size (Bytes)

Note — The CCM Padding Packet Size (Bytes) parameter cannot be configured when the CCM interval parameter is set to 10 ms or 100 ms.

17 If the MD for the MEP has a Name Type of none and the associated MEG has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable; click on the Y.1731 Tests tab. Otherwise, go to step 21.

18 Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

19 Click on the AIS tab.

20 Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

21 Click on the OK button. A dialog box appears.

22 Click on the OK button. The MEP (Create) form closes.

23 Click on the OK button. The Spoke SDP Binding (Create) form closes and a dialog box appears.

24 Click on the OK button.

Procedure 71-57 To create an L2 SDP spoke termination on a VPRN service

Ensure that a service and site have been created in the VPRN. To terminate an L2 service on a VPRN SDP spoke, you must identify the VC and an interface belonging to the VC. The interface must not have an associated port.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN and click on the Properties button. The VPRN Service (Edit) form opens.

4 On the navigation tree, click on the site to which you need to create an L2 SDP spoke termination; expand the entries for that site.

5 Right-click on Spoke SDP Bindings and choose Create Spoke SDP Binding. The Spoke SDP Binding (Create) form opens with the General tab displayed.

6 Click on the Select button in the Source Interface panel to select an interface with no port assigned.

If you are creating this spoke SDP binding for use with an IP mirror interface, select the required IP mirror interface as the source interface.

7 Click on the OK button. The Select Interface - Spoke SDP Bindings form closes and the Spoke SDP Bindings (Create) form reappears with the interface information displayed.

8 Specify a destination node for the spoke SDP binding by performing one of the following tasks.

a If the destination node is a managed node, choose of managed nodes.

i Click on the Select button in the Tunnel Termination Site panel. The Select Destination Network Element - Spoke SDP Binding form opens.

ii Choose a destination node and click on the OK button. The Select Destination Network Element - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form refreshes with the tunnel termination site (the destination node) identifier displayed.

b If the destination node is an unmanaged node, specify the system ID for the Tunnel Termination Site parameter.

c If you are configuring IP mirroring, select a mirror source site as the tunnel termination site.

9 Configure the parameters:

- VC ID
- Auto-Assign ID
- VC Type
- Enable Ingress FlowSpec IPv4
- Enable Ingress FlowSpec IPv6

These parameters appear only when a source interface is assigned to the spoke SDP binding.

10 Configure the parameters in the Hash Label panel:

- Enable Hash Label
- Enable Signal Capability

The Enable Hash Label and Enable Signal Capability parameters can only be configured for spoke-SDP bindings that are access interface terminated.

11 Perform one of the following to specify a transport tunnel for the spoke SDP binding.

a Let the 5620 SAM configure the transport tunnel automatically.

i Enable the Auto-Select Transport Tunnel parameter.

ii Configure the Profile Name or the Tunnel Auto-Selection Transport Preference parameter.

b Configure the transport tunnel manually.

i Click on the Select button in the Tunnel panel. The Select Tunnel - Spoke SDP Binding form opens.

ii Choose a service tunnel for the spoke SDP binding and click on the OK button. The Select Tunnel - Spoke SDP Binding form closes, and the Spoke SDP Binding (Create) form refreshes with the service tunnel identifier.

12 Choose an Application Profile for the spoke SDP binding.

i Click on the Select button beside the Application Profile parameter. The Application Profile String: - Spoke SDP Binding form opens.

ii Configure the filter criteria. A list of Application Profiles appears.

iii Choose an application profile and click on the OK button. The Application Profile String: - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form opens.

Note — The Application Profile String: - Spoke SDP Binding - VPRN service form displays only local profiles on the NE.

13 Choose one of the following AA transit policy types, if required.

Note 1 — You can only associate one AA transit policy type with a service object.

Note 2 — You can bind a transit policy to only one L3 access interface or spoke SDP binding per node.

Note 3 — The transit policy and the application profile must belong to the same application assurance group or partition.

a Associate an AA transit IP policy with the service object:

i Click on the Select button in the Transit IP Policy panel. The Select Transit IP Policy form opens.

ii Choose a transit IP policy and click on the OK button.

b Associate an AA transit prefix policy with the service object:

i Click on the Select button in the Transit Prefix Policy panel. The Select Transit Prefix Policy form opens.

ii Choose a transit IP policy and click on the OK button.

14 Click on the QoS tab.

15 Configure the required parameters in the Forwarding Plane Redirect panel:

i Click on the Network Policy Select button to assign a policy to the Spoke SDP Binding. The Select Network Policy form opens.

ii Choose a policy and click on the OK button. The Network Policy form closes and the Spoke SDP Binding (Create) form refreshes with the Network Policy information displayed.

iii Click on the Ingress Queue Group Template Policy Select button to assign a policy to the Spoke SDP Binding. The Select Ingress Queue Group Template Policy form opens.

iv Choose a policy and click on the OK button. The Ingress Queue Group Template Policy form closes and the Spoke SDP Binding (Create) form refreshes with the Ingress Queue Group Template Policy information displayed.

v Configure the Instance ID parameter.

16 Configure the required parameters in the Port Redirect panel:

i Click on the Network Policy Select button to assign a policy to the Spoke SDP Binding. The Select Network Policy form opens.

ii Choose a policy and click on the OK button. The Network Policy form closes and the Spoke SDP Binding (Create) form refreshes with the Network Policy information displayed.

iii Click on the Egress Queue Group Template Policy Select button to assign a policy to the Spoke SDP Binding. The Select Egress Queue Group Template Policy form opens.

iv Choose a policy and click on the OK button. The Egress Queue Group Template Policy form closes and the Spoke SDP Binding (Create) form refreshes with the Egress Queue Group Template Policy information displayed.

v Configure the Instance ID parameter.

17 Click on the States tab.

18 Configure the Administrative State parameter.

19 Assign ingress and egress ACL filters to the spoke SDP binding, if required.

i Click on the ACL tab.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter. The Select Ingress Filter - Spoke SDP Binding form opens.

iii Choose an ingress ACL filter. If you are configuring IP mirroring, you can optionally select an ingress IP filter. This is a packet mirroring option which specifies that packets matching the IP filter are mirrored to the mirror destination. Click on the OK button. The Select Ingress Filter - Spoke SDP Binding form closes and the Spoke SDP Binding (Create) form reappears with the ingress ACL filter information displayed.

iv Click on the Select button in the Egress Filter panel to choose an egress ACL filter. The Select Egress Filter - Spoke SDP Binding form opens.

v Choose an egress ACL filter and click on the OK button. The Select Egress Filter - Spoke SDP Binding form closes and the L3 Access Interface (Edit) form reappears with the egress ACL filter information displayed.

20 If you are configuring IP mirroring, go to step 22.

21 Assign an accounting policy to the spoke SDP binding, if required.

i Click on the Accounting tab.

ii Configure the Collect Accounting Statistics parameter.

iii Click on the Select button to choose an accounting policy. The Select Accounting Policy - Spoke SDP Binding form opens.

iv Choose an accounting policy and click on the OK button. The Select Accounting Policy - Spoke SDP Binding form closes and the L3 Access Interface (Edit) form reappears with the accounting policy information displayed.

22 Click on the OK button. The Spoke SDP Binding (Create) form closes and a dialog box appears.

23 Click on the OK button. The VPRN Service (Edit) form reappears with the new information displayed in the service navigation tree.

Procedure 71-58 To configure an MPLS-TP static pseudowire on a VPRN spoke SDP binding

Perform this procedure to create an MPLS-TP static pseudowire on the spoke SDP binding. An MPLS-TP service tunnel must be used in the SDP binding, and the Control Word parameter for pseudowire OAM must be set to Preferred. See Procedure 71-57.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Select a VPRN and click on the Properties button. The VPRN Service (Edit) form opens.

4 On the navigation tree, expand the site on which you want to configure the spoke SDP binding, and expand the Spoke SDP Bindings icon.

5 Click on the SDP binding on which you want to configure the MPLS-TP static pseudowire. The Spoke SDP Binding (Edit) form opens with the General tab displayed.

6 Click on the Control Channel tab.

7 Configure the parameters:

- Status
- Refresh Timer (seconds)
- Request Timer (seconds)

8 Click on the MPLS-TP PW tab.

9 Click on the Create button. The PW Path ID (Create) form opens.

10 Configure the Path AGI parameter.

11 Configure the parameters in the Source Attachment Individual Identifier panel:

- SAII Global ID
- SAII Node ID
- SAII AC ID

12 Configure the parameters in the Target Attachment Individual Identifier panel:

- TAII Global ID
- TAII Node ID
- TAII AC ID

13 Click on the OK button. The PW Path ID (Create) form closes.

14 Click on the OK button. The Spoke SDP Binding (Edit) form closes.

15 Close the VPRN Service (Edit) form.

16 Close the Manage Services form.

Procedure 71-59 To configure a subscriber interface on a VPRN

The 7450 ESS in mixed mode, 7710 SR and 7750 SR support the configuration of a subscriber interface in a VPRN.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Choose a VPRN and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, navigate to the Subscriber Interfaces object. Perform one of the following:

a To create a subscriber interface, right-click on the Subscriber Interfaces object and choose Create VPRN Subscriber Interface from the menu. The VPRN Subscriber Interface (Create) form opens.

b To modify a subscriber interface, right-click on the subscriber interface object and choose Properties from the menu. The VPRN Subscriber Interface (Edit) form opens.

5 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- Default Primary DNS Server Address
- Default Secondary DNS Server Address
- Allow Unmatched Subnets
- Tunnel Fault Notification

The Tunnel Fault Notification parameter is configurable on interfaces where the device has ports configured in access or hybrid mode with QinQ encapsulation.

If you are configuring a tunnel facility MEP, Tunnel Fault Notification must be set to Accept, in order to receive the fault notification from the tunnel facility MEP.

Note 1 — The Name value for a subscriber interface must be unique in the context on the VPRN Service Site. That is, there cannot be another L3 access interface, subscriber interface, or group interface with the same name on the same VPRN site.

Note 2 — You must configure the Default Primary DNS Server Address parameter before you can configure the Default Secondary DNS Server Address parameter.

6 Configure IPv6 forwarding on the subscriber interface, if required.

i Configure the IPv6 Allowed parameter.

ii Configure the parameters.

- Admin Link Local Address
- IPv6 Delegated Prefix Length
- IPv6 Allow Unmatching Prefixes
- Default Primary IPv6 DNS Server Address
- Default Secondary IPv6 DNS Server Address

You must remove the check mark from the Default check box to access the Default Primary IPv6 DNS Server Address and Default Secondary IPv6 DNS Server Address parameters.

iii Click on the IPv6 Subscriber Prefixes tab.

iv Choose a subscriber prefix and click on the Properties button, or click on the Create button to create a new subscriber prefix.

v In the Subscriber Prefix [Edit|Create] form, configure the parameters:

- Address ID
- IP Address
- Prefix Length
- WAN Host
- Prefix Delegation

7 Configure the Interface Class parameters, if required.

i Configure the Class parameter.

ii If you selected a value of Unnumbered for the Class parameter, configure the Unnumbered Type parameter.

iii Configure the Interface Name parameter or the IP Address parameter.

8 Configure the DHCP Server Synchronization parameters, if required:

- Delayed Up Period
- Delay on Init Only

9 Perform one of the following:

a Create a subscriber interface for a wholesale and retail VPRN.

When you configure the routing instance for the VPRN, you can set the Type parameter to Subscriber Split Horizon to enable the forwarding service and forwarding subscriber information. The subscriber split horizon VPRN controls the flow of traffic for wholesale subscriber applications. See Procedure 71-1 for more information on how to configure this parameter.

Note — You cannot create a group interface under a forwarding subscriber interface.

Go to step 10.

b Create a subscriber interface for a traditional VPRN. Go to step 12.

10 Assign a forwarding service to the subscriber interface if you are configuring a wholesale and retail configuration for the VPRN.

i Click on the Select button in the Forwarding Service panel to choose a service. The Select Forwarding Service - VPRN Subscriber Interface form opens.

ii Choose a service and click on the OK button. The Select Forwarding Service - VPRN Subscriber Interface form closes, and the VPRN Subscriber Interface (Create) form reappears with the service information displayed.

iii Configure the Private Retail Subnet parameter that appears after you have assigned a forwarding service.

11 Assign a forwarding subscriber interface to the VPRN subscriber interface.

i Click on the Select button in the Forwarding Subscriber Interface panel to choose a subscriber. The Select Forwarding Subscriber Interface - VPRN Subscriber Interface form opens.

ii Choose a subscriber and click on the OK button. The Select Forwarding Subscriber Interface - VPRN Subscriber Interface form closes, and the VPRN Subscriber Interface (Create) form reappears with the subscriber information displayed.

12 Create IP addresses for the subscriber interface that are inherited by the SAPs in the group interfaces that are child objects of the subscriber interface.

i Click on the Addresses tab.

ii Click on the Create button. The IP Address (Create) form opens.

iii Configure the parameters:

- Address ID
- IP Address
- Prefix Length
- Populate Host Routes
- Track SRRP Instance
- Hold Up Time (milliseconds)
- Gateway IP Address
- Broadcast Address Format

iv Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

v Click on the OK button. The Subscriber Interface (Create) form reappears with the assigned IP addresses displayed.

vi Repeat steps ii to v for each additional IP address that you need to create.

13 Configure IPv4 DHCP for the interface, if required.

i Click on the DHCP tab.

ii If you specified a forwarding service in step 10, the General tab is configurable. Configure the parameters that define the forwarding service information. Otherwise go to step vii.

- Enable DHCP Relay
- Description
- Lease Populate

iii If you specified a forwarding service in step 10 and depending on the type and release of the device that you are configuring, the Subscriber Authentication Policy panel is present. Choose a Subscriber Authentication policy, if required. Otherwise, go to step vii.

iv Click on the Select button in the Subscriber Authentication Policy panel to choose a subscriber authentication policy. The Select Subscriber Authentication Policy - SubItfDhcpRelayCfg form opens.

v Configure the filter criteria. A list of available policies appears.

vi Choose a policy and click on the OK button. The Select Subscriber Authentication Policy - SubItfDhcpRelayCfg form closes, and the VPRN Subscriber Interface (Create) form refreshes with the subscriber authentication policy name.

vii Configure the parameters:

- IP Address
- Use as source

viii Click on the Server tab.

ix Configure the parameters.

- Server 1 through Server 8
- Administrative State
- Emulated Server IP Address
- Lease Time
- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time Override

The Number of Days, Number of Hours, Number of Minutes, Number of Seconds, and Lease Time Override parameters are configurable only when the Lease Time parameter is set to Specified Time Period.

x Click on the Client Applications tab.

xi Configure the Client Applications parameter. You can enable either or both of the PPPoE or DHCP choices.

14 Configure PPPoE for the interface, if required.

Note — PPPoE is only configurable on a VPRN subscriber interface if the interface is a retailer interface.

i Click on the PPPoE tab.

ii Configure the parameters:

- Description
- Session Limit

15 Configure the ARP host for the interface, if required.

Note — The ARP host is only configurable on a VPRN subscriber interface when the interface is a retailer interface.

i Click on the ARP Host Configuration tab.

ii Configure the parameters:

- Administrative State
- ARP Host Limit

16 Click on the OK button. The VPRN Subscriber Interface (Create) form closes, and a dialog box appears.

17 Click on the OK button. The VPRN Service (Edit) form reappears with the new subscriber interface displayed in the service navigation tree.

18 Click on the OK button. A dialog box appears.

19 Click on the Yes button. The VPRN Service (Edit) form closes, and the Manage Services form reappears.

20 Close the Manage Services form.

Procedure 71-60 To configure a group interface on a VPRN

The 7450 ESS in mixed mode, 7710 SR and 7750 SR support the configuration of a group interface in a VPRN.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, navigate to the site and subscriber interface on which you need to configure a group interface. Perform one of the following:

a To create a group interface, right-click on the subscriber interface and choose Create VPRN Group Interface from the menu. The VPRN Group Interface (Create) form opens.

b To modify a group interface, right-click on the group interface object and choose Properties from the menu. The VPRN Group Interface (Edit) form opens.

5 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- MAC Address
- Trusted
- LNS
- Specific Type
- Enable WPP
- IPv6 Allowed
- IPv6 IPoE Bridged Mode Enabled
- QoS Route Lookup IPv4
- QoS Route Lookup IPv6
- Configured IP MTU

Note — The LNS parameter defines the type of group interface (regular or LNS). This parameter is set at creation time and cannot be modified. Regular group interfaces cannot configure LNS attributes and an LNS group interface does not allow PPPoE configuration or SAPs.

6 If you enabled the IPv6 Allowed parameter in step 5, configure IPv6 router advertisement and DHCPv6 on the group interface.

i Click on the IPv6 Advertisement tab and configure the parameters:

- Administrative State
- Current Hop Limit
- Managed Address Config
- Max Interval (seconds)
- Min Interval (seconds)
- Link MTU
- Other Stateful Config
- Reachable Time (milliseconds)
- Retransmit Time (milliseconds)
- Router Lifetime (seconds)
- Autonomous Address Configuration
- Preferred Life Time
- Lifetime (seconds)

ii Click on the DHCPv6 tab.

iii Click on the Select button and select a local user database from the Select Local User Database form.

iv Click on the Proxy Server tab and configure the parameters:

- Administrative State
- Renew Timer
- Rebind Timer
- Valid Life Time
- Preferred Life Time
- Client Applications
- Server ID Type
- ID Type
- Value

Note — The ID Type and Value parameters are configurable only if the Server ID Type parameter is set to Enterprise.

v Click on the Relay tab and configure the parameters:

- Administrative State
- Description
- Remote ID
- Client Applications
- Link Address

vi Configure the Server 1 through Server 8 parameters.

vii Configure the interface name for each DHCPv6 server by clicking on the Select button in the Zone Index panel. The Select Zone Index - GrplfDhcpv6RelayCfg form opens with a list of local L3 access interfaces.

viii Choose an interface and click on the OK button. The Select Zone Index - GrplfDhcpv6RelayCfg form closes and the VPRN Group Interface form refreshes with the interface name.

Note — If you have entered a Unicast address, then the Interface Name parameter is not required.

7 If you enabled the Enable WPP parameter in step 5, configure WPP on the group interface.

i Click on the WPP tab.

ii Configure the Administrative State parameter.

iii Click on the Select button in the WPP Site panel and choose a WPP site from the Select WPP Site form.

iv Configure the Portal Name parameter.

v Click on the Select button beside the Initial Subscriber Profile parameter and choose a subscriber profile from the Select Subscriber Profile form.

vi Click on the Select button beside the Initial SLA Profile parameter and choose an SLA profile from the Select SLA Profile form.

vii Click on the Select button beside the Initial Application Profile parameter and choose an application profile from the Select Application Profile form.

viii Configure the Restore Default Profile On Disconnection parameter.

8 Click on the Anti-Spoofing tab.

9 Configure the ARP Populate parameter.

10 Click on the Subscriber Management tab.

11 Configure the parameters:

- SHCV Enabled
- SHCV Interval (minutes)
- SHCV Source
- SHCV Action
- SHCV Retry Timeout (seconds)
- SHCV Retry Count
- SHCV Family

12 As required, configure ICMP for the group interface.

i Click on the ICMP tab.

ii Configure the parameters:

- Mask Reply
- Redirects
- Unreachables
- TTL Expired
- Number of Redirects
- Redirects Time (seconds)
- Number of Unreachables
- Unreachables Time (seconds)
- Number of TTL Expired
- TTL Expired Time (seconds)

13 As required, configure ARP for the group interface.

i Click on the ARP tab. The General tab is displayed.

ii Configure the Timeout (seconds) parameter.

iii Click on the Proxy ARP tab.

iv Configure the parameters:

- Remote Proxy ARP
- Enable Local Proxy ARP
- Proxy ARP Policy 1 through Proxy ARP Policy 5

14 As required, configure IPv4 DHCP relay for the group interface.

i Click on the DHCP tab. The DHCP form opens with the General tab displayed.

ii Configure the parameters:

- Enable DHCP Relay
- Description
- Match Circuit ID
- Trusted
- Lease Populate
- L2 Header
- Anti-Spoof MAC Address
- Action
- Circuit ID
- Remote ID
- Remote ID String
- Vendor Specific Options
- Vendor String
- IP address (GI address)
- Use as source
- Relay Unicast Message

When the Relay Unicast Message parameter is set to Renew or Release Update Source IP, the GI address parameter can be configured as any local configured address in the same routing instance as the GI address for the DHCP relayed messages. If the Relay Unicast Message parameter is set to None, the GI address is restricted to the IP address configured on the subscriber interface.

iii Depending on the type and release of device that you are configuring, the Subscriber Authentication Policy panel is present. Choose a Subscriber Authentication policy, if required. Otherwise, go to step xiii.

iv Click on the Select button in the Subscriber Authentication panel to choose a subscriber authentication policy. The Select Subscriber Authentication Policy - GrpItfDhcpRelayCfg form opens.

v Configure the filter criteria. A list of available policies appears.

vi Choose a policy and click on the OK button. The Select Subscriber Authentication Policy - GrpItfDhcpRelayCfg form closes, and the VPRN Group Interface (Create) form reappears with the policy name information displayed.

vii Click on the Select button in the Local User Database panel to choose a local user database. The Select localUserDbPointer - GrpItfDhcpRelayCfg form opens.

viii Configure the filter criteria. A list of available databases appears.

ix Choose a database and click on the OK button. The Select localUserDbPointer - GrpItfDhcpRelayCfg form closes, and the VPRN Group Interface (Create) form reappears with the database name information displayed.

x Click on the Select button in the DHCP Filter panel to choose a filter policy to bind with the group interface. The Select dhcpFilterPointer - GrpItfDhcpRelayCfg form opens.

xi Configure the filter criteria, and click on the Search button. A list of available filter policies appears.

xii Choose a filter policy and click on the OK button. The Select dhcpFilterPointer - GrpItfDhcpRelayCfg form closes, and the VPRN Group Interface (Create) form reappears with the filter policy information displayed.

xiii Click on the Server tab.

xiv Configure the parameters:

- Server 1 to Server 8
- Administrative State
- Emulated Server IP Address
- Lease Time
- Number of Days
- Number of Hours
- Number of Minutes
- Number of Seconds
- Lease Time Override

The Number of Days, Number of Hours, Number of Minutes, Number of Seconds, and Lease Time Override parameters are configurable only when the Lease Time parameter is set to Specified Time Period.

xv Click on the Client Applications tab and configure the Client Applications parameter.

15 Click on the Default Hosts tab to create a default host where the associated DHCP filter policy is configured with the Bypass Host creation action. See Procedure 44-7 for more information about DHCP filter creation. See step 14 x in this procedure for more information about how to bind a DHCP filter with the group interface.

i Click on the Create button. The Default Host (Create) form opens.

ii Click on the Select button in the Default Host Configuration panel to choose the Default Host IP Address parameter value for the DHCP filter policy to associate with the subscriber interface SAP. The Select Default Host Configuration form opens.

iii Configure the filter criteria, and click on the Search button. A list of available DHCP filter policies appears.

iv Choose a DHCP filter policy and click on the OK button. The Select Default Host Configuration form closes, and the Default Host (Create) form reappears with the IP address for the selected DHCP filter policy displayed.

v Configure the Next Hop IP Address parameter.

vi Click on the Apply button. The Default Host (Create) form closes and the default host is added to the Default Hosts list.

16 Configure PPP for the group interface, if required.

i Click on the PPP tab.

ii Configure the Description and Administrative State parameters in the PPPoE panel.

iii Click on the Select button beside the Policy field in the PPPoE panel and choose a PPPoE policy from the Select Policy form.

iv Click on the Select button beside the Local User DB field in the PPPoE panel and choose a PPPoE Local User DB from the The Select Local User DB form.

v Configure the remaining parameters in the PPPoE panel:

- Session Limit
- Session Limit per SAP
- Anti-Spoofing
- CCAG Use Original SAP
- Vendor Specific Option String

vi Configure the Description and Administrative State parameters in the PPP panel.

vii Click on the Select button beside the Policy field in the PPP panel and choose a PPP policy from the Select Policy form.

viii Click on the Select button beside the Local User DB field in the PPP panel and choose a PPP Local User DB from the The Select Local User DB form.

ix Configure the Session Limit parameter in the PPP panel

17 Configure IPoE linkage for the group interface, if required.

i Click on the IPoE Linkage tab.

ii Configure the parameters:

- Administrative State
- Sharing Circuit-ID
- Unsolicited Router Advertisements

18 Configure the ARP host for the group interface, if required.

i Click on the ARP Host Configuration tab.

ii Configure the parameters:

- Administrative State
- ARP Host Limit
- Minimum Authentication Interval (minutes)
- SAP ARP Host Limit

19 Configure local address assignment for the group interface, if required.

i Click on the Local Address Assignment tab.

ii Configure the parameters:

- Administrative State
- Default Pool Name
- Secondary Pool Name

iii On the IPv4 Options panel, configure the PPP-v4 parameter and select a local DHCP server, if required.

iv On the IPv6 Options panel, configure the IPoE WAN and PPP SLAAC parameters and select a local DHCPv6 server, if required.

20 If you set the LNS parameter to TRUE in step 5, configure LNS for the group interface.

Note — After you create an LNS group interface, you must configure the L2TP tunnel group profile or tunnel profile to terminate sessions for the LNS group interface that you just created; see Procedure 23-34. You can also configure the termination of sessions on a group interface using a RADIUS server.

i Click on the LNS tab.

ii Configure the Description parameter.

iii Click on the Select button in the Default Subscriber Profile panel. The Select Default Subscriber Profile (Terminate LNS PPP Sessions) form opens with a list of available profiles.

iv Choose a subscriber profile and click on the OK button. The Select Default Subscriber Profile (Terminate LNS PPP Sessions) form closes and the VPRN Group Interface (Create) form reappears with the Subscriber Profile displayed.

v Click on the Select button in the Default SLA Profile panel. The Select Default SLA Profile (Terminate LNS PPP Sessions) form opens with a list of available SLA profiles.

vi Choose an SLA profile and click on the OK button. The Select Default SLA Profile (Terminate LNS PPP Sessions) form closes and the VPRN Group Interface (Create) form reappears with the SLA Profile displayed.

vii Click on the Select button in the Subscriber Identification Policy panel. The Select Subscriber Identification Policy (Terminate LNS PPP Sessions) form opens with a list of available subscriber identification policies.

viii Choose a subscriber identification policy and click on the OK button. The Select Subscriber Identification Policy (Terminate LNS PPP Sessions) form closes and the VPRN Group Interface (Create) form reappears with the subscriber identification policy displayed.

ix Click on the Select button in the Default Application Profile panel. The Select Default Application Profile (Terminate LNS PPP Sessions) form opens with a list of available default application profiles.

x Choose a default application profile and click on the OK button. The Select Default Application Profile (Terminate LNS PPP Sessions) form closes and the VPRN Group Interface (Create) form reappears with the default application profile displayed.

xi Configure the Default Subscriber Identification String parameter.

21 Click on the Service Access Points tab to configure SAPs for the group interface.

22 Click on the Create button. The VPRN Service Access Point (Create) form opens with the General tab displayed.

23 Configure the parameters:

- Name
- Description
- Administrative State
- Calling Station ID

24 Associate a host lockout policy with the group interface, if required. Click on the Select button in the Host Lockout panel to select a policy.

25 Click on the Port tab.

26 Click on the Select button to choose a port for the L3 access interface. The Select Terminating Port - VPRN L3 Access Interface form opens.

Note — The form lists only ports in access or hybrid mode. To choose a port that is not listed, you must set the Mode parameter for the port to Access or Hybrid. After you do this, the port is listed when you click on the Search button.

27 Use the configurable filter and Search button to choose a port, and click on the OK button. The Select Terminating Port - VPRN L3 Access Interface form closes, and the VPRN L3 Access Interface (Create) form displays the port information.

28 Configure the parameters:

- Auto-Assign ID
- Outer Encapsulation Value
- Inner Encapsulation Value
- Outer Encapsulation Value (VPI)
- Inner Encapsulation Value (VCI)
- SAP Description
- SAP Administrative State

The Auto-Assign ID parameter is configurable if the port uses dot1q encapsulation. When the parameter is enabled, the 5620 SAM automatically configures the Outer Encapsulation Value parameter using the lowest unassigned value.

Note — You can set the Auto-Assign ID parameter to be the default parameter for dot1q encapsulation by enabling the Access Interface Encap Value (Dot1q only) parameter on the User Preferences form. Choose Application→ User Preferences from the main menu.

The Inner Encapsulation Value is configurable only when the port is an Ethernet or frame relay port with QinQ encapsulation.

The Outer Encapsulation Value (VPI) and Inner Encapsulation Value (VCI) parameters are configurable only for ATM ports.

29 Assign ingress and egress QoS policies to the SAP, if required.

Note — Items such as policies, schedulers, and filters can be applied later to multiple service components at once. Choose and right-click the components in the service navigation tree, choose Properties, and configure the parameters on the appropriate tab.

i Click on the QoS tab.

ii Configure the parameters:

- Ingress Match QinQ Dot1P
- Egress Mark QinQ Top Bits Only
- Use SAP ID as Subscriber ID

The Ingress Match QinQ Dot1P and Egress Mark QinQ Top Bits Only parameters are configurable only when the encapsulation type of the port is BCP dot1q, dot1q, or QinQ.

iii Click on the Select button in the Ingress Policy panel to choose an ingress QoS policy. The Select Ingress Policy - VPRN Service Access Point form opens.

iv Configure the filter criteria and click on the Search button. A list of available ingress policies appear.

v Choose an ingress QoS policy and click on the OK button. The Select Ingress Policy - VPRN Service Access Point form closes, and the VPRN Service Access Point (Create) form reappears with the ingress QoS policy information displayed.

Note — If you select an ingress policy which has a forwarding class mapped to an ingress queue group, you must ensure that the port you selected in step 27 has the access ingress queue group with the same name created on it.

See Procedure 16-1 for more information about how to configure Ethernet ports. See chapter 42 for more information about queue group template policies.

vi Click on the Select button in the Egress Policy panel to choose an egress QoS policy. The Select Egress Policy - VPRN Service Access Point form opens.

vii Configure the filter criteria and click on the Search button. A list of available egress policies is displayed.

viii Choose an egress QoS policy and click on the OK button. The Select Egress Policy - VPRN Service Access Point form closes, and the VPRN Service Access Point (Create) form reappears with the egress QoS policy information displayed.

Note — If you select an egress policy which has a forwarding class mapped to an egress queue group, you must ensure that the port you selected in step 27 has the access egress queue group with the same name created on it.

See Procedure 16-1 for more information about how to configure Ethernet ports. See chapter 42 for more information about queue group template policies.

30 Click on the Schedulers tab to configure scheduling; otherwise, go to step 32.

Note — The Schedulers tab is configurable only if a port is assigned to the SAP earlier in the procedure.

31 Perform one of the following.

a Specify that an aggregation scheduler policy is not applied to the SAP.

i Set the Aggregation parameter to off.

Note — The Aggregation parameter is not configurable if the port you selected in step 27 is an HSMDA port.

ii Configure the parameters:

- Aggregate Rate Limit (kbps)
- Frame-Based Accounting

Note 1 — The Aggregate Rate Limit (kbps) and Frame-Based Accounting parameters are configurable only when there is no scheduler specified in the Egress Scheduler panel.

Note 2 — The Frame-Based Accounting parameter is not configurable if the port you selected in step 27 is an HSMDA port.

Note 3 — You cannot specify an egress scheduler when the Aggregate Rate Limit (kbps) parameter is set to a value greater than zero.

iii Click on the Select button in the Ingress Scheduler panel to choose an ingress scheduler. The Select Ingress Scheduler - VPRN Service Access Point form opens.

iv Choose an ingress scheduler and click on the OK button. The Select Ingress Scheduler - VPRN Service Access Point form closes, and the VPRN Service Access Point (Create) form refreshes with the ingress scheduler information displayed.

v Click on the Select button in the Ingress Policer Control Policy panel to choose an ingress policer control policy. The Select Ingress Policer Control Policy form opens.

vi Choose a policer control policy and click on the OK button. The Select Ingress Policer Control Policy form closes and the VPRN Service Access Point (Create) form reappears with the ingress policer control policy information displayed.

vii If the port you selected in step 27 is an HSMDA port, go to step 32.

viii Click on the Select button in the Egress Scheduler panel to choose an egress scheduler. The Select Egress Scheduler - VPRN Service Access Point form opens.

ix Choose an egress scheduler and click on the OK button. The Select Egress Scheduler - VPRN Service Access Point form closes, and the VPRN Service Access Point (Create) form refreshes with the egress scheduler information displayed.

x Click on the Select button in the Egress Policer Control Policy panel to choose an egress policer control policy. The Select Egress Policer Control Policy form opens.

xi Choose a policer control policy and click on the OK button. The Select Egress Policer Control Policy form closes and the VPRN Service Access Point (Create) form reappears with the egress policer control policy information displayed.

xii Go to step 32.

b Specify that an aggregation scheduler policy is applied to the SAP.

i Set the Aggregation parameter to on.

Note — You cannot specify an access scheduler policy if the port you selected in step 27 is an HSMDA port. Go to step 32.

ii Configure the Frame-Based Accounting parameter.

iii Click on the Select button in the Aggregation Scheduler panel to choose an aggregation scheduler. The Select Aggregation Scheduler - VPRN Service Access Point form opens.

iv Choose an aggregation scheduler and click on the OK button. The Select Aggregation Scheduler - VPRN Service Access Point form closes, and the VPRN Service Access Point (Create) form refreshes with the aggregation scheduler information displayed.

32 Assign ingress and egress ACL filters to the SAP, if required.

i Click on the ACL tab.

ii Click on the Select button in the Ingress Filter panel to choose an ingress ACL filter from the Select Ingress Filter - VPRN Service Access Point form.

iii Click on the Select button in the Egress Filter panel to choose an egress ACL filter from the Select Egress Filter - VPRN Service Access Point form.

33 Click on the Accounting tab to assign an accounting policy to the SAP.

i Configure the Collect Accounting Statistics parameter.

ii Click on the Select button to choose an accounting policy. The Select Accounting Policy - VPRN Service Access Point form opens.

iii Choose an accounting policy and click on the OK button. The Select Accounting Policy - VPRN Service Access Point form closes, and the VPRN Service Access Point (Create) form reappears with the accounting policy information displayed.

34 Click on the Anti-Spoofing tab to configure anti-spoofing for the SAP.

i Configure the Anti-Spoofing parameter.

To configure residential subscriber management for static hosts, the Anti-Spoofing parameter must be set to at least IP-address matching, or optionally, to IP- and MAC-address matching.

ii Click on the Static Hosts tab to add a static host to the SAP.

iii Click on the Static Hosts tab to configure a static subscriber host entry for each subscriber host that is not managed by DHCP.

iv Click on the Create button. The Access Interface Anti-Spoofing Static Host Display (Create) form opens.

v Configure the parameters:

- IP Address
- MAC Address
- Subscriber Identification

vi Configure residential subscriber management for the static host.

vii Click on the Select button in the Subscriber Profile panel to choose a subscriber profile for the static host, if required. The Select Subscriber Profile - AntiSpoofingStaticHosts form opens with the list of available subscriber profiles displayed. Otherwise, go to step 35.

viii Choose a subscriber profile and click on the OK button. The Select Subscriber Profile - AntiSpoofingStaticHosts form closes, and the subscriber profile name appears in the Subscriber Profile panel.

ix Click on the Select button in the SLA Profile panel to choose an SLA profile for the static host. The Select SLA Profile - AntiSpoofingStaticHosts form opens with the list of available SLA profiles displayed.

x Choose an SLA profile and click on the OK button. The Select SLA Profile - AntiSpoofingStaticHosts form closes, and the SLA profile name appears in the SLA Profile panel.

xi Click on the Select button in the Application Profile panel to choose an application profile for the static host. The Select Application Profile - AntiSpoofingStaticHosts form opens with the list of application profiles on the NE displayed.

xii Choose an application profile and click on the OK button. The Select Application Profile - AntiSpoofingStaticHosts form closes, and the application profile name appears in the Application Profile panel.

35 Click on the OK button. A dialog box appears.

36 Click on the OK button. The Access Interface Anti-Spoofing Static Host Display (Create) form closes.

37 Assign a DoS protection policy or DDoS protection policy to the SAP, if required.

Note — A default DoS protection policy is automatically assigned to the SAP.

i Click on the Security tab.

ii Click on the Select button in the NE DoS Protection panel and select a DoS protection policy from the Select NE DoS Protection form.

iii Click on the Select button next to the NE DDoS Protection field and select a DDoS protection policy from the Select NE DDoS Protection Policy form.

iv Configure the MAC Monitoring parameter.

38 Click on the Subscriber Management tab to configure residential subscriber management on the SAP. The IGMP Host Tracking tab is displayed.

i Click on the Select button to choose the import policy used to filter IGMP packets. The Select SapIgmpHostTracking form opens.

ii Configure the filter parameters and click on the Search button. A list of import policies appears.

iii Choose a policy and click on the OK button. The selected import policy name appears.

iv Configure the parameters:

- Expiry Time (seconds)
- Max Number of Groups
- Max Number of Sources per Group
- Disable Router Alert Check

v You can click on the Host Tracking Info tab to view a list of hosts that are being tracked on this service access point.

vi Click on the Profiles tab.

vii Configure the parameters:

- Admin Status
- Service Model
- Subscriber Limit
- Profiled Traffic only
- Non-Subscriber Traffic Identification
- Default Subscriber Identification Type
- Default Subscriber ID
- Default Intermediate Destination Id Type
- Default Intermediate Destination Id

viii Click on the Select button in the Default Subscriber Profile panel to choose a default subscriber profile for the SAP, if required. The Select Default Subscriber Profile form opens with the list of available subscriber profiles displayed.

ix Choose a subscriber profile and click on the OK button. The Select Default Subscriber Profile form closes, and the subscriber profile name appears in the Default Subscriber Profile panel.

x Click on the Select button in the Default SLA Profile panel to choose a Default SLA profile for the SAP, if required. The Select Default SLA Profile form opens with the list of available SLA profiles displayed.

xi Choose an SLA profile and click on the OK button. The Select Default SLA Profile form closes, and the SLA profile name appears in the Default SLA Profile panel.

xii Click on the Select button in the Subscriber Identification Policy panel to choose a subscriber identification policy for the SAP, if required. The Select Subscriber Identification Policy form opens with the list of available subscriber identification policies displayed.

xiii Choose a subscriber identification policy and click on the OK button. The Select Subscriber Identification Policy form closes, and the subscriber identification policy name appears in the Subscriber Identification Policy panel.

xiv Click on the Select button in the Default Application Profile panel to choose a default application profile for the SAP, if required. The Select Default Application Profile form opens with the list of application profiles on the NE displayed.

xv Choose an application profile and click on the OK button. The Select Default Application Profile form closes, and the application profile name appears in the Default Application Profile panel.

xvi Click on the Select button in the Non-Subscriber Traffic Subscriber Profile panel to choose a non-subscriber subscriber profile for the SAP, if required. The Select Non-Subscriber Traffic Subscriber Profile form opens with the list of available subscriber profiles displayed.

xvii Choose a subscriber profile and click on the OK button. The Select Non-Subscriber Traffic Subscriber Profile form closes, and the subscriber profile name appears in the Non-Subscriber Traffic Subscriber Profile panel.

xviii Click on the Select button in the Non-Subscriber Traffic SLA Profile panel to choose a Non-Subscriber Traffic SLA profile for the SAP, if required. The Select Non-Subscriber Traffic SLA Profile form opens with the list of available SLA profiles displayed.

xix Choose an SLA profile and click on the OK button. The Select Non-Subscriber Traffic SLA Profile form closes, and the SLA profile name appears in the Non-Subscriber Traffic SLA Profile panel.

xx Click on the Select button in the Non-Subscriber Traffic Application Profile panel to choose a non-subscriber traffic application profile for the SAP, if required. The Select Non-Subscriber Traffic Application Profile form opens with the list of application profiles on the NE displayed.

xxi Choose an application profile and click on the OK button. The Select Non-Subscriber Traffic Application Profile form closes, and the application profile name appears in the Non-Subscriber Traffic Application Profile panel.

xxii Click on the Subscriber Hosts tab to view active hosts for the subscriber instance, if required.

39 Configure ATM on the SAP, if required.

i Click on the ATM tab.

ii Configure the parameters:

- AAL5 Encapsulation
- ATM OAM Alarm Cell Handling
- Periodic ATM OAM Loopback

iii Click on the Select button in the Ingress ATM Policy panel to choose an ingress ATM policy. The Select Ingress ATM Policy - ATM Configuration form opens.

iv Choose an ingress ATM policy and click on the OK button. The Select Ingress ATM Policy - ATM Configuration form closes, and the VPRN Service Access Point (Create) form refreshes with the ingress ATM policy information displayed.

v Click on the Select button in the Egress ATM Policy panel to choose an egress ATM policy. The Select Egress ATM Policy - ATM Configuration form opens.

vi Choose an egress ATM policy and click on the OK button. The Select Egress ATM Policy - ATM Configuration form closes, and the VPRN Service Access Point (Create) form refreshes with the egress ATM policy information displayed.

40 Click on the OK button. The VPRN Service Access Point (Create) form closes and a dialog box appears.

41 Click on the OK button. The VPRN Group Interface (Create) form refreshes to display the SAP.

42 To configure an additional SAP in the group interface, go to step 22.

43 Click on the SRRP tab.

44 Configure the parameters in the Routing panel:

- Enabled
- Hold Time (seconds)

45 Click on the Create button in the SRRP Instance panel. The SRRP Instance (Create) form opens with the General tab displayed.

46 Configure the parameters:

- SRRP ID
- Description
- Administrative State

47 Click on the Select button in the Operational Group panel. The Select Monitored Group Name - SRRP Instance form opens.

48 Choose a Monitored Group Name and click on the OK button. The Select Monitored Group Name - SRRP Instance form closes.

49 Configure the Priority Step parameter.

50 Click on the Behavior tab.

51 Configure the General parameters:

- Gateway MAC Address
- Keep Alive Interval
- Priority
- Preempt
- FIB Population Mode
- One Gratuitous ARP Per SAP

52 Click on the Select button in the Message Path panel. The Select Message Path Pointer - SRRP Instance form opens, displaying the SAPs available on the site.

53 Select the SAP you need to use for the in-band messaging between the sites and click on the OK button. The Select Message Path Pointer - SRRP Instance form closes.

54 Click on the Select button in the Policy Pointer 1 panel. The Select Policy Pointer 1 - SRRP Instance form opens.

55 Choose an entry and click on the OK button. The Select Policy Pointer 1 - SRRP Instance form closes.

56 Click on the Select button in the Policy Pointer 1 panel. The Select Policy Pointer 2 - SRRP Instance form opens.

57 Choose an entry and click on the OK button. The Select Policy Pointer 2 - SRRP Instance form closes.

58 Click on the OK button. The SRRP Instance (Create) form closes and a dialog box appears.

59 Click on the OK button.

60 Click on the OK button. The VPRN Group Interface (Create) form closes and a dialog box appears.

61 Click on the OK button. The VPRN Service (Edit) form refreshes to display the SAP below the group interface.

62 Click on the OK button. A dialog box appears.

63 Click on the Yes button. The VPRN Service (Edit) form closes.

64 Close the Manage Services form.

Procedure 71-61 To collect and view PPP ATM SAP statistics and information for a VPRN group interface

See "Statistics collection overview" in the *5620 SAM Statistics Management Guide* for general information about configuring and collecting statistics.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Choose VPRN Service (VPRN) from the object drop-down list.

3 Configure the filter criteria and click on the Search button. A list of VPRN services appears.

4 Choose a service and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

5 On the navigation tree, click on a group interface. The VPRN Group Interface (Edit) form opens.

6 Click on the Statistics tab.

7 Choose PPP ATM SAP (Service Management) from the object drop-down list.

8 Click on the Collect button to collect the PPP ATM SAP statistics.

9 Choose a statistics record and click on the Properties button to view the record. The statistics record form opens.

10 View the statistics information.

11 Click on the Close button to close the statistics record form.

12 Repeat steps 9 to 11 for each statistics record that you need to view.

13 Close the VPRN Group Interface (Edit) form.

14 Close the VPRN Service (Edit) form.

15 Close the Manage Services form.

Procedure 71-62 To configure a WLAN GW for a VPRN group interface

Before you can configure a WLAN GW for a VPRN group interface, you must configure a VPRN group interface with the Specific Type parameter set to Soft GRE. See Procedure 71-60.

1 Choose Manage→Service→Services from the navigation tree view selector. The Manage Services form opens.

2 Choose VPRN Site (VPRN) from the Object drop-down list.

3 Click on the Search button. A list of VPRN sites is displayed.

4 Select a VPRN site with a VPRN group interface and click on the Properties button. The VPRN Site form opens with the general tab displayed.

For the purposes of WLAN GW configuration, you must choose a Soft GRE type VPRN group interface.

5 On the VPRN Site form navigation tree, expand the Subscriber Interfaces icon.

6 Expand a subscriber interface with a VPRN group interface.

7 Click on a VPRN group interface. The general tab is displayed.

8 Click on the WLAN GW tab.

9 Click on the Select button in the WLAN GW Group panel and choose a WLAN GW group form the Select WLAN GW Group form.

10 Click on the Select button in the Tunnel Router Instance panel and choose a tunnel router instance from the Select Tunnel Router Instance form.

11 Configure the WLAN Gateway Address parameter.

12 Click on the Select button in the Default Retail Service panel and choose a default retail IES service from the Select Default Retail Service form.

13 Configure the parameters:

- TCP Maximum Segment Size Adjustment
- Data Triggered UE Creation
- Mobility Detection Trigger
- Hold Time

14 Configure egress QoS, if required.

i In the Egress QoS panel, configure the parameters:

- Multi Client Only Shaping
- Shaping
- Hold Time
  Enabling the Infinite check box sets the Hold Time parameter to infinite.

ii Click on the Select button beside the QoS Policy field and choose an access egress policy from the Select QoS - Soft GRE Config form.

iii Click on the Select button beside the Scheduler Policy field and choose a scheduler policy from the Select Scheduler - Soft GRE Config form.

iv Configure the Aggregate Rate Limit parameter. Do not configure this parameter with a positive value if you specified a scheduler policy in step iii.

15 Click on the Select button beside the Authentication Policy field and choose an authentication policy from the Select ISA RADIUS Policies - Soft GRE Config form.

16 Configure an authentication hold time, if required:

i Enable the check box in the Authentication Hold Time panel.

ii Specify an authentication hold time in the Hours, Minutes, and Seconds fields.

17 Configure SAP parameters, as required.

i Click on the SAP Parameters tab.

ii Configure the Description parameter.

iii Click on the Select button beside the Subscriber Profile parameter and choose a subscriber profile from the Select Subscriber Profile form.

iv Click on the Select button beside the SLA Profile parameter and choose an SLA profile from the Select SLA Profile form.

v Click on the Select button beside the Application Profile parameter and choose an application profile from the Select Application Profile form.

vi Click on the Select button beside the Subscriber Identification Policy parameter and choose a subscriber identification policy from the Select Subscriber Identification Policy form.

vii Configure the Default ID Type parameter.

viii If the Default ID Type parameter was set to Use String, configure the Default ID String parameter.

18 Configure DHCP, as required.

i Click on the DHCP tab.

ii Configure the parameters:

- Administrative State
- L2 Aware IP Address
- IP Address Lease Time (Initial State)
  Remove the check mark from the Default check box and configure the Hours, Minutes, and Seconds parameters.
- IP Address Lease Time (Active State)
  Remove the check mark from the Default check box and configure the Hours, Minutes, and Seconds parameters.
- Primary DNS Server
- Secondary DNS Server
- Primary NBNS Server
- Secondary NBNS Server

iii Click on the Select button next to the NAT Policy field and choose a NAT policy from the Select NAT Policy form.

iv Click on the Select button next to the HTTP Redirect Policy field and choose an HTTP redirect policy from the Select HTTP Redirect Policy form.

19 Configure VLAN tag ranges, as required.

i Click on the VLAN Tag Ranges tab.

ii Click on the Create button. The VLAN Tag Range form opens.

iii Configure the parameters:

- Start VLAN Tag
- End VLAN Tag

iv Click on the Select button next to the Retail Service ID field and choose a retail service from the Select Retail Service form.

v Configure the Data Triggered User Equipment Creation parameter.

vi Click on the Select button next to the NAT Policy field and choose a NAT policy from the Select NAT Policy form.

vii Click on the Select button next to the HTTP Redirect Policy field and choose an HTTP redirect policy from the Select HTTP Redirect Policy form.

viii Click on the Select button next to the Authentication Policy field and choose an authentication policy from the Select Authentication Policy form.

ix Configure the Hold Time parameter. Remove the check mark from the Default check box and configure the Hours, Minutes, and Seconds parameters.

x Configure the Routing Instance parameter.

xi Click on the Select button in the RADIUS Proxy Cache panel and choose a RADIUS proxy cache server from the Select RADIUS Proxy Cache form.

xii Configure the MAC Address Format and Show Format parameters.

xiii Configure DHCP, as required.

xiv Click on the DHCP tab.

xv Configure the parameters:

- Administrative State
- L2 Aware IP Address
- IP Address Lease Time (Initial State)
  Remove the check mark from the Default check box and configure the Hours, Minutes, and Seconds parameters.
- IP Address Lease Time (Active State)
  Remove the check mark from the Default check box and configure the Hours, Minutes, and Seconds parameters.
- Primary DNS Server
- Secondary DNS Server
- Primary NBNS Server
- Secondary NBNS Server

xvi Click on the OK button. A dialog box appears.

xvii Click on the OK button. The VLAN Tag Ranges tab is updated with the new VLAN tag range displayed.

20 Click on the OK button. A dialog box appears.

21 Click on the OK button. The VPRN Site (Edit) form closes.

22 Close the Manage Services form.

Procedure 71-63 To add an IP mirror interface to a VPRN

Perform this procedure to configure an IP mirror interface in a VPRN service. This is a spoke terminated interface used to receive mirrored packets from a remote source.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you need to add the IP mirror interface; expand the entries for that site.

5 Right-click on IP Mirror Interfaces and choose Create IP Mirror Interface. The IP Mirror Interface (Create) form opens.

6 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State

Note — The Name value for an IP mirror interface must be unique in VPRN site. There cannot be another L3 access interface, subscriber interface, or group interface with the same name on the VPRN site.

7 Click on the OK button. The IP Mirror Interface (Create) form closes and a dialog box appears.

8 Click on the OK button. The VPRN Service (Edit) form reappears with the IP mirror interface displayed in the service navigation tree.

9 Create a spoke SDP binding for the interface by performing steps 5 to 23 of Procedure 71-57.

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The VPRN Service (Edit) form closes, and the Manage Services form reappears.

12 Close the Manage Services form.

Procedure 71-64 To add a TMS interface to a VPRN

The 7750 SR-7 and 7750 SR-12 devices support the configuration of a TMS interface in a VPRN.

The following conditions must be met before you can configure a TMS interface.

- You must have one VPRN configured. The TMS interface is configured on this on-ramp VPRN.
- Optionally, you can have two addition VPRNs configured, one for the management VPRN and one for the off-ramp VPRN.
- Each VPRN must be associated within the same site on the same node.
- The ISA-TMS daughter card must be installed.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and click on the Search button. A list of services appears.

3 Choose a VPRN and click on the Properties button. The VPRN Service Subscriber (Edit) form opens with the General tab displayed.

4 On the navigation tree, click on the site to which you need to add the TMS interface; expand the entries for that site.

5 Right-click on the TMS Interfaces icon and choose Create TMS Interface. The TMS Interface (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State
- IPv6 Allowed

Note — The Name value for a TMS interface must be unique in the context of the VPRN Service Site. That is, there cannot be another L3 access interface, subscriber interface, group interface or TMS interface with the same name on the same VPRN site.

7 Assign an off-ramp VPRN to the TMS interface

i Click on the Select button in the Off-Ramp VPRN panel and Choose a VPRN from the Select Off-Ramp VPRN - TMS Interface form.

ii Click on the OK button. The Select Off-Ramp VPRN - TMS Interface form closes, and the TMS Interface (Create) form reappears with the VPRN information displayed.

8 Assign a management VPRN to the TMS interface

i Click on the Select button in the Management VPRN panel and Choose a VPRN from the Select Management VPRN - TMS Interface form.

ii Click on the OK button. The Select Management VPRN - TMS Interface form closes, and the TMS Interface (Create) form reappears with the subscriber information displayed.

9 Associate an ISA-TMS daughter card with the TMS interface.

Note — An ISA-TMS card can only be assigned to one TMS interface.

i Click on the Select button in the TMS Info panel and select an ISA-TMS to associate with the TMS interface from the Select ISA-TMS - TMS Interface form.

ii Click on the OK button. The Select ISA-TMS - TMS Interface form closes, and the TMS Interface (Create) form reappears with the slot name for the daughter card displayed.

10 Configure the ISA-TMS Authentication parameter.

11 Assign an IP address to the TMS interface.

i Click on the Addresses tab.

ii Click on the Create button. The IP Address (Create) form opens.

iii Configure the parameters:

- Address ID
- IP Address
- Prefix Length

iv Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

v Click on the OK button. The TMS Interface (Create) form reappears with the assigned IP addresses displayed.

12 Click on the OK button. The TMS Interface (Create) form closes, and a dialog box appears.

13 Click on the OK button. The VPRN Service Subscriber (Edit) form reappears with the new TMS interface displayed in the service navigation tree.

14 Click on the OK button. A dialog box appears.

15 Click on the Yes button. The VPRN Service Subscriber (Edit) form closes, and the Manage Services form reappears.

16 Close the Manage Services form.

Procedure 71-65 To implement dual homing using SRRP

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 Create the redundant interface used for SRRP out-of-band messaging between the two NEs.

Note 1 — The two sites that participate in the dual homing configuration do not have to be part of the same service.

Note 2 — Ensure that the pair of sites each contains a properly configured subscriber interface and SAPs underneath the group interface that are participating in the redundant configuration.

Note 3 — Ensure that all subscriber interface IP addresses have a gateway address configured on them.

i On the navigation tree, click on the sites to which you need to add the redundant pair; expand the entries for that site.

ii Right-click on Redundant Interfaces for one site of the redundant pair, and choose Create Redundant Interface. The Redundant Interface (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Interface ID
- Auto-Assign ID
- Name
- Description
- Administrative State

iv Click on the Addresses tab.

v Click on the Create button. The IP Address (Create) form opens.

vi Specify IP addresses for the redundant interface on the current and remote sites. Configure the parameters:

- Address ID
- IP Address
- Prefix Length
- Remote IP Address

  This must be on the same subnet as the redundant interface IP address of the current site. For example, if the IP address of the current site is 7.7.7.7, with a prefix length of 24, then the redundant interface IP address of the remote site must be 7.7.7.d, where d is a value from 0 to 255, excluding 7.
- Broadcast Address Format

vii Click on the OK button. The IP Address (Create) form closes, and a dialog box appears.

viii Click on the OK button. The Redundant Interface (Create) form reappears with the assigned redundant interface IP addresses listed.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Redundant Interface (Create) form for the current site closes.

5 Create an SDP spoke binding between the current and remote sites. The Source Interface is the Redundant Interface you created in step 4 and the Tunnel Termination SIte is the remote site. The Return Tunnel must come from the remote site. See Procedure 71-56 for more information.

6 Assign the Redundant Interface to the Group Interface for the current site.

i On the navigation tree under the Subscriber Interface, right-click on the Group Interface you need to use and choose Properties. The VPRN Group Interface (Edit) form opens with the General tab displayed.

ii Click on the Select button in the Redundant Interface panel. The Select Redundant Interface - VPRN Group Interface form opens.

iii Configure the list filter parameters if required and click on the Search button. A list of Redundant Interfaces on the site appears at the bottom of the form.

iv Select the Redundant Interface you created in step 4. The Select Redundant Interface - VPRN Group Interface form closes and the interface you selected appears in the Redundant Interface field.

v Click on the OK button. The VPRN Group Interface (Edit) form closes.

7 Create an SRRP Instance for the current site.

i On the navigation tree under Group Interfaces, right-click on the SRRP Instances item for the current site, and choose Create SRRP Instance. The SRRP Instance (Create) form opens with the General tab displayed.

ii Configure the parameters:

- SRRP ID
- Description
- Administrative State

Note — The SRRP ID value must be the same for the current and remote sites.

iii Click on the Behavior tab.

iv Configure the General parameters:

- Gateway MAC Address Default is 00-00-00-00-00-00.
- Keep Alive Interval
- Priority
- FIB Population Mode

v Configure the Message Path by clicking the Select button adjacent to the Port field. The Select Message Path Pointer - SRRP Instance form opens, displaying the SAPs available on the site. Select the SAP you need to use for the in-band messaging between the sites.

vi Configure the Policy Pointers for the SRRP Instance, if required.

vii Click on the OK button. The SRRP Instance (Create) form closes, and a dialog box appears.

viii Click on the OK button. The VPRN Service (Edit) form reappears with the SRRP Instance displayed.

8 Click on the Turn Up button to activate the SRRP instance.

9 Repeat steps 4 to 8 for the remote site.

Note 1 — When you repeat steps 4 to 8 for the remote site, that site becomes the current site and the previously configured site is the remote site.

Note 2 — After the two sites have been properly set up, you can examine the SRRP peer associations at any time by right-clicking an SRRP Instance in the service's navigation tree. This opens the SRRP Instance - Edit form, which contains a read-only field called SRRP Peer. The Site ID, Service ID, and Operational State of the associated peer appear in this field.

You can also examine the state of an SRRP Instance by checking the Operational Flags field. The flags indicate specific problems that might occur with the SRRP Instance, as follows:

- Duplicate Subscriber IF Address: one of the local subscriber IP addresses is the same as a subscriber IP address on the remote node.
- Redundant Interface Mismatch: the local SRRP instance and remote SRRP instance have mismatched redundant interfaces.
- SAP Mismatch: the local SRRP instance is backing a different set of SAPs than the peer.
- Subnet Mismatch: one of the subnets that SRRP is backing up does not have a match with the peer.
- Dual Master: both SRRP instances are master at the same time.
- SAP Tag Mismatch: the local SRRP instance is backing a set of SAPs with different remote and local tags.
- SRRP ID Mismatch: the peer has a different SRRP instance ID backing the same subnet.

10 Click on the OK button. A dialog box appears.

11 Click on the OK button. The VPRN Service (Edit) form closes.

Procedure 71-66 To create an OSPF sham link

Perform this procedure to create an intra-area OSPF sham link between two VPRN sites. See "OSPF sham link support" in section 71.1 for more information.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service.

4 Click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

5 On the navigation tree, choose the first site that to participate in the sham link. If you need to create the site, perform Procedure 71-3.

6 Choose an L3 access interface for the site. If you need to create the L3 access interface, perform steps 5 to 18 of Procedure 71-22.

7 Configure OSPFv2 for the site. Perform steps 6 to 10 of Procedure 71-50. Ensure that you select substep a in step 8.

8 Right-click on the OSPFv2 icon under the Protocols icon and choose Create Sham Link. The ShamLink (Create) form opens with the General tab displayed.

9 Click on the Select button to configure the Remote Neighbor IP Address parameter. This is the IP Address of the other site participating in the sham link.

10 Click on the Select button in the Interface panel to configure the Interface Name parameter. The Select Interface - ShamLink form opens.

11 Click on the Search button.

12 Choose an interface from the displayed list and click on the OK button. The Select Interface - ShamLink form closes and the ShamLink (Create) form refreshes with the selected Interface Name displayed.

13 Click on the Select button in the Area panel to configure the Area ID parameter. The Select Area - ShamLink form opens.

14 Click on the Search button.

15 Choose an area from the displayed list and click on the OK button. The Select Area - ShamLink form closes and the ShamLink (Create) form refreshes with the selected Area ID displayed.

16 Configure the Administrative State parameter.

17 Click on the Protocol Properties tab.

18 Configure the parameters:

- Metric
- Hello Interval (seconds)
- Router Dead Interval (seconds)
- Retransmission Interval (seconds)
- Transit Delay (seconds)

19 The Authentication tab is configurable, depending on the OSPF version. Click on the Authentication tab to configure authentication for the sham link, if required. Otherwise, go to step 22.

20 Configure the Authentication Type parameter. Perform one of the following:

a Click on the Authentication Type menu button and choose MD5-based Authentication from the drop-down menu.

i Click on the Create button to create an MD5 authentication key. The Md5Key (Create) form opens.

ii Configure the parameters:

- Key Index
- Key
- Re-enter Key

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The Md5Key (Create) form closes, and the new authentication key appears in the list.

b Click on the Authentication Type menu button and choose Simple Password from the drop-down menu.

i Click on the Change Password button to enter a password. The Password (Create) form opens.

ii Configure the parameters:

- Password
- Re-enter Password

iii Click on the OK button. A dialog box appears.

iv Click on the Yes button. The Password (Create) form closes.

21 You can click on the Virtual Neighbor tab to view OSPF configuration information on neighbor sites, if required.

22 Click on the OK button. A dialog box appears.

23 Click on the Yes button. The ShamLink (Create) form closes, and the 5620 SAM displays an icon for the new sham link in the navigation tree.

24 Repeat steps 5 to 23 for the second site participating in the sham link.

25 Click on the OK button. A dialog box appears.

26 Click on the Yes button to confirm the action. The VPRN Service (Edit) form closes and the Manage Services form reappears.

27 Click on the Close button to close the Manage Services form.

Procedure 71-67 To run an OAM validation test for a VPRN service

An OAM validator test suite must be created for the tested entity. See chapter 77 for more information about how to create an OAM validator test suite.

Note — As an alternative, you can also run an OAM validation test on the service by performing a One Time Validation. This is a mostly automated procedure and is described in Procedure 77-9.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a service and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

4 Click on the Validate button. If the Validate button is not visible, click on the More Actions button and choose Validate. If an OAM validator test suite is not associated to the service, a dialog box appears. Perform the following steps:

- **i** Click on the OK button to associate the service with an existing OAM validator test suite. The Choose Validator Test Suite form opens.
- **ii** Configure the filter criteria. A list of OAM validator test suites appears.
- **iii** Choose an OAM validator test suite and click on the OK button. The Choose Validator Test Suite form closes.

5 View the State Cause indicators. When the validation test fails, a check mark appears beside the OAM Validation Failure indicator.

6 Click on the Tests tab.

7 Click on the Tested Entity Result tab.

8 Choose an entry and click on the Properties button. The Tested Entity Result (Edit) form opens with the General tab displayed.

9 Click on the Results tab to display the validation test results.

10 If you need to compare two test results from the same type of test, choose the two test results and click on the Compare button; the Difference form opens. Otherwise, go to step 13.

11 Compare the test results.

12 Close the Difference form.

13 Close the Tested Entity Result form.

14 Close the VPRN Service (Edit) form.

15 Close the Manage Services form.

Procedure 71-68 To view the service topology map associated with a VPRN service

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Topology View button. A Topology View dialog box appears.

4 Click on the Yes button to proceed. The Service Topology - map opens.

See chapter 6 for more information about service topology views.

Procedure 71-69 To view the VPRN service operational status

The Aggregated Operational State and State Cause indicators on the General tab of the service management form display information about service faults.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a service and click on the Properties button. The VPRN Service (Edit) form opens.

4 View the Aggregated Operational State and State Cause indicators. When the Aggregated Operational State is Down or Partially Down, a check mark beside the appropriate State Cause indicator identifies the type of associated service fault.

5 Click on the appropriate tab to view or edit an object that is identified as faulty by a State Cause indicator.

6 Click on the Faults tab to view the alarms for the object. The Object Alarms tab is displayed.

7 Click on the Aggregated Alarms tab to view the aggregated alarms for the object. The Aggregated Alarms tab is displayed.

8 Close the VPRN Service (Edit) form.

9 Click on the Close button to close the Manage Services form.

Procedure 71-70 To view DHCPv6 leases

This procedure describes how to view the DHCPv6 prefixes that the server has given out.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 On the navigation tree, click on the site where you need to view DHCPv6 leases; expand the entries for that site.

5 Choose Routing Instance from the navigation tree. The Site (Edit) form opens with the General tab displayed.

6 Click on the RADIUS/DHCP/Diameter tab. The Local DHCP Servers tab is displayed.

7 Click on the DHCP V6 tab. The list of associated DHCPv6 servers is displayed.

8 Choose a DHCPv6 server and click on the Properties button. The Local DHCPv6 Server (Edit) form opens with the General tab displayed.

9 Click on the Show Leases button. If the Show Leases button is not visible, click on the More Actions button and choose Show Leases. The DHCPv6 Server Show Leases form opens.

10 Perform one of the following:

a To view the entire list of leases that are active on the DHCPv6 server, click OK.

b To view the lease information for a specific prefix, enter the IP address in the Prefix parameter for the particular DHCPv6 server and click OK.

Note — If the prefix does not exist in the list of leases, a message displays.

c To view the detailed lease information for a specific prefix, enter the IP address in the Prefix parameter for the particular DHCPv6 server, select the Detail check box, and click OK. The form displays the CLI details for the specific prefix.

11 Close the DHCPv6 Server Show Leases form.

12 Close the Local DHCPv6 Server (Edit) form.

13 Close the Site (Edit) form.

14 Close the VPRN Service (Edit) form.

15 Close the Manage Services form.

Procedure 71-71 To view DHCPv6 log events

This procedure describes how to view lease not owner and pool unknown log events for local DHCPv6 servers.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

4 On the navigation tree, click on the site where you need to view DHCPv6 log events; expand the entries for that site.

5 Choose Routing Instance from the navigation tree. The Site (Edit) form opens with the General tab displayed.

6 Click on the RADIUS/DHCP/Diameter tab. The Local DHCP Servers tab is displayed.

7 Click on the DHCP V6 tab. The list of associated DHCPv6 servers is displayed.

8 Choose a DHCPv6 server and click on the Properties button. The Local DHCPv6 Server (Edit) form opens with the General tab displayed.

9 Click on the Logs tab. The Lease Not Owner Log and Pool Unknown Log tabs display.

10 Click on the tab for the type of log that you wish to display. Configure the filter criteria and click on the Search button. A list of NE SHCV event logs appears.

11 Configure the filter criteria and click on the Search button. A list of event logs appears.

12 Choose a log entry and click on the Properties button. The Log form opens.

13 View the log entry.

14 Close the Log form.

15 Close the Local DHCPv6 Server (Edit) form.

Procedure 71-72 To modify a VPRN service

Caution 1 — Modifying parameters can be service-affecting.

Caution 2 — The behavior of the VPRN service may become unpredictable if modifications to the configuration affect the IPsec portion of the service configuration. For example, if a VPRN service is configured with IPsec tunnels, IPsec SAPS, and policies are deleted, the service is not deleted from the 5620 SAM and the service will be in an inconsistent state. The IPSEC portion of the VPRN configuration must be deleted using CLI scripts or the CLI before the VPRN service can be deleted from the 5620 SAM.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Properties button. The VPRN Service (Edit) form opens with the general properties of the service displayed on the General tab.

The following tabs list the service elements that can be individually or collectively selected and configured:

- Tests tab — allows the creation and execution of service-specific diagnostic tests
- Sites tab — lists the sites that are included in the service
- L3 Access Interfaces tab — lists the L3 access interfaces that are included in the service
- Spoke SDP Bindings tab — displays the spoke SDP bindings that are associated with the service
- Addresses tab — lists the IP addresses that are associated with the service

Note — You cannot remove an IP address from an interface when the IP address of a static host is defined in the subnet of the interface IP address and the ARP Populate parameter is enabled on the Anti-Spoofing tab.

- Template tab — displays the template used to create the service, if applicable.
- Faults tab — displays the faults associated with the service

Note — Users with the administrator scope of command role can click on the Select button on the Template tab to associate a service template with the service object, if required.

4 Modify the parameters for the service, as required.

To configure items in the tabs that contain lists of service elements, select the items and click on the Properties button.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button to confirm the action. The VPRN Service (Edit) form closes and the Manage Services form reappears.

7 Click on the Close button to close the Manage Services form.

Procedure 71-73 To modify a VPRN service using the topology view

The topology view for a service provides a graphical representation of the various components and their interconnections. You can also use this view to add, modify, or just navigate to service components. This provides an alternative approach to performing these functions from the navigation tree view.

Working from the topology view can expedite the creation of the components, since many of the fields you would ordinarily have to set in the configuration forms will be automatically populated using this approach. The configuration forms can also be accessed directly at any time from this view by right-clicking a component. This allows quick access to conduct more detailed component configuration.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria. A list of services appears.

3 Choose a VPRN service and click on the Topology View button. The Service Topology map opens.

The remainder of this procedure contains a number of sub-procedures describing the various components that can be viewed, created, or modified from the topology view. These include:

- Creating a new site. Go to step 4.
- Creating site components. Go to step 9.
- Creating spoke SDP bindings. Go to step 36.
- Viewing the route target topology. Go to step 44.

Adding a new site

4 Right-click on any blank space in the service topology map. A contextual menu is displayed. Choose the Create VPRN Site option.

The Select Network Elements form opens.

5 Select one or more sites to add to the service and click OK. The VPRN Site (Create) form for the new site is displayed. If you selected more than one site, the VPRN Site (Multiple Instances) (Create) form for the new sites is displayed.

6 Click on OK. The VPRN Site (Create) (or VPRN Site (Multiple Instances) (Create)) form closes and the new site (or sites) is displayed on the map.

7 If you need to perform detailed configuration of site properties for the new site, right-click the site icon and select Properties from the contextual menu. The VPRN Site (Edit) form opens. See Procedure 71-1 for detailed site configuration information.

8 Return to step 3 for a list of other functions you can perform from the topology view or go to step 46 to finish.

Creating site components

9 Right-click on any site icon in the service topology map. A contextual menu is displayed. You can choose to create one of the following:

- VPRN L3 Access Interface. Go to step 10.
- Tunnel Interface. Go to step 15.
- VPRN Subscriber Interface. Go to step 20.
- Redundant Interface. Go to step 24.
- IP Mirror Interface. Go to step 28.
- Video Interface. Go to step 32.

10 If you choose to create a VPRN L3 Access Interface, then the VPRN L3 Access Interface (Create) form is displayed.

11 Configure the Name parameter on the General tab.

12 Click on the Port tab and assign a port to the interface.

See Procedure 71-22 for detailed information on further configuring the interface, if required.

13 Click OK. The VPRN L3 Access Interface (Create) form closes and the new L3 access interface is displayed in the topology view.

14 Go to step 35.

15 If you choose to create a tunnel interface, then the Tunnel Interface (Create) form is displayed.

16 Configure the Name parameter on the General tab.

17 Click on the Port tab and assign a port to the interface.

See Procedure 29-6 in Chapter 29 for detailed information on further configuring the interface, if required.

18 Click OK. The Tunnel Interface (Create) form closes and the new tunnel interface is displayed in the topology view.

19 Go to step 35.

20 If you choose to create a VPRN Subscriber Interface, then the VPRN Subscriber Interface (Create) form is displayed.

21 Configure the Name parameter for the interface.

See Procedure 71-59 for detailed information on further configuring the interface, if required.

22 Click OK. The VPRN Subscriber Interface (Create) form closes and the new subscriber interface is displayed in the topology view.

23 Go to step 35.

24 If you choose to create a Redundant Interface, then the Redundant Interface (Create) form is displayed.

25 Configure the Name parameter for the interface.

See Procedure 71-65 for detailed information on further configuring the interface, if required.

26 Click OK. The Redundant Interface (Create) form closes and the new redundant interface is displayed in the topology view.

27 Go to step 35.

28 If you choose to create an IP Mirror Interface, then the IP Mirror Interface (Create) form is displayed.

29 Configure the Name parameter for the interface.

See Procedure 71-63 for detailed information on further configuring the interface, if required.

30 Click OK. The IP Mirror Interface (Create) form closes.

31 Go to step 35.

32 If you choose to create a Video Interface, then the Video Interface (Create) form is displayed.

33 Configure the Name parameter for the interface.

See Procedure 30-1 in Chapter 30 for detailed information on further configuring the interface, if required.

34 Click OK. The Video Interface (Create) form closes and the new video interface is displayed in the topology view.

35 Return to step 3 for a list of other functions you can perform from the topology view or go to step 46 to finish.

Creating spoke SDP bindings

36 Select the sites you need to connect in the service topology map and right-click on any one of them. A contextual menu is displayed.

Note — When you create a spoke binding between two sites, the order in which you select them is important. The first site you select will become the source site and the second site will become the destination site. Therefore, it is not recommended that you do a marquee-select in the topology view, since you will not be sure of this hierarchy. Instead, select the sites individually, and hold down the Shift or Ctrl key after your first selection.

37 Select Connect from the contextual menu and choose the Create Spoke SDP Binding option.

The Spoke SDP Binding (Create) form is displayed.

Note — For this function, it is assumed that you clicked on the source site first and then held down the Shift or Ctrl key while right-clicking on the destination site to display the contextual menu.

38 Enable the Auto-Select Transport Tunnel parameter.

39 You can manually configure other parameters here if required, or click on the OK button. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Spoke SDP Binding (Create) form closes and the new binding between the two sites is displayed in the topology view. See Procedure 71-56 for more detailed information on creating and configuring spoke SDP bindings, if required.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. See Chapter 27 for information about how to create the required tunnel. After the tunnel is created, you can repeat this sub-procedure.

40 Assuming that the spoke SDP binding was successfully created in step 39, select the same two sites again in the topology view, although this time do so in the opposite order that you originally selected them. This allows you to create a spoke binding for the return tunnel.

41 Right-click on the second site you selected and choose the Create Spoke SDP Binding ... option from the contextual menu. The Spoke SDP Binding (Create) form is displayed.

42 You can manually configure other parameters here if required, or click on the OK button. One of the following will result:

- If an available transport tunnel exists between the two sites, then the Spoke SDP Binding (Create) form closes and the new return binding between the two sites is displayed in the topology view.
- If an available transport tunnel does not exist between the two sites, then an error message is displayed to that affect. See Chapter 27 for information about how to create the required tunnel. After the tunnel is created, you can repeat this sub-procedure.

43 Return to step 3 for a list of other functions you can perform from the topology view or go to step 46 to finish.

Viewing the route target topology

44 Right-click on any blank space in the service topology map. A contextual menu is displayed. Choose the Highlight Route Target Topology option.

This option essentially draws dotted lines to represent the route target topology between NEs. For example, for two NEs A and B, if the import and export route targets match, then two dotted lines will be drawn on the map. One will represent the route target going from A to B, and the other from B to A.

45 Return to step 3 for a list of other functions you can perform from the topology view or go to step 46 to finish.

46 Close the Service Topology form.

47 Close the Manage Services form.

Procedure 71-74 To delete a VPRN service

Warning — Deleting a service may result in a service disruption for customers. Consider the implication of deleting the service before proceeding.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 As required, configure the filter criteria to locate the service or range of services to be deleted. A list of services appears.

3 Choose a service or a range of services from the list.

Note 1 — You cannot delete a VPRN service when IPsec security policies, interfaces, or tunnels are configured. See the appropriate node documentation for more information about modifying or deleting IPsec configurations.

For example, if a VPRN service is configured with IPsec tunnels, IPsec SAPS, and policies is deleted, the service is not deleted from the 5620 SAM and the service will be in an inconsistent state. The IPSEC portion of the VPRN configuration must be deleted using the CLI scripts or through the CLI before the VPRN service can be deleted from the 5620 SAM.

Note 2 — The L3 interface properties for the IPSEC SAP cannot be configured using the 5620 SAM.

4 Click on the Delete button. A warning form opens. This form is dynamic based on the priority of the service. Perform one of the following:

a For services with a low priority, go to Step 5.

b For services with a medium priority, configure the “Enter the highest priority of the service being deleted” text field by typing: Medium. Go to Step 5.

c For services with a high priority, configure the “Enter the highest priority of the service being deleted” text field by typing: High. Go to step 5.

5 For all services regardless of how their priority is configured, acknowledge the check box that prompts you confirm that you understand the implications of deleting the service.

Note — If you select multiple services with different priorities, you must enter the highest priority level of selected services before you can delete the services.

6 Click on the Yes button to confirm the action. The service is deleted and removed from the list.

7 Click on the Close button to close the Manage Services form.

72 — PW routing and dynamic MS-PW service management

72.1 PW routing and dynamic MS-PW service management overview *72-2*

72.2 Workflow to configure PW routing and dynamic MS-PW services *72-3*

72.3 PW routing and dynamic MS-PW service management procedures *72-5*

72.1 PW routing and dynamic MS-PW service management overview

Service providers require a solution for interconnecting customer sites that span different domains, such as MAN-WAN or Inter-AS (in the same Service Provider or Inter-Provider). The 5620 SAM supports two methods for interconnecting customers sites:

- PW routing
- MS-PW routing

PW routing

The 5620 SAM supports inter-domain services for VLL through the use of VLL spoke switching, which allows creation of a VLL service by cross-connecting two spoke SDPs. However, this requires statically configuring the PW switching points at the gateway S-PEs between domains. See "VLL spoke switching" in chapter 67 for more information.

Static PW routing is supported on the 7450 ESS, 7710 SR, and 7750 SR, and on a Release 11.0 or later 7950 XRS.

MS-PW routing

Multi-Segment Pseudo-Wire routing provides solutions for inter-domain services by using dynamic MS-PW routing and signaling, in which the switching points are automatically instantiated in the Switching-Provider Edge (S-PE) NEs. The path of the MS-PW is dynamically signaled end-to-end by T-LDP, using PW routing information stored in the S-PEs by MP-BGP. Per-PW configuration is only required at the endpoints of the MS-PW in the Termination-Provider Edge (T-PE) NEs.

Dynamic MS-PWs are characterized by the following:

- They are supported for VLL Epipe services
- Dynamic and static routes, as well as explicit paths for MS-PWs are supported
- Dynamic MS-PWs may be established across LDP or RFC 3107 labeled BGP SDPs
- Dynamic MS-PWs may be used as a part of a set of PWs for PW redundancy, including MC-LAG. Diverse routes for the active and standby MS-PWs can be configured by using explicit paths, or dynamically by using a BGP route distinguisher.
- Diverse routes for the active and standby MS-PWs can be achieved by using explicit paths or dynamically using a BGP route distinguisher.

Dynamic MS-PWs are supported on Release 9.0 R3 and later 7450 ESS, 7710 SR, 7750 SR chassis types that support Epipe service creation, and on the 7950 XRS.

Dynamic MP-PW services

Spoke SDP FEC configuration will bind a service to an existing Service Distribution Point (SDP), using a dynamic MS-PW. When using dynamic MS-PWs, the particular SDP to bind to is automatically selected based on the Target Attachment Individual Identifier (TAII) and the path to use, specified under the Spoke SDP FEC. The selected SDP will terminate on the first hop S-PE of the MS-PW. Therefore, an SDP should be defined that can reach the first hop of the MS-PW. The NE creates a spoke SDP binding to associate an SDP with a service. If the required SDP does not exist, the NE creates one based on the parameters specified in the spoke SDP FEC, for example, the SAII/TAII, Path, or PW template. The Creation Mode attribute for such an SDP indicates Multi-Segment PW.

This differs from the regular spoke SDP binding creation in that it creates a spoke SDP binding using a PW with the FEC128. However, the Spoke SDP FEC enables PWs with other FEC types to be used.

Spoke SDP FEC configuration is currently only applicable to an Epipe site. It can be configured under the Epipe service or at a service endpoint of an Epipe site, with or without ICB. The creation under an Epipe service is demonstrated in Procedure 72-3.

72.2 Workflow to configure PW routing and dynamic MS-PW services

The following workflow lists the high-level steps required to configure PW routing and dynamic MS-PW services. Enabling MS-PW support requires configuration in the following areas:

- network commissioning
- SR NE pre-provisioning
- dynamic MS-PW service
- optional PW routing and MS-Service tasks

Network commissioning

1 To use PW routing to establish dynamic pseudo-wires from source to destination, without using static routes and a specified path:

   a Enable BGP on the routing instance of the required node. See Procedure 23-1 for more information.

   b Configure the BGP Family parameter to include the options MS-PW and IPv4. This must be done on the BGP site, associated BGP groups, and BGP peers.

   Refer to the following procedures:

   - BGP Site configuration: See step 25 in Procedure 23-2
   - BGP Peer Group configuration: See step 22 in Procedure 23-4
   - BGP Peers configuration: See step 21 in Procedure 23-5

2 If more than one equal cost route is required for the PW routing, configure the following:

a In the routing instance for the required NE, set the Maximum Number of Equal Cost Routes parameter to a value greater than 1. See step 19 in Procedure 22-1.

b For the required BGP Site, set the Multi Path parameter to a value greater than 1. See step 9 in Procedure 23-2.

3 Configure a routing policy with the Family parameter having the MS-PW option enabled. This will then be exported under the BGP site. See step 26 in Procedure 22-15.

4 If path diversity is required for primary/standby MS-PWs, perform the following:

a Configure a routing policy having multiple statement entries, each associated with a different community, from a different neighbour, with family including MS-PW and a local preference. The communities configured here are used further on in the procedure when configuring a MS-PW local prefix. See Procedure 22-15 for more information, with attention to steps 28 and 29.

b Import the above policy under the BGP site. See Procedure 23-2 for more information.

5 If there are ASBRs, set Next Hop Self to True under each peer group. For example, set one for the inner-AS and one for the external-AS. Without this setting, the SDPs created by MS-PW routing only reach to the BGP interface's IP address, but not the system ID. See step 11 in Procedure 23-4. Refer also to Chapter 71 for information on ASBRs.

6 If all T-PEs and S-PEs are within the same AS, then the S-PEs must be configured as route reflectors (RR). Perform the following:

a Set the Cluster ID parameter on the BGP site or BGP peer group that includes the T-PEs as BGP peers on the S-PE. See step 4 in Procedure 23-2.

Note — Two T-PEs can not be configured as BGP peers to each other. They must be configured as BGP peers of the RR.

b Configure a routing policy with Advertise Next Hop Self set to true and Action set to Accept, and then export this policy under the BGP site. See step 9 in Procedure 22-15.

This completes the summary of essential network commissioning requirements.

SR NE pre-provisioning

7 Configure PW routing:

a using the navigation tree (see Procedure 72-1)

b using the Manage Services form (see Procedure 72-2)

Configure a dynamic MS-PW service

8 Configure a dynamic MS-PW service using PW routing. See Procedure 72-3.

Optional PW routing and MS-Service tasks

9 As required, perform one or more of the following:

a On-demand resync of the MS-PW routing table for a specified NE is supported and can be accessed from a number of places in the 5620 SAM. See Procedure 72-4 for information on displaying MS-PW routing tables.

b Conduct various spoke SDP FEC operations from the endpoint of an Epipe site. See Procedure 72-5.

c Discover and manage MS-PW switching sites. See Procedure 72-6.

d Run an OAM VCCV Ping or Trace validation test for the MS-PW service. See Procedure 72-7.

72.3 PW routing and dynamic MS-PW service management procedures

This section contains the configuration and management procedures required to configure PW routing and dynamic MS-PW services using the 5620 SAM.

Procedure 72-1 To configure PW routing using the navigation tree

This procedure creates service routes for the MS-PW routing on the NE using the navigation tree. Configuration of the following steps is required on the T-PE or S-PE, as detailed.

1 Right-click on a discovered device in the navigation tree and choose Properties from the contextual menu. The properties form for the device opens.

2 Click on the Globals tab and then the Service sub-tab.

3 Click on the PW Routing sub-tab and then its General sub-tab.

4 Configure the parameters:

- SPE Address
- Boot Timer (seconds)
- Retry Timer (seconds)
- Retry Count

The SPE Address must be unique in the network. This parameter must be configured on all T-PEs and S-PEs that are involved in this PW routing.

The Number of BGP Routes, Number of Static Routes, Number of Local Routes, and Number of Host Routes attributes are for information only and can be resync-ed from the NE.

5 Click on the Local Prefixes sub-tab under PW Routing.

6 Click the Create button. The PW Routing NE Local Prefix (Create) form opens.

7 Configure the Local Prefix parameter.

You must configure this parameter to enable the MS-PW routing configuration on a T-PE node. This Local Prefix is also used in other portions of the MS-PW configuration, such as setting static routes on the remote T-PE or intermediate S-PEs, and setting Source Attachment Individual Identifier (SAII) and Target Attachment Individual Identifier (TAII) addresses on a spoke SDP FEC on the T-PE.

8 Click the Create button in the BGP RD panel. The PW Routing NE BGP RD (Create) form opens.

A route distinguisher must be configured to enable this local prefix to be advertised by MP-BGP to the network.

9 Configure the Route Distinguisher parameter.

10 Click the Select button to configure the BGP Community parameter.

The Community can only be selected from the list. Members were created as part of the routing policy configuration in Procedure 22-15 and importing the routing policy under the BGP site in Procedure 23-2.

11 Click on OK.

12 Repeat steps 8 to 11 to create up to four route distinguishers per local prefix.

13 Repeat steps 5 to 13 to create up to 16 local prefixes per NE. The local prefixes you create must be unique in the network.

14 Click the OK button. The PW Routing NE Local Prefix (Create) form closes.

At this point the NE can start to advertise the defined local prefix to its BGP peers.

15 Click on the Static Routes sub-tab under PW Routing.

16 Click the Create button. The PW Routing NE Static Route Configuration (Create) form opens.

A static route can be configured on both the T-PE and S-PE, based on your requirements.

17 Click the Select button to configure the Target T-PE's PW Address parameter.

This specifies the local prefix defined in the remote T-PE. It can be selected from a managed T-PE or S-PE, or directly entered.

18 Click the Select button to configure the Next Hop parameter.

This specifies the system IP address of the next-hop S-PE or T-PE. It can be selected from a managed T-PE or directly entered.

19 Click the OK button. The PW Routing NE Static Route Configuration (Create) form closes.

At this point the NE can start to advertise the defined static route to its BGP peers.

20 Click on the Configured Paths sub-tab under PW Routing if you need to configure an explicit path. All such configured paths are displayed in the list.

The path should be configured on the T-PEs, which is then used in the spoke SDP FEC to establish a pseudo-wire through the specified path.

21 Click the Create button. The PW Routing NE Path Configuration (Create) form opens, with the General tab displayed.

22 Specify a Path Name.

23 Click the Create button in the Hops panel. The PW Routing Hop (Create) form opens.

24 Configure the Hop ID parameter.

25 Configure the Hop Address parameter.

This specifies the system IP address of the next-hop S-PE or T-PE (where the T-LDP session to a given S-PE terminates). It can be entered directly or chosen from the managed S-PE or T-PE by clicking the Select button.

26 Click the OK button. The PW Routing Hop (Create) form closes.

27 Repeat steps 23 to 26 to create the required hops.

28 Click the OK button. The PW Routing NE Path Configuration (Create) form closes.

Procedure 72-2 To create, modify, or view a PW routing NE configuration using the Manage Services form

Perform this procedure to create, modify, or view a PW Routing NE configuration using the Manage PW Routing NE Configuration form. This is an alternative approach to the SR NE pre-provisioning section detailed in the procedural workflow in Procedure 72-1.

1 Choose Manage→Service→PW Routing NE Configuration from the 5620 SAM main menu. The Manage PW Routing NE Configuration form opens.

2 Configure the drop-down filter criteria for PW Routing NE Path Configuration and click the Search button. A list of PW Routing NE configurations appears in the form.

3 Choose the required PW Routing NE configuration and click on the Properties button. The PW Routing NE Configuration (Edit) form opens with the General tab displayed.

4 Configure the parameters, as required:

- SPE Address
- Boot Timer (seconds)
- Retry Timer (seconds)
- Retry Count

5 Click the Local Prefixes tab.

6 Click the Search button and then Properties for an existing prefix, or the Create button for a new one from this tab. If you are creating a new local prefix, configure the Local Prefix parameter on the General tab of the PW Routing NE Local Prefix form.

Whether you are working with an existing or a new local prefix, you can also search for or create new BGP RDs for the current prefix.

7 Click the Search button and then Properties for an existing BGP RD, or the Create button for a new one from this tab. If you are creating a new BGP RD, configure the Route Distinguisher and Community parameters in the PW Routing NE BGP RD (Create) form.

8 Click OK to close the PW Routing NE BGP RD (Create) form. The new BGP RD appears in the list.

9 If there are local spoke SDP FECs associated with this local prefix, click the Local Spoke SDP FECs tab to list them. Select an item from the list and click Properties to view the object information, if required.

10 Click the Static Routes tab.

11 Click the Search button and then Properties for an existing static route, or the Create button for a new one from this tab. If you are creating a static route, configure the Target T-PE's PW Address and Next Hop parameters in the PW Routing NE Static Route Configuration (Create) form.

12 Click OK to close the PW Routing NE Static Route Configuration (Create) form. The new static route appears in the list.

13 Click the Configured Paths tab.

14 Click the Search button and then Properties for an existing path configuration, or the Create button for a new one from this tab. If you are creating a new path configuration, configure the Path Name parameter on the General tab of the PW Routing NE Path Configuration form.

Whether you are working with an existing or a new path configuration, you can also search for or create new Hops for the current configuration.

15 Click the Search button and then Properties for an existing Hop, or the Create button for a new one from this tab. If you are creating a new Hop, configure the Hop ID and Hop Address parameters in the PW Routing Hop (Create) form.

16 Click OK to close the PW Routing Hop (Create) form. The new Hop appears in the list.

17 If there are spoke SDP FECs associated with this path configuration, click the Spoke SDP FECs tab to list them. Select an item from the list and click Properties to view the object information, if required.

18 Click OK to close PW Routing NE Configuration (Edit) form.

Procedure 72-3 To configure a dynamic MS-PW service using PW routing

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria for Service→VLL (VLL)→Epipe Service→(Epipe). A list of services appears at the bottom of the Manage Services form.

3 Choose the required VLL Epipe service that contains the T-PE site and click on the Properties button. The Epipe Service (Edit) form opens with the General tab displayed.

4 Click on the Spoke SDP FECs tab.

5 Click the Create button. The Spoke SDP FEC (Create) form opens.

Note — Only one spoke can be configured on the terminating site, including both regular spoke SDP bindings and spoke SDP FECs.

6 Configure the parameters:

- PW ID
- Auto-Assign ID
- SAII Address
- SAII AC ID
- Auto Config
- TAII Address
- TAII AC ID
- Administrative State
- Signaling Type
- Retry Timer (seconds)
- Retry Count
- Path
- PW Template

The Auto Config parameter enables automatic endpoint configuration. This allows the configuration of a spoke SDP endpoint without specifying the TAII associated with that spoke SDP. In this mode, the far end T-PE actively initiates MS-PW signaling and will send the initial label mapping message using T-LDP, while the T-PE for which Auto Config is specified will act as the passive T-PE. The Auto Config parameter cannot be enabled if the Signaling Type is set to Master or if the TAII Address is specified.

If you are going to use SAII and TAII addresses instead of Auto Config, then you must decide which method will be used for the PW routing.

- For dynamic PW routing, the local prefix associated with the SAII/TAIl address should be configured with a route distinguisher, with an optional community (refer to steps 8 to 12 in Procedure 72-1). The SAII and TAII addresses must be unique in the network.
- For static routing, the local prefix should be associated with static routes configured under PW routing (refer to steps 15 to 19 in Procedure 72-1). A spoke SDP FEC cannot be turned up if no local prefix is configured under PW routing.
- When using a specified path, the Path parameter must be configured. The associated Select button allows you to select a path that will be used for this spoke SDP and which is configured under PW Routing. If no path is configured, then each next hop of the MS-PW used by the spoke SDP will be chosen locally at each S-PE and T-PE, using dynamic PW routing.

7 If redundancy is required, specify an Endpoint using the associated Select button.

8 Configure the parameters:

- Inter-Chassis Backup
- Precedence
- Active State
- Enable PW Standby Signaling Slave

9 Click the Return Spoke SDP FEC tab to configure a return spoke SDP FEC, as required.

This tab is only displayed when the TAII Address configured in step 6 was set by selection for the current spoke SDP FEC.

10 Configure the PW ID parameter for the return spoke SDP FEC and click Apply.

When a valid PW ID for the return spoke SDP FEC is entered, additional parameters are displayed. If the PW ID is not valid, then the return spoke SDP FEC will not be created.

11 Configure the parameters:

- Signaling Type
- Auto Config
- Path
- PW Template
- Set ICB

12 Specify an Endpoint using the associated Select button.

When the return spoke SDP FEC is created, it will have corresponding attributes such as the SAII and TAII Address values and AC ID cross-matching with the current spoke SDP FEC.

13 Click OK to apply the configurations and close the Spoke SDP FEC (Create) form.

When a spoke SDP FEC is successfully created, it will be listed under the Spoke SDP FECs tab for this Epipe site.

14 Select the spoke SDP FEC from the list and click Properties.

The spoke SDP FEC should contain the following tabs: General, Spoke SDP Associated, Tests, and Faults.

The Spoke SDP Associated tab will list the spoke SDP bindings created by using this Spoke SDP FEC for MS-PW routing. All such spoke SDP bindings have their Creation Mode attribute set as Multi-Segment PW. The related SDP FEC Auto-bind tab shows the associated SAII or TAII defined in the Spoke SDP FEC.

The Faults tab will display any mis-configuration alarms associated with this spoke SDP FEC.

15 Close the Epipe Service (Edit) form.

When the configuration for both T-PEs is complete, the NEs can start negotiating and establishing the spoke SDP bindings from T-PE to S-PE and from S-PE to T-PE.

Procedure 72-4 To display MS-PW routing tables

On-demand resync of the MS-PW routing table for a specified NE is supported and can be accessed from a number of places in the 5620 SAM.

1 Select an applicable NE from one of the following locations:

- Navigation tree
- Physical Topology map
- Service Tunnel map

2 Right-click the NE to open the pop-up menu.

3 Click on the Show MS-PW Routes and select one of the following show commands:

- BGP
- Service

The Service Routing rtr BGP or Service Routing rtr Service form opens accordingly. The requested routing table information is presented, along with a detailed status/error report.

4 Close the Service Routing rtr report form.

Procedure 72-5 To perform spoke SDP FEC operations from an endpoint

Perform this procedure to conduct various spoke SDP FEC operations from the endpoint of an Epipe site.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria for Service→VLL (VLL)→Epipe Service→(Epipe). A list of services appears at the bottom of the Manage Services form.

3 Choose the required VLL Epipe service that contains the primary and backup spoke SDP FECs and click on the Properties button. The Epipe Service (Edit) form opens with the General tab displayed.

4 Expand the Spoke SDP FECs item under the required Epipe site in the navigation tree.

5 Right-click the required Spoke SDP FEC. A pop-up menu appears. Select the required action:

- Force Switchover
- Clear Forced Switchover
- Turn Up
- Shut Down
- Delete
- Resync
- Properties

The Forced Switchover and Clear Forced Switchover options are only applicable where the Epipe site has been configured for redundancy, as detailed in Procedure 72-3. The switchover applies to the primary and backup spoke SDP FECs configured on the Epipe site.

6 Close the Epipe Service (Edit) form.

Procedure 72-6 To discover and manage MS-PW switching sites

With PW routing configured on T-PEs and S-PEs, and spoke SDP FECs configured on the T-PEs, the SR 7x50 will establish the pseudo-wires between T-PEs. This includes creating switching sites between two T-PEs. A switching site for MS-PW is a read-only site (nothing can be modified) and it cannot be deleted. It is controlled by the NE.

Use the following method to discover such sites, if required.

Note 1 — The switching sites and spoke SDP bindings created by MS-PW routing are tagged with their Creation Mode attribute indicating Multi-Segment PW (as opposed to Manual for non-MS-PW entities).

Note 2 — When a switching site is discovered, the associated spoke SDP bindings under it are also discovered and re-synced. The 5620 SAM will create a composite service and connector(s) if there are matching spoke SDP bindings found in other Epipe services (based on cross-matching of the spoke SDP ingress/egress labels). The related service is added to the newly-created composite service.

1 Conduct an RCA Audit to discover switching sites, if required. This is done within the Epipe service that contains the T-PEs having MS-PW configured. The audit will find all MS-PW switching sites associated with T-PEs in this service and provide management solutions.

Refer to Procedure 80-1 for details on configuring an RCA audit.

2 Perform Procedure 80-2.

Procedure 72-7 To conduct MS-PW routing OAM tests

The MS-PW routing configuration can be tested using OAM VCCV Ping and Trace tests.

1 To conduct a VCCV Ping test refer to Procedure 32-23.

The test can be created either from the Service Test Manager or from a configured Epipe service, Epipe site, or a Spoke SDP FEC.

If you choose a spoke SDP binding created by MS-PW routing, the VCCV ping is specifically for MS-PW, and the SAII and TAII parameters will be auto-filled. This allows you to conduct a MS-PW VCCV Ping on an S-PE.

If the test is created from a configured Spoke SDP FEC, the test object will be auto-filled with the configured spoke SDP FEC.

Alternatively, if the test is created from the Service Test Manager, an Epipe service, or an Epipe site (both the termination site and the switching site), then you must select a spoke SDP FEC (only for T-PE) or a spoke SDP binding of type FEC 129 created by the MS-PW routing.

2 To conduct a VCCV Trace test refer to Procedure 32-24.

The test can be created either from the Service Test Manager or from a configured Epipe service, Epipe site, or a Spoke SDP FEC.

If the test is created from a configured Spoke SDP FEC, the test object will be auto-filled with the configured spoke SDP FEC.

Alternatively, if the test is created from the Service Test Manager, an Epipe service, or an Epipe site (both the termination site and the switching site), then you must select a spoke SDP FEC (only for T-PE) or a spoke SDP binding of type FEC 129 created by the MS-PW routing.

Note 1 — When configuring either a VCCV Ping or VCCV Trace test for dynamic MS-PW from an S-PE, the Reply Type must be set to IP.

Note 2 — If the selected spoke SDP binding is created by MS-PW routing, you can only conduct a VCCV ping for MS-PW FEC129, not for FEC128.

Note 3 — If a PW template is used in the Spoke SDP FEC configuration, it must have its Enable Control Word parameter enabled, since both VCCV Ping and Trace require Control Word support.

3 To create a Test Suite refer to Procedures 77-4 and 77-8.

A Test suite can be generated based on the selected policy for a specified VLL Epipe service.

If the selected policy has its Entity Type set to VLL Service, then the VCCV Ping and VCCV Trace tests that are generated will adhere to the following:

- No tests are generated for spoke SDP bindings created by MS-PW routing.
- Both VCCV Ping and VCCV Trace tests for MS-PW will be generated if there are spoke SDP FECs in the specified Epipe service.

If the selected policy has its Entity Type set to Service Connector, then there is also no test generated for the spoke SDP bindings created by MS-PW.

73 — Service PW template policy management

73.1 Service PW template policies overview *73-2*

73.2 Workflow to configure PW template policies *73-2*

73.3 Service PW template policies procedures *73-2*

73.1 Service PW template policies overview

Service PW templates policies enable you to automatically create SDP bindings on NEs that support BGP AD VPLS. PW templates contain the configuration to use when the 5620 SAM creates SDP bindings automatically through BGP AD. PW templates use the 5620 SAM policy distribution model to distribute the template to the NEs.

To prevent unwanted service disruptions, NEs do not automatically reconfigure SDP bindings when a change is made to the PW template from which they were generated. You can manually trigger a template re-evaluation to cause the NEs to re-configure SDPs to match the configuration in the template. PW templates can be re-evaluated at three levels:

- service
- service site
- local definition of PW template policy

When you re-evaluate a PW template from the local definition of the PW template policy, the 5620 SAM re-evaluates the selected template for all of the VPLSs on the selected site.

When you re-evaluate a PW template from the service site, the 5620 SAM re-evaluates the selected template on the selected service site.

When you re-evaluate a PW template from the service, the 5620 SAM re-evaluates the selected template on all sites in the VPLS.

73.2 Workflow to configure PW template policies

The following workflow lists the high-level steps required to create and manage a service PW template policy.

1 Create a PW template policy. See Procedure 73-1.

2 Release and distribute the PW template policy to each NE that is or will be a component of the VPLS or BGP VPLS. See Procedure 73-2.

3 Reevaluate PW template when a configuration change is made to the PW template. See Procedure 73-3.

73.3 Service PW template policies procedures

The following procedure describes how to manage service PW template policies.

Procedure 73-1 To create a PW template policy

1 Choose Manage→Service→Service PW Template Policies from the 5620 SAM main menu. The Manage Service PW Template Policies form opens.

2 Click on the Create button. The Service PW Template (Create) form opens with the General tab displayed.

3 Perform one of the following:

a Click on the Populate from Pseudowire button. If this button is not visible, click on the More Actions button and choose Populate from Pseudowire.

This allows you to populate the Service PW Template form using an existing pseudowire (SDP Binding) as a base.

i After choosing Populate from Pseudowire, the Select a Pseudowire form opens.

ii Click on the Search button.

iii Choose the required pseudowire from the displayed list.

iv Click on OK. All of the relevant values are copied into the Service PW Template form.

v Go to step 22.

b Populate the form manually.

i Configure the parameters:

- Policy ID
- Auto-Assign ID
- Description
- Enable Hash Label
- Enable Signal Capability
- Use Provisioned SDP
- Force VLAN VC Forwarding
- Enable Control Word
- VC Type
- Collect Stats
- Block On Peer Fault

Note 1 — The Block On Peer Fault parameter takes effect only when PW status signaling is enabled.

Note 2 — The Block On Peer Fault parameter is not configurable on a spoke SDP that is on an MC LAG or an endpoint.

ii Select an Accounting Policy, if required, by clicking on the Select button. The Select Accounting Policy form opens.

iii Select an accounting policy and click OK, or create a new one by clicking on the Create button.

4 Click on the MAC tab.

5 Configure the following parameters, as required:

- MAC Learning
- MAC Aging
- Discard Unknown Source
- Limit MAC Move
- MAC Pinning
- VLAN VC Tag
- MAC Address Limit
- Restrict Protected Source (MAC)
- Restrict Protected Source Action (MAC)
- Auto Learn MAC Protect (MAC)

6 Click on the Split Horizon Group tab.

7 Configure the following parameters, as required:

- Split Horizon Group Name
- Description
- Restrict Protected Source (Split Horizon Group)
- Restrict Protected Source Action (Split Horizon Group)
- Restrict Unprotected Destination
- Auto Learn MAC Protect (Split Horizon Group)

8 Click on the Ingress Filters tab.

9 Configure the Ingress Filter Type parameter, if required.

10 Click on the Egress Filters tab.

11 Configure the Egress Filter Type parameter, if required.

12 Click on the IGMP tab.

13 Configure the following parameters, as required:

- IGMP Version
- IGMP Fast Leave
- IGMP Import Policy
- IGMP Last Member Interval (deciseconds)
- IGMP Max Number Groups
- IGMP Max Number Sources Per Group
- IGMP General Query Interval (seconds)
- IGMP Query Response Interval (seconds)
- IGMP Robust Count
- IGMP Send Queries

14 Click on the QoS tab.

15 Configure the required parameters in the Ingress Forwarding Plane Redirect panel:

i Click on the Network Policy Select button to assign a policy to the PW template. The Select Network Policy form opens.

ii Choose a policy from the list and click on the OK button. The Network Policy form closes.

iii Click on the Ingress Queue Group Template Policy Select button to assign a policy to the PW template. The Select Ingress Queue Group Template Policy form opens.

iv Choose a policy from the list and click on the OK button. The Ingress Queue Group Template Policy form closes.

v Configure the Instance ID parameter.

16 Click on the Tunnel Admin Groups tab.

Note — You can apply the inclusion or exclusion of tunnel administrative groups only if you set the Use Provisioned SDP parameter to true in step 3b i.

17 Click on the tunnel administrative groups that you need to include in the PW template policy in the Included Admin Groups-Unassigned panel. You can choose multiple groups by holding down the CTRL key when you click on the group.

18 Click on the right arrow to move the selected administrative groups into the Included Admin Groups-Assigned panel. You can move an assigned administrative group to the unassigned portion of the form if required, by selecting the group and clicking on the left arrow.

19 Click on the tunnel administrative groups that you need to exclude from the PW template policy in the Excluded Admin Groups-Unassigned panel. You can choose multiple groups by holding down the CTRL key when you click on the group.

20 Click the right arrow to move the selected administrative groups into the Excluded Admin Groups-Assigned panel. You can move an assigned tunnel administrative group to the unassigned portion of the form, if required, by selecting the group and clicking the left arrow

21 Configure the required parameters in the Egress Port Redirect panel:

- **i** Click on the Network Policy Select button to assign a policy to the PW template. The Select Network Policy form opens.
- **ii** Choose a policy from the list and click on the OK button. The Network Policy form closes.
- **iii** Click on the Egress Queue Group Template Policy Select button to assign a policy to the PW template. The Select Egress Queue Group Template Policy form opens.
- **iv** Choose a policy from the list and click on the OK button. The Egress Queue Group Template Policy form closes.
- **v** Configure the Instance ID parameter.

22 Click on the OK button to confirm your changes. The Service PW Template - Local Policy - (Edit) form closes.

23 Click on the OK button to close the Service PW Template - Global Policy form.

Procedure 73-2 To distribute a PW template policy

Use this procedure to manually distribute PW template policies that are used by BGP AD capable NEs and to configure the distribution mode of local policies.

When you distribute a global policy, local policies using the Sync With Global distribution mode allow the NE to receive the policy.

Note — Local policies using the Local Edit Only distribution mode do not allow the NE to receive the distribution of a global policy. You must ensure that the policy distribution mode for the local policy is set to Sync With Global if you need the NE to receive the distribution of a global policy.

1 Choose Manage→Service→Service PW Template Policies from the 5620 SAM main menu. The Manage Service PW Template Policies form opens.

2 Click on the Search button.

3 Choose the policy or policies that you need to distribute.

4 Perform steps 5 to 24 in Procedure 42-1 to release and distribute the Service PW Template Policy.

Procedure 73-3 To reevaluate a PW template policy on a local definition after a configuration change

Perform the following procedure to cause the NEs to re-configure SDPs to match the configuration in the template when a PW template policy is modified. This causes a re-evaluation of the selected template for all VPLS services on the selected NE.

You can also reevaluate a PW template policy at the service and service site levels.

1 Choose Manage→Service→Service PW Template Policies from the 5620 SAM main menu. The Manage Service PW Template Policies form opens.

2 Choose a PW template policy and click on the Properties button. The Service PW Template Policy (Edit) form opens with the General tab displayed.

3 Click on the Local Definitions tab.

4 Choose the NE on which you need to re-evaluate the PW template policy. The Service PW Template - Local Policy (Edit) form opens with the General tab displayed.

5 Click on the Re-evaluate PW Template button to run an evaluation of the modified template. If this button is not visible, click the More Actions button and choose Re-evaluate PW Template. The 5620 SAM performs a re-evaluation of the selected template for all VPLS services on the selected NE.

6 A dialog box appears indicating if the re-evaluation was successful. If it was not, the reason for the failure is displayed. If you make any subsequent modifications, you can re-evaluate the template again. Click on the OK button.

7 Close the Service PW Template - Local Policy - (Edit) form.

8 Click on the OK button to close the Service PW Template - Global Policy form.

74 — Composite service management

74.1 Composite service management overview *74-2*

74.2 Sample composite service configuration *74-7*

74.3 Workflow to create a composite service *74-8*

74.4 Composite service management procedures *74-9*

74.1 Composite service management overview

A composite service is a set of linked services. Composite service functionality supports complex applications that require a combination of services, such as VLAN connections to an HVPLS, an IES spoke into a VPLS, or a VPRN-to-VPLS interconnection.

Services that are owned by different customers can be connected to form a composite service. An example is an HVPLS in which the core VPLS belongs to one customer and the satellite VPLS instances belong to other customers. An HVPLS is considered to be a composite service by the 5620 SAM.

Composite services consist of customer services, called SCs in the context of a composite service, and connectors. A connector is a bidirectional logical link between two SCs, such as a pair of PW spokes that carry traffic in opposite directions between VLL and VPLS instances, a dot1q-encapsulated link between a VLAN and a VPLS, or an internal cross-connect.

The term SCP describes a type of connector endpoint. In the case of the services that are available on the 7210 SAS, 7450 ESS, 7710 SR, 7750 SR, or the 7950 XRS, an SCP is a service interface or SAP. For L2 switches, an SCP may be a network interface, such as an uplink port.

Composite services exist only in the context of the 5620 SAM and are configured through the 5620 SAM GUI or an OSS application. They are unknown to individual network devices. To simplify composite service configuration and to ensure that non-5620 SAM device configuration does not disrupt the management of composite services, the following rules apply to the creation, deletion, modification, and presentation of composite services.

- A composite service can have zero SCs.
- A composite service can have zero connectors.
- Two connected SCs can belong to only one composite service.
- A connector between two SCs belongs to only one composite service.
- An SC cannot be removed from a composite service until its connector to the composite service is removed.
- A group of connected services can be moved from one composite service to another.

The 5620 SAM supports composite-service configuration using the following methods.

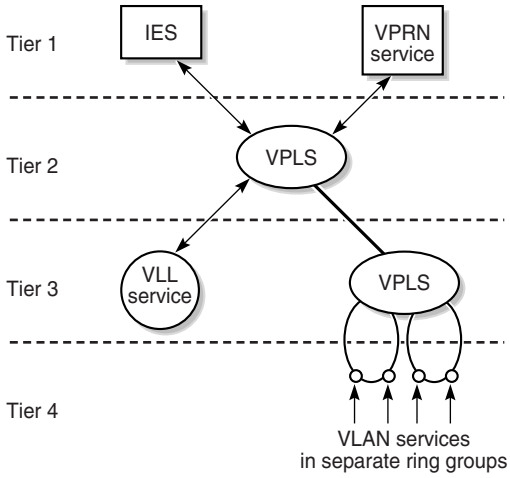
- Tabbed configuration forms with an embedded navigation tree that provides a logical, hierarchical view of the composite service and acts as a configuration interface. When you right-click on an object in the navigation tree, a menu specific to the object appears. When you choose an object in the menu, the related configuration form opens.
- Connector creation and configuration from within the composite service's flat topology view
- Pre-configured template. A user who is assigned the service management scope of command role can create a composite-service template. The service management user can also create a connector template. See "Managing

templates" in the *5620 SAM Scripts and Templates Developer Guide* for more information about the administrative tasks associated with creating and using templates.

If a service that is specified for inclusion in a composite service does not currently belong to a composite service, it is added to the composite service regardless of its administrative or operational state. If the specified service is part of an existing composite service, it can be moved to a different composite service. However, SCs that are connected to the specified service are also moved to the new composite service upon confirmation of the action by the 5620 SAM operator. The 5620 SAM performs no such action confirmation for OSS applications.

Services within a composite service can have the same service ID, service type, and customer ID. For example, a VPLS with service ID 5 on one NE and an IES service with service ID 5 on another NE can be combined to create a composite service.

Hierarchical organization of composite services



The 5620 SAM organizes the SCs in a composite service by tiers within a hierarchy during network discovery and for display purposes. When you add an SC to a composite service, the 5620 SAM assigns a default tier value to the SC according to the service type. Table 74-1 lists the default tiers for different service types.

Table 74-1 Default tiers for service types

Service type	Default tier
IES and VPRN	1
VPLS and MVPLS	2
VLL	3
VLAN	4

The default tier values reflect common deployment configurations. Figure 74-1 shows a composite service hierarchy. SCs are not restricted to the default tiers, as in the case of the VPLS in Tier 3 that forms an HVPLS with the VPLS in Tier 2.

Figure 74-1 Default SC tier assignments

You can change the tier of an SC at any time and can specify a value other than one of the defaults that the 5620 SAM assigns; composite services can have many tiers.

The tier value of an SC determines the relative position of the SC within a composite service topology map. The 5620 SAM displays SCs in rows by tier, in numerical order from the top of the panel downward, beginning with tier 1.

You can move SC icons in a composite service topology map from one tier to another for a customized view, then use the Rearrange by Service Tiers button to organize the SC icons in the map panel according to tier.

Caution — The composite service topology map is redrawn when you click on the Rearrange by Service Tiers button, and you cannot revert to the former layout of the composite service topology map.

See chapter 6 for more information about 5620 SAM map management.

Network discovery of composite services

The 5620 SAM associates SCs and connectors with composite services during network discovery. The following rules apply to this process.

- When the 5620 SAM discovers a valid connector between two services that do not belong to a composite service, a composite service that contains the services and connector is automatically created.
- When the 5620 SAM discovers a valid connector between two services and one of the services belongs to a composite service, the other service is added as an SC of the composite service.
- When the 5620 SAM discovers a valid connector between two services and the two services are SCs of different composite services, an alarm is raised and the connector is excluded from the 5620 SAM database.

The 5620 SAM assigns a default tier value to a service upon creation and to a new SC during network discovery. The tiered hierarchy provides a common framework for service configurations that are provisioned through the 5620 SAM and CLI. A 5620 SAM operator can assign a different tier value to an SC after discovery.

A composite service has Aggregated Operational State and Service Component Degraded status indicators. The General tab of the Composite Service management form displays these indicators.

The Aggregated Operational State indicator has four possible values: Up, Down, Partially Down, and Unknown. The value is derived from the aggregated SC operational states as follows.

- Up—All SCs are operationally up
- Partially Down—At least one SC is operationally down
- Down—All SCs are operationally down
- Unknown—The status of at least one SC is undetermined

The Service Component Degraded indicator shows whether there is an operational flag set on any of the service sites under this composite service.

Connector types

The following types of connectors join SCs in a composite service:

- SCP-to-SCP
- internal cross-connect
- PW spoke
- routed VPLS

Note — The 5620 SAM does not create connectors between mesh SDP bindings.

SCP-to-SCP connectors

SCP-to-SCP connectors can join any two SC types that have service interfaces on the same device or on different devices. A connector between VPLS and VPRN SAPs is an SCP-to-SCP connector, as is a connector between a dot1q-encapsulated VPLS SAP and L2 switch uplink port in a VLAN ring group. Table 74-2 describes the supported encapsulation types.

Table 74-2 Supported encapsulation types

SAP type	Encapsulation type
Ethernet	dot1q
	QinQ
	Null

(1 of 2)

SAP type	Encapsulation type
ATM	VPI/VCI
	VPI
FR	DLCI
SONET/SDH	BCP Null
	BCP dot1q
	IPCP
	PPP Auto
	cHDLC
	WAN Mirror
LAG	Null
	dot1q

(2 of 2)

The operational status of an SCP-to-SCP connector depends on the operational status of its endpoints. An alarm raised against one of the endpoints causes an alarm to be raised against the connector. Such alarms are aggregated within the composite service.

Internal cross-connect connectors

An internal cross-connect connector can join any SC types. It uses a CCAG to join two SCs that have SAPs or network interfaces on the same device. This functionality is available in the 7450 ESS, 7710 SR, and 7750 SR. The following rules apply to internal cross-connect connectors.

- A SAP can be connected to another SAP or to a network interface using a CCAG.
- When a SAP or network interface is deleted, the connector associated with it is also deleted.
- The deletion of an internal cross-connect connector causes the associated interfaces and SAPs to be deleted.

The operational state of an internal cross-connect connector depends on the operational state of the CCAG. An alarm raised against the CCAG causes an alarm to be raised against the connector. Such alarms are aggregated within the composite service.

PW spoke connectors

A PW spoke connector generally joins VPLS instances to create an HVPLS. In the 7210 SAS-M, 7210 SAS-X, 7450 ESS, 7710 SR, 7750 SR, and 7950 XRS, a PW spoke can, for example, connect IES and VPLS instances to provide distributed Internet access service. The endpoints of a PW spoke connector must be on different devices. PW spoke connectors are subject to restrictions on the SC types that they can join. Table 74-3 shows the SC types that can be linked by PW spoke connectors.

Table 74-3 Valid PW spoke interconnections

SC type	Valid PW spoke SC interconnections
VLL	IES, VPLS
VLAN	—
VPLS	IES, VLL, VPLS
MVPLS	MVPLS
IES	VLL, VPLS
VPRN	VLL, VPLS

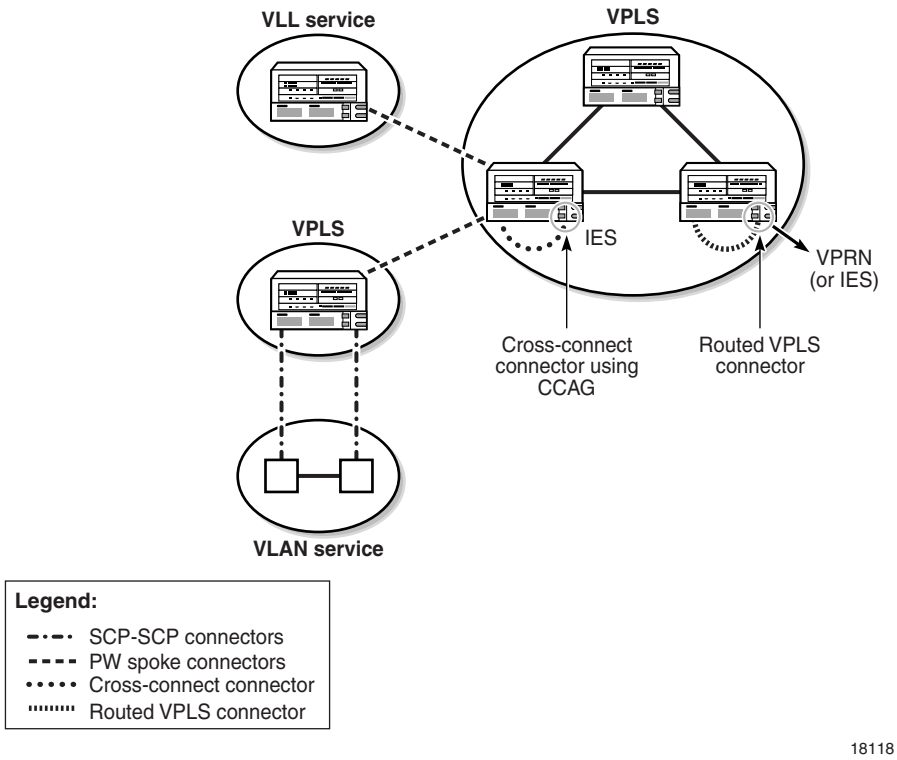
The operational state of a PW spoke connector depends on the operational state of the underlying SDP bindings. An alarm raised against one of the SDP bindings causes an alarm to be raised against the connector. Such alarms are aggregated within the composite service.

Routed VPLS connectors

A routed VPLS connector joins an L3 access interface within an IES or VPRN service context to a VPLS or I-VPLS on the same site. When an IES or VPRN IP interface is bound to a VPLS site name, the site name cannot be bound to another IP interface. Although an IES or VPRN IP interface can only be bound to a single VPLS site, the service context that contains the IP interface can have other IP interfaces bound to other VPLS sites. Both the IES or VPRN IP interface and VPLS site must be located on the same NE.

If a VPLS site name does not exist within the system, the binding between the IP interface and the VPLS site remains operationally down until a VPLS site name is assigned to the VPLS site. When an IP interface is bound to a VPLS site, the operational state of the binding depends on the operational state of the VPLS site, or whether the IP interface binding is enabled on the VPLS site.

The operational state of the routed VPLS connector depends on the operational state of the binding and the operational state of the L3 IP interface.



The routed VPLS connector function is supported for IOM3 cards in the following devices:

- Release 8.0 R4 or later 7450 ESS in mixed mode
- Release 8.0 R4 or later 7750 SR
- Release 8.0 R5 or later 7750 SR-c4
- Release 6.0 or later 7705 SAR, all variants
- 7950 XRS

74.2 Sample composite service configuration

Figure 74-2 shows a sample composite service configuration that involves a variety of customer services and uses the three SC connector types.

Figure 74-2 Sample composite service configuration

74.3 Workflow to create a composite service

The following workflow lists the high-level steps required to create a composite service. As a prerequisite for creating a composite service, this workflow assumes the following:

- a group or customer with the required user access privileges has been configured.
- the IP or IP/MPLS core network exists.
- any required service tunnels are created including the static or dynamic LSP required to create the service tunnel; see Procedure 27-1 for more information.
- the access ports for the service are created; see chapter 16 for more information.
- any required pre-defined routing, QoS, scheduling, filter, accounting, and time of day suite policies are created; see chapter 42 for more information. You do not have to create pre-defined policies if policies are created on a per-service basis.

- any required MP-BGP for PE-to-PE routing is configured; see chapter 23 for more information about protocol configuration.
- the other network services that are to be the SCs of the composite service are created.

1 As required, modify the default system preferences for composite services such as specifying if composite services are auto-discovered or if service alarms are aggregated for composite services.

2 Create composite service.

i Define the general properties for the composite service. See Procedure 74-1 for more information.

ii Specify the services for inclusion in the composite service. You can specify multiple services in one operation. See Procedure 74-2 for more information.

iii Create connectors to link the SCs of the composite service. See Procedures 74-3, 74-4, 74-5, and 74-6 for more information.

iv Turn up the composite service.

3 As required, run an OAM validation test for the composite service. See Procedure 74-7 for more information. Alternatively, you can also run a One Time Validation on the composite service. See Procedure 77-9 for more information.

4 As required, force a manual rediscovery of all composite services in the 5620 SAM to discover new service connectors that would add SCs to an existing composite service, or for new service connectors that would connect together two SCs to create a new composite service. See Procedure 74-8 for more information.

5 Manage a composite service.

i View the service topology map associated with a composite service. See Procedure 74-9 for more information.

ii As required, modify a composite service:

- using the navigation tree; see Procedure 74-10 for more information
- using the flat topology view; see Procedure 74-11 for more information

iii As required, delete a composite service. See Procedure 74-12 for more information.

74.4 Composite service management procedures

Use the following procedures to perform composite service creation and management tasks.

Procedure 74-1 To create a composite service

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Click on the Create button. The Composite Service (Create) form opens with the General tab displayed.

3 Configure the parameters.

- Composite ID
- Auto-Assign ID
- Name
- Description

The Composite ID parameter is configurable only if the Auto-Assign ID parameter is disabled.

4 Click on the Apply button. The form refreshes with additional parameters.

5 Configure the parameters:

- Current OLC State
- Revert OLC State

6 Perform one of the following:

a Add an SC to the composite service. Perform steps 4 to 11 of Procedure 74-2.

b Complete composite service creation if SCs are to be added later. Go to step 7.

7 Click on the OK button. The CompositeService - *Service Name* (Edit) form closes and a dialog box appears.

8 Click on the Yes button to confirm the action. The Manage Composite Services form reappears with the new composite service displayed in the list.

9 Close the Manage Composite Services form.

Procedure 74-2 To add services to a composite service

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure the filter criteria and click the Search button. A list of composite services appears.

3 Select a composite service and click on the Properties button. The Composite Service (Edit) form opens with the General tab displayed.

4 In the navigation tree, right-click on the Services icon and choose Add Services. The Add Services form opens.

Note — You can also create a service for inclusion in the composite service by right-clicking on the Services icon and choosing Create *Service Type*.

5 Click on the Search button. A list of available services is displayed.

6 Select a service and click on the OK button. You can select multiple services. The service or services are added below the Services object in the navigation tree.

7 Perform one of the following:

- **a** Add a connector to the composite service. Go to step 8.
- **b** Complete composite service creation if connectors are to be created later. Go to step 9.

8 Perform one of the following to add a connector to the composite service:

- **a** Create a cross connect connector. Perform steps 4 to 21 of Procedure 74-3.
- **b** Create a routed VPLS connector. Perform steps 4 to 20 of Procedure 74-6.
- **c** Create an SCP connector. Perform steps 4 to 22 of Procedure 74-4.
- **d** Create SpokeConnector. Perform steps 4 to 29 of Procedure 74-5.

9 Click on the OK button. The CompositeService - *Service Name* (Edit) form closes and a dialog box appears.

10 Click on the Yes button to confirm the action. The Manage Composite Services form reappears with the new composite service displayed in the list.

11 Close the Manage Composite Services form.

Procedure 74-3 To create a cross connect connector

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure the filter criteria and click the Search button. A list of composite services appears.

3 Select a composite service and click on the Properties button. The Composite Service (Edit) form opens with the General tab displayed.

4 In the navigation tree, right-click on the Connectors icon and choose Create CrossConnect. The Cross Connect (Create) form opens.

Note — The service endpoints of a cross-connect connector must be on the same NE.

5 Configure the parameters:

- Name
- Description

6 Click on the Select button in the Service A panel to choose an SC to associate with the connector. The Select Service A - Cross Connect form opens with a list of available SCs displayed.

7 Choose an SC and click on the OK button. The Select Service A - Cross Connect form closes and the Cross Connect (Create) form refreshes.

8 Click on the Select button in the Service B panel to choose an SC to associate with the connector. The Select Service B - Cross Connect form opens with a list of available SCs displayed.

9 Choose an SC and click on the OK button. The Select Service B - Cross Connect form closes and the Cross Connect (Create) form refreshes.

10 Click on the Select button in the Site A panel to choose a site to associate with the connector. The Select Site - Cross Connect form opens with a list of available sites displayed.

11 Choose a site and click on the OK button. The Select Site - Cross Connect form closes and the Cross Connect (Create) form refreshes.

12 Click on the Select button in the Site B panel to choose an SC to associate with the connector. The Select Site - Cross Connect form opens with a list of available sites displayed.

13 Choose a site and click on the OK button. The Select Site - Cross Connect form closes and the Cross Connect (Create) form refreshes.

14 Click on the Transport tab.

15 Click on the Select button to choose a CCAG for the connector. The Select CCAG - Cross Connect form opens with a list of available CCAGs displayed.

16 Choose a CCAG and click on the OK button. The Select CCAG - Cross Connect (Create) form closes and the Cross Connect (Create) form refreshes.

17 Configure the parameters.

- CC ID
- Auto-Assign ID

18 Click on the OK button. The Cross Connect (Create) form closes and the CompositeService - *Service Name* (Edit) form refreshes.

19 Click on the OK button. A dialog box appears.

20 Click on the Yes button to confirm the action. The Manage Composite Services form reappears with the new composite service displayed in the list.

21 Close the Manage Composite Services form.

Procedure 74-4 To create an SCP connector

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure the filter criteria and click the Search button. A list of composite services appears.

3 Select a composite service and click on the Properties button. The Composite Service (Edit) form opens with the General tab displayed.

4 In the navigation tree, right-click on the Connectors icon and choose Create ScpConnector. The ScpConnector (Create) form opens.

5 Configure the parameters:

- Name
- Description

6 Click on the Select button in the Service A panel to choose an SC to associate with the connector. The Select Service A - ScpConnector form opens with a list of available SCs displayed.

7 Select an SC and click on the OK button. The Select Service A - Scp Connector (Create) form closes and the ScpConnector (Create) form refreshes.

8 Click on the Select button in the Service B panel to choose an SC to associate with the connector. The Select Service B - ScpConnector form opens with a list of available SCs displayed.

9 Select an SC and click on the OK button. The Select Service B - Scp Connector (Create) form closes and the ScpConnector (Create) form refreshes.

10 Click on the Select button in the Site A panel to choose a site to associate with the connector. The Select Site - ScpConnector form opens with a list of available sites displayed.

11 Select a site and click on the OK button. The Select Site - Scp Connector (Create) form closes and the ScpConnector (Create) form refreshes.

12 Click on the Select button in the Site B panel to choose a site to associate with the connector. The Select Site - ScpConnector form opens with a list of available sites displayed.

13 Select a site and click on the OK button. The Select Site - Scp Connector form closes and the ScpConnector (Create) form refreshes.

14 Click on the Service Connection Point tab.

15 Click on the Select button in the Service Connection Point A panel to choose an SCP to associate with the connector. The Select Service Connection Point A - Scp Connector form opens with a list of available SCPs displayed.

16 Select an SCP and click on the OK button. The Select Service Connection Point A - Scp Connector form closes and the ScpConnector (Create) form refreshes.

17 Click on the Select button in the Service Connection Point B panel to choose an SCP to associate with the connector. The Select Service Connection Point B - Scp Connector form opens with a list of available SCPs displayed.

18 Select an SCP and click on the OK button. The Select Service Connection Point B - Scp Connector form closes and the ScpConnector (Create) form refreshes.

19 Click on the OK button. the ScpConnector (Create) form closes and the CompositeService - *Service Name* (Edit) form refreshes.

20 Click on the OK button. A dialog box appears.

21 Click on the Yes button to confirm the action. The Manage Composite Services form reappears with the new composite service displayed in the list.

22 Close the Manage Composite Services form.

Procedure 74-5 To create a spoke connector

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure the filter criteria and click the Search button. A list of composite services appears.

3 Select a composite service and click on the Properties button. The Composite Service (Edit) form opens with the General tab displayed.

4 In the navigation tree, right-click on the Connectors icon and choose Create ScpConnector. The SpokeConnector (Create) form opens.

Note — The service endpoints of a spoke connector must be on different NEs.

5 Configure the parameters:

- Name
- Description

6 Click on the Select button in the Service A panel to choose an SC to associate with the connector. The Select Service A - Spoke Connector form opens with a list of available SCs displayed.

7 Select an SC and click on the OK button. The Select Service A - Spoke Connector (Create) form closes and the SpokeConnector (Create) form refreshes.

8 Click on the Select button in the Service B panel to choose an SC to associate with the connector. The Select Service B - Spoke Connector form opens with a list of available SCs displayed.

9 Select an SC and click on the OK button. The Select Service B - Spoke Connector form closes and the SpokeConnector (Create) form refreshes.

10 Click on the Select button in the Site A panel to choose a site from service A to associate with the connector. The Select Site - Spoke Connector form opens with a list of available sites displayed.

11 Select a site and click on the OK button. The Select Site - Spoke Connector form closes and the SpokeConnector (Create) form refreshes.

12 Click on the Select button in the Site B panel to choose a site from service B to associate with the connector. The Select Site - Spoke Connector form opens with a list of available sites displayed.

13 Select a site and click on the OK button. The Select Site - Spoke Connector form closes and the SpokeConnector (Create) form refreshes.

14 Click on the Transport tab.

15 Configure the parameters.

- VC ID
- Auto-Assign ID
- Auto Select Tunnels
- Transport Type

The Transport Type parameter is configurable when the Auto Select Tunnels parameter is enabled.

16 If the Auto Select Tunnels parameter is enabled, go to step 21.

17 Click on the Select button in the Tunnel A panel to choose a service tunnel to associate with the connector. The Select Tunnel From Site A - Spoke Connector form opens with a list of available service tunnels displayed.

18 Select a tunnel and click on the OK button. The Select Tunnel From Site A - Spoke Connector form closes and the SpokeConnector (Create) form refreshes.

19 Click on the Select button in the Tunnel B panel to choose a service tunnel to associate with the connector. The Select Tunnel From Site B - Spoke Connector (Create) form opens with a list of available service tunnels displayed.

20 Select a tunnel and click on the OK button. The Select Tunnel From Site B - Spoke Connector (Create) form closes and the SpokeConnector (Create) form refreshes.

21 The First L3 Access Interface panel is present, if one of the SCs in the composite service is an IES. If the First L3 Access Interface panel is not present, go to step 26.

22 Click on the Select button in the First L3 Access Interface panel to choose an access interface to associate with the spoke connector. The Select First L3 Access Interface - Spoke Connector (Create) form opens with a list of available L3 access interfaces displayed.

23 The Second L3 Access Interface panel is present, if another of the SCs in the composite service is an IES. If the Second L3 Access Interface panel is not present, go to step 26.

24 Click on the Select button in the Second L3 Access Interface panel to choose an access interface to associate with the spoke connector. The Select Second L3 Access Interface - Spoke Connector (Create) form opens with a list of available L3 access interfaces displayed.

25 Select an L3 access interface and click on the OK button. The Select L3 Access Interface - Spoke Connector (Create) form closes and the SpokeConnector (Create) form refreshes.

26 Click on the OK button. The SpokeConnector (Create) form closes and the CompositeService - *Service Name* (Edit) form refreshes.

27 Click on the OK button. A dialog box appears.

28 Click on the Yes button to confirm the action. The Manage Composite Services form reappears with the new composite service displayed in the list.

29 Close the Manage Composite Services form.

Procedure 74-6 To create a routed VPLS connector

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure the filter criteria and click the Search button. A list of composite services appears.

3 Select a composite service and click on the Properties button. The Composite Service (Edit) form opens with the General tab displayed.

4 In the navigation tree, right-click on the Connectors icon and choose Create RoutedVplsConnector. The RoutedVplsConnector (Create) form opens.

5 Configure the parameters:

- Name
- Description

6 Click on the Select button in the Service A panel to choose an SC to associate with the connector. The Select Service A - RoutedVplsConnector form opens with a list of available SCs displayed.

7 Select an SC and click on the OK button. The Select Service A - RoutedVplsConnector form closes and the RoutedVplsConnector (Create) form refreshes.

8 Click on the Select button in the Service B panel to choose an SC to associate with the connector. The Select Service B - RoutedVplsConnector form opens with a list of available SCs displayed.

9 Select an SC and click on the OK button. The Select Service B - RoutedVplsConnector form closes and the RoutedVplsConnector (Create) form refreshes.

10 Click on the Select button in the Site A panel to choose a site to associate with the connector. The Select Site - RoutedVplsConnector form opens with a list of available sites displayed.

11 Select a site and click on the OK button. The Select Site - RoutedVplsConnector form closes and the RoutedVplsConnector (Create) form refreshes.

12 Click on the Select button in the Site B panel to choose a site to associate with the connector. The Select Site - RoutedVplsConnector form opens with a list of available sites displayed.

13 Select a site and click on the OK button. The Select Site - RoutedVplsConnector form closes and the RoutedVplsConnector (Create) form refreshes.

Note — The sites that you select in steps 11 and 13 must be located on the same NE.

14 Click on the Routed-VPLS L3 Connection Point tab.

15 Click on the Select button to choose an interface for the connector. The Select L3 Access Interface - RoutedVplsConnector form opens with a list of available L3 Access Interfaces displayed.

16 Select an L3 Access Interface and click on the OK button. The RoutedVplsConnector (Create) form refreshes.

17 Click on the OK button. The RoutedVplsConnector (Create) form closes and the CompositeService - *Service Name* (Edit) form refreshes.

18 Click on the OK button. A dialog box appears.

19 Click on the Yes button to confirm the action. The Manage Composite Services form reappears with the new composite service displayed in the list.

20 Close the Manage Composite Services form.

Procedure 74-7 To run an OAM validation test for a composite service

A validator test suite must be created for the tested entity. See chapter 77 for more information about how to create a validator test suite.

Note — As an alternative, you can also run an OAM validation test on the composite service by performing a One Time Validation. This is a mostly automated procedure and is described in Procedure 77-9.

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure the filter criteria and click Search. A list of composite services appears in the Manage Composite Services form.

3 Select a composite service and click on the Properties button. The Composite Service (Edit) form opens with the General tab displayed.

4 Click on the Action button and select Validate. If a validator test suite is not associated to the composite service, a dialog box appears. Perform the following steps:

   i Click on the OK button to associate the composite service with an existing validator test suite. The Choose Validator Test Suite form appears.

   ii Configure the filter criteria. A list of validator test suites appears.

   iii Select a validator test suite and click on the OK button. The Choose Validator Test Suite form closes.

5 View the Operational Flags indicators. If the validation test fails, a check mark appears beside the OAM Validation Failed indicator.

6 Click on the Tests tab.

7 Click on the Tested Entity Result tab.

8 Select an entry and click on the Properties button. The Tested Entity Result form opens and displays information about the validation test.

9 Close the Tested Entity Result form.

10 Close the Composite Service (Edit) form.

11 Close the Manage Composite Services form.

Procedure 74-8 To rediscover composite services

Complete this procedure to force a manual rediscovery of all composite services in the 5620 SAM. The Rediscover Composite Services command performs a network discovery that looks for new service connectors that would add SCs to an existing composite service, or for new service connectors that would connect together two SCs to create a new composite service.

Note — If the Auto Discover Composite Services system preference is enabled, composite services are rediscovered as part of routine network discovery in the 5620 SAM. See Procedure 64-2 for more information.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Click on the Rediscover Composite Services button.

3 A warning form appears. Click on the Yes button to start the rediscovery.

4 A progress bar appears, indicating the status of the rediscovery process. Upon completion, an information form appears, indicating the number of composite services and connectors discovered. Click on Ok to close the form.

5 Click on the Close button to close the Manage Composite Services form.

Procedure 74-9 To view the service topology map associated with a composite service

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure the filter criteria. A list of composite services appears at the bottom of the Manage Composite Services form.

3 Select a composite service and perform one of the following steps:

   a Click on the Topology View button. A Composite Service Topology - *Service Name* map opens.

   b Click on the Topology View Flat button. A Composite Service Flat Topology - *Service Name* map opens. The Flat Topology map is a flattened view of a composite service, meaning that all the service objects are displayed simultaneously, along with the service sites, access interfaces, and the links or groups of links between them.

   See chapter 6 for more information about composite service topology views.

Procedure 74-10 To modify a composite service using the navigation tree

Caution — Modifying parameters can be service-affecting.

Note — You can also modify composite service components and add service connectors from the flat topology view. See Procedure 74-11.

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure the filter criteria. A list of composite services appears at the bottom of the Manage Composite Services form.

3 Select a composite service and click on the Properties button. The CompositeService - *Service Name* (Edit) form opens with the General tab displayed.

4 To configure parameters for an item, in the navigation tree, select and right-click on the item, and choose Properties from the contextual menu.

Using the contextual menu, you can also:

- Add SCs and connectors to a composite service
- Create services for inclusion in the composite service. When you create services by using the contextual menu, the services are automatically added to the composite service.
- Remove SCs and connectors from a composite service
- Move SCs to another composite service
- Delete SCs

Warning — Deleting an SC is not the same as removing an SC from a composite service. Deleting an SC removes the service from the 5620 SAM database. To avoid a service outage, be certain of the action that you are taking.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button to confirm the action. The CompositeService - *Service Name* (Edit) form closes and the Manage Composite Services form reappears.

7 Click on the Close button to close the Manage Composite Services form.

Procedure 74-11 To modify a composite service using the flat topology view

You can modify composite service components and add service connectors from the flat topology view. The main advantage of creating connectors using the flat topology view is that most of the parameters in the associated configuration forms are automatically populated when you select an item in the map.

Caution — Modifying parameters can be service-affecting.

Note — You can also modify and add composite service components using the navigation tree. Refer to Procedure 74-10.

1 Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Configure the filter criteria. A list of composite services appears at the bottom of the Manage Composite Services form.

3 Select a composite service and click on the Properties button. The CompositeService - *Service Name* (Edit) form opens with the General tab displayed.

4 Click the Flat Topology View button. The Composite Service Flat Topology map opens.

5 To configure parameters for any item on the map, right-click on the item, and choose Properties from the contextual menu. The configuration form for the item is displayed.

6 Edit the parameters as required. Refer to Procedure 74-1 for detailed configuration information on creating and configuring components.

7 Add service connectors to the composite service, if required.

Depending on the sites or ports you select, when you right-click on a component, the contextual menu contains one or more of the following choices:

- Create Cross Connect. Go to step 8.
- Create Routed Vpls Connector. Go to step 9.
- Create Scp Connector. Go to step 10.
- Create Spoke Connector. Go to step 11.

Click on the required item in the contextual menu and proceed to the associated step indicated in this list.

Note — If you need to modify any of the automatically-populated parameters in the associated configuration forms while creating these connectors, refer to Procedure 74-10 for detailed information.

8 To create a Cross Connect Connector:

i Select the two site icons that you want to create the Cross Connect Connector for. These icons represent the same physical NE that exists in two separate services, since service endpoints of a Cross Connect Connector must be on the same NE.

ii Right-click on either of the icons and select Create Cross Connect from the contextual menu.

The CrossConnect (Create) form opens with the General tab displayed.

iii Configure the parameters.

- Name
- Description (optional)

iv Click on the Transport tab.

v Click on the Select button to choose a CCAG for the connector. The Select CCAG - Cross Connect form opens with a list of available CCAGs displayed.

vi Select a CCAG and click on the OK button. The Select CCAG - Cross Connect (Create) form closes and the CrossConnect (Create) form refreshes.

vii Click on the OK button. The CrossConnect (Create) form closes and the new Cross Connect Connector is displayed on the map.

viii Go to step 15.

9 To create a Routed Vpls Connector:

i Select a VPLS site icon and an L3 Access Interface icon that you want to create the Routed Vpls Connector for. These icons must belong to the same NE.

ii Right-click on either of the icons and select Create Routed Vpls Connector from the contextual menu.

The RoutedVplsConnector (Create) form opens with the General tab displayed.

iii Configure the parameters.

- Name
- Description (optional)

iv Click on the OK button. The RoutedVplsConnector (Create) form closes and the new Routed Vpls Connector is displayed on the map.

v Go to step 15.

10 To create a Scp Connector:

i Select the port icons for the two sites that you want to create the Scp Connector for.

ii Right-click on either of the icons and select Create Scp Connector from the contextual menu.

The ScpConnector (Create) form opens with the General tab displayed.

iii Configure the parameters.

- Name
- Description (optional)

iv Click on the OK button. The ScpConnector (Create) form closes and the new Scp Connector is displayed on the map.

v Go to step 15.

11 To create a Spoke Connector:

i Select the two site icons that you want to create the Spoke Connector for. These icons must be two different NEs that exist in two separate services.

ii Right-click on either of the icons and select Create Spoke Connector from the contextual menu.

The SpokeConnector (Create) form opens with the General tab displayed.

iii Configure the parameters.

- Name
- Description (optional)

iv Click on the OK button. The SpokeConnector (Create) form closes and the new Spoke Connector is displayed on the map.

12 Create new services within the composite service view, if required.

i Right-click on the flat topology map background and choose Create from the menu. A list of services appears.

ii Click on the service type you want to create. The appropriate Service (Create) form appears.

iii Configure the parameters for the service as required and then click on the OK button in the Service (Create) form.

See the appropriate service management chapter for information about creating a specific service type.

iv The Service (Create) form closes and the new service is displayed on the map.

13 Add services to the composite service, if required.

i Right-click on the flat topology map background and choose Add→Service(s) from the menu. An Add Services - Composite Services form appears.

ii Configure the filter criteria and click on the Search button. A list of services appears at the bottom of the Add Services - Composite Services form.

iii Select a service and click on the OK button. The Add Services - Composite Services form closes and the service is displayed on the map. If the service includes service sites, the sites are also displayed on the map.

14 Add service sites to an existing service in the composite service, if required.

i Right-click on the flat topology map background and choose Add→Service Site(s) from the menu. A Find Service form appears.

ii Configure the filter criteria and click on the Search button. A list of services that are already part of the composite service appears at the bottom of the Find Service form.

iii Select a service and click on the OK button. The Find Service form closes and a Select Network Elements form appears with a list of available NEs.

iv Select one or more NEs and then click on the OK button. A Service Site (Create) form appears. If more than one NE is selected, a Service Site, Multiple Instances (Create) form appears.

v Configure the service site and click on the OK button. The new service site is displayed on the map.

See the appropriate service management chapter for information about configuring a specific service site type.

15 Click on the OK button in the CompositeService - *Service Name* (Edit) form. A dialog box appears.

16 Click on the Yes button to confirm your changes. The CompositeService - *Service Name* (Edit) form closes and the Manage Composite Services form reappears.

17 Click on the Close button to close the Manage Composite Services form.

Procedure 74-12 To delete a composite service

Warning — Deleting a service may result in a service disruption for customers. Consider the implication of deleting the service before proceeding.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 As required, configure the filter criteria to locate the service or range of services to be deleted. A list of services appears at the bottom of the Manage Services form.

3 Choose a service or a range of services from the list.

4 Click on the Delete button. A warning form appears. This form is dynamic based on the priority of the service. Perform one of the following:

   a For services with a low priority, go to Step 5.

   b For services with a medium priority, configure the "Enter the highest priority of the service being deleted" text field by typing: Medium. Go to Step 5.

   c For services with a high priority, configure the "Enter the highest priority of the service being deleted" text field by typing: High. Go to step 5.

5 For all services regardless of how their priority is configured, acknowledge the check box that prompts you confirm that you understand the implications of deleting the service.

Note — If you select multiple services with different priorities, you must enter the highest priority level of selected services before you can delete the services.

6 Click on the Yes button to confirm the action. The service is deleted and removed from the list.

7 Click on the Close button to close the Manage Services form.

75 — Dynamic service management

75.1 Dynamic service management overview *75-2*

75.2 Dynamically-created objects *75-3*

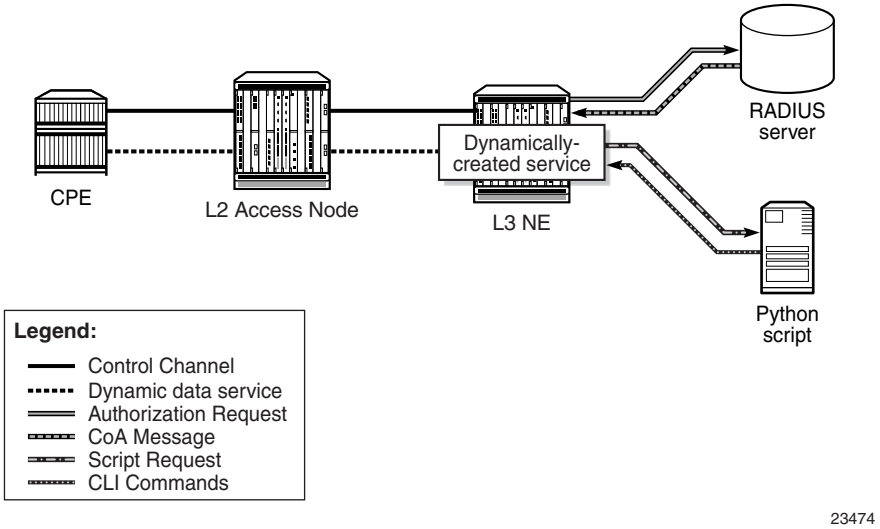
75.3 Workflow to create dynamic services *75-4*

75.4 Dynamic service management procedures *75-4*

75.1 Dynamic service management overview

A dynamic service is a service in which sites are created using information contained in RADIUS Change of Authorization messages instead of manual operator input.

The 7450 ESS in mixed mode, Release 11.0 or later, and the 7750 SR, Release 11.0 or later, support dynamic service creation for the following service types:



- Epipe
- IES
- VPLS
- VPRN

Dynamic service structure

The creation of a dynamic service is triggered by a CPE device establishing a control channel (PPPoE, IPoE, or DHCP) with an L3 NE. The control channel is authenticated using RADIUS, and the RADIUS server sends Access-Accept or Change of Authorization messages that contain the parameters for the dynamic service required by the triggering device.

The L3 NE passes the information from the RADIUS messages to a Python script, which returns CLI commands that create the required dynamic sites on the NE. Figure 75-1 shows a basic dynamic service.

Figure 75-1 Basic dynamic service

When the control channel fails - for example, when the CPE device is removed - the NE deletes any dynamic services that were created for the control channel.

75.2 Dynamically-created objects

Network objects in a dynamic service are read-only on the NE and in the 5620 SAM, and cannot be modified except through RADIUS CoA messages. As a result, some operations are not supported on dynamically-created sites. This section describes the unsupported operations.

Dynamically created service sites are discovered and synchronized with the 5620 SAM in the same manner as manually created service sites. A service that contains a dynamically created object has the Contains Dynamically Created Sites parameter enabled, and cannot be deleted until the dynamically created object is removed from the service.

Unsupported operations

Table 75-1 describes the operations that cannot be performed on dynamically created objects.

Table 75-1 Unsupported operations on dynamically created objects

Operation	Description
Object configuration operations	
Delete	You cannot delete dynamically created objects. A RADIUS CoA message must request their deletion, or the control channel for the dynamic service that created the object must be disconnected.
Create child objects	You cannot create objects within dynamically created sites; for example, subscriber interfaces or spoke SDP bindings.
Topology map actions	You cannot interact with dynamically-created objects that appear on the service topology map, except to display their parameters.
SAP copy/move	Dynamically created SAPs are not included in SAP copy or move operations. The operations proceed normally, but skip any dynamically created SAPs.
MDA or card removal	You cannot delete MDAs or cards with dynamic sites.
Automated operations	
Automatic MEP/MIP creation	MEGs skip MEP or MIP creation on SAPs and SDP bindings that are on a dynamically-created site.
SDP binding auto-completion	Dynamically-created sites are skipped during SDP binding auto-completion.
Service Throughput site list	Dynamically-created sites do not appear on the Service Throughput form

ID range behavior

Each NE that is configured for dynamic service must specify an ID range for dynamically-created sites. Dynamically-created sites can only use IDs from the specified range, and non-dynamic sites cannot use IDs from that range. When a dynamic service is created on an NE, the next available ID from the specified range is used.

75.3 Workflow to create dynamic services

The following workflow lists the high-level steps required to configure an NE to process dynamic service requests. As a prerequisite for creating a dynamic service, this workflow assumes that the following appropriate preconfigurations have been performed:

- pre-discovery CLI modifications
- discovery including mediation configuration with CLI user name and password
- creation of python scripts to be called by the NE; for more information about creating dynamic service python scripts, and CLI operations supported for python scripts, see the *7750 SR OS Triple Play Guide*.
- creation of RADIUS policies

1. Create a RADIUS script policy; see Procedure 54-16.
2. Create a dynamic service policy; see Procedure 75-1.
3. Configure the NE for dynamic service; see Procedure 75-2.
4. Configure a RADIUS-authenticated control channel. See the *7750 SR OS Triple Play Guide* for more information about dynamic service control channels.
5. If required, list the dynamically created objects on an NE; see Procedure 75-3.
6. If required, delete a dynamic service and all associated dynamically-created objects by deleting the control channel.

75.4 Dynamic service management procedures

Use the following procedures to perform dynamic service creation and management tasks.

Procedure 75-1 To configure a dynamic service policy

1 Choose Policies→Dynamic Service Policy from the 5620 SAM main menu. The Dynamic Service Policy form opens.

2 Perform one of the following:

a Create a dynamic service policy

i Click on the Create button. The Dynamic Service Policy, Global Policy (Create) form opens with the General tab displayed.

ii Go to step 3.

b Modify an existing dynamic service policy.

i Configure the filter criteria and click on the Search button. A list of dynamic service policies appears.

ii Select a dynamic service policy and click on the Properties button. The Dynamic Service Policy (Edit) form opens with the General tab displayed.

3 Configure the parameters:

- Displayed Name
- Description
- SAP Limit

4 Click on the Select button beside the Script Policy parameter and select a RADIUS script policy for the dynamic service policy. See Procedure 54-16 for information about configuring RADIUS script policies.

5 Click on the Select button beside the CLI User parameter and select a CLI user for the dynamic service policy.

6 Click on the Accounting tab. Each dynamic services policy has two accounting instances.

7 Choose an accounting instance and click on the Properties button. The Accounting (Create) form appears.

8 Configure the parameters:

- Instance
- Stats Type

9 Click on the Select button beside the RADIUS Server Policy parameter and select a RADIUS server policy for the accounting instance. See Procedure 49-4 for information about configuring RADIUS server policies.

10 Configure the parameters in the Update Interval panel:

- Hours
- Minutes
- Days
- Disable Update Interval
- Update Interval Jitter
- Set Jitter to 10% of Update Interval

11 Click on the OK button. If required, repeat steps 7 to 11 for the other accounting instance. The Accounting (Create) form closes.

12 On the Dynamic Service Policy (Create) form, click on the OK button. The Dynamic Service Policy form closes.

13 On the Dynamic Service Policy list form, click on the Search button to display the newly created policy or policies. Choose a policy.

14 Click on the Distribute button to manually distribute the policy locally to devices. Policies are also automatically distributed to devices when they are used by resources on the device.

Note — When the policy is in draft mode, the Distribute button is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution. Releasing the global policy also distributes the policy to existing local definitions. See chapter 42 for more information.

Procedure 75-2 To configure an NE for dynamic service

1 Choose Manage→Service→Dynamic Service NE Configuration from the 5620 SAM main menu. The Dynamic Service NE Configuration form appears.

2 Configure the filters and click on the Search button. A list of NEs that support dynamic services appears.

3 Choose an NE and click on the Properties button. The Dynamic Service NE Configuration (Edit) form appears.

4 Disable the Disable Creation parameter to allow the dynamic creation of network objects on the NE.

5 Define an ID range using the Start and End parameters. Dynamically-created objects are created using IDs from within the specified range.

6 Configure the Access-Accept parameter in the Timers panel.

7 Click on the OK button. The Dynamic Service NE Configuration (Edit) form closes.

Procedure 75-3 To list dynamically created objects on an NE

1 Choose Manage→Service→Dynamic Service NE Configuration from the 5620 SAM main menu. The Dynamic Service NE Configuration form appears.

2 Configure the filters and click on the Search button. A list of NEs that support dynamic services appears.

3 Choose an NE and click on the Properties button. The Dynamic Service NE Configuration (Edit) form appears.

4 Click on one of the following tabs to list the related dynamically created objects on the NE:

- Dynamic SAP Info
- Root Objects
- Script Snippets
- Service Sites

5 Click on the Search button to query the NE. A list of dynamically created objects appears.

Note — The list of objects in the Dynamic SAP Info tab is automatically updated.

6 Click on the OK button. The Dynamic Service NE Configuration (Edit) form closes.

76 — Application assurance

76.1 Application assurance overview *76-2*

76.2 ISA-AA groups and partitions *76-4*

76.3 AA components *76-6*

76.4 5670 RAM reporting attributes *76-11*

76.5 AA accounting policies *76-13*

76.6 Workflow to configure AA *76-14*

76.7 Application assurance procedures *76-15*

76.1 Application assurance overview

Application Assurance, or AA, is a service-enabling technology that enhances the hierarchical per-subscriber, per-service, and per-application QoS functions by providing more granular traffic control. In addition to QoS enhancements, AA provides traffic diversion, application identification, statistics collection, and data reporting to the 5670 RAM.

AA enables deep packet inspection of subscriber traffic where policies are applied to specific traffic types on a per-subscriber basis to determine the action to perform on the traffic.

AA and dynamic subscriber policy control allow a broadband network to provide application-based subscriber management for Internet access. The benefits of AA for residential and business service providers are:

- enhanced application-level SLAs through policy-based network traffic control and improved QoS sophistication at the application and site level
- traffic flow thresholds and threshold-crossing notification
- application-aware reporting and performance analysis
- greater network security
- scalability to support a large number of services, and flexibility to control network costs

The 5620 SAM supports 7450 ESS, 7750 MG, and 7750 SR AA functions.

Note — AA is not supported on a single-slot chassis.

NE traffic is selected to be processed by AA and then undergoes inspection by an ISA-AA MDA. See chapter 14 for information about using the 5620 SAM to configure an ISA-AA group that contains one or more ISA-AA MDAs.

You can configure cflowd on an ISA-AA group. AA cflowd supports basic cflowd sampling, as well as TCP performance data collection for AA applications and application groups. Each ISA-AA group supports one cflowd instance. See chapter 14 for information about configuring AA cflowd on an ISA-AA group.

Note — AA policies can only be configured on an NE when an ISA-AA group is already configured on the system.

The two elements of AA processing are:

- identification of the traffic on a per-flow or per-session basis
- policy treatment of the identified traffic

AA protocol signatures

The 5620 SAM generates a set of signatures that identify AA protocols. The signature set includes:

- protocol support summary—list of protocols that can be identified with the load using a combination of pattern and behavioral techniques. The protocols are used to generate statistics by protocol and as input in combination with other information to identify applications.
- pattern signatures—set of pattern-match signatures used in analysis
- behavior signatures—set of diagnostic techniques used in analysis

Because protocol signatures are intended to be the most basic block of application identification, other AA components, such as application filters, are provided to further customize protocol signatures. Customization reduces the need for a new protocol signature load when a new application may need to be identified.

Each protocol can be referenced in the definition of one or more applications by the application filter definition. The assignment of each supported protocol to an application filter or application is optional, allowing for the addition of new signature protocols without the need to update the application filter and applications.

Protocol signature upgrades

The 5620 SAM supports signature upgrades without automatically affecting policy behavior. All post-R1 new signatures are disabled, by default, during an upgrade to ensure that policies or services are not affected.

You can obtain new protocol signatures by dynamically upgrading only the ISA-AA MDA software on an NE, if the new software is from the same major release. If the software is from a different major release, you must upgrade the entire NE to obtain the new signatures. See "Managing NE software upgrades" in the *5620 SAM System Administrator Guide* for information about performing device software upgrades.

The protocols that are included in R1 of a release are designated as parent signatures and cannot be disabled. Within a major release, all protocols introduced after R1 of a release as part of an isa-aa.tim ISSU are, by default, shut down. When shut down, protocols introduced after R1 do not change AA behavior. For example, traffic maps to the parent protocol on which the new signature is based. Enabling or disabling a new protocol takes affect for new flows only. The protocols must be enabled on a per-protocol basis to take effect. Perform Procedure 76-26 to enable AA protocols.

AA policers

AA policers can be bandwidth or flow limiting, and can have one of the following scopes:

- system scope—limits all traffic entering the ISA-AA MDA
- subscriber scope—limits apply to the traffic of a subscriber

After a policer is referred to by an AQP for one traffic direction, the same policer cannot be referred to in the other direction. AQP rules with policer actions must specify a traffic direction other than "both".

AA flow watermark policies

AA supports the configuration of high and low thresholds, or watermarks, for logs and traps when there is a high consumption of the flow table. The flow table has a limited size and the thresholds are established to alert users that the flow table is approaching maximum capacity. When the high threshold is reached, an alarm is generated. The alarm is cleared when the flow table capacity has dropped below the specified low threshold.

AA transit IP and transit prefix policies

AA transit IP and transit prefix policies define how AA transit subscribers are created by an NE. Transit IP policies can be configured to discover dynamic transit subscribers via DHCP or RADIUS, and can also be configured with a list of static transit subscribers. Transit IP policies can also be configured to discover dynamic transit subscribers when traffic is detected on a parent SAP or spoke SDP binding.

Transit prefix policies allow you to specify transit subscribers by using network or subscriber IP ranges.

AA transit subscribers can persist in the 5620 SAM database. Transit subscriber aggregators allow you to aggregate multiple database persisted transit subscriber instances for VPN sites.

Application performance reporting

Application performance reporting adds a layer of route configuration to the handling of AA TCP performance, RTP/UDP performance, and flow-based volume reporting to the 5670 RAM. You can enable application performance reporting on service objects, and configure default DCP groups with address rules to apply a DCP subnet group to an entire network, an IP address range, or a single IP address for Internet or intranet traffic.

You can also create custom DCP subnet groups and bind them to individual L3 access interfaces and spoke SDP bindings. The 5670 RAM ignores application performance reporting configuration and objects on services that do not have an associated application profile.

AA HTTP error redirect policies

AA HTTP error redirect policies allow you to specify templates for local NE termination of HTTP errors and web browser redirection to customized error pages according to HTTP error codes.

76.2 ISA-AA groups and partitions

The 5620 SAM supports ISA-AA partitions. An ISA-AA partition is a unique child object of an ISA-AA group that can be assigned its own AA policy. There is no relationship between partitions of different ISA-AA groups. You can partition an ISA-AA group into AA policy partitions with one partition for each VPN-specific AA service. The partition supports VPN-specific custom protocols, applications, application group definitions, policy definitions and reporting. Each partition policy can be divided into multiple application QoS policies using ASOs. Multiple ISA-AA groups are used to scale the number of VPN-specific AA policies.

Multiple ISA-AA groups

The following operations can be performed at the ISA-AA group level

- Define one or more ISA-AA groups to allow AA resource partitioning and reservation of different types of AA service.
- Assign physical ISA-AAs to a group.
- Specify forwarding classes to be diverted for inspection by the AA subscribers that belong to the group and choose the AA policy to be applied to the group.
- Configure redundancy and bypass mode features to protect against equipment failure.
- Configure QoS on IOMs that host ISA-AA traffic.
- Configure ISA capacity planning using low and high thresholds.
- Enable ISA-AA partitions for ISA-AA groups.

Residential services are an example where all AA services can be configured as part of a single group that encompasses all ISA-AAs. The configuration provides the management of common applications and reporting for all subscribers and services, with common or per-customer AQP (uses ASO characteristics to divide the AQP of the ISA-AA into per-application profile QoS policies).

Multiple ISA-AA groups can also be used to create separate services based on different sets of common applications, traffic diversion needs, or different redundancy models. Multiple ISA-AA groups can be used for:

- a mix of residential and business customers
- different business VPN verticals
- business services with a common template base but different levels of redundancy, forwarding class diversion, or scaling over what is supported per single group

ISA-AA partitions

ISA-AA groups and partitions improve the scaling of policies. If partitions are not configured, the ISA-AA group acts as a single partition. When partitions are configured, application identification, and policy and statistics configuration apply only to the partition and not any other partitions that are configured under the same AA group. Although the definition of application profiles and related ASO characteristics is in the context of a partition, the application profile names must be unique for the NE. Definition of applications, application groups, and AQPs are also specific and only apply to a specific partition.

The following operations can be performed at the ISA-AA partition level

- Define unique applications and application groups per partition.
- Define AQP policies per partition.
- Define common applications and application groups with per partition processing and accounting.

ISA-AA partitions support accounting and customized reporting for every AA subscriber associated with a partition. You can perform the following operations:

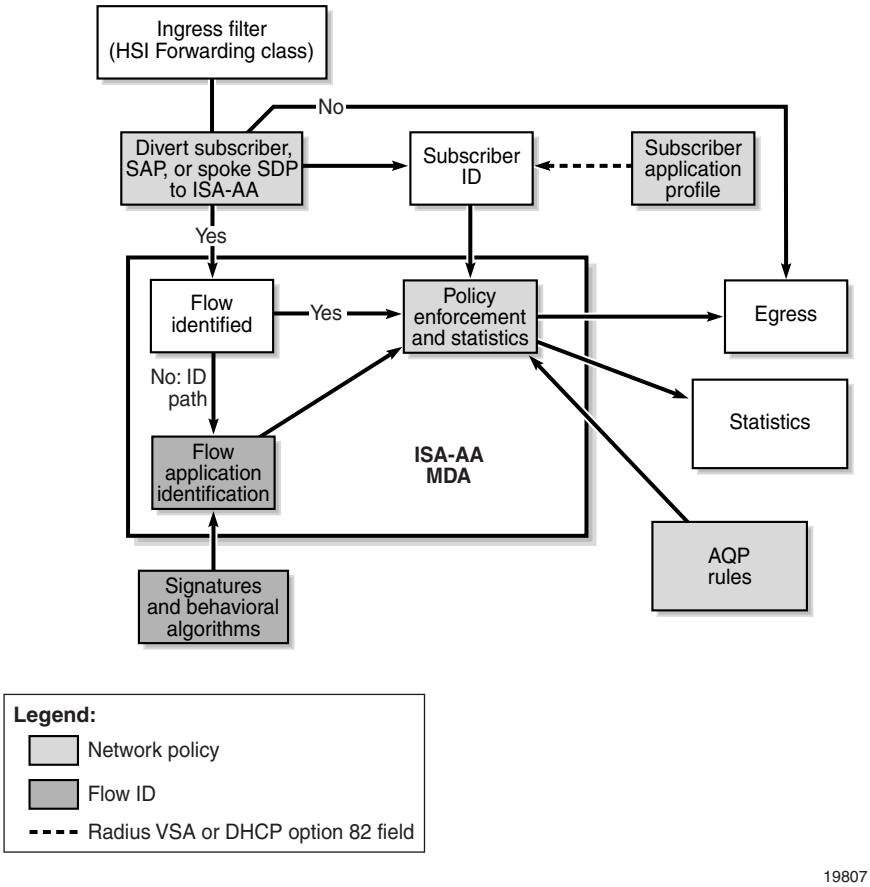
- Define different types of reporting and accounting policies for different partitions in a single AA group.
- Display AA group level protocol statistics with partition visibility (for example, you can view protocol counts that are reported for each partition of the group).

When you create or delete an ISA-AA partition, a default AA accounting policy is automatically created in or deleted from the ISA-AA partition. See Procedure 14-2 for information about how to create and configure ISA-AA groups and partitions.

76.3 AA components

The 5620 SAM supports AA component creation and configuration using configuration forms and scripts. Figure 76-1 shows the AA components.

Figure 76-1 AA components



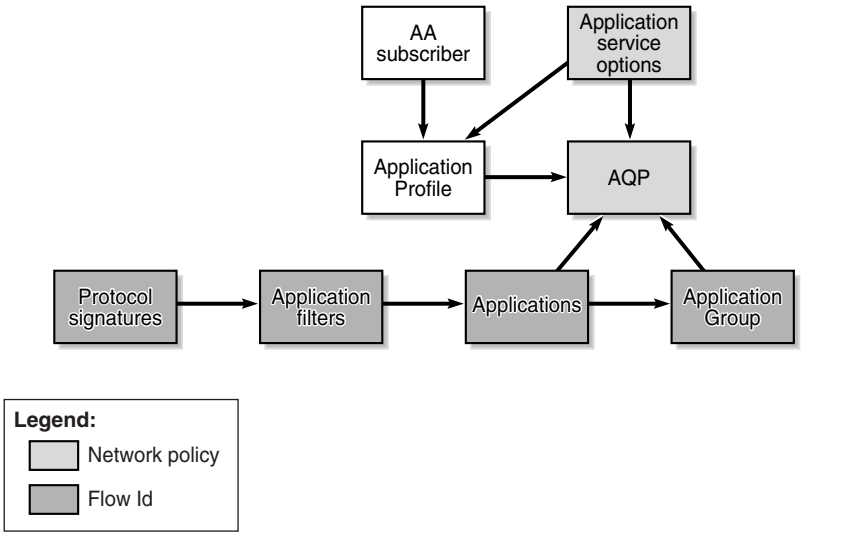


Figure 76-2 shows the relationship between the AA components.

Figure 76-2 AA policy structure

AA group policies

An AA group policy includes the following components:

- applications
- application groups
- application profiles
- application filters
- application service options, or ASOs
- application QoS policies, or AQPs
- custom protocols

Policy sync groups

Policy sync groups allow AA group policy components to be centrally defined and used across multiple ISA-AA groups and partitions. Policy sync groups define common AA group policy components by specifying a group policy as the master policy. The AA group policy classes of the master AA group are available to other AA groups that are members of the same policy sync group.

The list of AA group policy classes can be edited at the policy sync group level, with the option to include or exclude individual child classes. All actions for a given policy sync group affect only the child classes that are included for that policy sync group.

Use the Policy Sync Group menu option to designate an AA group policy as the master policy, and add one or more AA group policies as Policy Sync Group members. You can overwrite or add the contents of the master policy to one or more of its members.

Applications

Applications define and assign a description to the application names that are supported by the application filter entries. Each application is associated with one of the application groups. Applications are used by AA to identify the type of IP traffic in the subscriber traffic.

The application name is a key match criterion within the AQP rules that are applied to the IP traffic of a subscriber. The application name is also the unique identifier of the application object for northbound reporting systems such as the 5670 RAM. Changing an application name results in the loss of the previous application and the creation of a new application.

One predefined application ("unknown") is provided by AA. The unknown application cannot be modified. All other applications must be configured. An application must be configured before the associated application filter is defined.

Network operators can:

- change the application group that an application is associated with
- view which application filters are defining the application

You can obtain a CLI script from Alcatel-Lucent that updates the AA application database on an NE. Using the 5620 SAM script management function, you can update the list of applications on multiple NEs at one time. Contact Alcatel-Lucent technical support for more information.

Application groups

An application group is a container for multiple applications. A set of default application groups is provided by AA. At least one default application group ("unknown") must be associated with each NE. The default application groups cannot be modified.

Multiple applications can be assigned to an application group. An application can only belong to one group. Applications that are not assigned to an application group are automatically placed in the "unknown" application group.

Application profiles

Application profiles enable AA service for traffic to and from an ESM subscriber, SAP, or spoke SDP. Each application profile is unique and defines the AA service that the AA subscriber receives. The type of traffic is configured in the system-wide configuration of QoS forwarding classes to be diverted to the ISA-AA MDA for subscribers with AA enabled. The forwarding class is used for any subscriber traffic that a service provider needs to inspect using AA.

A subscriber can be assigned to an application profile that affects every host of the subscriber. For SAP or spoke SDP AA subscribers, an application profile can be assigned that affects the traffic originating from or destined for the SAP or spoke SDP.

For subscribers with application profiles that enable AA, traffic is diverted to the active ISA-AA MDA using ingress QoS policy filters. The filters identify forwarding and sub-forwarding classes that can be diverted for AA. The system identifies and diverts only traffic for any subscriber who is treated by the ISA-AA MDA, according to the application profile of the subscriber. Diversion to the ISA-AA MDA depends on the ISA-AA MDA status. If a subscriber is not configured to divert traffic to the ISA-AA MDA, normal ingress forwarding occurs.

The characteristics of application profiles are:

- By default, subscribers are not assigned to an application profile and traffic is not diverted for AA analysis.
- One or more application profiles can be configured.
- Application profiles are customer-defined and created using the configured application service options characteristics.
- Application profiles allow ASO characteristics to be associated with AA subscribers.
- Local instances of the application profile are configured to bind to specific objects of an NE (for example, L2 access interface, SAP, local subscriber explicit map entry, and so on).
- Application profiles can only be assigned when ISA-AA cards are assigned to an ISA-AA group
- Global application profiles must be manually distributed to the NEs.
- Application profiles can be assigned a capacity cost for subscriber load balancing among ISAs within the AA group.

ASOs

Application service options, or ASOs define the service provider and customer network functions that are common to sets of subscribers. ASOs prevent subscribers from requiring each subscriber-specific entry in the application QoS policies for standard network services.

In a typical application, ASOs define the HSI service parameters.

- ASOs are optional; AA can check the subscriber IP traffic without the use of application service options.
- ASOs can be configured for each AA group policy.
- ASOs are a series of user-defined application characteristics.
- ASO characteristics are used to create application profiles and provide information to user-defined AQP rules.
- The set of ASOs represent network-wide menus of service capabilities that are available to subscribers.

Some examples of ASOs are:

- entry for each managed application group; for example, VoIP, P2P, and HTTP
- multiple entries where specific applications in an application group can be individually managed as service parameters; for example, HTTP content from a specific content provider, or streaming video from network television or games

- HSI tiers, for example, Gold, Silver, and Bronze, that specify bandwidth levels
- bandwidth parameters for each service option

ASO characteristics are used:

- as input to application profiles
- by application QoS policies to influence how specific traffic is checked and how policies are applied

ASOs are assigned one or more characteristic values to define m service offerings to customers.

Caution — The 5620 SAM cannot discover or synchronize an ASO characteristic on an NE, or an object that references the ASO characteristic, if the characteristic name includes a forward slash (/).

During GUI- or OSS-based ASO configuration, the 5620 SAM prevents the inclusion of a forward slash in the Displayed Name value.

You can configure ASO characteristics for an AA subscriber using an AA subscriber policy override. An AA subscriber policy override can be configured for a SAP or spoke SDP binding, but not for an ESM subscriber. The AA subscriber must have an application profile assigned, or the subscriber policy override is rejected.

You can retrieve on demand the ASO values that are assigned to an AA subscriber from the Edit form of the SAP or spoke SDP binding AA subscriber.

Application filters

Application filters are provided as an indirect action between protocols and applications to allow the addition of variable parameters, for example, port numbers and IP addresses, to an application definition. An application filter contains numbered entries that define the use of protocol signatures and other application criteria. Multiple filter entries can be used to define an application, but each application filter entry maps to one application.

A traffic flow may have multiple filter entries. The entries are applied to the flow sequentially, and the matching entry with the lowest ID value is applied first. A traffic flow can be assigned to only one application.

You can accommodate the insertion of new entries in a list of entries by renumbering one or more of the existing entries using a GUI or OSS client. See Procedure 76-4 for information about renumbering application filter entries using the GUI.

AQPs

Application Qos Policies, or AQPs, are lists of rules that define the match criteria and action to be performed on all traffic flows. The AQP rules use the application groups, applications, and so on, as the match criteria. The output of the AQP rules defines the policy actions to perform.

AQP rules consist of match and action criteria:

- Match—Refers to the criteria used to identify a flow in order to apply actions such as dropping, forwarding, mirroring, and policing of bandwidth and flow. Matches cannot be made against protocols. Match criteria can be a combination of the following:
  - applications or application groups
  - ASO characteristics
  - flow direction
  - AA subscribers
  - flow source or destination IP address and/or port
- Action—Defines AA actions to be applied to traffic. For example, you can apply a set of actions such as bandwidth policing, packet discards, QoS remarking, and flow count, and/or rate limiting to a flow.

Custom protocols

Custom protocols are supported using configurable strings of up to 16 hexadecimal octets for pattern-matched application identification in the payload of TCP- and UDP-based applications. The match applies to the client-to-server, server-to-client, or any direction for TCP based applications, and to any direction for UDP-based applications.

You can configure a custom protocol description, custom protocol ID and shutdown. When a custom protocol is administratively disabled, traffic is identified as though the protocol is not configured.

Custom protocols and Alcatel-Lucent protocols are distinct; the span of a custom protocol is limited to the group or partition associated with an AA policy. Alcatel-Lucent protocols span all groups and partitions. Custom protocols are used in the application definition without limitations. All application filter entries, except strings, are supported. Custom protocol statistics collection on an ISA-AA partition group or special study subscriber is supported.

76.4 5670 RAM reporting attributes

5670 RAM reporting attributes are metadata parameters that specify how data is reported to the 5670 RAM. The parameters are not deployed to devices. Reporting attributes are configurable on the 5670 RAM Parameters tab of the AA application and AA application group properties form, and on the Application Assurance tab of the following properties forms:

- residential subscriber instance
- service
- SAP
- customer

The Reporting child tab contains service class and bandwidth reporting attributes that are configurable for the following objects:

- spoke SDP bindings
- access interfaces
- VPN-type transit prefix subscribers

Note — You must associate an application profile with an object before you can configure AA reporting for the object.

You can configure service-level IP detail reporting, which collects information about the top end users, by volume, of applications and applications groups. The following service types support IP detail configuration:

- IES
- VLL Epipe
- VLL Ipipe
- VPLS
- VPRN

Usage-based billing

The 5620 SAM supports application-specific reporting to the 5670 RAM based on configurable charging groups. You create charging groups as child objects of an AA group policy and can assign them to the following:

- applications
- application groups
- charging group thresholds
- AA subscriber statistics objects

You can assign one charging group to multiple applications or application groups, and can associate an application or application group with only one charging group.

You can configure charging groups with specific usage quotas and notification thresholds, and assign the thresholds to application profiles.

Residential DCP groups

On AA partitions and unpartitioned AA groups, a 5620 SAM operator can configure residential DCP groups that specify how to summarize the collected data. The 5670 RAM uses the group specifications as an aggregation framework for analysis and reporting.

A residential DCP group organizes subscriber traffic based on an IP address range that represents a subscriber address range or the server address range of a content provider. Residential DCP groups can help customers understand traffic patterns like the following:

- the volume of application traffic delivered to a specific regional market, for product management or policy development
- the application performance in a specific regional market; for example, how streamed video that is external in origin affects the local video-on-demand service
- the source of continuous high-volume traffic that is external in origin

76.5 AA accounting policies

AA accounting statistics provide information about application use in a network. You can configure AA accounting to collect and report statistics when at least one ISA-AA MDA is active. The AA accounting statistics provide information about application use on a SAP or spoke SDP, or by a subscriber during a collection interval. The collected information can be viewed in graphical or tabular form using the 5620 SAM GUI, or sent to a module such as the 5670 RAM for reporting and trend analysis.

AA accounting collects statistics on traffic flows. The 5620 SAM can collect the following AA statistics types:

- AA application
- AA application group
- AA protocol
- AA subscriber protocol (special-study)
- AA subscriber application (special-study)
- AA subscriber custom record

AA uses the 5620 SAM and NE accounting statistics and logging capabilities to collect statistics. See “Statistics collection overview” in the *5620 SAM Statistics Management Guide* for general information about configuring and collecting accounting statistics. See Procedure 76-7 for information about configuring an AA accounting policy.

The 5620 SAM can be configured to generate statistics for each protocol and application for a specific subscriber. You can enable AA statistics collection on a specific NE for a subset of subscribers for detailed traffic monitoring. An NE can have one policy for each AA statistics type that is enabled.

The AA subscriber protocol and AA subscriber application statistics are special study statistics for detailed accounting statistics collection on a limited number of subscribers, SAPs, or spoke SDPs on an NE. The number of subscribers, SAPs, or spoke SDPs is limited to constrain the volume of generated statistics.

Special study statistics are enabled by adding subscribers, SAPs, or spoke SDPs to a list in an ISA-AA group on an NE for AA debugging purposes. When a subscriber is on a special study list, the ISA-AA creates one statistics record for each application and application group that is associated with the subscriber. When a SAP or spoke SDP is on a special-study list, the ISA-AA creates one statistics record for each

application, application group, and protocol flow on the SAP or spoke SDP. See Procedure 14-2 for information about configuring special study objects in an ISA-AA group.

An AA custom record subscriber accounting policy applies to all subscribers, SAPs and spoke SDPs in an ISA-AA group for a specified set of AA protocols, applications, and application groups. The policy enables statistics collection on only the specified objects, which limits the volume of collected data and the statistics collection processing load. For example, a 5620 SAM operator may require statistics for only three application groups and 10 applications. You can view and configure the AA statistics objects from the AA Subscriber Stats Objects tab on the properties form of an ISA-AA group.

76.6 Workflow to configure AA

1. Configure the required ISA-AA groups and partitions on NEs. See Procedure 14-2.
2. Configure AA group policies using Procedure 76-1. As required, configure the following components:
   - ASOs and ASO overrides
   - application profiles
   - application groups
   - charging groups
   - applications
   - application filters
   - custom protocols
3. Configure AA policers. See Procedure 76-3.
4. Configure AQPs for AA group policies. See Procedure 76-5.
5. Create a policy sync group. See Procedure 76-6.
6. Create an AA accounting policy to specify when statistics are collected from the ISA-AA MDA. See Procedure 76-7.
7. Configure an AA flow watermark policy. See Procedure 76-8.
8. Configure AA transit IP policies and transit prefix policies as required.
   - **i** Configure AA transit IP policies. See Procedure 76-9.
   - **ii** Configure AA transit prefix policies. See Procedure 76-10.
   - **iii** Configure database persisted transit subscriber aggregators. See Procedure 76-11.
   - **iv** Associate database persisted transit subscribers with aggregators. See Procedure 76-12.

v Configure reporting attributes for AA reporting on a database persisted transit subscriber. See Procedure 76-13.

vi As required, view the database persisted transit subscriber information. See Procedure 76-14.

9 Configure usage-based billing as required:

i Enable usage-based billing at the application profile level. See Procedure 76-15.

ii Associate applications with charging groups. See Procedure 76-16.

10 Configure application performance reporting on a service. See Procedure 76-17.

11 Create a custom DCP subnet group for application performance reporting on a service and related objects. See Procedure 76-19.

12 Configure AA HTTP error redirect policies. See Procedure 76-20.

13 Configure AA HTTP redirect policies. See Procedure 76-21.

14 Configure AA protocol signatures and enable inactive protocols, as required. See Procedure 76-26.

15 As required, view AA results:

a view AA summary information for subscribers, transit subscribers, SAPs, and spoke SDPs on ISA-AA MDAs; see Procedure 76-27 for more information

b view the AA special study statistics data for subscribers, transit subscribers, SAPs, or spoke SDPs on an ISA-AA MDA; see Procedure 76-29 for more information

c view application filter hit counts on local definitions of AA group policies; see Procedure 76-28 for more information

d view application filter hit counts on local definitions of AA group policies; see Procedure 76-30 for more information

16 As required, delete AA objects or records.

a Delete an AA application, application group, or custom protocol; see Procedure 76-31 for more information.

b Remove the record of an inactive AA transit subscriber from the 5620 SAM database; see Procedure 76-32 for more information.

76.7 Application assurance procedures

Use the following procedures to configure AA policies and parameters in the 5620 SAM.

Procedure 76-1 To configure an AA group policy

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Perform one of the following:

a Create a policy. Perform the following steps.

i Click on the Create button and choose Create AA Group Policy from the drop-down list. The AA Group Policy (Create) form opens.

ii Configure the parameters:

- Group ID
- Partition ID

iii Click on the Apply button. The form name changes to AA Group Policy (Edit), and additional tabs are displayed.

b Configure an existing policy. Perform the following steps.

i Click on the Search button. The AA group policies are listed.

ii Select an AA group policy in the list and click on the Properties button. The AA Group Policy (Edit) form opens with the General tab displayed.

3 Configure the Description parameter.

4 To specify a default charging group, click on the Select button and choose a charging group from the Select Default Charging Group form.

5 To create an application group, perform the following steps.

Note — You can also manage application groups using the right-click contextual menu options for the Application Groups object on the AA Identification Components tab.

i Click on the Application Groups tab.

ii Click on the Create button. The Application Group (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Displayed Name
- Description
- Export ID

Note — You must select the check box beside the Export ID parameter before you can configure the parameter.

iv Click on the Charging Group tab.

v Click on the Select button and choose a charging group from the Select Charging Group form.

vi Click on the 5670 RAM Parameters tab.

vii Configure the Traffic Type parameter.

viii Click on the OK button. A dialog box appears.

ix Click on the OK button. The AA Group Policy (Edit) form reappears.

6 Repeat step 5 to create an additional application group, if required.

7 To create a charging group, perform the following steps.

i Click on the Charging Groups tab.

ii Click on the Create button. The Charging Group (Create) form opens.

iii Configure the parameters:

- Displayed Name
- Description
- Export ID

Note — You must select the check box beside the Export ID parameter before you can configure the parameter.

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The AA Group Policy (Edit) form reappears.

8 Repeat step 7 to create an additional charging group, if required.

9 To create an application, perform the following steps.

Note — You can also manage applications using the right-click contextual menu options for the Applications object on the AA Identification Components tab.

i Click on the Applications tab.

ii Click on the Create button. The Application (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Displayed Name
- Description
- Export ID

Note — You must select the check box beside the Export ID parameter before you can configure the parameter.

iv Click on the Application Group tab.

v Click on the Select button and choose an application group from the Select Application Group form.

vi Click on the Charging Group tab.

vii Click on the Select button and choose a charging group from the Select Charging Group form.

viii Click on the 5670 RAM Parameters tab.

Note — The 5670 RAM can perform an application performance index analysis on an AA application. An application performance index configuration is not distributed to an NE as part of a policy distribution.

The 5670 RAM provides a comparative analysis of TCP and UDP application usage. For each application, you can specify whether the application is TCP or UDP. TCP or UDP data is not distributed to an NE as part of a policy distribution.

ix Configure the general parameters:

- Application Flag
- Traffic Type

x Configure the parameters in the Thresholds panel:

- Threshold Administrative State
- Round Trip Time Tolerated (milliseconds)
- Mean Total Delay Tolerated (milliseconds)
- Total Delay Standard Deviation Tolerated (milliseconds)
- Packet Loss Tolerated (%)
- Frustrated (milliseconds)
- Frustrated (milliseconds)
- Frustrated (milliseconds)
- Frustrated (%)

xi Click on the OK button. A dialog box appears.

xii Click on the OK button. The Application (Create) form closes and the AA Group Policy (Edit) form reappears.

10 Repeat step 9 to create an additional application, if required.

11 To create an application filter, perform the following steps.

Note — You can also manage application filters using the right-click contextual menu options for the Application Filters object on the AA Identification Components tab.

i Click on the Application Filters tab.

ii Click on the Create button. The Application Filter (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Entry ID
- Description
- Administrative State

iv Click on the General Properties tab.

v Configure the Flow Set-up Direction parameter.

vi Configure the parameters in the IP Protocol panel, as required.

- IP Protocol Operator
- IP Protocol Number

vii Configure the parameters in the Protocol panel, as required.

- Protocol Operator
- Protocol Type

viii Configure the parameters in the Server panel, as required.

- Server Address Operator
- Server Address
- Server Address Mask

ix Configure the parameters in the Server Port panel, as required.

- Server Port Operator
- Server Port Value Type
- Server Port/Low Value
- Server Port High Value
- Server Port First Packet Policy

x Click on the Select button in the Protocol panel and choose a protocol from the Select Protocol or Select Custom Protocol form, depending on the Protocol Type parameter setting.

xi Click on the Application tab.

xii Click on the Select button in the Application panel and choose an application from the Select Application form.

xiii Click on the Application Filter Expressions tab.

xiv Click on the Create button. The Application Filter Expression (Create) form opens.

xv Configure the parameters:

- Index
- Type
- Operator
- String

xvi Click on the OK button. A dialog box appears.

xvii Click on the OK button. The Application Filter Expression (Create) form closes and the expression information is listed on the Application Filter (Create) form.

xviii Repeat step 11 xiv to xvii to create an additional application filter expression, if required.

Note — You can create a maximum of three application filter expressions.

xix Click on the OK button. A dialog box appears.

xx Click on the OK button. The Application Filter (Create) form reappears.

12 Repeat step 11 to create an additional application filter, if required.

13 Click on the OK button. A dialog box appears.

14 Click on the OK button. The Application Filter (Create) form closes and the AA Group Policy (Edit) form reappears.

15 To create an ASO, perform the following steps.

i Click on the Application Service Options tab.

ii Click on the Create button. The Application Service Option (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Displayed Name
- ASO Characteristic Default Value

Note — The Displayed Name of an ASO cannot contain a forward slash (/) character.

iv Click on the Application Service Option Value Entries tab.

v Click on the Create button. The Application Service Option Value Entry (Create) form opens.

vi Configure the ASO Characteristic Value parameter.

vii Click on the OK button. A dialog box appears.

viii Click on the OK button. The Application Service Option Value Entry (Create) form closes and the entry information is listed on the Application Service Option (Create) form.

ix Repeat steps 15 v to viii to create an additional ASO value entry.

x Click on the OK button. A dialog box appears.

xi Click on the OK button. The Application Service Option (Create) form closes and the AA Group Policy (Edit) form reappears.

16 Repeat step 15 to create an additional ASO, if required.

17 To create an application profile, perform the following steps.

i Click on the Application Profiles tab.

ii Click on the Create button. The Application Profile (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Displayed Name
- Description
- Divert
- Capacity Cost

iv Click on the 5670 RAM Parameters tab.

v Configure the Billing Reset Date parameter.

vi Configure the parameters in the Apdex Thresholds panel.

- Unacceptable
- Poor
- Fair
- Good

vii Configure the parameters in the MOS Thresholds panel.

- Unacceptable
- Poor
- Fair
- Good

viii Click on the Charging Group Thresholds tab.

ix Click on the Create button. The Charging Group Thresholds (Create) form opens.

x Configure the parameters:

- Quota (GB)
- Description
- Administrative State
- High Threshold (%)
- Middle Threshold (%)
- Low Threshold (%)

xi Click on the Select button and choose a charging group from the Select Charging Group form.

xii Click on the OK button. A dialog box appears.

xiii Click on the OK button. The Charging Group Thresholds (Create) form closes and the thresholds entry is listed on the Application Profile (Create) form.

xiv Click on the Characteristics tab.

xv Click on the Create button. The Application Profile Characteristic (Create) form opens.

xvi Click on the Select button beside the ASO Characteristic parameter and select an ASO Characteristic from the Select Application Service Option form.

xvii Click on the Select button beside the ASO Characteristic Value parameter and select an ASO characteristic value from the Select Application Service Option Characteristic Value form.

xviii Click on the OK button. A dialog box appears.

xix Click on the OK button. The Application Profile Characteristic (Create) form closes and the entry is listed on the Application Profile (Create) form.

xx Repeat steps 17 xv to xix to create an additional application profile characteristic, if required.

xxi Click on the OK button. A dialog box appears.

xxii Click on the OK button. The AA Group Policy (Edit) form reappears.

18 Repeat step 17 to create an additional application profile, if required.

19 Create a custom protocol, if required.

i Click on the Custom Protocols tab.

ii Click on the Create button. The Custom Protocol (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Entry ID
- Description
- IP Protocol Number
- Administrative State

iv Click on the Custom Protocol Expressions tab.

v Click on the Create button. The Custom Protocol Expressions (Create) form opens.

vi Configure the parameters:

- Index
- Custom Protocol Expression Offset
- Custom Protocol Expression Direction
- Operator
- String

vii Click on the OK button. A dialog box appears.

viii Click on the OK button. The Custom Protocol Expression (Create) form closes and the expression is listed on the Custom Protocol (Create) form.

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Custom Protocol Expressions (Create) form closes and the AA Group Policy (Edit) form reappears.

20 Click on the OK button. A dialog box appears.

21 Click on the Yes button. The AA Group Policy (Edit) form closes, and the Application Assurance Policies form reappears.

22 Close the Application Assurance Policies form.

Procedure 76-2 To configure AARP

Perform this procedure to create or modify an AARP instance on an NE.

1 Choose Manage→ISA Functions→ISA AA from the 5620 SAM main menu. The Manage ISA-AA form opens.

2 Perform one of the following:

a Create an AARP instance. Perform the following steps.

i Click on the Create button and choose Create AARP from the drop-down list. The Select Network Elements form opens.

ii Select an NE in the list and click on the OK button. The AARP (Create) form opens.

iii Configure the ID parameter.

iv Click on the Apply button. The form name changes to AARP (Edit), and additional tabs are displayed.

b Configure an existing AARP instance. Perform the following steps.

i Choose AARP (Application Assurance) from the object drop-down list.

ii Click on the Search button. The AARP instances are listed.

iii Select an AARP instance in the list and click on the Properties button. The AARP (Edit) form opens with the General tab displayed.

3 Configure the following parameters:

- Description
- Peer IP Address

4 Perform one of the following.

a If the endpoint is a SAP, perform the following steps.

i Set the Peer Endpoint Type parameter to SAP.

ii If the SAP has a name, use the Select button to choose the SAP. Otherwise, configure the following parameters:

- SAP Terminating Port
- SAP Encapsulation Type
- SAP Outer Encapsulation Value
- SAP Inner Encapsulation Value

The SAP Outer Encapsulation Value parameter is configurable when the SAP Encapsulation Type parameter is set to Dot1 Q:

The SAP Inner Encapsulation Value parameter is configurable when the SAP Encapsulation Type parameter is set to Q in Q:

b If the endpoint is a spoke SDP binding, perform the following steps.

i Set the Peer Endpoint Type parameter to Spoke SDP Binding.

ii If the spoke SDP binding has a name, use the Select button to choose the spoke SDP binding. Otherwise, configure the Spoke SDP Bind ID parameter.

5 Configure the remaining parameters:

- Administrative State
- Priority
- Master Select Mode

6 Click on the Apply button. A dialog box appears.

7 Click on the Yes button.

8 View the Operational Flag and Peer Operational Flag indicators to ensure that the configuration is correct; modify the configuration, if required.

9 Close the AARP (Edit) form.

10 Close the Manage ISA-AA form.

Procedure 76-3 To configure an AA policer

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Perform one of the following:

a Create a policer. Perform the following steps.

i Click on the Create button and choose Create AA Policer from the drop-down list. The AA Policer (Create) form opens.

ii Configure the parameters:

- ISA-AA Group ID
- Displayed Name
- Type
- Granularity

Note — The distribution of an AA policer to an NE fails if the ISA-AA group specified by the ISA-AA Group ID does not exist on the NE.

iii Click on the Apply button. The form name changes to AA Policer (Edit), and additional tabs are displayed.

b Configure an existing policer. Perform the following steps.

i Choose AA Policer (Application Assurance) from the object drop-down list.

ii Click on the Search button. The policies are listed.

iii Select a policer in the list and click on the Properties button. The AA Policer (Edit) form opens with the General tab displayed.

3 Configure the Description parameter:

4 Perform one of the following:

a If the Type parameter is set to Dual Bucket Bandwidth, configure the following parameters:

- MBS (KB)
- CBS (KB)
- PIR (Kbps)
- CIR (Kbps)
- PIR
- CIR

b If the Type parameter is set to Flow Count Limit, configure the following parameters:

- Action
- Flow Count (flows)

c If the Type parameter is set to Flow Rate Limit, configure the following parameters:

- Action
- MBS (flows)
- PIR (flows/s)
- PIR

d If the Type parameter is set to Single Bucket Bandwidth, configure the following parameters:

- Action
- MBS (KB)
- PIR (Kbps)
- PIR

5 To configure a time-of-day override for the policer, perform the following steps.

i Click on the TOD Overrides tab.

ii Click on the Create button. The AA Policer Override (Create) form opens with the General tab displayed.

iii Configure the parameters:

- Index
- Description
- Administrative State
- MBS
- CBS (KB)
- PIR (Kbps)
- CUR (Kbps)

iv Click on the Frequency tab.

v Configure the parameters:

- Frequency
- Start Hour
- End Hour
- Start Minute
- End Minute
- Start Day
- End Day

Note — The End Day parameter is configurable when the Frequency parameter is set to Weekly.

vi Click on the OK button. A dialog box appears.

vii Click on the OK button. The AA Policer Override (Create) form closes, and the time-of-day override is listed on the AA Policer (Edit) form.

6 Click on the OK button. A dialog box appears.

7 Click on the OK button. The AA Policer (Edit) form closes.

8 Close the Application Assurance Policies form.

Procedure 76-4 To renumber application filter entries

Perform this procedure to assign new ID values to one or more application filter entries in an AA group policy.

Note — The 5620 SAM renumbers a filter entry ID only when the following are true.

- The new value is unused.
- The new value is less than or equal to the maximum allowed value.
- The renumbering does not change the filter order.

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Group Policy (Application Assurance) from the object drop-down list and click on the Search button. A list of AA group policies is displayed.

3 Select a policy in the list and click on the Properties button. The AA Group Policy (Edit) form opens with the General tab displayed.

4 Click on the Application Filters tab. A list of application filter entries is displayed.

5 To renumber one filter entry, perform the following steps.

i Select the entry and click on the Renumber ID button. The Renumber Entry ID form opens.

ii Configure the New Entry ID parameter.

iii Click on the OK button. The Renumber Entry ID form closes and a dialog box appears.

iv Click on the Yes button. The 5620 SAM renumbers the entry.

6 To renumber multiple filter entries, perform the following steps.

i Select the lowest-numbered entry that you want to renumber and click on the Renumber IDs button. The Renumber Entry ID form opens.

ii Configure the following parameters:

- Start Entry ID
- End Entry ID

Note — An End Entry ID value of 0 specifies that there is no ending entry ID; the range of entry IDs to renumber extends to the highest-numbered entry in the list.

iii Perform one of the following.

- Select Add Factor to add an offset to each entry ID in the specified range.
- Select Multiply Factor to multiply the ID of the selected entry and each higher-numbered entry in the specified range by an offset.

iv Configure the Factor Value parameter by specifying the required addition or multiplication offset.

v Click on the OK button. The Renumber Entry ID form closes and a dialog box appears.

vi Click on the Yes button. The 5620 SAM renumbers the entries.

7 Close the AA Group Policy (Edit) form.

8 Close the Application Assurance Policies form.

Procedure 76-5 To configure an AQP

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Group Policy (Application Assurance) from the object drop-down list and click on the Search button. A list of AA group policies is displayed.

Note — The 5620 SAM does not create local AA Group policies for each applicable managed NE. Instead, the local AA Group Policy is created/deleted when the ISA-AA group is created/deleted.

3 Select a policy in the list and click on the Properties button. The AA Group Policy (Edit) form opens with the General tab displayed.

4 Click on the Application QoS Entries tab.

5 Click on the Create button. The Application QoS Policy (Create) form opens with the General tab displayed.

6 Configure the parameters:

- Entry ID
- Description
- Administrative State

7 Click on the Match Criteria tab.

8 Configure the Traffic Direction parameter.

9 To specify an application as a criterion, perform the following steps.

i Configure the Application Operator parameter.

ii Click on the Select button in the Application panel and choose an application from the Select Application Name - Application QoS Policy form.

10 To specify an application group as a criterion, perform the following steps.

i Configure the Application Group Operator parameter.

ii Click on the Select button in the Application Group panel and choose an application group from the Select Application Group Name - Application QoS Policy form.

11 To specify DSCP criteria, configure the parameters in the DSCP panel:

- DSCP Operator
- DSCP

12 To specify IP criteria, configure the parameters in the IP Protocol panel:

- IP Protocol Operator
- IP Protocol Number

13 To specify a charging group as a criterion, perform the following steps.

i Configure the Charging Group Operator parameter.

ii Click on the Select button in the Charging Group panel and choose a charging group from the Select Charging Group - Application QoS Policy form.

14 To configure subscriber criteria, click on the AA Subscriber tab. Otherwise, go to step 17.

15 Configure the Subscriber Type parameter.

Note 1 — The SAP and Spoke SDP Binding options for the Subscriber Type parameter are selectable only for local AQP entry creation.

Note 2 — If the Subscriber Type parameter is set to None, the other parameters on the AA Subscriber tab are reset to the default values.

16 Perform one of the following:

a If the SubscriberType parameter is set to ESM, configure the ESM Subscriber parameter.

b If the SubscriberType parameter is set to SAP, configure the SAP Subscriber parameter.

c If the SubscriberType parameter is set to Spoke SDP Binding, configure the Spoke Subscriber parameter.

d If the SubscriberType parameter is set to Transit, configure the Transit Subscriber parameter.

17 To configure source or destination criteria, perform the following steps.

i Click on the Source and Destination tab.

ii Configure the parameters in the Source Address panel:

- Address Operator
- Address
- Address Length

iii Configure the parameters in the Source Port panel:

- Port Operator
- Port Value Type
- Port Value/Low Value
- Port High Value

iv Configure the parameters in the Destination Address panel:

- Address Operator
- Address
- Address Length

v Configure the parameters in the Destination Port panel:

- Port Operator
- Port Value Type
- Port Value/Low Value
- Port High Value

18 To configure ASO characteristic criteria, perform the following steps.

i Click on the Characteristics tab.

ii Click on the Create button. The Application QoS Policy Characteristic (Create) form opens.

iii Configure the parameters:

- ASO Characteristic
- ASO Characteristic Operator
- ASO Characteristic Value

iv Click on the OK button. A dialog box appears.

v Click on the Yes button. The Application QoS Policy Characteristic (Create) form closes.

19 Click on the Action tab.

20 Configure the Drop parameter.

21 If you select the Drop parameter, go to step 31.

22 Click on the Select buttons in the following panels, as required, and use the form that opens to choose the associated agent:

- Bandwidth Limit Policer
- Flow Rate Limit Policer
- Flow Count Limit Policer
- HTTP Error Redirect

23 To configure HTTP redirect, perform the following steps.

i Click on the Select button in the HTTP Redirect panel and use the form that opens to choose an HTTP redirect policy.

ii Configure the Flow Type parameter.

24 Click on the Select button in the HTTP Enrichment panel and use the form that opens to choose an HTTP enrichment policy.

25 Click on the Select button in the HTTP Notification panel and use the form that opens to choose an HTTP notification policy.

26 Click on the Select button in the Session Filter panel and use the form that opens to choose a session filter.

Note — The following devices support AA session filters:

- 7750 MG, Release 4.0 R6 or later
- 7450 ESS, Release 11.0 or later
- 7750 SR, Release 11.0 or later

27 Configure the parameters:

- Subscriber Cut Through
- Mirror Source All Inclusive

Note — The Mirror Source All Inclusive parameter is configurable only when you configure an AQP entry in a local definition of the AA group policy.

28 Click on the Select button in the Mirror Source panel to choose a mirror service from the Select Mirror Service form.

Note — You can specify a mirror service only when you configure an AQP entry in a local definition of the AA group policy.

29 Click on the Select button in the URL Filter panel and use the form that opens to choose a URL filter.

30 Configure the remarking parameters in the Remark panel:

- Forwarding Class
- Priority
- Remark DSCP In Profile
- Remark DSCP Out Profile

31 Click on the OK button. A dialog box appears.

32 Click on the OK button. The Application QoS Policy (Create) form closes.

33 Close the AA Group Policy (Edit) form.

34 Close the Application Assurance Policies form.

Procedure 76-6 To configure a policy sync group

1 Choose Policies→Policy Sync Group from the 5620 SAM main menu. The Policy Sync Groups form opens.

2 Perform one of the following:

a Create a policy sync group. Perform the following steps.

i Click on the Create button and choose Policy Sync Group. The Policy Sync Group (Create) form opens.

ii Configure the parameters:

- ID
- Auto-Assign ID

iii Click on the Select button in the Master Policy panel to choose a master policy from the Select Master Policy - Policy Sync Group form.

iv Click on the Apply button. The Policy Sync Group (Create) form name changes to Policy Sync Group (Edit), and the form displays additional tabs.

b Configure an existing policy sync group. Perform the following steps.

i Click on the Search button. A list of policy sync groups is displayed.

ii Select a group in the list and click on the Properties button. The Policy Sync Group (Edit) form opens with the General tab displayed.

3 Configure the following parameters:

- Description
- Displayed Name

4 To specify the AA group policy classes to include in the policy sync group, perform the followings steps.

i Click on the Included Classes tab. The tab lists the classes that are included in the policy sync group.

Note — The Sync Members, Add to Members, and Update Master actions performed on an AA group policy affect only the classes listed under the Included Classes tab.

ii To add one or more classes, click on the Add button and use the Select form that opens to specify the classes. The classes are listed on the Policy Sync Group (Edit) form.

iii To delete one or more classes, select the classes and click on the Delete button. The classes are removed from the list.

5 To add a member AA group policy, perform the following steps.

i Click on the Members tab.

ii Click on the Add button. The Select AA Group Policy - Policy Sync Group form opens.

iii Choose one or more AA group policies in the list and click on the OK button. The Confirm form opens. The form displays the following options:

- Listed master policy classes will overwrite member classes
- Listed master policy classes will be added to member classes

Note 1 — The Sync Members button performs the same function as the "Listed master policy classes will overwrite member classes" option.

Note 2 — The Add to Members button performs the same function as the "Listed master policy classes will be added to member classes" option.

iv Choose an option and click on the OK button. The member is listed on the Policy Sync Group (Edit) form.

6 To remove a member AA group policy, perform the following steps.

i Click on the Members tab.

ii Select a member policy in the list.

iii Click on the Delete button. The member policy is removed from the list.

7 To compare two member policies, perform the following steps.

i Select two policies in the list and click on the Compare button. The Compare - AA Group Policy form opens.

Note — You can use the Swap button to switch Policy A and Policy B.

ii Click on the Compare button to view the differences between Policy A and Policy B.

iii Choose a result and click on the Properties button. The Difference - AA Group Policy (*class type*) form opens.

iv View the differences between the two policies.

Note — After a Sync Member or Add to Member action, the member policy mode changes to Draft.

8 To add the classes defined in the master policy to each member policy, click on the Add To Members button. The master policy classes are added to each member policy.

9 To synchronize each member policy with the master policy, click on the Sync Members button. The master policy class list overwrite the class list in each member policy.

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The Policy Sync Group (Edit) form closes, and the Policy Sync Groups form reappears.

12 Close the Policy Sync Groups form.

Procedure 76-7 To configure an AA accounting policy

See "Statistics collection overview" in the *5620 SAM Statistics Management Guide* for general information about configuring and collecting accounting statistics.

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Perform one of the following:

a Create a policy. Perform the following steps.

i Click on the Create button and choose AA Accounting Policy. The AA Accounting Policy (Create) form opens.

ii Configure the parameters:

- Group ID
- Partition ID

iii Click on the Apply button. The form name changes to AA Accounting Policy (Edit), and additional tabs are displayed.

b Configure an existing policy. Perform the following steps.

i Choose AA Accounting Policy (Application Assurance) from the object drop-down list.

ii Click on the Search button. A list of AA accounting policies is displayed.

iii Select a policy in the list and click on the Properties button. The AA Accounting Policy (Edit) form opens.

3 Configure the Description parameter.

4 Click on the Apply button. The form displays additional tabs.

5 Click on the Accounting Policies tab. A list of accounting policies is displayed.

6 Configure each accounting policy in the list, if required.

i Select the accounting policy and click on the Properties button. The AA Accounting Configuration form is displayed.

ii Configure the parameters:

- Description
- Collect Accounting Statistics

iii Click on the Select button in the Accounting Policy panel to choose an accounting policy from the Select Accounting Policy form.

iv Configure the following policy-specific parameters, if required:

- Administrative State
- Collect Aggregate Statistics
- Collect Maximum Throughput Statistics
- TCP Retransmission Packets Exclusion

Note — The TCP Retransmission Packets Exclusion parameter is configurable only on a Release 4.0 R5 or later 7750 MG, and only when the accounting policy type is AA Subscriber Custom Record.

v Click on the OK button. The AA Accounting Configuration (Edit) form closes.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The AA Accounting Policy (Edit) form closes, and the Application Assurance Policies form reappears.

9 Close the Application Assurance Policies form.

Procedure 76-8 To configure an AA flow watermark

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Flow Watermark (Application Assurance) from the object drop-down list.

3 Click on the Search button. The AA flow watermarks are listed.

4 Select an entry in the list and click on the Properties button. The AA Flow Watermark (Edit) form opens with the General tab displayed.

5 Configure the parameters:

- Flow Full High Watermark
- Flow Full Low Watermark
- Flow Setup High Watermark
- Flow Setup Low Watermark
- Packet Rate High Watermark
- Packet Rate Low Watermark
- Bit Rate High Watermark
- Bit Rate Low Watermark

6 Click on the Apply button. A dialog box appears.

7 Click on the Yes button. The Configuration Mode changes to Draft.

8 Click on the Switch Mode button. A dialog box appears.

9 Click on the Yes button. The Configuration Mode changes to Released.

10 Click on the Distribute button to manually distribute the policy to one or more NEs. The Distribute - AA Flow Watermark form opens.

11 Select one or more NEs in the Available Nodes panel to which you want to distribute the policy and click on the right arrow. The NEs move to the Selected Nodes panel.

12 Click on the Distribute button. The policy is distributed to the NEs.

13 Close the Distribute - AA Flow Watermark form. The Application Assurance Policies form reappears.

14 Close the Application Assurance Policies form.

Procedure 76-9 To configure an AA transit IP policy

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Perform one of the following.

a Create an AA transit IP policy. Perform the following steps.

i Click on the Create button and choose AA Transit IP Policy. The AA Transit IP Policy (Create) form opens with General tab displayed.

ii Configure the following parameters:

- Group ID
- Partition ID
- Auto-Assign ID
- Policy ID

b Configure an existing AA transit IP policy. Perform the following steps.

i Choose AA Transit IP Policy (Application Assurance) from the object drop-down list.

ii Click on the Search button. The AA transit IP policies are listed.

iii Select a policy in the list and click on the Properties button. The AA Transit IP Policy (Edit) form opens.

3 Configure the following parameters:

- Description
- IPv6 Address Prefix Length

4 Click on the Select button in the Default Application Profile panel to choose a default application profile from the Select Default Application Profile - AA Transit IP Policy form.

Note — Only application profiles with the same Group ID and Partition ID values as the AA transit IP policy are listed.

5 Click on the Select button in the Subscriber Identification Policy panel to choose a subscriber identification policy from the Select Subscriber Identification Policy form.

6 Configure the following parameters:

- DHCP
- Seen IP
- Auto Create
- RADIUS

Note — The following parameters cannot be enabled at the same time:

- DHCP, and RADIUS or Seen IP
- Auto Create, and DHCP or RADIUS

7 If the RADIUS parameter is set to Enabled, click on the Select button in the Subscriber Authentication Policy panel to choose a subscriber authentication policy from the Select Subscriber Authentication Policy form.

8 If the RADIUS parameter is set to Enabled, click on the Select button in the AA RADIUS Accounting Policy panel to choose an AA RADIUS accounting policy from the Select AA RADIUS Accounting Policy form.

9 To add a static subscriber to the policy, perform the following steps.

i Click on the Subscribers tab.

ii Click on the Create button. The Transit Subscriber (Create) form opens with the General tab displayed.

iii Configure the Displayed Name parameter.

iv Click on the Select button in the Application Profile panel to choose an application profile from the Select Application Profile form.

v Click on the IP Addresses tab.

vi Click on the Create button. The Transit IP Address (Create) form opens.

vii Configure the Address parameter.

viii Click on the OK button. The address is listed on the Transit Subscriber (Create) form.

ix Repeat steps vi to viii to add another address, if required.

x Click on the OK button. A dialog box appears.

xi Click on the OK button. The Transit Subscriber (Create) form closes.

10 Repeat step 9 to add another static subscriber to the AA transit IP policy, if required.

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The AA Transit IP Policy (Create) or (Edit) form closes and the Application Assurance Policies form reappears.

13 Close the Application Assurance Policies form.

Procedure 76-10 To configure an AA transit prefix policy

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Perform one of the following.

a Create an AA transit prefix policy. Perform the following steps.

i Click on the Create button and choose AA Transit Prefix Policy. The AA Transit Prefix Policy (Create) form opens with the General tab displayed.

ii Configure the parameters:

- Group ID
- Partition ID
- Auto-Assign ID
- Policy ID

iii Click on the Apply button. The form name changes to AA Transit Prefix Policy (Edit), and additional tabs are displayed.

b Configure an existing AA transit prefix policy. Perform the following steps.

i Choose AA Transit Prefix Policy (Application Assurance) from the object drop-down list.

ii Click on the Search button. The AA transit prefix policies are listed.

iii Select an AA transit prefix policy in the list and click on the Properties button. The AA Transit Prefix Policy (Edit) form opens with the General tab displayed.

3 Configure the Description parameter.

4 To configure a subscriber, perform the following steps.

i Click on the Subscribers tab.

ii Click on the Create button. The Transit Prefix Subscriber (Create) form opens.

iii Configure the parameters:

- Displayed Name
- Remote

iv Click on the Select button in the Application Profile panel to choose an application profile from the Select Application Profile - Transit Prefix Subscriber form.

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The Transit Prefix Subscriber (Create) form closes, and the subscriber is listed on the AA Transit Prefix Policy (Edit) form.

vii Repeat steps ii to vi to create an additional transit prefix subscriber, if required.

5 To create a transit prefix entry, perform the following steps.

i Click on the Entries tab.

ii Click on the Create button. The Transit Prefix Entry (Create) form opens.

iii Click on the Select button in the Subscriber panel to choose a subscriber from the Select Subscriber - Transit Prefix Entry form.

iv Configure the parameters:

- Match Subscriber Address
- Subscriber Address
- Match Network Address
- Network Address
- ID
- Auto-Assign ID
- Subscriber Address Prefix Length
- Network Address Prefix Length

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The Transit Prefix Entry (Create) form closes, and the entry is listed on the AA Transit Prefix Policy (Edit) form.

vii Repeat steps ii to vi to create an additional transit prefix entry, if required.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The AA Transit Prefix Policy (Edit) form closes and the Application Assurance Policies form reappears.

8 Close the Application Assurance Policies form.

Procedure 76-11 To configure a database persisted transit subscriber aggregator

1 Choose Manage→AA Transit Subscribers from the 5620 SAM main menu. The Manage AA Transit Subscribers form opens.

2 Perform one of the following:

- **a** Create a database persisted transit subscriber aggregator. Perform the following steps.
  - **i** Click on the Create button and choose Transit Subscriber Aggregator. The Database Persisted Transit Subscriber Aggregator (Create) form opens with the General tab displayed.
  - **ii** Configure the Name parameter.
  - **iii** Click on the Apply button. The form name changes to Database Persisted Transit Subscriber Aggregator (Edit), and additional tabs are displayed.
- **b** Configure an existing database persisted transit subscriber aggregator. Perform the following steps.
  - **i** Choose Database Persisted Transit Subscriber Aggregator (Application Assurance) from the object drop-down list.
  - **ii** Click on the Search button. The database persisted transit subscriber aggregators are listed.
  - **iii** Select a database persisted transit subscriber aggregator in the list and click on the Properties button. The Database Persisted Transit Subscriber Aggregator (Edit) form opens with the General tab displayed.

3 Configure the parameters:

- Description
- Keyword List

4 Click on the OK button. The Database Persisted Transit Subscriber Aggregator (Edit) form closes, and the Manage AA Transit Subscribers form reappears.

5 Close the Manage AA Transit Subscribers form.

Procedure 76-12 To associate a database persisted transit subscriber with an aggregator

Note — You can only associate an aggregator object with database persisted transit subscribers that belong to ISA-AA groups for which the Subscriber Scale parameter is set to VPN.

1 Choose Manage→AA Transit Subscribers from the 5620 SAM main menu. The Manage AA Transit Subscribers form opens.

2 Choose Database Persisted Transit Subscriber (Application Assurance) from the object drop-down list.

3 Click on the Search button. The database persisted transit subscribers are listed.

4 Select a database persisted transit subscriber in the list and click on the Properties button. The Database Persisted Transit Subscriber (Edit) form opens with the General tab displayed.

5 Click on the 5670 RAM Parameters tab.

6 Click on the Select button. The Select Database Persisted Transit Subscriber Aggregator form opens.

7 Configure the filter for the Keywords List column and click on the Search button. A list of database persisted transit subscriber aggregators is displayed.

8 Select an aggregator in the list and click on the OK button. The aggregator information is displayed on the Database Persisted Transit Subscriber (Edit) form.

9 Click on the OK button. A dialog box appears.

10 Click on the Yes button. The Database Persisted Transit Subscriber (Edit) form closes, and the Manage AA Transit Subscribers form reappears.

11 Repeat steps 4 to 10 to associate more database persisted transit subscribers with aggregators, as required.

12 Close the Manage AA Transit Subscribers form.

Procedure 76-13 To configure 5670 RAM AA reporting attributes for a database persisted transit subscriber

Note — You can perform this procedure only for VPN transit subscribers.

1 Choose Manage→AA Transit Subscribers from the 5620 SAM main menu. The Manage AA Transit Subscribers form opens.

2 Choose Database Persisted Transit Subscriber (Application Assurance) from the object drop-down list.

3 Configure the filter criteria, if required, and click on the Search button. A list of database persisted transit subscribers is displayed.

4 Select a subscriber in the list and click on the Properties button. The Database Persisted Transit Subscriber (Edit) form opens with the General tab displayed.

5 Click on the 5670 RAM Parameters tab.

6 Click on the Reporting tab.

7 Click on the Create button. The AA Reporting (Create) form opens.

8 Configure the parameters:

- Customer Name
- Subscriber Class
- Total Bandwidth Upstream (Kbps)
- Class of Service 1 Bandwidth Upstream (Kbps)
- Class of Service 2 Bandwidth Upstream (Kbps)
- Class of Service 3 Bandwidth Upstream (Kbps)
- Class of Service 4 Bandwidth Upstream (Kbps)
- Subscriber Name
- Subscriber Type
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)
- Downstream (Kbps)

9 Click on the OK button. The AA Reporting (Create) form closes and the reporting object is displayed in the list.

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The Database Persisted Transit Subscriber (Edit) form closes, and the Manage AA Transit Subscribers form reappears.

12 Close the Manage AA Transit Subscribers form.

Procedure 76-14 To view database persisted transit subscriber information

1 Choose Manage→AA Transit Subscribers from the 5620 SAM main menu. The Manage AA Transit Subscribers form opens.

2 Choose Database Persisted Transit Subscriber (Application Assurance) from the object drop-down list.

3 Configure the filter criteria, if required, and click on the Search button. The database persisted transit subscribers are listed.

4 Select a subscriber in the list and click on the Properties button. The Database Persisted Transit Subscriber (Edit) form opens with the General tab displayed.

5 View the subscriber information, as required.

6 Close the Database Persisted Transit Subscriber (Edit) form.

7 Close the Manage AA Transit Subscribers form.

Procedure 76-15 To configure usage-based billing for an application profile

You must perform this procedure on an existing application profile. Perform Procedure 76-16 to assign applications to charging groups.

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Group Policy (Application Assurance) from the object drop-down list.

3 Click on the Search button. The policies are listed.

4 Select an AA group policy in the list and click on the Properties button. The AA Group Policy form opens with the General tab displayed.

5 Click on the Application Profiles tab.

6 Select an application profile in the list and click on the Properties button. The Application Profile (Edit) form opens with the General tab displayed.

7 Click on the 5670 RAM Parameters tab.

8 Configure the Billing Reset Date parameter.

9 Configure the parameters in the Apdex Thresholds panel.

- Unacceptable
- Poor
- Fair
- Good

10 Configure the parameters in the MOS Thresholds panel.

- Unacceptable
- Poor
- Fair
- Good

11 Click on the Charging Group Thresholds tab.

12 Perform one of the following.

a Create a new charging group threshold set. Perform the following steps.

i Click on the Create button. The Charging Group Thresholds (Create) form opens.

ii Configure the parameters:

- ID
- Auto-Assign ID

b Configure an existing charging group threshold set. Select a charging group threshold in the list and click on the Properties button. The Charging Group Thresholds (Edit) form opens.

13 Configure the parameters:

- Quota (GB)
- Description
- Administrative State
- High Threshold (%)
- Middle Threshold (%)
- Low Threshold (%)

14 Click on the Select button and choose a charging group from the Select Charging Group form.

15 Click on the OK button. The Charging Group Thresholds (Edit) form closes.

16 Repeat steps 12 to 15 to configure an additional charging group, if required.

17 Click on the OK button. The Application Profile (Edit) form closes.

18 Click on the OK button. A dialog box appears.

19 Click on the Yes button. The AA Group Policy (Edit) form closes, and the Application Assurance Policies form reappears.

20 Close the Application Assurance Policies form.

Procedure 76-16 To associate an application with a charging group

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Group Policy (Application Assurance) from the object drop-down list.

3 Click on the Search button. The AA group policies are listed.

4 Select an AA group policy in the list and click on the Properties button. The AA Group Policy (Edit) form opens with the General tab displayed.

5 Click on the Applications tab.

6 Select an application in the list and click on the Properties button. The Application (Edit) form opens with the General tab displayed.

7 Click on the Charging Group tab.

8 Click on the Select button to choose a charging group from the Select Charging Group form.

9 Click on the OK button. The Application (Edit) form closes.

10 Click on the OK button. A dialog box appears.

11 Click on the Yes button. The AA Group Policy (Edit) form closes, and the Application Assurance Policies form reappears.

12 Close the Application Assurance Policies form.

Procedure 76-17 To enable application performance reporting on a service using default DCP subnet groups

Perform this procedure to enable application performance reporting on a service and configure the default DCP subnet groups. See Procedure 76-19 for information about configuring custom DCP subnet groups.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria, if required, and click on the Search button. A list of services is displayed.

3 Select a service and click on the Properties button. The *service_type* Service (Edit) form opens with the General tab displayed.

4 Click on the 5670 RAM Parameters tab.

5 Select the Enable Application Performance Reporting parameter.

6 Click on the Apply button. A dialog box appears.

7 Click on the Yes button. The 5620 SAM creates default Internet and Intranet DCP subnet groups, which are listed on the Default DCP Groups tab.

8 To configure address rules for a default DCP subnet group, perform the following steps.

   i Click on the Default DCP Groups tab.

   ii Select a default subnet group in the list and click on the Properties form. The Default DCP Group (Edit) form opens with the General tab displayed.

   iii Click on the Address Rules tab.

   iv Click on the Create button. The DCP Address Rule (Create) form opens.

v Configure the parameters:

- Auto-Assign ID
- ID
- Description
- IP Address Low
- High
- Mask

vi Click on the OK button. A dialog box appears.

vii Click on the OK button. The DCP Address Rule (Create) form closes.

viii Repeat steps iv to vii to add another address rule, if required.

ix Click on the OK button. The Default DCP Group for closes.

9 Click on the OK button. A dialog box appears.

10 Click on the Yes button. The *service_type* Service (Edit) form closes, and the Manage Services form reappears.

11 Close the Manage Services form.

Procedure 76-18 To disable application performance reporting on a service

Perform this procedure to disable application performance reporting on a service and delete the default DCP subnet groups.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria, if required, and click on the Search button. A list of services is displayed.

3 Select a service and click on the Properties button. The *service_type* Service (Edit) form opens with the General tab displayed.

4 Click on the 5670 RAM Parameters tab.

5 Deselect the Enable Application Performance Reporting parameter.

6 Click on the Apply button. A dialog box appears.

7 Click on the Yes button.

8 Click on the Default DCP Groups tab.

9 Click on the Delete All Result button. A dialog box appears.

10 Click on the Yes button. The default DCP subnet groups are deleted.

11 Click on the OK button A dialog appears.

12 Click on the Yes button. The *service_type* Service (Edit) form closes, and the Manage Services form reappears.

13 Close the Manage Services form.

Procedure 76-19 To configure a custom DCP subnet group

Perform this procedure to create a custom DCP subnet group for application performance reporting on a service and child objects. A custom DCP subnet group must be bound to one or more access interfaces or spoke SDP bindings.

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria, if required, and click on the Search button. A list of services is displayed.

3 Select a service and click on the Properties button. The *service_type* Service (Edit) form opens with the General tab displayed.

4 Click on the 5670 RAM Parameters tab.

5 Click on the Custom DCP Groups tab.

6 Click on the Create button. The Custom DCP Group (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Auto-Assign ID
- ID
- Description
- Address Type
- Collect Stats

8 To associate the subnet group with a SAP, click on the Select button in the SAP Subscriber panel and choose a SAP from the Select SAP Subscriber - Custom DCP Group form.

9 To associate the subnet group with a spoke SDP binding, click on the Select button in the spoke SDP binding Subscriber panel and choose a SAP from the Select Spoke SDP Binding Subscriber - Custom DCP Group form.

10 To associate the subnet group with a transit subscriber, click on the Select button in the spoke SDP binding Subscriber panel and choose a SAP from the Select Transit Subscriber - Custom DCP Group form.

11 To add an address rule to the subnet group, perform the following steps.

i Click on the Address Rules tab.

ii Click on the Create button. The DCP Address Rule (Create) form opens.

iii Configure the parameters:

- Auto-Assign ID
- ID
- Description
- IP Address Low
- High
- Mask

iv Click on the OK button. A dialog box appears.

v Click on the OK button. The DCP Address Rule (Create) form closes.

vi Repeat steps ii to iv to add another address rule to the subnet group, if required.

12 Click on the OK button. A dialog box appears.

13 Click on the OK button. The Custom DCP Group (Create) form closes.

14 Click on the OK button. A dialog appears.

15 Click on the Yes button. The *service_type* Service form closes, and the Manage Services form reappears.

16 Close the Manage Services form.

Procedure 76-20 To configure an AA HTTP error redirect policy

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose one of the following:

a Create an AA HTTP error redirect policy. Perform the following steps.

i Click on the Create button and choose AA HTTP Error Redirect. The AA HHTP Error Redirect (Create) form opens with the General tab displayed.

ii Configure the parameters:

- ISA-AA Group ID
- Displayed Name

iii Click on the Apply button. The form name changes to AA HTTP Error Redirect (Edit), and the form displays additional tabs.

b Configure an existing AA HTTP error redirect policy. Perform the following steps.

i Choose AA HTTP Error Redirect (Application Assurance) from the object drop-down list.

ii Click on the Search button. The AA HTTP Error Redirect policies are listed.

iii Select an AA HTTP Error Redirect policy in the list and click on the Properties button. The AA HTTP Error Redirect (Edit) form opens with the General tab displayed.

3 Configure the parameters:

- Description
- Enabled
- HTTP Host
- Participant ID

4 Click on the Select button beside the Template ID parameter choose a template from the Select Template ID form. The template ID is displayed on the AA HTTP Error Redirect (Edit) form.

5 To configure an HTTP error code, perform the following steps.

i Click on the HTTP Error Codes tab.

ii Click on the Create button. The HTTP Redirect Error Code (Create) form opens.

iii Click on the Select button beside the Redirect Error Code parameter and choose an error code from the Select Error Code form. The error code is displayed on the HTTP Redirect Error Code (Create) form.

iv Configure the Message Size (octets) parameter.

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The HTTP Redirect Error Code (Create) form closes, and the error code is listed on the AA HTTP Error Redirect (Edit) form.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The AA HTTP Error Redirect (Edit) form closes, and the Application Assurance Policies form reappears.

8 Close the Application Assurance Policies form.

Procedure 76-21 To configure an AA HTTP redirect policy

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose one of the following:

a Create an AA HTTP redirect policy. Perform the following steps.

i Click on the Create button and choose AA HTTP Redirect. The AA HHTP Redirect (Create) form opens with the General tab displayed.

ii Configure the parameters:

- ISA-AA Group ID
- Displayed Name

iii Click on the Apply button. The form name changes to AA HTTP Redirect (Edit), and the form displays additional tabs.

b Configure an existing AA HTTP redirect policy. Perform the following steps.

i Choose AA HTTP Redirect (Application Assurance) from the object drop-down list.

ii Click on the Search button. The AA HTTP Redirect policies are listed.

iii Select an AA HTTP Redirect policy in the list and click on the Properties button. The AA HTTP Redirect (Edit) form opens with the General tab displayed.

3 Configure the parameters:

- Description
- Enabled
- HTTP Host

4 Click on the Select button beside the Template ID parameter choose a template from the Select Template ID form. The template ID is displayed on the AA HTTP Redirect (Edit) form.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The AA HTTP Redirect (Edit) form closes, and the Application Assurance Policies form reappears.

7 Close the Application Assurance Policies form.

Procedure 76-22 To configure an AA HTTP enrichment policy

Perform this procedure to create an AA HTTP enrichment policy that is to be associated with an AQP. See Procedure 76-5 for information about configuring an AQP.

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Perform one of the following:

a Create an AA HTTP enrichment policy. Perform the following steps.

i Click on the Create button and choose AA HTTP Enrichment. The AA HHTP Enrichment (Create) form opens with the General tab displayed.

ii Configure the parameters:

- ISA-AA Group ID
- Displayed Name

iii Click on the Apply button. The form displays additional tabs and panels.

b Modify an AA HTTP enrichment policy. Perform the following steps.

i Choose AA HTTP Enrichment (Application Assurance) from the object drop-down list.

ii Configure the filter criteria, if required, and click on the Search button. A list of AA HTTP enrichment policies is displayed.

iii Select a policy in the list and click on the Properties button. The AA HTTP Enrichment (Edit) form opens with the General tab displayed.

3 Configure the parameters:

- Description
- Enabled

4 Click on the HTTP Enrichment Fields tab.

5 Click on the Create button. The HTTP Enrichment Field (Create) form opens.

6 Perform one of the following.

a Click on the Select button and choose a field from the Select Field list form.

b Configure the Name parameter.

7 Configure the remaining parameters:

- Anti Spoof
- Encode Type
- Encode Key

The Anti Spoof parameter is configurable only on a Release 5.0 R5 or later 7750 MG.

The Encode Type and Encode Key parameters are configurable on a Release 11.0 R4 or later 7450 ESS or 7750 SR, and on a Release 5.0 R5 or later 7750 MG.

8 Repeat steps 5 to 7 to add another field, if required.

9 Click on the OK button. A dialog box appears.

10 Click on the OK button. The HTTP Enrichment Field (Create) form closes.

11 Click on the OK button. A dialog box appears.

12 Click on the Yes button. The AA HTTP Enrichment (Edit) form closes and the Application Assurance Policies form reappears.

13 Close the Application Assurance Policies form.

Procedure 76-23 To configure an HTTP notification policy

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Perform one of the following:

a Create an AA HTTP notification policy. Perform the following steps.

i Click on the Create button and choose AA HTTP Notification. The AA HHTP Notification (Create) form opens with the General tab displayed.

ii Configure the parameters:

- ISA-AA Group ID
- Displayed Name

iii Click on the Apply button. The form name changes to AA HTTP Notification (Edit), and the form displays additional tabs.

b Configure an existing AA HTTP notification policy. Perform the following steps.

i Choose AA HTTP Notification (Application Assurance) from the object drop-down list.

ii Click on the Search button. The AA HTTP Notification policies are listed.

iii Select an AA HTTP Notification policy in the list and click on the Properties button. The AA HTTP Notification (Edit) form opens with the General tab displayed.

3 Configure the parameters:

- Description
- Administrative State
- Script URL
- Interval Type
- Interval (minutes)

The Interval (minutes) parameter is configurable when the Interval Type parameter is set to Minimum Interval.

4 Click on the Select button and use the form that opens to choose a template. The template ID is displayed on the AA HTTP Notification (Edit) form.

5 Click on the OK button. A dialog box appears.

6 Click on the Yes button. The AA HTTP Notification (Edit) form closes, and the Application Assurance Policies form reappears.

7 Close the Application Assurance Policies form.

Procedure 76-24 To configure an AA session filter

Perform this procedure to create an AA session filter that is to be associated with an AQP. See Procedure 76-5 for information about configuring an AQP.

Note — AA session filters are supported only by the following devices:

- 7750 MG, Release 4.0 R6 or later
- 7450 ESS, Release 11.0 or later
- 7750 SR, Release 11.0 or later

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Perform one of the following:

a Create an AA session filter. Perform the following steps.

i Click on the Create button and choose AA Session Filter. The AA Session Filter (Create) form opens with the General tab displayed.

ii Configure the parameters:

- Group ID
- Partition ID
- Displayed Name

iii Click on the Apply button. The form displays additional tabs and panels.

b Modify an AA session filter. Perform the following steps.

i Choose AA Session Filter (Application Assurance) from the object drop-down list.

ii Configure the filter criteria, if required, and click on the Search button. A list of AA session filters is displayed.

iii Select a filter in the list and click on the Properties button. The AA Session Filter (Edit) form opens with the General tab displayed.

3 Configure the parameters:

- Description
- Default Action

4 Click on the Entries tab.

5 Click on the Create button. The AA Session Filter Params (Create) form opens.

6 Configure the parameters:

- ID
- Description
- Action

7 Click on the Match Criteria tab.

8 Configure the Protocol Number parameter.

9 Configure the Source Address parameters:

- Source Address
- Length

10 Configure the Destination Address parameters:

- Destination Address
- Length

11 If the Protocol Number parameter is set to SCTP, TCP, or UDP, configure the following parameters in the Source Port and Destination Port panels, as required:

- Port Operator
- Port Value/Low Value
- Port High Value

12 Click on the OK button. A dialog box appears.

13 Click on the OK button. The AA Session Filter Params (Create) form closes.

14 Repeat steps 5 to 13 to add another filter entry, if required.

15 Click on the OK button. A dialog box appears.

16 Click on the Yes button. The AA Session Filter (Edit) form closes and the Application Assurance Policies form reappears.

17 Close the Application Assurance Policies form.

Procedure 76-25 To configure a URL filter

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Perform one of the following:

a Create a URL filter. Perform the following steps.

i Click on the Create button and choose URL Filter. The AA URL Filter (Create) form opens with the General tab displayed.

ii Configure the parameters:

- ISA-AA Group ID
- Displayed Name

iii Click on the Apply button. The form name changes to AA URL Filter (Edit), and the form displays additional tabs.

b Configure an existing URL filter. Perform the following steps.

i Choose AA URL Filter (Application Assurance) from the object drop-down list.

ii Click on the Search button. The AA URL filter policies are listed.

iii Select a URL filter in the list and click on the Properties button. The AA URL Filter (Edit) form opens with the General tab displayed.

3 Configure the parameters:

- Description
- Administrative State
- VLAN ID
- Default Action

4 If you set the Default Action parameter to Block Http Redirect, click on the Select button beside the HTTP Redirect Name parameter and use the form that opens to choose an HTTP Redirect policy.

5 Click on the Select button beside the ICAP HTTP Redirect Name parameter and use the form that opens to choose an HTTP Redirect policy.

6 To create an ICAP Server entry, perform the following steps.

i Click on the ICAP Server tab.

ii Click on the Create button. The AA ICAP Server Entries form opens.

iii Configure the parameters:

- Description
- Administrative State
- Server Address
- Server Port

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The AA URL Filter (Edit) form closes, and the Application Assurance Policies form reappears.

9 Close the Application Assurance Policies form.

Procedure 76-26 To enable an AA protocol signature

Perform this procedure to administratively enable an AA protocol signature for use by AA functions.

1 Choose Manage→ISA Functions→ISA-AA from the 5620 SAM main menu. The Manage ISA-AA form opens.

2 Choose AA Protocol (Application Assurance) from the object drop-down list.

3 Specify a filter to create a filtered list of protocols, and click on the Search button. A list of protocols is displayed.

4 Select an entry in the list and click on the Properties button. The AA Protocol (Edit) form opens.

5 View the entry information.

6 Configure the Protocol Administrative State parameter, if required.

Note — You can configure the Protocol Administrative State parameter only for a local protocol.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The AA Protocol (Edit) form closes, and the Manage ISA-AA form reappears.

9 Close the Manage ISA-AA form.

Procedure 76-27 To view AA summary information for an ISA-AA group or partition

Perform this procedure to view the AA summary information for an ISA-AA group or partition. You can view summary information for the following object types:

- subscribers
- transit subscribers

- SAPs
- spoke SDP bindings

AA summary information is typically used for AA debugging purposes. You can view debug statistics information on the Statistics tab of an AA object.

Caution — The AA summary information on the NE may be slightly out of synchronization with the 5620 SAM database. Before you attempt to resynchronize an ISA-AA group, Alcatel-Lucent recommends that you consider the effect of resynchronizing an ISA-AA group; such an operation may require the retrieval of a large volume of information, and may affect NE performance.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to an ISA-AA group. The path is Network→NE→Logical Groups→ISA-AA Group→ISA-AA Group.

3 Right-click on the ISA-AA Group icon and choose Properties from the contextual menu. The ISA-AA Group (Edit) form opens.

4 If partitions are enabled in the ISA-=AA group, perform the following steps.

i Click on the Partitions tab. The AA group partitions are displayed.

ii Select a partition in the list and click on the Properties button. The ISA-AA Group Partition (Edit) form opens.

5 To view the summary information for an object, perform the following steps.

i Click on the AA Summary tab. The following tabs are displayed; each tab lists the corresponding objects in the ISA-AA group:

- Subscribers
- SAPs
- Spoke SDP Bindings
- Transit Subscribers

ii Click on the appropriate tab.

iii Select an object in the list and click on the Properties button. The AA *object_type* (Edit) form opens.

iv View the information.

6 Close the open forms, as required.

Procedure 76-28 To view AA statistics data for an ISA-AA group or partition

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the required ISA-AA group. The path is Network→NE→Logical Groups→ISA-AA Groups-ISA-AA Group.

3 Right-click on the ISA-AA Group icon and choose Properties from the contextual menu. The ISA-AA Group (Edit) form opens with the General tab displayed.

4 Perform one of the following:

   a View AA statistics data for an ISA-AA group. Perform the following steps.

      i Click on the Statistics tab.

      ii Choose an AA statistics class from the object drop-down list.

   b View AA statistics data for an ISA-AA partition. Perform the following steps.

      i Click on the ISA-AA Partitions tab. A list of ISA-AA partitions is displayed.

      ii Select an entry in the list and click on the Properties button. The ISA-AA Group Partition (Edit) form opens with the General tab displayed.

      iii Click on the Statistics tab.

      iv Choose an AA statistics class from the object drop-down list.

5 Perform one of the following:

   a Click on the Collect button to perform an on-demand collection of the current performance statistics data. The collected statistics entries are listed on the form.

   b Click on the Collect All button to collect one on-demand statistics record for each statistic type that the object supports. The collected statistics entries are listed on the form.

6 Select an entry in the list and click on the Properties button. The Statistics Record form opens.

7 View the statistics data.

8 Close the Statistics Record form.

9 Close the AA *object_type* (Edit) form.

10 Close the ISA-AA Group (Edit) form.

Procedure 76-29 To view the AA special study statistics data

Perform this procedure to view the AA special study statistics data for subscribers, transit subscribers, SAPs, or spoke SDPs on an ISA-AA MDA. If the ISA-AA group is partitioned, the AA special study tabs appear on the partition.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Navigate to the required ISA-AA group. The path is Network→NE→Logical Groups→ISA-AA Groups-ISA-AA Group.

3 Right-click on the ISA-AA Group icon and choose Properties from the contextual menu. The ISA-AA Group (Edit) form opens with the General tab displayed.

4 Click on the AA Special Study tab. The following tabs are displayed; each tab lists the corresponding objects in the ISA-AA group:

- Subscribers
- SAPs
- Spoke SDP Bindings
- Transit Subscribers

5 Click on the appropriate tab. A list of objects is displayed.

6 Select an object in the list and click on the Properties button. The AA *object_type* Config (Edit) form opens.

7 Click on the Statistics tab.

8 Choose an AA statistics class from the object drop-down list.

9 Perform one of the following:

a Click on the Collect button to perform an on-demand collection of the current performance statistics data. The collected statistics entries are listed on the form.

b Click on the Collect All button to collect one on-demand statistics record for each statistic type that the object supports. The collected statistics entries are listed on the form.

10 Select an entry in the list and click on the Properties button. The Statistics Record form opens.

11 View the statistics data.

12 Close the Statistics Record form.

13 Close the AA *object_type* Config (Edit) form.

14 Close the ISA-AA Group (Edit) form.

Procedure 76-30 To view AA statistics data for application filters

Perform this procedure to view the application filter hit counts for a local AA group policy.

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Group Policy (Application Assurance) from the object drop-down list.

3 Click on the Search button. A list of AA group policies is displayed.

4 Select an AA group policy in the list and click on the Properties button. The AA Group Policy - Global Policy (Edit) form opens with the General tab displayed.

5 Click on the Local Definitions tab.

6 Click on the Search button. A list of local AA group policies is displayed.

7 Select a policy in the list and click on the Properties button. The AA Group Policy - Local Policy (Edit) form opens with the General tab displayed.

8 Click on the Application Filters tab.

9 Click on the Search button. A list of application filters is displayed.

10 Select an application filter in the list and click on the Properties button. The Application Filter - Local Policy (Edit) form opens with the General tab displayed.

11 Click on the Statistics tab.

12 Click on the Collect All button.

13 Click on the Search button. A list of collected statistics is displayed.

14 Select a statistics object in the list and click on the Properties button. The Statistics Record - AA Application Filter Stats form opens.

15 View the statistics data.

16 Close the Statistics Record - AA Application Filter Stats form.

17 Close the Application Filter - Local Policy (Edit) form.

18 Close the AA Group Policy - Local Policy (Edit) form.

19 Close the AA Group Policy - Global Policy (Edit) form.

20 Close the Application Assurance Policies form.

Procedure 76-31 To delete an AA application, application group, or custom protocol

1 Choose Policies→ISA Policies→Application Assurance from the 5620 SAM main menu. The Application Assurance Policies form opens.

2 Choose AA Group Policy (Application Assurance) from the object drop-down list and click on the Search button. A list of AA group policies is displayed.

Note — The 5620 SAM does not create or delete a local AA group policy on each applicable managed NE. A local AA group policy is created or deleted when the ISA-AA group is created or deleted.

3 Select a policy in the list and click on the Properties button. The AA Group Policy (Edit) form opens with the General tab displayed.

4 Perform one of the following.

- **a** Delete an AA application. Click on the Applications tab. A list of AA applications is displayed.
- **b** Delete an application group. Click on the Application Groups tab. A list of application groups is displayed.
- **c** Delete a custom protocol. Click on the Custom Protocols tab. A list of custom protocols is displayed.

5 Select the entry to delete and click on the Delete button. A dialog box appears.

6 Click on the View Dependencies button.

Note — If the application, application group, or custom protocol is associated with a global AA group policy, the dependency count includes all dependencies on the global and local policy instances. When the AA application is on a local AA group policy, the counts include the dependencies on the local policy instance only.

7 Review the dependencies.

8 Click on the OK button.

9 Select the I understand the implications of this action check box.

10 Click on the Yes button. A dialog box appears.

11 Click on the OK button. The object is removed from the list.

12 Click on the Apply button. A dialog box appears.

13 Click on the Yes button.

14 After you delete an AA application, application group, or custom protocol from a global AA group policy, you must distribute the policy changes to each NE that has a local definition of the policy.

To distribute the policy to one or more NEs, perform the following steps.

i Click on the General tab.

ii Click on the Switch Mode button. A dialog box appears.

iii Click on the OK button.

15 Close the AA Group Policy (Edit) form.

Procedure 76-32 To delete an inactive AA transit subscriber instance

Perform this procedure to remove the record of an inactive AA transit subscriber from the 5620 SAM database. An AA transit subscriber instance become inactive when the subscriber is deleted from an AA transit IP policy.

Note 1 — You can use a size constraint policy to ensure that the number of inactive AA transit subscriber instances in the 5620 SAM database remains at a manageable level. See chapter 56 for more information.

Note 2 — AA statistics data can be lost when you delete an AA transit subscriber instance before the 5620 SAM finishes collecting and processing the AA statistics. Alcatel-Lucent recommends that you wait at least two statistics collection intervals before you delete an inactive AA transit subscriber instance.

1 Choose Manage→AA Transit Subscribers from the 5620 SAM main menu. The Manage AA Transit Subscribers form opens.

2 Click on the Search button. A list of AA transit subscriber instances is displayed.

3 Click on the Active column header to sort the list. An inactive AA transit subscriber instance has no check mark in the Active column.

4 Select the AA transit subscriber instance to delete and click on the Delete button. The AA transit subscriber instance is removed from the list.

5 Close the Manage AA Transit Subscribers form.

77.13 Service Test Manager procedures *77-33*

77.1 Service Test Manager overview

The 5620 SAM service test manager (STM) provides the ability to group various OAM tests into test suites for network troubleshooting and for verifying compliance with SLAs. You can schedule the execution of a test suite to provide continual performance feedback, or run a test suite on demand to investigate service issues. The test results are logged for monitoring and trend analysis.

The grouping of tests into a test suite allows a 5620 SAM operator to use one schedule for the periodic execution of multiple OAM diagnostics against multiple network objects; for example, services, NEs, or transport components. An operator can choose to include existing tests, use the 5620 SAM to generate the tests that comprise a test suite, or both. Groups of tests in a suite can be configured to execute sequentially or concurrently. In addition, you can configure a test suite as an OAM validator to verify the operational status of a service. This can also be done on a one-time basis using the One Time Validation function.

You can configure threshold-crossing parameters to generate alarms when rising or falling threshold values are reached due to the reach, latency, or jitter issues discovered by the OAM tests.

The 5620 SAM STM allows the deployment of the maximum number of tests to a 7450 ESS, 7750 SR, or 7950 XRS. The 5620 SAM raises an alarm when the number of tests on an NE is 60% of the configured maximum. Attempts to create or execute a test using the 5620 SAM fail when the number of deployed tests on an NE is too high.

Test policies

To enable the automatic generation of tests for a test suite, the 5620 SAM requires a test policy that contains a set of test definitions and pre- and post-processing rules. A test policy also specifies the order of execution for the generated tests. A test policy applies to only one test suite, and a test suite can have only one associated test policy.

Test policy parameters can be configured to only display test results if a test fails or generates a threshold crossing alarm. In large networks, this can substantially reduce the amount of test data that the 5620 SAM needs to collect.

A test policy is specific to one type of entity; for example, a VLL service or service tunnel. The test definitions in the policy are restricted to the tests that apply to the entity type specified in the policy. A test policy is applied to a test suite during test suite creation.

Test suites

A test suite contains three test groups:

- **First-run tests**
  First-run tests are the tests in a suite that the 5620 SAM executes before the tests in the other groups. First-run tests are chosen from a list of existing tests and might typically include high-level diagnostics; for example, a service site ping or VPRN ping. No restrictions apply to the types of tests that are selectable as first-run tests.

- **Generated tests**

  Generated tests are created by the 5620 SAM for use against a specific network entity, based on the entity type specified in the suite and the specific tested entities that are named in the associated test policy. For example, a service site ping test policy associated with a three-site VPRN test suite causes the 5620 SAM to generate six tests: one site ping test from each site in the VPRN to the other two sites. When you change the configuration of a network entity, such as a service, you must regenerate the generated tests that apply to the entity. Test regeneration removes previously generated tests from a test suite.
- **Last-run tests**

  Last-run tests are the tests in a suite that the 5620 SAM executes after the tests in the other groups. Last-run tests are chosen from a list of existing tests and might typically include transport-layer diagnostics; for example, an LSP trace or a tunnel ping. No restrictions apply to the types of tests that are selectable as last-run tests.

To create a test suite that contains tests for different entity types, you can specify that the test suite applies to no specific entity type. In this way, you can create a group of disparate tests to which no test policy restrictions apply. Specifying none as the entity type in a test suite has the following effects.

- It allows you to choose any predefined test as a first-run or last-run test.
- It disables test generation in the test suite, because test generation requires a test policy that is based on a specific entity type.

Note 1 — The 5620 SAM does not attempt to discover tests or test suites that are configured locally on an NE, for example, using a CLI.

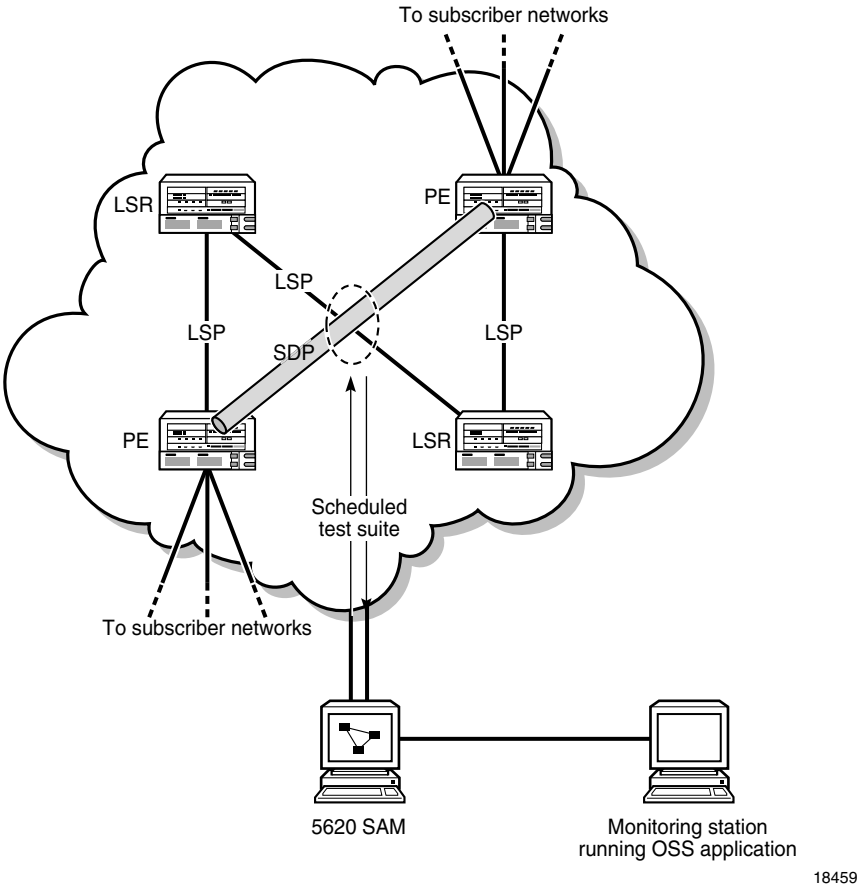
Note 2 — If you attempt to modify an OAM test or test suite that is deployed to a suspended NE, the 5620 SAM raises an alarm.

To manage the system resources that test execution consumes, the 5620 SAM assigns a weight value to a test. When the 5620 SAM executes a test, it attempts to reserve the test weight from a resource pool, performs the test, then returns the test weight to the pool. The weight of a test suite is the sum of the weights of the individual tests in the suite. The 5620 SAM attempts to reserve the weight of the whole suite for the duration of suite execution. If the required weight for a test or test suite is unavailable, execution is halted and the Status value contained in the test result is set to Not Enough Resources.

You can create an OAM service validation test to verify the operational status of a service. The operational status of a service depends on the operational states of its service sites or instances. It is possible for a service to be operationally up when communication between sites is not operational. For example, a VRF can be operationally up but the routes to its peers might not be populated because of the routing policy, route target, or ACL configuration. The State Cause of the service indicates the success or failure of the OAM validation test, and therefore, service connectivity.

You can configure an OAM validator when you create a test suite and run the OAM validation test from the service configuration form.

Note — OAM validation tests are not supported for HVPLS.



Consider the following when you create or execute test suites.

- A test, whether pre-existing or generated, is associated with only one test suite.
- You can execute a generated test on demand, not just in the context of a test suite.
- STM test suites can be configured as scheduled tasks. See chapter 7 for information about using the 5620 SAM to schedule tasks.
- Using an NE schedule does not ensure that the target NEs perform the actions in an associated STM scheduled task in the order specified; the NEs that execute an NE scheduled task operate independently and are not directed by the 5620 SAM. As soon as an NE completes an action in an NE scheduled task, it performs the next action.
- The 5620 SAM database logs test results only for scheduled test suites that are associated with SAM schedules. Logging for test suites that are associated with NE schedules is performed locally on each target NE.
- Size constraint policies control the number of historical records that the 5620 SAM retains in the database. You can configure size constraint policies to limit the number of database objects that are associated with specific test types. See chapter 42 for information about size constraint policies.
- A 5620 SAM user who is assigned the admin or QoS/ACL management scope of command role can create and modify all tests, test policies, and test suites. A user who is assigned the service management scope of command role can create and modify only STM components that are related to services. A user who is assigned the topology management role can create and modify only STM components that are related to network transport elements.
- OAM test suites in which the Validation Test Suite parameter is enabled are used to test the operational status of a service or service-related entity such as a service tunnel. The result of this validator test is indicated by the OAM Validation Failed state cause indicator on the General tab of the management form for the object.
- You can view test suite results for an object from the Tests tab of the configuration form for the object.

77.2 Sample Service Test Manager implementation

Figure 77-1 shows a sample STM implementation that illustrates how you can use STM suites to verify service operation and identify network problems.

Figure 77-1 Sample STM implementation

In the sample network, two scheduled STM test suites run constantly to ensure that the transport elements are functioning properly. One test suite monitors the SDPs, and the other test suite monitors the LSPs. A 5620 SAM administrator can quickly update the test suites, as required, to reflect network topology changes by revising the list of tested entities in the suite and regenerating the tests. An OSS application collects the test result information which is then available for monitoring by NOC staff.

Note — This sample configuration uses a SAM schedule to create a scheduled task. See chapter 7 for information about SAM schedules.

The SDP test suite contains the following generated tests for each SDP:

- tunnel ping
- MTU ping

The LSP test suite contains the following generated test for each LSP path:

- LSP ping (tested entity type is LSP path)

NOC monitoring staff become aware that tunnel ping operations fail occasionally on one SDP. Packet loss is not yet significant enough to affect SLAs, but threatens to become so, based on the observed trend. NOC staff run a test suite against the LSPs in the affected LSP path. The test suite contains the following generated test for each LSP in the LSP path:

- LSP ping (tested entity type is LSP)

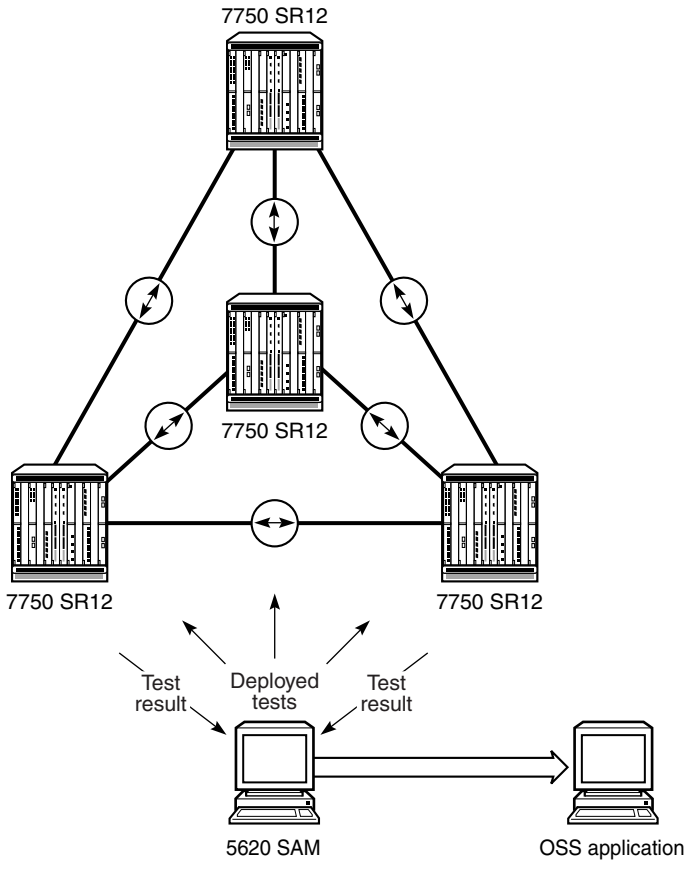
Test results show that the packet loss is related to a specific LSP in the path. Investigation of the LSP traffic pattern indicates that a recently provisioned service is causing the LSP to be oversubscribed. The problem is addressed by a network designer and is corrected through configuration changes.

Table 77-1 lists the high-level tasks necessary to configure and use the STM elements in this sample.

Table 77-1 Sample STM implementation configuration sequence

Task	Description
1. Scheduled STM test-suite creation	Create STM test policies for transport-layer elements. • Create a test policy for the SDPs. Specify Tunnel (SDP) as the Entity Type for the policy, and choose Tunnel Ping and MTU Ping as the test definitions. Create separate tunnel ping definitions for different forwarding classes, as required. • Create a test policy for the LSP paths. Specify LSP as the Entity Type for the policy and choose LSP Ping as the test definition. In the test definition, specify LSP Path as the Target Type. Create separate LSP ping definitions for different forwarding classes, as required. Create STM test suites for transport-layer elements. • Create a test suite for the SDPs. Specify Tunnel (SDP) as the Entity Type for the suite, choose the SDP test policy, choose the SDPs against which the suite is to run, and use the 5620 SAM to generate the tests in the suite. Create a schedule for the test suite according to network monitoring requirements, and apply the schedule to the test suite to create a scheduled task. • Create a test suite for the LSP paths. Specify LSP as the Entity Type for the suite, choose the LSP test policy, choose the LSP paths against which the suite is to run, and use the 5620 SAM to generate the tests in the suite. Create a schedule for the test suite according to network monitoring requirements, and apply the schedule to the test suite to create a scheduled task.
2. Data presentation	Customize the tabular display of test results in the 5620 SAM, or create an OSS application that retrieves test-result data from the 5620 SAM and presents it as information in graphical format for NOC staff.
3. Creation of non-scheduled STM test suite or individual OAM tests for network troubleshooting	Create an STM test policy for the LSPs for use during network troubleshooting. • Create a test policy for the LSPs. Specify LSP as the Entity Type for the policy and choose LSP Ping as the test definition. In the test definition, specify LSP as the Target Type. Create separate LSP ping definitions for different forwarding classes, as required. Create a non-scheduled STM test suite (or individual OAM tests, depending on the number of LSPs involved) for the LSPs in the LSP path. • Specify LSP as the Entity Type for the suite, choose the newly created LSP test policy, choose the LSPs in the LSP path against which the suite is to run, and use the 5620 SAM to generate the tests for the suite.
4. Network monitoring	Use the 5620 SAM to display the scheduled test results in tabular format, or use an OSS application to monitor the LSP ping, tunnel ping, and MTU ping diagnostic results in real time. Record inconsistencies and trends, and troubleshoot the network as required. Use the threshold-crossing alarm capabilities to raise alarms when traffic characteristics rise above or fall below specific values.

(1 of 2)



Task	Description
5. Network troubleshooting	When potential trouble arises, use a non-scheduled STM test suite or individual STM tests to help identify the cause. • Create individual tests or edit the existing non-scheduled test suite. Include as tested entities the LSPs that comprise the LSP path and regenerate the tests for the suite, as required. • Execute the non-scheduled test suite and monitor the test results. • Edit the test definition in the test policy. Change test parameter values as required, regenerate the tests in the suite, and re-execute the suite. Continue to refine the diagnostic test results until the problem manifests itself in the test results.

(2 of 2)

77.3 Sample network monitoring configuration

Figure 77-2 shows the high-level flow of tests and test results in a simple network topology that the network provider wants to continually monitor using the STM. See section 77.4 for the explicit steps required to create the STM configuration.

Figure 77-2 Continual network topology monitoring

A 5620 SAM administrator creates and schedules an STM test suite to monitor the LSP mesh and identify potential overloading and reachability problems before they affect service traffic. The test suite contains ping and trace test definitions for three different classes of in-profile traffic and is scheduled to run every 15 minutes.

Note — This sample configuration uses a SAM schedule to create a scheduled task. See chapter 7 for information about SAM schedules.

Because the same group of tests is to be run on multiple entities of the same type, the test suite consists of generated tests only. The test policy that the 5620 SAM uses to generate the tests contains the following six test definitions:

- LSP ping - be in
- LSP ping - af in
- LSP ping - nc in
- LSP trace - be in
- LSP trace - af in
- LSP trace - nc in

The 5620 SAM generates 72 tests for the test suite—3 ping tests and 3 trace tests for each of the 12 LSPs and LSP paths. Every 15 minutes, the 5620 SAM scheduler executes the tests and stores the results. An OSS application periodically retrieves the test results, performs trend analysis and presents the transport utilization information to NOC monitoring staff.

The 5620 SAM generates an alarm in the event of an LSP ping probe failure or an LSP trace path change, as specified in the test policy, so 5620 SAM operators become aware of new transport faults as they arise.

77.4 Sample network monitoring configuration steps

The following steps explicitly define the end-to-end configuration of the network monitoring sample in section 77.3. For conciseness, the procedure lists only the configuration steps and parameters that are specific to and necessary for the sample. See the procedures in section 77.13 for complete STM configuration information.

Create test policy for test generation

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Create Test Policy from the Create contextual menu. The Test Policy (Create) form opens.

4 Configure the parameters in Table 77-2 using the supplied values:

Table 77-2 Test policy General tab parameters

Parameter	Value	Comment
Name	LSP Test Policy	—
NE Schedulable	disabled	NE-schedulable test results are not returned to the 5620 SAM.
Entity Type	LSP	—

5 Click on the Test Definitions tab.

6 Click on the Add button to add a test definition to the test policy. A menu appears.

7 Choose MPLS→Add LSP Ping. The LSP Ping Definition (Create) form opens with the General tab displayed.

In the sample configuration, the operator creates a separate LSP Ping test definition for each of the following forwarding classes:

- be (best effort - low priority, delivery not guaranteed)
- af (assured forwarding - medium priority, delivery guaranteed)
- nc (network control - high priority, delivery guaranteed)

8 Configure the parameters in Table 77-3 using the supplied values, most of which are common to the three test definitions:

Table 77-3 LSP Ping Definition parameters

Parameter	Value	Comment
General tab		
Name	LSP Ping - be in LSP Ping - af in LSP Ping - nc in	First test definition Second test definition Third test definition
Target Type	LSP	—
Test parameters tab		
Number of Test Packets	5	This provides more analysis granularity than a single test packet without affecting network performance.
Size (octets)	108	This is the minimum packet size for this type of test on the 7450 ESS and 7750 SR. The minimum packet size varies, depending on the type and release of device against which a test runs.
Forwarding Class	be af nc	For LSP Ping - be in test definition For LSP Ping - af in test definition For LSP Ping - nc in test definition To cover a range of traffic streams and to test different network queues, multiple test definitions are necessary. The sample configuration uses three LSP ping definitions that differ only by forwarding class.
Forwarding Profile	in	All test packets are marked in-profile. This means that they follow the same path as service traffic.

(1 of 2)

Parameter	Value	Comment
Results configuration tab		
Probe History Size (rows)	100	—
Trap Generation	Probe Failure	Test-probe failures provide early notification of LSP congestion or reachability issues to a 5620 SAM operator. OSS analysis of the results indicates trends for further investigation.

(2 of 2)

9 Click on the OK button. The LSP Test Definition (Create) form closes and a dialog box appears.

10 Click on the OK button. The test definition is listed on the Test Policy (Create) form.

11 Repeat steps 6 to 10 for the remaining test definitions listed in step 7.

12 Click on the Add button to add a test definition to the test policy. A menu appears.

13 Choose MPLS→Add LSP Trace. The LSP Trace Definition (Create) form opens with the General tab displayed.

In the sample configuration, the operator creates a separate LSP Trace test definition for each of the following forwarding classes:

- be (best effort - low priority, delivery not guaranteed)
- af (assured forwarding - medium priority, delivery guaranteed)
- nc (network control - high priority, delivery guaranteed)

14 Configure the parameters in Table 77-4 using the supplied values. Values that are not common to the three test definitions are so indicated.

Table 77-4 LSP Trace Definition parameters

Parameter	Value	Comment
General tab		
Name	LSP Trace - be in LSP Trace - af in LSP Trace - nc in	For first test definition For second test definition For third test definition
Target Type	LSP Path	—
Test parameters tab		
Number of Test Packets	5	This provides more analysis granularity than a single test packet without affecting network performance.
Size (octets)	108	This is the minimum packet size for this type of test on the 7450 ESS and 7750 SR. The minimum packet size varies, depending on the type and release of device against which a test runs.

(1 of 2)

Parameter	Value	Comment
Forwarding Class	be af nc	For LSP Trace - be in definition For LSP Trace - af in definition For LSP Trace - nc in definition To cover a range of traffic streams and to test different network queues, multiple test definitions are necessary. The sample configuration uses a different LSP ping definition for each forwarding class.
Forwarding Profile	in	All LSP ping test definitions in the sample involve in-profile traffic.
Results configuration tab		
Probe History Size (rows)	100	—
Trap Generation	Test Failure Path Change	A test failure trap may indicate a routing or congestion issue, but it also indicates test misconfiguration when the Maximum Time to Live parameter value is too low to allow a test probe to reach the destination LSP. A path change trap may indicate an intermittently congested or unresponsive LSP.

(2 of 2)

15 Click on the OK button. The LSP Test Definition (Create) form closes and a dialog box appears.

16 Click on the OK button. The test definition is listed on the Test Policy (Create) form.

17 Repeat steps 12 to 16 for the remaining test definitions listed in step 13.

18 Click on the OK button. A dialog box appears.

19 Click on the Yes button. The Test Policy (Create) form closes and the Service Test Manager form reappears.

Create schedule

20 Choose Tools→Schedules→Schedule from the 5620 SAM main menu. The Schedule form opens.

21 Click on the Create button and choose Create SAM Schedule. The SAM Schedule (Create) form opens.

22 Configure the parameters in Table 77-5 using the supplied values:

Table 77-5 SAM Schedule parameters

Parameter	Value	Comment
Name	LSP Assurance	—

(1 of 2)

Parameter	Value	Comment
Current Client Start Time	a future time	Specify the date and time at which the schedule is to be first triggered. This value is used to calculate the times of subsequent triggers, based on the Frequency parameter value. Compare this value and the Frequency parameter value with those in other 5620 SAM schedules to ensure that the schedule trigger times are staggered and the resulting NE task load is balanced.
Ongoing	enabled	This setting tells the 5620 SAM to continually trigger execution of the task associated with the schedule.
Frequency	Per Minute / 15	You must also select the Run Every Minutes radio button and specify 15 as the number of minutes for the triggering frequency.

(2 of 2)

23 Click on the OK button. The SAM Schedule (Create) form closes.

24 Close the Schedule form.

Create test suite

25 Click on the Create button in the Service Test Manager form and choose Create Test Suite from the contextual menu. The Test Suite (Create) form opens with the General tab displayed.

26 Configure the parameters in Table 77-6 using the supplied values.

Table 77-6 Test suite parameters

Parameter	Value	Comment
Name	LSP Test Suite	—
Entity Type	LSP	—
NE Schedulable	disabled	NE-schedulable test results are not returned to the 5620 SAM.

27 Click on the Test Policy tab.

28 Click on the Add button to choose a test policy that governs the generation of tests in the test suite. The Select Test Policy - Test Suite form opens.

29 Configure the filter properties and click on the Search button. A list of test policies is displayed.

30 Select the LSP Test Policy entry and click on the OK button. The test policy is listed on the Test Suite (Create) form.

31 Click on the Tested Entities tab.

32 Click on the Add button to choose the LSPs that are to be regularly assessed by the test suite. The Select Tested Entity - Test Suite form opens.

33 Configure the filter properties and click on the Search button to display a list of LSPs.

34 Select the LSPs that you want to include and click on the OK button. The LSPs are listed on the Test Suite (Create) form.

35 Click on the Apply button to save the changes. Additional buttons appear and the form name changes to Test Suite (Edit).

36 Click on the Generated Tests tab.

37 Click on the Generate Tests button. The 5620 SAM generates a test for each LSP listed on the Tested Entities tab. The tests are listed on the form as they are generated.

Apply a span of control to a test suite

38 Click on the Spans tab.

39 Click on the Add button. The Select Spans - Test Suite form opens with a list of available spans.

40 Select one or more spans to apply to the test suite.

41 Click on the OK button. The Select Spans - Test Suite form closes and a dialog box appears.

42 Click on the OK button to confirm the action.

Create scheduled task

43 Click on the Schedule button and choose Create SAM Scheduled Task. The SAM Scheduled Task (Create) form opens with LSP Test Suite displayed in the Task panel.

44 Configure the parameters in Table 77-7 using the supplied values.

Table 77-7 SAM scheduled task parameters

Parameter	Value	Comment
Scheduled Task Name	Periodic LSP Check	—
Administrative State	Enabled	The 5620 SAM executes the scheduled task at regular intervals based on the specified Current Client Start Time and Frequency.

45 Click on the Select button. The Select Schedule - SAM Scheduled Task form opens.

46 Select LSP Assurance and click on the OK button. The 5620 SAM automatically populates the Schedule panel with the schedule information.

47 Click on the OK button. The SAM Scheduled Task (Create) form closes and the Test Suite (Edit) form reappears.

48 Close the Test Suite (Edit) form.

49 Close the Service Test Manager form.

77.5 Sample SAA accounting files configuration

The following sample configuration focuses on the configuration of SAA accounting files that are to be collected following the generation of an NE schedulable test of VLL services.

A network provider wants to use the 5620 SAM to view test result information for a NE schedulable test of VLL services and wants the 5620 SAM to process the OAM results MIB entries and produce a compressed XML record that is stored in SAA accounting files on the nodes.

A 5620 SAM administrator must create an NE schedulable test for VLL services that records test result information in SAA accounting files. The administrator creates one accounting policy, one file policy, one test policy, and one test suite. Section 77.6 describes the steps that are required to create a test.

77.6 Sample SAA accounting files configuration steps

The following steps explicitly define the end-to-end configuration of the SAA accounting files sample in section 77.5. For conciseness, the procedure lists only the configuration steps and parameters that are specific to and necessary for the sample. See the procedures in section 77.13 for complete STM configuration information.

Create accounting policy

1 Choose Tools→Statistics→Accounting Policies from the 5620 SAM main menu. The Manage Accounting Policies form opens.

2 Click on the Create button. The Accounting Policy (Create) form opens.

3 Configure the parameters in Table 77-8 using the supplied values.

Table 77-8 Accounting policy parameters

Parameter	Value	Comment
Displayed Name	SAA Accounting Policy	—
Type	NE Schedulable Tests	You must choose this value to allow the configuration of SAA accounting files

4 Click on the Select button beside the File ID parameter. The Select A File Policy form opens.

5 Click on the Create button. The File Policy (Create) form opens.

6 Configure the Displayed Name parameter. For the purposes of this sample, the value shall be SAA File Policy.

7 Click on the OK button. The File Policy (Create) form closes and the Select A File Policy form reappears.

8 Select the SAA File Policy entry and click on the OK button. The Select A File form closes and the file policy is listed on the Accounting Policy (Create) form.

9 Click on the OK button. The Accounting Policy (Create) form closes and the Manage Accounting Policies form reappears.

10 Configure the filter properties and click on the Search button. A list of accounting policies is displayed

11 Select the SAA Accounting Policy entry and click on the Distribute button. The Distribute form opens.

12 Select the entities that you want to include and click on the OK button. The Distribute form closes.

13 Close the Manage Accounting Policies form.

Create test policy

14 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

15 Click on the Create button.

16 Choose Create Test Policy from the Create contextual menu. The Test Policy (Create) form opens.

17 Configure the parameters in Table 77-9 using the supplied values:

Table 77-9 Test policy parameters

Parameter	Value	Comment
Name	SAA Test Policy	—
NE Schedulable	enabled	You must enable this parameter to allow the configuration of SAA accounting files.
Entity Type	VLL Service	—
Accounting Files	enabled	You must enable this parameter to allow the configuration of SAA accounting files.

18 Click on the Test Definitions tab.

19 Click on the Add button to add a test definition to the test policy. A menu appears.

20 Choose Service→Add VCCV Ping. The VCCV Ping Definition (Create) form opens with the General tab displayed.

21 Click on the OK button. The VCCV Ping Definition (Create) form closes and a dialog box appears.

22 Click on the OK button. The test definition is listed on the Test Policy (Create) form.

23 Click on the OK button. The Test Policy (Create) form closes and the Service Test Manager form reappears.

Create test suite

24 Click on the Create button in the Service Test Manager form and choose Create Test Suite from the contextual menu. The Test Suite (Create) form opens with the General tab displayed.

25 Configure the parameters in Table 77-10 using the supplied values:

Table 77-10 Test suite parameters

Parameter	Value	Comment
Name	SAA Test Suite	—
Entity Type	VLL Service	—
NE Schedulable	enabled	You must enable this parameter to allow the configuration of SAA accounting files.

26 Click on the Test Policy tab.

27 Click on the Add button to choose a test policy that governs the generation of tests in the test suite. The Select Test Policy - Test Suite form opens.

28 Configure the filter properties and click on the Search button. A list of test policies is displayed.

29 Select the SAA Test Policy entry and click on the OK button. The test policy is listed on the Test Suite (Create) form.

30 Click on the Tested Entities tab.

31 Click on the Add button. The Select Tested Entity - Test Suite form opens.

32 Configure the filter properties and click on the Search button to display a list of entities.

33 Select the nodes that were used in step 12 and click on the OK button. The nodes are listed on the Test Suite (Create) form.

34 Click on the Apply button to save the changes. Additional buttons appear and the form name changes to Test Suite (Edit).

35 Click on the Generated Tests tab.

36 Click on the Generate Tests button. The 5620 SAM generates a test for each entity listed on the Tested Entities tab. The tests are listed on the form as they are generated.

77.7 Sample threshold-crossing alarm configuration

The following sample configuration focuses on the configuration of a threshold-crossing alarm that is to be included in a test suite. It does not describe the configuration of the test suite, schedule or scheduled task associated with the sample. No test policy is required for the configuration, as it does not involve generated tests.

A network provider wants to use the 5620 SAM to monitor a customer VPLS named VPLS 17 that carries VoIP traffic. He wants the 5620 SAM to raise an alarm when the round-trip jitter value rises above a specified threshold.

Network jitter values typically range from 10 to 15 ms, but are occasionally as high as 25 ms. Jitter buffers in the end-user VoIP sets can accommodate up to 80 ms of jitter. A network engineer determines that a jitter test threshold of 30 ms is low enough to allow NOC operators sufficient time for investigating a jitter increase, yet high enough to exclude spurious jitter events.

A 5620 SAM administrator wants to creates a scheduled CPE ping test suite for the VPLS that periodically measures the round-trip jitter between each VPLS site and an end device. The administrator creates one CPE ping test for each site in the VPLS. Section 77.8 describes the steps required to create one such test.

77.8 Sample threshold-crossing alarm configuration steps

The following procedure explicitly defines the configuration steps required to create the test with a threshold-crossing alarm described in section 77.7. See section 77.4 for information about sample test-suite, test policy, or scheduling configurations. See the procedures in section 77.13 for complete STM configuration information.

For conciseness, the procedure lists only the configuration steps and parameters that are specific to and necessary for the sample.

Create CPE ping test with threshold-crossing criteria

1 Click on the Create button in the Service Test Manager form and choose L2 Service→CPE ping from the contextual menu. The CPE Ping Test (Create) form opens with the General tab displayed.

2 Configure the parameters in Table 77-11 using the supplied values:

Table 77-11 General CPE Ping test parameters

Parameter	Value	Comment
General tab		
Name	CPE Ping Test - VPLS 17, Site A	A descriptive name such as this is helpful for quickly identifying the entity under test when viewing the test results.
NE Schedulable	enabled	You must enable this parameter to allow the configuration of threshold-crossing criteria.
Select button in Service panel	VPLS 17	Click on the Search button on the Select Service - CPE Ping form that opens to choose a service.
Select button in Site panel	Site A	Click on the Search button on the Select Site - CPE Ping form that opens to choose a service.
Destination Path Address	*IP address of an end device connected to Site A*	This is the IP address to which the CPE ping packets are sent.
Source IP Address	*IP address of the NE that originates the test packets*	This IP address must be in the same subnet as the Destination IP Address.

(1 of 2)

Parameter	Value	Comment
Source MAC Address	*MAC address of the NE that originates the test packets*	—
Test parameters tab		
Number of Test Packets	5	This provides more analysis granularity than a single test packet without affecting network performance.
Results configuration tab		
Probe History Size (rows)	100	This value provides a greater retained test-result history for occasional monitoring by a 5620 SAM operator.
Trap Generation	Probe Failure	Test-probe failures provide early notification of congestion or reachability issues to a 5620 SAM operator for troubleshooting purposes.

(2 of 2)

3 Click on the Apply button. Additional buttons and tabs appear, and the form name changes to CPE Ping *Test Name* (Edit).

4 Click on the Threshold Alarms tab.

5 Click on the Add button to add threshold criteria. The NE Threshold Event (Create) form opens with the General tab displayed.

6 Configure the parameters in Table 77-12 using the supplied values:

Table 77-12 Threshold-crossing CPE Ping test parameters

Parameter	Value	Comment
Type	Round-Trip Jitter	—
Generate Alarm on Rising Threshold	enabled	This is the default setting. Alternatively or additionally, by enabling the Generate Alarm on Rising Threshold parameter, you can configure the 5620 SAM to generate an alarm when a test-result value falls below a specified threshold. You can also configure the 5620 SAM to clear a rising-threshold alarm when the test-result value falls below the value configured for the falling threshold.
Rising Threshold tab		
Threshold Value	30	This value specifies that the 5620 SAM is to generate an alarm when an individual test result contains a round-trip jitter value greater than 30 ms.

7 Click on the OK button. The NE Threshold Event (Create) form closes.

8 Close the CPE Ping *Test Name* (Edit) form.

77.9 7210 SAS Y.1564 service test

The 5620 SAM supports ITU-T Y.1564 tests for Ethernet service configuration and performance. Y.1564 provides a standard for measuring throughput, latency, frame loss, and jitter to assess whether the tested service complies with an SLA.

The following 7210 SAS devices support Y.1564 service tests:

- 7210 SAS-D, Release 6.0 R2 or later
- 7210 SAS-M (in access-uplink mode), Release 5.0 R4 or later
- 7210 SAS-M (in network mode), Release 6.0 R2 or later

You can configure a supported 7210 SAS NE as a test-head for performing Y.1564 bidirectional throughput tests on an Epipe service. The test-head generates test data up to the configured line rate and sends it through the service from the source SAP to the remote SAP. The remote SAP performs a port loopback with MAC swap and returns the test data to the source SAP. The test-head analyses the data and produces the test results. You can assign a no-service access port as the test-head port on the 7210 SAS test-head NE. The source SAP for the service you are testing must reside on the same NE.

A test-head profile specifies the parameters for the test, including duration, line rate, frame payload, and acceptance criteria. Profiles are created and distributed using the 5620 SAM policy framework. See chapter 42 for more information.

You can create, save, and execute Y.1564 bidirectional tests for a configured Epipe service using the 5620 SAM Service Test Manager. Alternatively, you can use the Tests tab of the properties form for the service. To prevent service disruptions when other services share the ports on which the source SAP and remote SAP are configured, the 5620 SAM provides a function to move the SAPs to target ports where no services are configured. See Chapter 81 for more information.

You can add the Y.1564 bidirectional test to a 5620 SAM test suite as a first-run or last-run test, and you can use the test suite to schedule the test. Consider the following when you add the Y.1564 bidirectional test to a test suite:

- Test policies are not supported
- Generated tests are not supported
- The Y.1564 bidirectional test is not NE-schedulable
- Parallel tests are not supported. You can run only one Y.1564 bidirectional test at a time.

The system resource profile for the 7210 SAS test-head NE must be configured appropriately. You must allocate a minimum of four entries to the ingress internal ACL MAC resource pool, and a minimum of two entries to the egress internal resource pool (ACL MAC, IPv4 or IPv6 64-bit criteria). The test-head tool uses resources from these resource pools. If no resources are available in these pools, the test-head tool cannot function. You must not allocate resources to the egress internal ACL 128-bit IPv6 criteria. See "System resource profile" in section 8.5 and Procedure 13-20 for more information about configuring the system resource profile.

See the *7210 SAS M, X OS OAM and Diagnostic Guide* for more information about the Y.1564 test-head function.

Workflow to configure and execute Y.1564 bidirectional tests

See section 77.10 for sample 7210 SAS Y.1564 service test configuration steps. The service to be tested must already be configured in the 5620 SAM.

1 Ensure that the system resource profile for the 7210 SAS test-head NE is configured appropriately. See Procedure 13-20.

2 Ensure that the OLC state of the service to be tested is set to maintenance. See Procedure 67-1.

3 Select a test-head port on the applicable 7210 SAS NE. The source SAP for the service to be tested must be on the same NE.

4 Create a test-head profile and distribute the profile to the 7210 SAS NE that contains the test-head port and the source SAP of the service to be tested.

5 Configure the Y.1564 bidirectional test in the 5620 SAM Service Test Manager.

6 Move SAPs as required. See Chapter 81 for more information.

7 Add the Y.1564 bidirectional test to a test suite, if required. See Procedure 77-4 and the overview to this section, above.

8 Execute the test and view the results.

9 Restore the original SAP configuration, if required.

77.10 Sample 7210 SAS Y.1564 service test configuration steps

The following procedures list only the configuration steps and parameters that are required for the sample. See the procedures in section 77.13 for complete STM configuration information.

Select a test-head port

Note — You must configure the test-head port on the 7210 SAS NE that contains the source SAP of the service you need to test.

You can configure a test-head port on the following 7210 SAS devices:

- 7210 SAS-D, Release 6.0 R2 or later
- 7210 SAS-M (in access-uplink mode), Release 5.0 R4 or later
- 7210 SAS-M (in network mode), Release 6.0 R2 or later

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the 7210 SAS NE on which you need to configure a test-head port and choose Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab.

4 Click on the Service tab.

5 Click on the Select button in the TestHead Port section of the Loopback No Service Ports panel. A list of access ports appears.

6 Choose a port in the list and click on the OK button. The NE properties form reappears with the TestHead Port name displayed.

7 Click on the OK button. A dialog box appears.

8 Click on the Yes button. The NE properties form closes.

Create a test-head profile

Note — The test-head profile is distributed to the NE using the 5620 SAM policy distribution framework. See Chapter 42. You must distribute the test-head profile for the Y.1564 bidirectional test to the source site for the service that you are testing.

9 Choose Tools → Y1564 Test Head Profile from the 5620 SAM main menu. The Y1564 Test-Head Profiles form opens.

10 Click on the Create button. The Y1564 Test-Head Profile, Global Policy (Create) form opens with the General tab displayed.

11 Configure the parameters:

- Auto Assign ID
- Profile ID
- Description
- Frame Size
- Enable Test Completion Trap
- Hours (Hr)
- Minutes (Min)
- Seconds (Sec)
- CIR (Admin)(kbps)
- Adaptation Rule

12 Click on the Frame Payload tab.

13 Click on the Create button. The Y1564 Test-Head Payload, Y1564 Test-Head Profile, Global Policy (Create) form opens.

Note — You can create up to four Frame Payload configurations for each test-head profile.

14 Configure the parameters:

- ID
- Description
- Type
- Ether Type
- Source MAC Address
- Destination MAC Address
- Data Pattern
- VLAN Tag 1
- VLAN Tag 2
- IP Protocol
- IP Type of Service
- DSCP
- Time To Live
- Source IP Address
- Source Port
- Destination IP Address
- Destination Port

The parameters that are configurable depend on the option you choose for the Type parameter.

15 If you configured a value for the VLAN Tag 1 parameter, configure the parameters in the VLAN Tag 1 panel:

- TpID
- Dot1pID

Otherwise, go to step 17.

16 If you configured a value for the VLAN Tag 2 parameter, configure the parameters in the VLAN Tag 2 panel:

- TpID
- Dot1pID

17 Click on the OK button. A dialog box appears.

18 Click on the OK button.

19 Click on the Acceptance Criteria tab.

20 Click on the Create button. The Y1564 Test Head Acceptance Criteria, Y1564 Test Head Profile, Global Policy (Create) form opens.

Note — You can create up to four Acceptance Criteria configurations for each test-head profile.

21 Configure the parameters:

- Acceptance Criteria ID
- Default
- Jitter Threshold (microseconds)
- Default
- Latency Threshold (microseconds)
- Default
- Loss Threshold

22 Click on the OK button. A dialog box appears.

23 Click on the OK button. The Y1564 Test-Head Profile, Global Policy (Create) form reappears.

24 Click on the Apply button. The Y1564 Test-Head Profile, Global Policy (Create) form reappears with additional buttons.

25 Click on the General tab. The form is displayed with the Policy Configuration panel added.

26 Click on the Switch Mode button to change the Configuration Mode to Released. A dialog box appears.

27 Click on the Yes button. The Release - Y1564 Test-Head Profile form opens.

28 Select the required NEs and click on the Distribute button to manually distribute the policy to the NEs. You must distribute the test-head profile to the source site for the VLL Epipe service to be tested. The source site must be a 7210 SAS that supports Y.1564 bidirectional tests.

Configure and execute the test using the 5620 SAM Service Test Manager

Note — You can only configure tests for VLL Epipe services that are fully configured in the 5620 SAM.

29 Configure initial test settings.

i Choose Tools→ Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager (STM) form opens. Alternatively, you can configure tests from the Tests tab of the properties form for the service you need to test.

ii Click on the Create button and choose Service → Y1564 BiDirectional Test from the contextual menu. The Y1564 Bi-Directional Test (Create) form opens, with the General tab displayed.

iii Configure the parameters:

- Auto-Assign ID
- ID
- Name
- Description
- Administrative State

30 Choose a service for the test.

i In the Service panel, click on the Select button. The Select Service - Y1564 Bi-Directional Test form opens.

ii Click on the Search button and choose the VLL Epipe service that you need to test.

iii Click on the OK button. The Y1564 Bi-Directional Test (Create) form reappears with the service information and additional panels.

31 Configure the Source Site and SAP.

i In the Source Site panel, click on the Select button. The Select Source Site - Y1564 Bi-Directional Test form opens.

ii Click on the Search button and choose the 7210 SAS site that contains the source endpoint of the Epipe service.

iii Click on the OK button. The Y1564 Bi-Directional Test (Create) form reappears with the Source Site information and additional panels.

iv In the Source Test SAP section of the Source SAPs panel, click on the Select button. The Select Source Test SAP - Y1564 Bi-Directional Test form opens.

v Click on the Search button and choose the port that contains the source SAP for the Epipe service.

vi Click on the OK button. The Y1564 Bi-Directional Test (Create) form reappears with the Source Test SAP information displayed.

32 Configure the Remote Site and SAP, if required.

Note — Configuration of the Remote Site and SAP is optional in an Epipe service, since the second endpoint becomes the remote site and SAP by default. However, you must perform this step if you need to select a Remote SAP Target Port in order to move SAPs. See step 34.

i In the Remote Site panel, click on the Select button. The Select Remote Site - Y1564 Bi-Directional Test form opens.

ii Click on the Search button and choose the site that contains the remote endpoint of the Epipe service.

iii Click on the OK button. The Y1564 Bi-Directional Test (Create) form reappears with the Remote Site information displayed.

iv In the Remote Test SAP section of the Remote SAPs panel, click on the Select button. The Select Remote Test SAP - Y1564 Bi-Directional Test form opens.

v Click on the Search button and choose the port that contains the remote SAP for the Epipe service.

vi Click on the OK button. The Y1564 Bi-Directional Test (Create) form reappears with the Remote SAP information displayed.

33 Configure the Forwarding Class parameter, if required.

34 If required, move the SAPs to prevent service disruptions.

Note — When the ports that contain the source SAP or remote SAP also contain SAPs for services other than the service you are testing, the test may have an impact on those other services. If this impact is not a concern, you can enable the Ignore Service Impact Validations parameter. If service impact is a concern, you can choose to move the test source SAP or remote SAP to other ports that will not have an impact on services. When you move SAPs, leave the Ignore Service Impact Validations check box unselected. See Chapter 81 for more information.

i If service impact is not a concern, enable the Ignore Service Impact Validations parameter and go to step 35. Otherwise, go to step ii.

ii If required, click on the Select button in the Target Port section of the Source SAPs panel. The Select Target Port - Y1564 Bi-Directional Test form opens.

iii Click on the Search button and choose a port from the list that does not have an associated service.

iv Click on the OK button. The Y1564 Bi-Directional Test (Create) form reappears with the Target Port name displayed.

v If required, click on the Select button in the Target Port for Remote SAP section of the Remote SAPs panel. The Select Target Port for Remote SAP- Y1564 Bi-Directional Test form opens.

vi Click on the Search button and choose a port from the list that does not have an associated service.

vii Click on the OK button. The Y1564 Bi-Directional Test (Create) form reappears with the Target Port for Remote SAP name displayed.

35 Associate a test-head profile with the test.

i Click on the Test Parameters tab.

ii In the Profile panel, click on the Select button. The Select Profile - Y1564 Bi-Directional Test form opens.

iii Click on the Search button and choose a profile from the list. The Y1564 Bi-Directional Test (Create) form reappears with the profile information and additional panels.

Note — Alternatively, you can create a new test-head profile. See "Create a test-head profile" in this section.

iv Click on the Select button in the Payload section of the Payload and Acceptance Criteria panel. The Select Payload - Y1564 Bi-Directional Test form opens.

v Click on the Search button and choose a Frame Payload configuration from the list.

vi Click on the OK button. The Y1564 Bi-Directional Test (Create) form reappears with the Payload information, and the OK and Apply buttons are activated.

vii If required, click on the Select button in the Acceptance Criteria section of the Payload and Acceptance Criteria panel. Otherwise, go to step x. The select Acceptance Criteria - Y1564 Bi-Directional Test form opens.

viii Click on the Search button and choose an Acceptance Criteria configuration from the list.

ix Click on the OK button. The Y1564 Bi-Directional Test (Create) form reappears with the Acceptance Criteria ID displayed.

x Click on the Apply button.

36 If you configured a target port to perform a SAP move in step 34, click on the General tab and go to step 37. Otherwise, go to step 39 to execute the test.

37 Click on the Apply button. The Prepare and Execute buttons are activated.

38 Click on the Prepare button. The Source Test SAP and Remote Test SAP are moved to the Target ports. See Chapter 81 for more information.

39 Click on the Execute button to execute the test. The results tab of the Y1564 Bi-Directional Test is displayed. The test appears in the list.

40 Click on the test in the list to view the results. The Y1564 Bi-Directional Test - Results (View) form opens. The Result Status field displays Pending… until the test is complete. The test duration is configured in the test profile, and is displayed in the Test Duration panel. When the test is complete, the test information is displayed

41 To restore the moved SAPs to their original ports, click on the General tab and then click on the Restore button. See Procedure 81-2.

77.11 Sample OmniSwitch device SLA testing

You can use the 5620 SAM STM to perform a CPE SLA Test-Head OAM test to validate and test customer SLAs used on select OmniSwitch devices in Metro Ethernet networks. The test is critical for provisioning or troubleshooting network services between customer endpoints. The CPE SLA Test-Head OAM test supports unidirectional traffic and IPv4.

You can perform the following tasks on the 5620 SAM without an external test-head device:

- Generate specific flow-based traffic across the network to help identify flow-based issues.
- Identify the impact of QoS settings (for example, SAP profile or QoS policies) on the overall traffic.
- Check the throughput across a provider network. The throughput is displayed on the 5620 SAM GUI for each iteration of the test.
- Debug flow-specific traffic forwarding across the provider network.
- Analyze the behavior of various user-defined traffic patterns across the provider network.
- Perform the handover testing after the initial deployment.
- Perform on-demand testing and results monitoring using a central entity.

You can perform a CPE SLA Test-Head test using one CPE test-head profile or a group of profiles. You can also run several tests for one CPE Test-Head profile or group of profiles.

The following conditions are applicable to the creation of a CPE SLA Test-Head profile or a group of profiles and their execution:

- A CPE SLA Test-Head Group profile can contain up to eight stream/flows.
- A CPE SLA Test-Head Group profile can contain up to eight analyzers.
- When you configure the STM test execution details, the analyzer test name and the generator test name must be the same.
- If the analyzer has a test (flow) which is not in the generator group profile, the test is not valid.
- When you run a CPE SLA test or test group, only one test can be run at a time. You cannot run concurrent tests on the same device.

The following steps describe how to create a CPE SLA Test-Head profile or a group of profiles on the following devices:

- OS 6250M (Metro)
- OS 6250SME (Enterprise) with Metro license
- OS 6400
- OS 6450 with Metro license
- OS 6850E
- OS 6855 U24X
- OS 9000E

Note — This functionality is available for OS 6400, OS 6850E, OS 6855 U24X, and OS 9000E NEs with Release 6.4.5 R02 and later. For these NEs, CPE SLA Test-Head profiles and CPE SLA Test-Head Group profiles will be for distribution only if the profile has a Tx Rate of 64kbps or above.

The procedure lists only the configuration steps and parameters that are required for the sample. See the procedures in section 77.13 for complete STM configuration information.

Create a CPE SLA Test-Head profile

1 Choose Tools→AOS CPE Test-Head Profiles→CPE Test-Head Profile from the 5620 SAM main menu. The CPE Test-Head Profiles form opens.

2 Click on the Create button. The CPE Test-Head Profile, Global Policy (Create) form opens.

3 Configure the following parameters:

- Name
- Description
- Source Endpoint
- Destination Endpoint
- Source MAC
- Destination MAC
- Direction
- Role
- Tx Rate (kbps)
- Frame Size (bytes)

4 Configure the Frame Type parameter. The CPE Test-Head Profile, Global Policy (Create) form refreshes and displays additional parameters.

5 Configure the following parameters:

- VLAN-Tag
- Priority
- Pattern
- Drop Enable

6 Perform one of the following:

a If you set the Frame Type parameter to Ethernet, configure the Ether Type parameter.

b If you set the Frame Type parameter to IPV4, configure the following parameters.

- Source IP
- Destination IP
- Protocol
- TOS
- TTL
- Source Port
- Destination Port

The Source Port and Destination Port parameters appear when you set the Protocol parameter to TCP or UDP.

7 Click on the OK button. The CPE Test-Head Profiles form opens.

8 Click on the Search button to display the CPE Test-Head profile.

9 Choose the CPE Test-Head profile and click on the Released button to change the Global policy configuration mode to Released. Acknowledge the Warning message as required. You must release each CPE Test-Head test profile separately.

10 Distribute the CPE Test-Head profile locally to the managed devices.

Note — Policies are also automatically distributed to devices when the policies are used by resources on the device. See chapter 42 for more information about policies and policy distribution.

i Choose the CPE Test-Head profile and click on the Distribute button. The Distribute - CPE Test Head Profile form opens.

ii Choose the appropriate nodes from the Available Nodes column and click on the Move-right button.

iii Click on the Distribute button and close the form.

11 Configure the VLAN and port settings for the CPE Test-Head profile.

i Choose the CPE Test-Head profile and click on the Properties button to view the profile parameter settings.

ii Click on the Local Definitions tab and click on the Search button. The devices to which the test policy was distributed in step 10 appear.

iii Choose a device from the list and click on the Properties button. The CPE Test-Head Profile form opens with the General tab displayed.

iv In the VLAN panel, click on the Select button for the Service ID parameter. The Select vlanSitePointer - CPE Test-Head Profile form opens.

v Click on the Search button to list the VLAN sites.

vi Choose a device and click on the OK button.

vii Click on the Local Audit On button to change the mode to Local Edit only.

viii Click on the Select button for the Port parameter. The Select vlan port - CPE Test-Head Profile form opens.

ix Click on the Search button to list the ports.

x Choose a port and click on the OK button.

xi Click on the Apply button and close the form.

12 As required, repeat steps 1 to 11 if you need to create additional CPE SLA Test-Head profiles. You can group profiles as described in step 13, otherwise, go to step 15.

Create a CPE SLA Test-Head Group profile

13 If required, create a CPE SLA Test-Head Group profile which can be use to bind individual CPE Test-Head profiles to form a group of tests.

i Choose Tools→AOS CPE Test-Head Profiles→CPE Test-Head Group Profile from the 5620 SAM main menu. The CPE Test-Head Group Profile form opens.

ii Click on the Create button. The CPE Test-Head Group Profile, Global Policy (Create) form opens.

iii Configure the following parameters:

- Name
- Description
- Source Endpoint
- Destination Endpoint
- Direction
- Role
- Tx Rate (kbps)

Note — If the Role parameter is set to the Generator option, perform step 14 otherwise, continue with step 13.

iv Click on the CPE Test Group Member tab and click on the Create button. The Select Port - CPE Test Group Profile - Global Policy forms opens.

v Choose the appropriate CPE Test-Head profiles from the list and click on the OK button. The CPE Test-Head Group Profile, Global Policy (Create) form opens displaying the selected profiles.

vi Click on the OK button to save CPE Test-Head Group profile.

vii Click on the Search button to display the CPE Test-Head Group profile.

viii Choose the CPE Test-Head Group profile and perform steps 9, 10, and 11.

ix Go to step 15.

14 Configure the required feeder port for the generator.

i On the 5620 SAM network topology map, right-click on the appropriate device and choose Properties from the contextual menu. The Network Element - <*Node Name*> (Edit) form appears.

ii Click on the Globals tab.

iii Click on the AOS OAM tab.

iv Click on the Select button that is associated with the Feeder Port Name parameter. The Select Feeder Port - Network Element - <*Node Name*> form appears.

v Click on the Search button to list the feeder ports.

vi Choose the appropriate feeder port and click on the OK button. The Network Element - <*Node Name*> (Edit) form reappears.

vii Click on the OK button to save the feeder port information.

viii Perform the rest of the substeps in step 13.

Configure the STM test execution details

15 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager (STM) form opens.

16 Click on the Create button and choose one of the following options:

a AOS CPE→CPE SLA Test—Allows you to run a test on a CPE test-head profile or a group of profiles. The CPE SLA Test, CPETest-0 (Create) form opens with the General tab displayed. Perform steps 17 to 20, and step 22 to configure this option.

b AOS CPE→CPE SLA Test Group—Allows you to run several tests on a on a CPE test-head profile or group of profiles. The CPE SLA Test Group, CPETest-0 (Create) form opens with the General tab displayed. Complete steps 17, 18, 20, 21, and step 22 to configure this option.

17 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- Administrative State

18 In the Generator panel, click on the Select button. The Select Generator - CPE SLA Test - CPET Test-0 form opens.

i Click on the Search button to list the generator profiles.

ii Choose a generator profile and click on the OK button to close the form.

19 In the Analyzer panel, click on the Select button. The Select Analyzer - CPE SLA Test - CPET Test-0 form opens.

i Click on the Search button to list the analyzer profiles.

ii Choose an analyzer profile and click on the OK button to close the form.

20 Click on the Test Parameters tab and configure the following parameters:

- Number of Test Iterations
- Test Iteration Duration
- Generator Tx Rate
- Generator Frame Size (bytes)
- Increase Tx Rate Every Iteration

21 Click on the CPE SLA Test Group Members tab and click on the Create button. The CPE Test-Head Group Profile - CPE SLA Test Group CPETestGroup - 0 forms opens.

i Click on the Search button to display the CPE Test-Head Group profiles.

ii Choose the appropriate CPE Test-Head Group profiles and click on the OK button to close the form. The CPE SLA Test Group, CPETest-0 (Create) form reappears.

22 Click on the OK button to close the form.

Run the STM test and analyze the results

23 In the Service Test Manager (STM) form, choose one of the following options from the Test (Assurance) drop-down menu and click on the Search button.

a CPE SLA Test (AOS SAS)—This option displays all single CPE test-head profile tests that have been created.

b CPE SLA Test Group (AOS SAS)—This option displays all group CPE test-head profile tests that have been created.

24 Choose the appropriate CPE SLA test and click on the Execute button to start the test.

25 To view the test results, click on the Results tab.

77.12 Workflow to use the Service Test Manager

1 If you are configuring an OAM or an Ethernet CFM test, review the appropriate workflow.

a Review "Workflow to use OAM diagnostic tests" in chapter 32.

b Review "Workflow to configure Ethernet CFM" in chapter 78.

2 As required, configure the STM default settings to meet your operational requirements:

a Customize the STM default system preferences such as the default retention time for db test results and log file. See the *5620 SAM System Administrator Guide* for more information.

b Enable the debug STM mode, which allows you to access more options on the STM form. See Procedure 3-19 for more information.

3 Create or modify an STM test policy to define the generated tests for the STM test suite. See Procedure 77-1 for more information.

4 As required, configure the threshold-crossing alarms for test policies, test definitions, and assurance tests.

a Configure threshold-crossing alarms on NE-schedulable OAM tests within a test policy. See Procedure 77-2 for more information.

b Configure threshold-crossing alarms on non-NE-schedulable OAM tests within a test policy. See Procedure 77-3 for more information.

5 Create or modify an STM test suite. See Procedure 77-4 or 77-5 for more information.

- Choose the type of entity to which the suite applies.
  - Choose None if you want to include tests that are associated with different types of entities, such as VLL and Tunnel (SDP).
- As required:
  - associate a test policy with the test suite
  - choose tests for the first-run test group
  - generate tests for the test suite
  - choose tests for the last-run test group

6 As required, create a schedule for an STM test suite that you want to execute regularly for continual network monitoring. To schedule the execution of a test suite, you must first create the SAM schedule. See chapter 7 for information about creating schedules.

a Schedule the execution of a test suite using a SAM schedule. See Procedure 77-6 for more information.

b Configure threshold-crossing alarms on non-NE-schedulable OAM tests within a test policy. See Procedure 77-7 for more information.

c Enable the scheduled tasks.

d Apply schedules to test suites as required to create scheduled tasks.

7 Execute the STM test suite. See Procedure 77-8 more information.

8 Execute individual or multiple tests from the STM. See Procedure 77-10 more information.

9 Monitor the diagnostic results from the scheduled test suites and the alarm list for indications of network or service faults and threshold-crossing alarms.

a View test suite results. See Procedure 77-11 for more information.

b View and compare test suite results for a tested entity. See Procedure 77-12 for more information.

c View and compare test results. See Procedure 77-13 for more information.

77.13 Service Test Manager procedures

The following procedures describe how to perform 5620 SAM STM tasks.

Procedure 77-1 To configure a STM test policy

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Perform one of the following:

a Create a test policy. Perform the following steps.

i Click on the Create button.

ii Choose Test Policy from the Create contextual menu. The Test Policy (Create) form opens with the General tab displayed.

iii Configure the parameters:

- ID
- Auto-Assign ID
- NE Schedulable
- Entity Type
- Accounting Files
- Continuously Executed
- Test Result Storage

The Accounting Files, Continuously Executed, and Test Result Storage parameters are configurable when the NE Schedulable parameter is enabled.

The Continuously Executed and Test Result Storage parameters are only configurable when the Accounting Files parameter is enabled.

iv Go to step 3.

Note 1 — You must enable the NE Schedulable parameter if the test suite that you create using the policy is to become an NE scheduled task.

Note 2 — If you are creating a CFM Ethernet test, you must enable the NE Schedulable parameter, and optionally you can configure the Accounting Files and Continuously Executed parameters. You must select VLL Service, VPLS, or Composite Service for the Entity Type parameter.

b Configure an existing policy. Perform the following steps.

Note — If you modify a test policy that is associated with a test suite, you must regenerate the Generated tests in the test suite.

i Choose Test Policy (Assurance) from the object drop-down list.

ii Configure the filter criteria, if required, and click on the Search button. A list of test policies appears.

iii Choose a test policy and click on the Properties button. The Test Policy (Edit) form opens with the General tab displayed.

3 Configure the parameters:

- Name
- Description
- Strategy

The Strategy parameter is only configurable when the Entity Type parameter is set to VLL Services.

4 Click on the Test Definitions tab.

5 Click on the Add button to add a test definition to the test policy. A cascading submenu appears.

6 Choose an option from one of the categories in the cascading submenu. The options that appear depend on the Entity Type and NE Schedulable parameter values you specified in step 3. For example, Ethernet CFM test definition options only appears if you selected either the VLL Service or VPLS option as the Entity Type and if you also enabled the NE Schedulable parameter.

Each option in this step has three tabs that contain configurable parameters: General, Test Parameters, and Results Configuration. Parameters that are common to all options are listed in the remainder of this step. Parameters that are specific to a particular option are configured in step 7.

The following configurable parameters appear on the General tab of the configuration form for every option:

- Name
- Description
- Administrative State

Some or all of the following configurable parameters appear on the Test Parameters tab of the configuration form for most options in this step:

- Number of Test Packets
- Packet Interval (seconds)
- Packet Timeout (seconds)
- Probe History
- Forwarding Class
- Forwarding Profile

The Probe History parameter is configurable when the NE Schedulable parameter is enabled.

A combination of the following configurable parameters appears on the Results Configuration tab of the configuration form for most options in this step:

- Probe History Size (rows)
- Test Failure Threshold
- Packet Failure Threshold
- Maximum Failures
- Trap Generation

7 Perform this step to configure the parameters that are specific to the particular test definition you are creating.

Choose the required test definition option from the following:

a Site ping test definition (Service→Add Site Ping) for a VLL service, VPLS, VPRN service, mirror service, service connector, or router:

i Click on the Test Parameters tab.

ii Configure the parameters:

- Use Local Tunnel
- Use Remote Tunnel

iii Go to step 8.

b VCCV ping test definition (Service→Add VCCV Ping) for a VPLS/MVPLS/HVPLS or VLL service:

i Click on the Test Parameters tab.

ii Configure the parameters:

- Size (octets)
- Forwarding Class
- Forwarding Profile
- Reply Type

iii Go to step 8.

c VCCV trace test definition (Service→Add VCCV Trace) for a VLL service:

i Click on the Test Parameters tab.

ii Configure the parameters:

- Number of Test Packets
- Packet Interval (seconds)
- Packet Timeout (seconds)
- Size (octets)
- Forwarding Class
- Forwarding Profile
- Reply Type

iii Go to step 8.

d MAC ping test definition (Service→Add MAC Ping) for a VLL service or VPLS:

i Configure the following parameters on the General tab:

- Target MAC Address
- Source MAC Address

ii Click on the Test Parameters tab.

iii Configure the parameters:

- Time To Live
- Forwarding Class
- Forwarding Profile
- Reply Control
- Control Plane

iv Go to step 8.

e Multicast FIB ping test definition (Multicast→Add MFIB Ping) for a VPLS:

i Configure the following additional parameters on the General tab:

- Multicast Source
- Multicast Group

ii Click on the Test Parameters tab.

iii Configure the parameters:

- Time To Live
- Reply Via Control Plane

iv Go to step 8.

f Ping test definition (L3 Service→Add VPRN Ping) for a VPRN:

i Click on the Test Parameters tab.

ii Configure the parameters:

- Time To Live
- Reply Via Control Plane

iii Go to step 8.

g Trace test definition (L3 Service→Add VPRN Trace) for a VPRN:

i Click on the Test Parameters tab.

ii Configure the parameters:

- Initial Time to Live
- Maximum Time to Live
- DiffServ Field
- Reply Via Control Plane

iii Go to step 8.

h Multicast routing information test definition (Multicast→Add mrinfo) for a VPRN or router:

i There are no parameters that are specific to the mrinfo test definition.

ii Go to step 8.

i Multicast trace test definition (Multicast→Add mtrace) for a VPRN or router:

i Click on the Select button on the General tab to choose a multicast group to run the trace against.

ii Click on the Test Parameters tab.

iii Configure the parameters:

- Initial Time to Live
- Maximum Number of Hops

iv Go to step 8.

j ICMP ping test definition (ICMP→Add ICMP Ping) for a VPRN or router:

i Click on the Test Parameters tab.

ii Configure the parameters:

- Size (octets)
- Rapid
- Time To Live
- Data Pattern
- Positional Data Pattern
- DiffServ Field
- Bypass Routing
- Do Not Fragment
- Forwarding Class
- Forwarding Profile

iii Go to step 8.

k ICMP trace test definition (ICMP→Add ICMP Trace) for a VPRN or router:

i Click on the Test Parameters tab.

ii Configure the parameters:

- DiffServ Field
- Time To Wait (milliseconds)

iii Go to step 8.

l Tunnel ping test definition (Service Transport→Add Tunnel Ping) for a service tunnel:

i Click on the Test Parameters tab.

ii Configure the parameters:

- Size (octets)
- Forwarding Class
- Forwarding Profile

iii Go to step 8.

m MTU ping test definition (Service Transport→Add MTU Ping) for a service tunnel:

i Click on the Test Parameters tab.

ii Configure the parameters:

- Size (octets)
- MTU Start Size (octets)
- MTU End Size (octets)
- MTU Step Size (octets)

iii Go to step 8.

n Ping test definition (MPLS→Add LSP Ping) for an LSP:

i In the General tab, configure the Target Type parameter. If you are adding an MPLS-TP LSP ping test definition, go to step o.

ii Click on the Test Parameters tab.

iii Configure the parameters:

- Size (octets)
- Time To Live
- Forwarding Class
- Forwarding Profile

iv Go to step 8.

o Ping test definition (MPLS→Add LSP Ping) for an MPLS-TP LSP:

Note — The Entity Type parameter in step 2 must be set to LSP (MPLS-TP).

i Click on the Test Parameters tab.

ii Configure the parameters in the Execution Details panel:

- Number of Test Probes
- Packet Interval (seconds)
- Probe Timeout (seconds)

iii Configure the parameters in the Test Probe panel:

- Size (octets)
- Time To Live
- Forwarding Class
- Forwarding Profile

iv Go to step 8.

p Trace test definition (MPLS→Add LSP Trace) for an LSP:

i In the General tab, configure the Target Type parameter. If you are adding an MPLS-TP LSP ping test definition, go to step q

ii Click on the Test Parameters tab.

iii Configure the parameters:

- Size (octets)
- Initial Time to Live
- Maximum Time to Live
- Forwarding Class
- Forwarding Profile

iv Go to step 8.

q Trace test definition (MPLS→Add LSP Trace) for an MPLS-TP LSP:

Note — The Entity Type parameter in step 2 must be set to LSP (MPLS-TP).

i Click on the Test Parameters tab.

ii Configure the parameters in the Execution Details panel:

- Number of Test Probes
- Packet Interval (seconds)
- Probe Timeout (seconds)

iii Configure the parameters in the Test Probe panel:

- Size (octets)
- Initial Time To Live
- Maximum Time To Live
- Forwarding Class
- Forwarding Profile

iv Go to step 8.

r Ping test definition (MPLS→Add P2MP LSP Ping) for a P2MP LSP or P2MP LDP:

i Click on the Test Parameters tab.

ii Configure the parameters:

- Packet Timeout (seconds)
- Packet Interval (seconds)
- Size (octets)
- Time To Live
- Forwarding Class
- Forwarding Profile

The Time To Live parameter is only displayed when the Entity Type parameter is set to P2MP LSP.

iii Go to step 8.

s Trace test definition (MPLS→Add P2MP LSP Trace) for a P2MP LSP:

i Click on the Test Parameters tab.

ii Configure the parameters:

- Size (octets)
- Initial Time to Live
- Maximum Time to Live
- Forwarding Class
- Forwarding Profile

iii Go to step 8.

t Ping test definition (L1/L2→Add ATM Ping) for an ATM PVC:

i Click on the Test Parameters tab.

ii Configure the parameters:

- Loopback Location (hex)
- Destination Type

iii Go to step 8.

u CFM loopback test definition (Ethernet CFM→Add CFM Loopback) for a VLL service or VPLS:

i Click on the Test Parameters tab.

ii Configure the parameters:

- Number of Test Packets
- Packet Interval (seconds)
- Packet Timeout (seconds)
- Forwarding Class
- Forwarding Profile
- Size (octets)

iii Go to step 8.

v CFM link trace test definition (Ethernet CFM→Add CFM Link Trace) for a VLL service or VPLS:

Note — Creating a CFM link trace test policy with the Continuously Executed parameter enabled can create a large number of results, and cause a long delay when deleting the test suite. Alcatel-Lucent recommends that you disable the Continuously Executed parameter for test suites that use CFM link trace tests.

i Click on the Test Parameters tab.

ii Configure the parameters:

- Number of Test Packets
- Packet Interval (seconds)
- Packet Timeout (seconds)
- Forwarding Class
- Forwarding Profile
- TTL

iii Go to step 8.

w CFM two way delay test definition (Ethernet CFM→Add CFM Two Way Delay Test) for a VLL service or VPLS:

i Click on the Test Parameters tab.

ii Configure the parameters:

- Number of Test Packets
- Packet Interval (seconds)
- Packet Timeout (seconds)
- Forwarding Class
- Forwarding Profile

iii Go to step 8.

x CFM two way SLM test definition (Ethernet CFM→Add CFM Two Way SLM) for a VLL service or VPLS:

i Click on the Test Parameters tab.

ii Configure the parameters:

- Number of Test Packets
- Packet Interval (seconds)
- Packet Timeout (seconds)
- Forwarding Class
- Forwarding Profile
- Size (octets)

iii Go to step 8.

8 To configure threshold-crossing alarms as required, perform the following:

a Click on the Thresholds tab.

b Perform steps 9 to 15 of Procedure 77-3.

9 Click on the OK button. The Definition Create form closes and a dialog box appears.

10 Click on the OK button. The Test Policy (Create|Edit) form reappears with the new OAM test definition listed.

11 Perform steps 4 to 10 to add additional OAM test definitions to the policy.

12 If you added Ethernet CFM test definitions to the test policy then go to step 13. Otherwise go to step 19.

13 Click on the CFM Details tab.

14 Click the Select button to choose a MD Mgr Object ID. The Select Maintenance Domain form is displayed.

15 Click the Search button and choose the required maintenance domain from the list.

16 Click OK. The Select Maintenance Domain form closes and the selected MD Mgr Object ID is displayed in the CFM Details tab.

17 If you are configuring an existing test policy, click on the Update Test Suites button to apply the test policy changes to all test suites that are associated with the test policy. If you are creating a test policy, go to step 19.

Caution — The operation of scheduled test suites that use the test policy may be adversely affected if you modify the test policy while a scheduled task for the suite is enabled.

18 Click on the Usages tab to view a list of the test suites that use the test policy.

19 Click on the OK button. The Test Policy (Create|Edit) form closes.

20 Close the Service Test Manager form.

Procedure 77-2 To configure threshold-crossing alarms on NE-schedulable OAM tests within a test policy

Perform this procedure to configure threshold-crossing alarms for test policies, test definitions, and assurance tests that are NE-schedulable. An alarm is raised when a threshold is crossed, either because the value rose above or fell below the configured level.

Configuring threshold-crossing alarms on a test definition within the test policy creates a threshold definition that applies to generated tests. Configuring threshold-crossing alarms directly on a test that is NE-schedulable applies just to the test.

Note — If you modify a test policy associated with a test suite, you must regenerate the generated tests in the test suite.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test Policy (Assurance) from the object drop-down list.

3 Configure the filter criteria, if required, and click on the Search button. A list of test policies is displayed.

4 Choose an NE-schedulable policy from the list and click on the Properties button. The Test Policy (Edit) form opens with the General tab displayed.

5 Click on the Test Definitions tab. A list of tests associated with the policy opens.

6 Select a test from the list and click on the Properties button. The Test Definition—Test Policy (Edit) form opens with the General tab displayed.

7 Click on the Thresholds tab.

8 Click on the Create button. The Threshold Event Definition (Create) form opens with the General tab displayed.

9 Configure the parameters:

- Type
- Generate Alarm on Rising Threshold
- Clear Alarm on Falling Threshold
- Update Test Result Status
- Include Falling Threshold

The Clear Alarm on Falling Threshold parameter is configurable only when you enable the Include Falling Threshold parameter.

10 Click on the Rising Threshold tab.

11 Configure the Threshold Value parameter.

12 Click on the Falling Threshold tab.

Note — The Falling Threshold tab can be accessed only when the Include Falling Threshold parameter is enabled on the General tab of the Threshold Event Definition (Create) form.

13 Configure the Threshold Value parameter.

14 Click on the OK button. The Threshold Event Definition (Create) form closes and a dialog box appears.

15 Click on the OK button. The test appears on the list.

16 Repeat steps 8 to 15 to configure threshold events on additional tests.

17 Click on the OK button. The Test Definition—Test Policy (Edit) form closes and the Test Policy (Edit) form reappears.

18 Click on the OK button. A dialog box appears.

19 Confirm the action. The Test Policy (Edit) form closes and the Service Test Manager form reappears.

20 Close the Service Test Manager form.

Procedure 77-3 To configure threshold-crossing alarms on non-NE-schedulable OAM tests within a test policy

You can configure threshold-crossing alarms for test policies, test definitions, and assurance tests that are non-NE-schedulable. An alarm is raised when a threshold is crossed, either because the value rose above or fell below the configured level.

Configuring threshold-crossing alarms on a test definition within the test policy creates a threshold definition that applies to generated tests. Configuring threshold-crossing alarms directly on a test that is non-NE-schedulable applies just to the test.

Note — If you modify a test policy associated with a test suite, you must regenerate the generated tests in the test suite.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test Policy (Assurance) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. A list of test policies is displayed.

5 Choose a non-NE-schedulable policy from the list and click on the Properties button. The Test Policy (Edit) form opens with the General tab displayed.

6 Click on the Test Definitions tab. A list of tests associated with the policy opens.

7 Select a test from the list and click on the Properties button. The Test Definition—Test Policy (Edit) form opens with the General tab displayed.

8 Click on the Thresholds tab.

Note — The Thresholds tab is enabled or disabled depending on the test type selected in step 7. Threshold alarm events can not be configured for Site Ping, mrinfo, mtrace, VPRN Trace and Mtu Ping tests.

9 Click on the Create button. The Threshold Event Definition (Create) form opens with the General tab displayed.

10 Configure the parameters.

- Type
- Generate Alarm on Rising Threshold
- Clear Alarm on Falling Threshold
- Update Test Result Status
- Include Falling Threshold

The Clear Alarm on Falling Threshold parameter is configurable only when you enable the Include Falling Threshold parameter.

11 Click on the Rising Threshold tab.

12 Configure the Threshold Value parameter.

13 Click on the Falling Threshold tab.

Note — The Falling Threshold tab can be accessed only when the Include Falling Threshold parameter is enabled on the General tab of the Threshold Event Definition (Create) form.

14 Configure the Threshold Value parameter.

15 Click on the OK button. The Threshold Event Definition, (Create) form closes and a dialog box appears.

16 Click on the OK button. The test appears on the list.

17 Repeat steps 9 to 16 to configure threshold events on additional tests in the policy.

18 Click on the OK button. The Test Definition, Test Policy (Edit) form closes and the Test Policy (Edit) form reappears.

19 Click on the OK button. A dialog box appears.

20 Confirm the action. The Test Policy (Edit) form closes and the Service Test Manager form reappears.

21 Close the Service Test Manager form.

Procedure 77-4 To create a test suite

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Click on the Create button.

3 Choose Test Suite from the contextual menu. The Test Suite (Create) form opens.

4 Configure the parameters:

- ID
- Auto-Assign ID
- Name
- Description
- NE Schedulable
- Entity Type
- Validation Test Suite
- Timeout (minutes)
- First Run Execution Sequence
- Last Run Execution Sequence

Note 1 — The Entity Type parameter specifies that only test policies created for the same entity type are available for the test suite. The parameter also restricts the predefined tests that are available as first-run or last-run tests to those that apply to the entity type.

Note 2 — To create a test suite that includes tests for different entity types, specify None as the Entity Type parameter value. This allows you to choose any predefined test as a first-run or last-run test.

Note 3 — Specifying None as the Entity Type parameter value disables the generation of tests in a test suite; the policy that STM uses to generate tests must be associated with a specific entity type.

Note 4 — The Validation Test Suite parameter specifies that the test suite is used to validate the connectivity of the tested service entity to which it is applied. This is also refered to as a validator test suite. OAM validation tests are not supported for HVPLS.

You must click on the Validate button on the associated service or service tunnel configuration form to run the OAM validator test suite. If the Validate button is not visible, click on the More Actions button and choose Validate. The result of this OAM validation is indicated by the OAM Validation Failed operational flag.

Note 5 — First Run and Last Run tests can be added for test suites that have the Continuously Executed and Accounting Files options enabled can be added to test suites.

Note 6 — When issuing an Execute or Stop command for a test suite that has the Continuously Executed and Accounting Files options enabled, the execution or stopping of the First Run and Last Run tests will be triggered.

Note 7 — If you are creating an Ethernet CFM test suite, you must enable the NE Schedulable parameter.

5 To create a scheduled task, see procedure 77-6.

6 If you chose None as the Entity Type parameter value in step 4, go to step 17. To create a scheduled task, go to step 7.

7 Click on the Test Policy tab.

8 Click on the Add button to choose a test policy to associate with the test suite. The Select Test Policy - Test Suite form opens.

9 Click on the Search button to display a list of available test policies.

Note — Only test policies that apply to the type of entity specified by the Entity Type parameter in step 4 appear in the list.

10 Choose a test policy from the list and click on the OK button. The test policy appears on the Test Policy tab.

11 Click on the Tested Entities tab.

12 Click on the Add button to choose a service, transport element, or device as the object against which the test suite is run. The Add form opens.

13 Click on the Search button to display a list of available entities.

Note 1 — Only entities that match the type of entity specified in the test policy appear in the list.

Note 2 — There is a column titled Test Suite Count in the Search form. This indicates the number of configured test suites that a specific test entity is currently associated with. The counter also includes test suites that do not contain generated tests.

A Test Suite Count indicator is also displayed on the General tab of managed STM test entity objects. These include services, composite services, transport elements, and applicable devices.

14 Choose an entity from the list and click on the OK button. The Add form closes and an entry for the entity appears in the list on the Tested Entities tab.

15 Ensure the item is selected in the list and click on the Lock Test Generation button, if required.

Note — Locking the test generation means that the initial settings you specify when creating the test suite will be retained, even if later on you change some attributes (for instance, if you are testing SDP tunnels and you extend the tested entities by selecting another SDP tunnel). All customized test attributes are retained when re-generating the tests.

The 5620 SAM auto-locks tested entities when generated tests are either modified or deleted.

The Test Re-generation locked field in the list displays a check mark to indicate that the lock is enabled and the button's name changes to Unlock Test Generation. If you do not want to lock the test, then click the Unlock Test Generation button. The Test Re-generation locked field in the list will not display a check mark.

16 Repeat steps 12 to 14 for each additional entity that you want to specify.

17 Click on the First Run Tests tab.

18 Click on the Add button to choose a predefined test that is to execute before the generated tests in the suite. The Add form opens.

19 Click on the Search button to display a list of available tests.

20 Choose a test from the list and click on the OK button. The Add form closes and the test entry appears on the First Run Tests tab.

21 Repeat steps 18 to 20 for each additional first-run test that you want to specify.

22 When there is more than one test in the first-run list, the Move Up and Move Down buttons are active. Select a test entry and click on these buttons as needed to reorder the first-run test execution sequence, if required.

23 Click on the Last Run Tests tab.

24 Click on the Add button to include a predefined test that is to execute after the other tests in the suite have completed. The Add form opens.

25 Click on the Search button to display a list of available tests.

26 Choose a test from the list and click on the OK button. The Add form closes and the test entry appears on the Last Run Tests tab.

27 Repeat steps 24 to 26 for each additional last-run test that you want to specify.

28 When there is more than one test in the last-run list, the Move Up and Move Down buttons are active. Select a test entry and click on these buttons as needed to reorder the last-run test execution sequence, if required.

29 Click on the Apply button to save the changes. Additional buttons at the bottom of the form become active.

30 If you chose None as the Entity Type parameter value in step 4, go to step 34.

31 Click on the Generated Tests tab.

32 Click on the Generate Tests button. The 5620 SAM begins generating tests for the test suite based on the test policy. The tests appear in a list on the Generated Tests form as they are generated.

Note 1 — When the test policy or the configuration of an entity on the Tested Entities tab changes, you must regenerate the tests in the test suite by clicking on the Generate Tests button.

Note 2 — When tests have been generated in a test suite (which has a test policy already associated to it), these existing tests will not be altered (delete and recreated, or set to default tests), when the Generate Tests button is pressed again.

Note 3 — Any of the tests generated by a test suite can be deleted directly from the list on the Generated Tests tab. Select the tests you want to delete and press the Delete button.

Note 4 — For a test suite containing a P2MP LSP Ping Test Policy, the test suite generator will generate one test per S2L path (for P2MP LSP) or one test per leaf node address (for P2MP LDP).

33 Click on the Generation Logs tab to view the log file that the 5620 SAM creates during test generation, as required.

Note — Generation Logs messages only appear if any failures occur during the test generation process.

34 Click on the OK button to close the Test Suite (Create) form.

35 Close the Service Test Manager form.

Procedure 77-5 To modify a test suite

1 You can modify an existing test suite in two different ways. Perform one of the following:

   a Modify the test suite from within the Service Test Manager. Go to step 2.

   b Modify the test suite from within a tested entity. Go to step 11.

2 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

3 Choose Test Suite (Assurance) from the object drop-down list.

4 Configure the filter criteria.

5 Click on the Search button. A list of test suites appears.

6 Select a test suite and click on the Properties button. The Test Suite (Edit) form opens with the General tab displayed. Use the parameters on this tab to change the execution order of tests in the First run and Last run test groups, as required.

   The following tabs list the test-suite components that you can individually or collectively add to or remove from the test suite:

   - Test Policy tab — displays the test policy that is associated with the test suite
   - Tested Entities tab — lists the entities that are the subjects of the tests in the test suite
   - First Run Tests tab — lists the group of tests in the test suite that run first
   - Generated Tests tab — lists the generated tests that are included in the test suite
   - Last Run Tests tab — lists the group of tests in the test suite that run last

The following tabs display information about the creation and execution of the test suite:

- Results tab — lists the per-run results that are returned by each execution of the test suite
- Individual Test Results tab — lists all individual test results. This is similar to what is displayed when a Tested Entity is chosen and you click on Show Results.
- Generation Logs tab — lists the log entries that are created during test generation for the test suite
- Faults tab — displays the faults associated with the test suite

Note 1 — Generation Logs messages only appear if any failures occur during the test generation process.

Note 2 — You can use the Quick Filter on the test result tab pages to narrow down and limit the displayed results.

7 Modify the parameters for the test suite, as required.

To configure an item on a tab that contains a list of test suite components, select the item and click on the Properties button.

8 Make the changes you want and then click on the OK button. A dialog box appears.

9 Click on the Yes button to confirm the action. The Test Suite (Edit) form closes and the Service Test Manager form reappears.

10 Click on the Close button to close the Service Test Manager form.

11 You can alternatively add an entity to an existing test suite from within the Properties form of the particular entity. Several object types in 5620 SAM support this capability, including:

- VLL service
- VPLS
- VPRN service
- Composite service
- Mirror service
- Service connector
- ATM PVC
- LSP
- P2MP LSP
- Tunnel (SDP)
- P2MP LDP

12 Open the Properties form of the entity you want to add to a test suite.

13 Click on the Tests tab. The Test Suite sub-tab is displayed.

14 Click the Add button. The Add form appears.

15 Click the Search button to display a list of test suites. Only test suites applicable to this type of entity will be displayed.

16 Select the required test suite and click OK. The Add form closes and selected test suite appears in the Test Suite sub-tab.

The entity has now been added to this test suite. You can confirm this by clicking the Properties button to display the Test Suite (Edit) form. The newly-added entity will appear on the list in the Tested Entities tab. You can also modify any other parameters of the test suite here, as detailed in steps 2 to 9 above.

Note — Once you have added the entity, you can also run the test suite from the Test Suite sub-tab by clicking the Execute button.

Refer to Procedure 77-8 for information on executing a test suite.

Procedure 77-6 To schedule the execution of a test suite

You can use a SAM schedule to schedule the execution of a test suite. See chapter 7 for information about SAM schedules.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test Suite (Assurance) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. A list of test suites appears.

5 Double-click on the test suite that you need to schedule. The Test Suite (Edit) form opens with the General tab displayed.

6 Click on the Schedule button. The STM Scheduled Task (Create) form opens with the General tab displayed.

7 Configure the parameters:

- Scheduled Task Name
- Scheduled Task Description
- Administrative State

Caution — Setting the Administrative State parameter to Enabled puts the scheduled task into effect according to the schedule parameters. Ensure that the test suite and the objects to which it applies are appropriately configured before you set the parameter to Enabled.

8 Click on the Select button in the Schedule panel. The Select Schedule - STM Scheduled Task form opens.

9 If required, click on the Create button to configure a new SAM schedule. See Procedure 7-1 for more information.

10 Configure a filter if required and click on the Search button. A list of schedules appears.

11 Choose a schedule and click on the OK button. The Select Schedule - STM Scheduled Task form closes and the identification information for the chosen schedule is displayed on the STM Scheduled Task (Create) form.

12 Click on the OK button. The STM Scheduled Task (Create) form closes and the Test Suite (Edit) form reappears.

13 Close the Test Suite (Edit) form.

14 Close the Service Test Manager form.

Procedure 77-7 To schedule the execution of a test suite using an existing NE schedule

To schedule the execution of a test suite using an existing NE schedule, perform Procedure 7-5 to turn up the NE scheduled task.

Procedure 77-8 To execute a STM test suite

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test Suite (Assurance) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. A list of test suites appears.

5 Select a test suite in the list and click on the Properties button. The Test Suite (Edit) form opens with the General tab displayed.

6 Click on the Execute button. Execution of the test suite begins. You can view the test results when the test execution is complete.

Note 1 — You can run an OAM validation test from the Properties form of a service tunnel or an applicable service. See the applicable service management chapter for more information.

Note 2 — When you execute a test suite from the Properties form of an applicable service, only the tests belonging to that service will be executed. Tests within the suite, but not associated with the current tested entity, will not be executed.

Note 3 — When you execute a test suite under the tested entity (using the Execute button under the entity's Tests>Test Suite sub-tab), 5620 SAM will create a Tested Entity Result under the entity's Tests>Tested Entity Result sub-tab.

Note 4 — You can use the Delete All Result button in either the Results tab or the Individual Test Results tabs to remove all listed test results. Alternatively, you can use the Quick Filter on the test result tab pages to narrow down and limit the displayed results. The Delete All Result button will then only delete the filtered results. If no filter condition is specified, then the Delete All Result button will delete all the pages of results, not just the currently displayed page.

If the list under either of these tabs contains more than 1000 entries, only 1000 entries are displayed at a time, with paging available for the remainder. However, the Delete All Result button deletes all pages of results, not just the currently displayed page.

7 Close the Test Suite (Edit) form.

Procedure 77-9 To run a One Time Validation

The One Time Validation function provides a mechanism to quickly test a service or composite service either at the time it is provisioned or when it is already in service. A variety of services and transport components can be tested using this function.

The One Time Validation function operates in much the same way as running a Validator test suite (refer to Section 77.1 for more information), however the temporary objects that are automatically created for this method are deleted upon its completion. These include the test suite, tests, MEGs, and MEPs. No user action is required to do this.

Another significant difference between the two methods is that no results file is created. Instead, all tests and results are stored as archived objects that remain after the One Time Validation is finished. The results can be viewed in the 5620 SAM GUI. Refer to the 5620 SAM-O XML Reference (oneTimeValidate under sas.TestManager) for the required syntax to view the results using OSSI.

Executing a One Time Validation also updates the OAM Validation Failed state field as required, indicating whether or not the validation was successful.

Perform the following steps to run the One Time Validation:

1 Select the required test entity using the appropriate item under the 5620 SAM Manage menu item, and then click the Properties button. The entity's property form opens. Entities that you can test using this function include:

- VLL, VPLS, and VPRN services (Manage→Service→Services)
- Composite services (Manage→Service→Composite Services)
- Dynmaic LSPs (Manage→MPLS→Dynamic LSPs)
- Service tunnels (Manage→Service Tunnels)

2 Click on the One Time Validation button.

Note — If a regular OAM validation is currently running on the selected test entity, the One Time Validation function will not be executed.

The Choose Validator Test Policy form is displayed and lists all test policies that are applicable to the selected test entity.

3 Select the required policy from the list and click OK.

Note — A default read-only test policy (Validation-Default-Policy) is supplied for this purpose. You can copy this policy but not modify it. Modify the cloned copy as required, or you can select a test policy you have previously created (refer to Procedure 77-1 to create a test policy).

The One Time Validation function proceeds after you click the OK button. The automated operations that occur are as follows:

i The One Time Validation test suite is created.

ii The selected test entity is added to the test suite.

iii Any tests, MEGs, and MEPs that are appropriate to the test entity and that are required to run the validation are created.

iv The generated tests are executed.

v The test entity's OAM Validation Failed state indicator is updated as required (a checkmark indicates the OAM validation failed whereas a blank checkbox indicates that the validation succeeded).

vi Test results for each individual test that was created and executed to perform the validation are copied to new test result objects.

vii The test suite, tests, and any required OAM objects that were created to run the validation are deleted.

4 To view the test results, click on the tested entity's Test tab and then on the One Time Validation Result sub-tab.

Note — These archived test results are also available through the STM. They can be viewed by selecting the One Time Validation Result (Assurance) item from the object drop-down list. See Procedure 77-11 for more information.

5 Select one of the test results in the list and click on the Properties button. The One Time Validation Result (Edit) form opens with the General tab displayed.

6 Review the results as required and then close the One Time Validation Result (Edit) form.

Note — The archived test results are not deleted after viewing. They will remain available until manually deleted by the user.

7 Close the tested entity's property form.

Procedure 77-10 To execute one or more individual tests from the STM

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test (Assurance) from the object drop-down list.

3 Click on the Search button. A list of tests appears.

4 To execute a single test, go to step 5. To execute multiple tests directly from the STM list, go to step 8.

5 Select a test in the list and click on the Properties button. The Test (Edit) form opens, with the General tab displayed.

6 Click on the Execute button. Execution of the test begins and the Test (Edit) form displays the Results tab. You can view the test results when the test execution is complete.

7 Go to step 11.

8 Select the tests in the list that you want to run.

Note 1 — You can select and execute multiple tests from the test list, with the exception of CCM Tests. If multiple tests including CCM tests are selected, then the Execute button will be disabled.

Note 2 — You cannot modify multiple tests in one pass. If multiple tests are selected, the Properties button will be disabled.

9 Click on the Execute button. Execution of the tests begins.

10 View the results for any individual test once the execution is complete by clicking on the test in the list and then clicking on the Properties button. The Test (Edit) form opens and the results can be viewed on the Results tab.

11 Close the Test Suite (edit) form.

Procedure 77-11 To view Test Suite results

Perform this procedure to view test suite results from the Test Suite Result form.

Note 1 — You can also view the test suite results for an object from the Tests tab of the configuration form for the object.

Note 2 — You can reorder a column in a tabular information view by dragging the column heading to the desired position, then right-clicking on the column heading and choosing Save Table Preferences.

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager (STM) form opens.

2 Choose Test Suite Result (Assurance) from the object drop-down list.

3 Click on the Search button. A list of test suite results appears.

4 Select a test suite result and click on the Properties button. The Test Suite Result (View) form opens with the General tab displayed.

5 View the general information and statistics on the General tab.

6 Click on the Results tab to list the test results from the tests in the test suite.

7 Perform one or both of the following:

a Use the horizontal scroll bar at the bottom of the list to view the tabular information on the listed tests.

b Select an entry from the list and click the Properties button.

The result form for the selected test is displayed.

8 Close the Test Suite Result (View) form.

9 Close the Service Test Manager form.

Procedure 77-12 To view and compare Test Suite results for a tested entity

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test Suite (Assurance) from the object drop-down menu.

3 Configure the filter criteria.

4 Click on the Search button. A list of test suites appears.

5 Choose a test suite in the list and click on the Properties button. The Test Suite (edit) form opens with the General tab displayed.

6 Click on the Tested Entities tab to view a list of entities tested by the test suite.

7 Choose a tested entity from the list and click on the Show Results button. The Tested Entity (Edit) form opens.

8 Configure the filter criteria.

9 Click on the Search button. A list of test results appears.

10 Choose a test result from the list and click on the Properties button. The result form for the selected test opens.

11 Close the result form.

12 Close the Tested Entity (Edit) form.

13 Close the Test Suite (Edit) form.

14 Close the Service Test Manager (STM) form.

Procedure 77-13 To view and compare test results

1 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

2 Choose Test Result (Assurance) from the object drop-down list.

3 Configure the filter criteria.

4 Click on the Search button. A list of test results appears.

5 Choose a test result and click on the Properties button to view the properties of the test. The Results form for the selected test type opens.

6 Close the Results form.

7 Close the Service Test Manager (STM) form.

Procedure 77-14 To delete a test suite

1 If the test suite is scheduled, you must remove the scheduled task associated with the test suite before you can delete the test suite. See chapter 7 for more information.

2 Choose Tools→Service Test Manager (STM) from the 5620 SAM main menu. The Service Test Manager form opens.

3 Choose Test Suite (Assurance) from the object drop-down list.

4 Configure the filter criteria.

5 Click on the Search button. A list of test suites appears.

6 Select a test suite in the list and click on the Delete button. A dialog box appears.

7 Click on the Yes button to confirm the action. The test suite is deleted and removed from the list.

8 Click on the Close button to close the Service Test Manager form.

78 — Ethernet CFM

78.1 Ethernet CFM overview *78-2*

78.2 Workflow to configure Ethernet CFM *78-11*

78.3 Ethernet CFM procedures *78-12*

78.1 Ethernet CFM overview

The 5620 SAM Ethernet Connectivity Fault Management, or Ethernet CFM, function is implemented based on the IEEE 802.1ag OAM standard. This standard describes protocols for detecting, isolating, and reporting connectivity faults in an Ethernet network. You can use Ethernet CFM for the following:

- path discovery
- fault detection
- fault isolation
- fault notification

The IEEE 802.1ag OAM standard partitions a network into eight hierarchical levels called maintenance domains, or MDs. An MD is a network, or part of a network, that is provisioned with a set of maintenance entity groups, or MEGs, which are groups of service sites.

MEGs

Typically, a MEG represents one service and consists of a group of maintenance end points, or MEPs. Only one MEG can be associated with a service, but one service can be associated with multiple MEGs. MDs and MEGs are distributed to NEs using 5620 SAM policy distribution.

Within a MEG, MEPs can be sorted into logical groupings called MEG subgroups. A MEG that contains subgroups is called a Global MEG. By default, a Global MEG has one subgroup. MEG subgroups allow you to group managed MEPs and unmanaged remote MEPs so that Ethernet CFM can be directed to a specific area of a system, a MEG subgroup, rather than the entire system.

Ethernet CFM diagnostic tests detect connectivity failures between pairs of local and remote maintenance end points, or MEPs, in a MEG. Each MEP is a reference point that can initiate or terminate one of the following diagnostic tests:

- CFM continuity check
- CFM loopback
- CFM link trace
- CFM Eth test
- CFM two-way delay
- CFM one-way delay
- CFM single-ended loss (7705 SAR only)
- CFM two-way SLM

A CFM continuity check test is automatically generated when you create an MD. When you execute the test and a connectivity fault is present, the MEP that detects the fault raises an alarm. See Chapter 32 for information about a specific Ethernet CFM diagnostic test.

MEPs

MEPs are configured at the edge of an MD and perform the following functions:

- periodically send CFM continuity check messages
- validate CFM PDU replies

- discard CFM PDU messages that are not in the MEP configuration
- initiate and respond to CFM test messages

MEPs can be added to services automatically or manually. When a MEP is assigned to a service manually, it associates its MEG with a single site on the service. When a MEP is assigned to a service automatically, it associates its MEG with all sites on the service. MEPs which are generated automatically can inherit test generation options from the SAP or Service Site. See Procedure 78-1 for more information.

You can also add MEPs to services during Ethernet CFM test configuration from the Service Topology map. See "Working with Ethernet CFM objects" in chapter 6 for more information.

Each MEP is assigned an up or down direction. An up MEP is provisioned on an ingress port, and monitors the forwarding path inside a bridge NE to the egress port. A down MEP is provisioned on an egress port, and monitors the forwarding path between bridge NEs.

You can configure an initial MEP ID for automatic MEP ID assignment on an NE. See Procedure 78-2 for more information.

You can assign roles to managed MEPs and unmanaged remote MEPs during OAM test suite configuration. A MEP can be designated as a hub or spoke, and as a test source, a test target, or both. Assigning roles to MEPs in test suites can reduce the total number of automatic tests generated. See Procedure 78-1.

MEPs can inherit their roles from the SAP or Service Site. You can propagate test generation role settings to all unmanaged remote and managed MEPs on a SAP or service site using the Propagate to MEPs button on the ETH-CFM tab of the Access Interface (Edit) and Site (Edit) forms.

An up MEP can be associated with the following object types:

- Epipe and VPLS SAPs
- Epipe spoke SDP bindings
- VPLS mesh and spoke SDP bindings
- VPLS and MVPLS B-sites, as virtual MEPs
- B-L2 access interfaces
- OmniSwitch VLAN SAPs

A down MEP can be associated with the following object types:

- Epipe, Ipipe, IES, VPLS, and VPRN SAPs
- Epipe and IES spoke SDP bindings
- VPLS mesh and spoke SDP bindings
- B-L2 access interfaces
- MVPLS access interfaces
- OmniSwitch VLAN SAPs
- Network interfaces
- Ports
- LAGs

Virtual MEPs

A virtual MEP is an up MEP that is created on a VPLS site when a CFM continuity check test is run. Each virtual MEP transmits a CFM continuity check stream on all SAPs and SDPs of the site. A virtual MEP uses the site MAC address, if configured; otherwise, it uses the shelf MAC address. See chapter 68 for information about assigning virtual MEPs to a VPLS.

The following rules apply to virtual MEP management:

- One virtual MEP can be configured on a VPLS or MVPLS B-site.
- All regular MEPs on SAPs and SDP bindings in the same MEG as a virtual MEP must be configured as up MEPs.
- Regular MEPs in the same MEG and on the same B-site as a virtual MEP cannot be enabled when the virtual MEP is enabled.
- Virtual MEPs can be created in a MEG only when MIP creation in the MEG is disabled.

Facility MEP

A facility MEP is a MEP that is down and is created on a router interface, network interface, port, or LAG. A facility MEP detects failure conditions for an Ethernet transport network using ETH-CCM or AIS and, where appropriate, propagates alarm conditions so that the services that share this common transport are aware of the failure.

A virtual tunnel facility MEP is created by configuring a LAG MEP or a port MEP with a VLAN ID. In this instance the VLAN ID must match the outer encapsulation value of the SAP that is associated with the Tunnel MEP.

The following rules apply to facility MEP management:

- Only one facility MEP can be configured on a port, a LAG, or a network interface.
- A facility MEP can be configured on a port only if the MD level is 0.
- A facility MEP must be configured in the down direction.
- A facility MEP ID must be unique within the same device.
- Port facility MEPs are supported on ports in access, hybrid, or network mode with dot1q encapsulation, and on ports in access or hybrid mode with Q in Q encapsulation.
- Port facility MEPs cannot be configured on network elements that support Ethernet tunnels.
- Tunnel facility MEPs are supported on LAG ports configured with Q in Q encapsulation in access or hybrid mode.
- Tunnel facility MEPs must have a lower MD level than any service MEPs that are created on the same LAG.
- A tunnel facility MEP VLAN ID must be unique within the same port.
- Tunnel facility MEPs cannot be configured on LAGs with a VLAN ID of 0.
- Tunnel port facility MEPs cannot be configured on LAG members.
- Fast facility MEPs, which are MEPs with a CCM interval of 10 ms or 100 ms, cannot be configured when CCM padding is enabled.
- There must be 2 facility MEPs in a MEG subgroup to execute a CCM test.

MIPs

Maintenance intermediate points, or MIPs, are internal points in an MD that perform the following functions:

- validate received CFM PDUs
- validate and respond to link trace messages
- validate and respond to loopback messages

A MIP consists of two half-function objects that allow the MIP to be recognized as a MIP in one MD level and as a MEP on a higher level.

Ethernet-CFM redundancy

When you configure Ethernet-CFM redundancy, you can link MEPs to the state of the resiliency mechanism that is supported in MC-LAGs. The state of the MEP does not affect the state of resiliency mechanism.

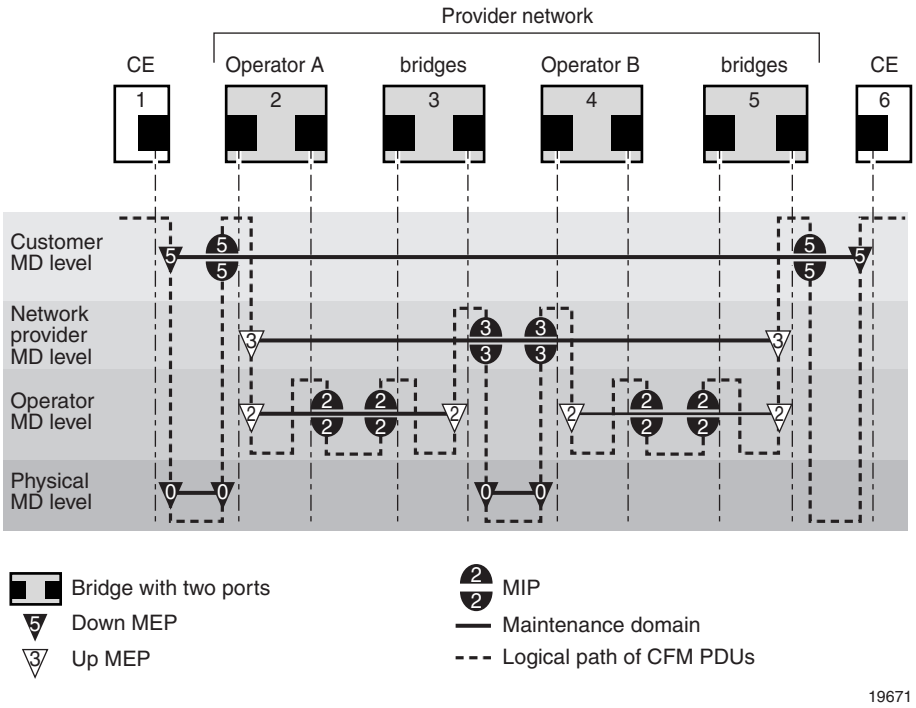
Ethernet-CFM redundancy is configured at the NE level. When you configure Ethernet-CFM redundancy, the state of a MEP is the same as the state of the SAP, LAG, or MC-LAG with which it is associated. For example, if the redundant MC-LAG is in standby state, the MEP is also in standby state. When a MEP is in standby state, the MEP is idle, CCMs are not exchanged, and the MEP does not respond to CFM tests.

Note — The MEP, SAP, and LAG must reside within an MC-LAG that has Ethernet-CFM redundancy configured. See Procedure 39-1 to configure MC-LAGs.

When Ethernet-CFM redundancy is configured and the active state of an MC-LAG changes, the MC-LAG Inactive state on the MEP changes and any defects on the MEP are flagged.

The state of MEPs, SAPs, and LAGs that are configured for Ethernet-CFM redundancy appears in the MC-LAG Inactive field. The status of MC-LAGs that are configured for Ethernet-CFM redundancy appears in the Is Active field.

In addition to configuring Ethernet-CFM redundancy at the NE level, you can configure Ethernet-CFM redundancy on tunnel MEPs. See Procedure 13-2 to configure Ethernet-CFM redundancy at the NE level. See Procedure 14-11 to configure Ethernet-CFM redundancy on a tunnel MEP.



Sample Ethernet CFM implementation

Figure 78-1 shows an example of MDs, MEPs, and MIPs in a IEEE 802.1ag network that consists of two operator areas, for example, services in the provider network, that are joined to create a network path for customer traffic. The number on an object identifies the associated MD, which is one of the following:

- MD 5—end-to-end customer path
- MD 3—end-to-end network provider path
- MD 2—paths within services
- MD 0—physical path

MD 5 provides access to a down MEP on each CE device, and to a MIP on each PE bridge. MD 3 provides access to an up MEP on each PE bridge, and to a MIP on each bridge between groups of operator bridges. MD 2 provides access to the up MEPs and MIPs in each service. MD 0 provides access to MEPs for checking the physical connectivity between NEs.

Figure 78-1 Ethernet CFM objects in example network

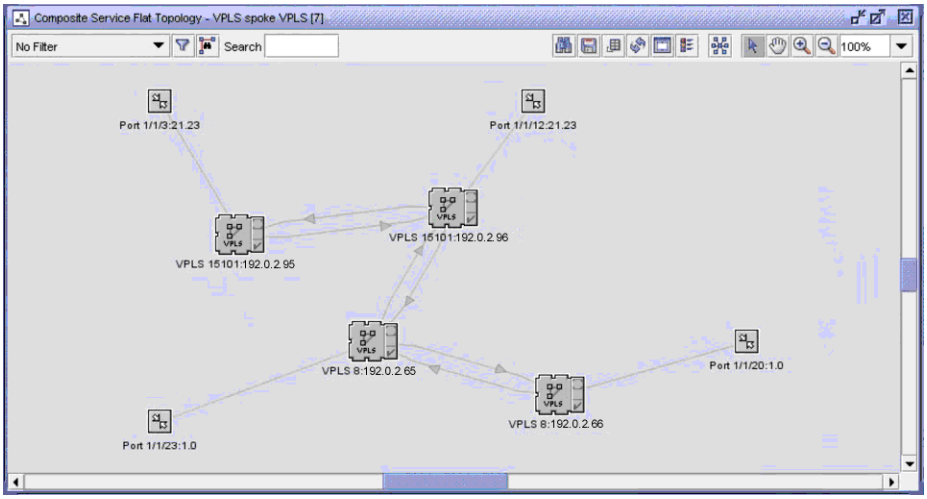
Ethernet CFM implementation for composite services

End-to-end test suite generation for composite services is available for VPLS and VLL Epipe services. In this context, a composite service is a set of services connected by one or more of the following:

- VLAN uplinks
- Spoke bindings
- CCAG connectors

Creating test suites and test policies for composite services is very similar to creating these for a regular service. Test generation options can be applied to modify the roles of managed and remote unmanaged up MEPs. See Procedure 78-1. The Accounting Files and Continuously Executed options are also available when you create a test policy for a composite service.

Once tests have been ordered to generate, a MEG is created on each eligible endpoint SAP. Tests are then generated for this MEG that target other eligible endpoint SAPs within the composite service. Results for individual tests can then be reviewed.



Note — If there is a previously created MEG on one of the service sites (for example, a MEG created for a service before the service was included in a composite service) and the Generate Tests button is selected, tests are not generated. When a MEG with only a subset of the composite service already exists on one of the service SAPs, the generation of tests is blocked. The MEG must be deleted before the CFM tests are generated.

Examples of Ethernet CFM tests for composite services

The following are examples of how the Ethernet CFM test generation rules for composite services are structured to operate.The examples are based on the default test roles for MEPs. The default roles are Hub and both Test Source and Test Target.

Figure 78-2 shows a flat topology view of a simple configuration of two VPLSs (VPLS 8 and VPLS 15101) that are connected by a pair of spoke bindings between sites 192.0.2.96 and 192.0.2.65.

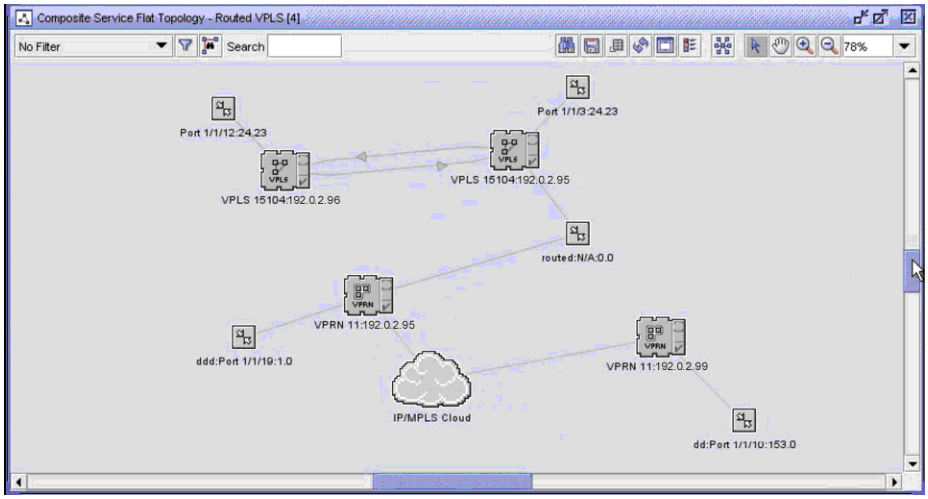


Figure 78-2 Composite service connected by spoke bindings

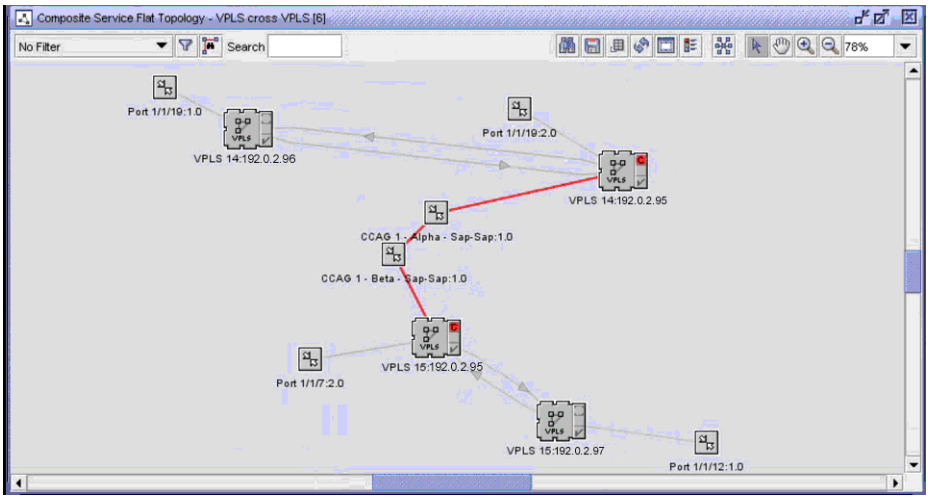
In this configuration, all four SAPs are considered as endpoints. Therefore MEPs are generated on each SAP and they all target each other. A total of twelve tests are generated. Double-clicking on an endpoint opens the interface configuration form and the MEP generated for this particular endpoint is displayed under the MEPs tab. If you then query the MEP's properties, the Tests tab in the MEP's configuration form displays the three tests that target the other MEPs in this composite service.

Figure 78-3 shows an example of a routed VPLS configuration with a VPLS (VPLS 15104) and a VPRN (VPRN 11). The services are connected by a routed VPLS interface (shown as routed:N/A:0.0).

Figure 78-3 Routed VPLS composite service



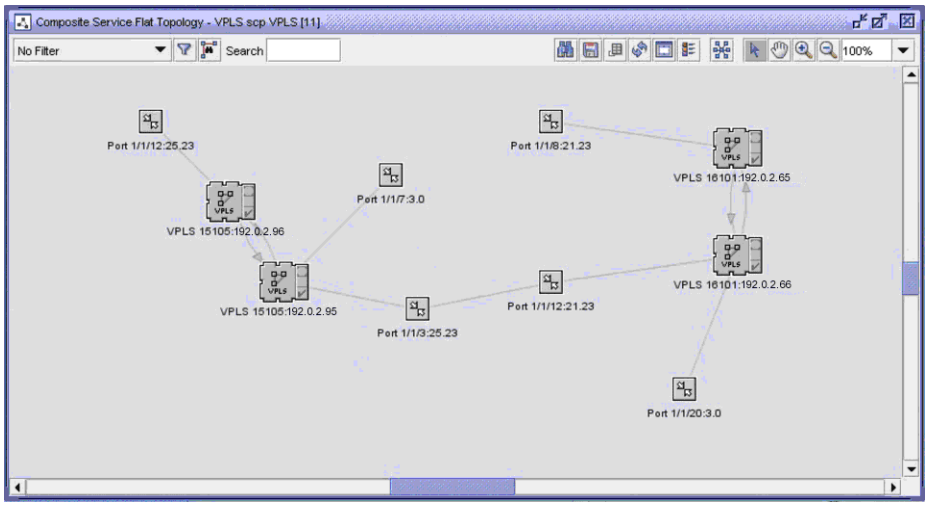
In this configuration, site 192.0.2.95 exists on both the VPLS and VPRN service. This is an overlapping site. The test generation rules would normally skip an overlapping site and no MEGs or tests would be generated for that site.

However in this case, the overlap for this site occurs in an unsupported service. The test generation rules for such a configuration will skip the unsupported VPRN service entirely and only generate tests for the supported VPLS, including site 192.0.2.95. Therefore, two MEPs and two tests (targeting each other) will be generated here, one for each of the SAPs on sites 192.0.2.96 and 192.0.2.95.

The test generation logs available in the test suite configuration form (under the Generation Logs tab) provide an explanation whenever the test generation rules cause items to be excluded from the tests. In this case, the log would state: “The CFM Composite Services Test Suite skipped the unsupported service”.

Figure 78-4 shows an example of a cross-connected VPLS composite service.

Figure 78-4 Cross-connected VPLS composite service



In this configuration, the two VPLSs (VPLS 14 and VPLS 15) are cross-connected by the SAPs CCAG 1-Alpha and CCAG 1-Beta. Both these SAPs originate from site 192.0.2.95, which exists in both services. It is therefore an overlapping site. The test generation rules skip overlapping sites, so no MEGs or tests are generated for any SAPs associated with that site.

Therefore, two MEPs and two tests (targeting each other) will be generated here, one for each of the SAPs on sites 192.0.2.96 and 192.0.2.97.

In addition, there will be two test generation logs available in the Generation Logs tab of the test suite configuration form. In this case, the logs would be identical, one stemming from each of the supported VPLSs. The logs would state: “Skipped overlapping service site”.

Figure 78-5 shows an example of an SCP-connected VPLS composite service.

Figure 78-5 SCP-connected VPLS composite service

In this configuration, the two VPLSs (VPLS 15105 and VPLS 16101) are joined by an SCP connector between sites 192.0.2.95 and 192.0.2.66. The test generation rules skip any SAPs identified as part of a connector, since they are not endpoints. So no MEGs or tests are generated for either connector SAP.

MEGs and tests will however, be generated for each of the other four SAPs shown in the example. In total, four MEGs and twelve tests will be generated.

In addition, there will be two test generation logs available in the Generation Logs tab of the test suite configuration form. In this case again, the logs would be identical, one stemming from each of the supported VPLSs. The logs would state: “Skipped service connecting SAPs”.

Primary VLAN support for Ethernet CFM

The Primary VLAN feature allows an operator to set a VLAN identifier to perform additional ETH-CFM extraction checking. Primary VLAN enabled MEPs will only perform the addition extraction routines for MEPs configured under the same SAP and that have an enabled Primary VLAN. When a MEP is configured without a Primary VLAN, only the classic extraction is performed.

By default, the ETH-CFM processing uses the exact SAP configuration to determine the proper offset for the start of the ETH-CFM e-type 0x8902 PDU. Any packet that includes ETH-CFM (e-type 0x8902) at the appropriate offset will be subjected to the extraction routines for MEPs or MIPs. If the ETH-CFM is not at the appropriate offset, the packets pass as user data.

The default mapping of the ingress packet to the SAP is based on the Layer 2 mapping. The mapping to the appropriate MEP is based on this Layer 2 look up. If there is not an exact match, as in the case of ambiguity or additional VLAN tags beyond the SAP delineation, then additional look ups for ETH-CFM are possible. This is mostly applicable to ambiguous SAPs, where a single VLAN or aggregate is transporting many VLANs underneath that aggregate function. It is also applicable to dot1q networks that carry multiple tags without using the default SAP. Fully-qualified SAPs are also able to use the Primary VLAN function. The extraction function is the same for either fully-qualified or ambiguous SAPs.

A MEP or MIP must be configured on a particular SAP to perform any ETH-CFM extraction. The classic extraction (which is the matching of the ETH-CFM packets immediately following the SAP configuration) is performed first. If the Ethernet encapsulation is set to dot1q and the SAP configuration is x/y/z:*, then the ETH-CFM extraction looks for ETH-CFM to appear in the header with no VLAN tags preceding it. If there is a match on this classic extraction, then there no further extraction routines are invoked. If the classic extraction fails and a second MEP is configured with Primary VLAN enabled, then the additional extraction will check to see if ETH-CFM immediately follows the specified Primary VLAN. If that is true, then the VLAN will be used as an index into the primary VLAN table and the extraction is performed based on normal criteria following the ETH-CFM rules.

The Primary VLAN function is supported for Up and Down MEPs, as well as Ingress and egress MIPs on an Ethernet SAP for VPLS and Epipe service MEPs (including Local Switched PBB ePipe with PBB Tunnel backup). Primary VLAN support is only applicable to service MEPs and not facility MEPs (specifically, not Tunnel MEPs). Facility MEPs are meant to validate the transport and not switching capability of a network element.

When enabling this function, an operator can specify the VLAN ID for generated MEG sites, and also whether or not the MEP should be a Primary VLAN MEP or MIP (only applicable to SAP MEPs or MIPs on VPLS and Epipe services)

The CCM test execution routine checks if all MEPs in the MEG or MEG Sub-group match before allowing the test execution to proceed.

Points to consider when enabling the Primary VLAN function:

- Alcatel-Lucent recommends that a unique MA should be employed for each Primary VLAN.
- The Primary VLAN function is only applied to SAPs (Virtual MEPs are not supported).
- The MHF-Creation parameter must be set to the static option to force the generation of Primary VLAN MIPs. This is suppressed on older or non-SR NEs.
- Primary VLAN MEPs can only be assigned at creation time.
- Primary VLAN MEPs must have an MA Service VLAN ID correctly set.
- The MA Service VLAN ID cannot be changed if Primary VLAN MEPs exist.

- Multiple Primary VLAN MEPs per SAP are supported. There is no restriction on the number of MEPs that are allowed on any SAP when employing this feature. Both the classic extraction context and every Primary VLAN on the SAP can support up to 16 MEPs (8 Up and 8 Down), one per MD level.
- All eight MD levels can be configure on all MEPs (0-7) that are configured on a SAP, within their specific context (classic or Primary VLAN). This allows an operator to have the complete range of eight MD levels for use in the specified primary VLAN. This avoids conflicts when the same MD Level and Layer 2 encapsulation maps to two different MEPs in the different contexts.
- Levels are specific within each of the contexts (classic and all the Primary VLANs configured on the same SAP). Therefore each lookup can have overlapping levels. The hierarchy is maintained within the extraction context.
- Primary VLAN MEPs and Fault Propagation are mutually exclusive.
- Primary VLAN MEPs and Fast CCM Interval are mutually exclusive.
- There is no sub second CCM support for Primary VLAN enabled MEPs.
- The Primary VLAN function is not applicable to Omni switches.

78.2 Workflow to configure Ethernet CFM

This workflow describes the procedures to create and run an Ethernet CFM test.

Ethernet CFM tests are configured through the 5620 SAM Service Test Manager. See chapter 77 for more information.

1 Configure the initial MEP ID value on an NE for automatic MEP creation. See Procedure 78-2 for more information.

2 Create an Ethernet CFM MD and subordinate objects associated with the MD such as a Global MEG, MEG, and MEP for each level at which Ethernet connectivity is to be monitored. See Procedure 78-1 for more information.

   i Create one or more global MEGs in each MD. Each MEG must be associated with one service or Ethernet path. Creating a Global MEG generates a CFM continuity check test.

   ii Associate a service with the Global MEG.

   iii As required, add an Ethernet path to the Global MEG.

   iv As required, add a managed MEP to the MEG.

   v As required, add a remote MEP to the MEG.

   vi As required, add an unmanaged remote MEP to the Global MEG.

   vii As required, add a MEG sub-group to a Global MEG.

3 As required, change the MEG sub-group association for managed MEPs or unmanaged remote MEPs. See Procedure 78-4 for more information.

4 As required, configure a default NE-level MD on an OmniSwitch. See Procedure 78-5 for more information.

5 Create a test policy, specifying at least one of the following Ethernet CFM test definitions:

- CFM Loopback
- CFM Link Trace
- CFM Two Way Delay Test
- CFM Two Way SLM

See Procedure 77-1 for more information.

6 Create a test suite. See Procedure 77-4 for more information.

7 As required, execute the generated Ethernet CFM test suite. See Procedures 77-6 and 77-8 for more information.

8 As required, view the test results. See Procedures 77-11, 77-12, and 77-13 for more information.

78.3 Ethernet CFM procedures

The following procedures describe how to configure and manage Ethernet CFM.

Procedure 78-1 To configure an Ethernet CFM MD and subordinate objects associated with the MD

Perform this procedure to configure an Ethernet CFM MD and subordinate objects associated with the MD such as a Global MEG, MEG, and MEP.

Many of the forms accessed in this procedure can also be accessed using the Service Topology map. See section 6.3 for information about working with maps.

Note — You can only perform this procedure when a service exists to associate with the MD or subordinate objects.

1 Choose Tools→Ethernet CFM→Maintenance Domain Policies from the 5620 SAM main menu. The Maintenance Domain Policies form opens.

2 Perform one of the following:

a Modify an existing MD.

i Configure a filter if required and click on the Search button. A list of MDs appears.

ii Select an MD in the list and click on the Properties button. The Maintenance Domain - Global Policy (Edit) form opens.

b Create a new MD.

i Click on the Create button. The Maintenance Domain - Global Policy (Create) form opens.

ii Configure the parameters:

- MD Mgr Object ID
- Maintenance Domain ID
- Auto-Assign ID
- Name Type
- Name
- Level

If the MD is to be used for Y.1731 performance measurement tests, you must set the Name Type parameter to none.

iii Click on the Apply button. The form displays additional tabs, and the form name changes to Maintenance Domain Global Policy (Edit).

iv Click on the Switch Mode button. A dialog box appears.

v Click on the Yes button. The Configuration Mode changes to Released.

3 Configure the Description parameter and click on the OK button. A dialog box appears.

4 Click on the Yes button. The Maintenance Domain - Global Policy (Edit) form closes, and the Maintenance Domain Policies form reappears.

5 Add a Global MEG to an MD.

i Select an MD in the list and click on the Properties button. The Maintenance Domain - Global Policy (Edit) form opens.

ii Click on the Global Maintenance Entity Group tab.

iii Click on the Create button. The Global Maintenance Entity Group (Create) form opens with the General tab displayed.

iv Configure the parameters:

- Auto-Assign ID
- Name
- Description
- Administrative State

v Configure the Name Format and Name parameters in the Maintenance Entity Group panel.

If you select icc-based as the Name Format, then the associated Name value must be 8 to 13 characters long.

vi Configure the parameters in the Initial MEG Configuration panel:

- Initial CCM Interval
- Initial MHF-Creation
- Initial CFM Hold Down Timer (Centiseconds)
- Initial MIP LTR Priority

When you are creating a Global MEG for a 7750 SR-c4, 7750 SR-c12, or 7450 ESS-6, the Initial CCM Interval must be set to 1s.

You can only configure the Initial CFM Hold Down Timer (Centiseconds) parameter when the Initial CCM Interval is set to10 ms or 100 ms.

When the Initial CCM Interval parameter is set to 10 ms or 100 ms, you cannot configure automatic MEP creation in step 7.

Note — When a Global MEG is created and applied, you can open the Global Maintenance Entity Group form at any time and view on the General tab two information fields that display the number of local MEGs and the number of MEPs currently associated with the Global MEG.

vii Click on the OK button. The Global Maintenance Entity Group (Create) form closes, and the Maintenance Domain - Global Policy (Edit) form reappears with the Global Maintenance Entity Group tab displayed. The Global MEG is listed on the form and a default MEG sub-group is added to the Global MEG.

6 To add a MEG sub-group to a Global MEG, perform one of the following, if required:

a Add a new MEG sub-group to a Global MEG.

i Select a Global MEG in the list and click on the Properties button. The Global Maintenance Entity Group (Edit) form opens with the General tab displayed.

ii Click on the MEG Sub-Group tab.

iii Click on the Create button. The MEG Sub-Group (Create) form opens.

iv Configure the parameters:

- MEG Sub-Group ID
- Auto-Assign ID
- Name
- Ignore test generation and CCM test

v Click on the OK button. A dialog box appears.

vi Click on the OK button. The MEG sub-group is listed on the Global Maintenance Entity Group (Edit) form.

vii Click on the OK button to close the Global Maintenance Entity Group (Edit) form. A dialog box appears.

viii Click on the Yes button. The Global Maintenance Entity Group (Edit) form closes and the Maintenance Domain (Edit) form appears.

ix Close the Maintenance Domain (Edit) form. The Maintenance Domain Policies form appears.

b Automatically create a new MEG sub-group based on existing remote MEP lists.

Note — You can only create MEG sub-groups using this method when a valid remote MEP list exists and the remote MEPs on the list are CCM enabled.

i Select a Global MEG in the list and click on the Properties button. The Global Maintenance Entity Group (Edit) form opens with the General tab displayed.

ii Click on the Discover MEG Sub Groups button. If this button is not visible, click on the More Actions button and choose Discover MEG Sub Groups. When remote MEPs on valid lists are CCM enabled, new MEG sub-groups are created from the remote MEP lists. The new MEG sub-groups are listed on the Global Maintenance Entity Group (Edit) form.

iii Click on the OK button to close the Global Maintenance Entity Group (Edit) form. A dialog box appears.

iv Click on the Yes button. The Global Maintenance Entity Group (Edit) form closes and the Maintenance Domain (Edit) form appears.

v Close the Maintenance Domain (Edit) form. The Maintenance Domain Policies form appears.

7 To associate a service with a Global MEG, perform one of the following, if required:

a Automatically associate all NEs in a service with a Global MEG.

i Select an MD in the list and click on the Properties button. The Maintenance Domain - Global Policy (Edit) form opens.

ii Click on the Global Maintenance Entity Group tab.

iii Click on the Create button. The Global Maintenance Entity Group (Create) form opens with the General tab displayed.

iv Click on the Service tab.

v Click on the Create button. The Service (Create) form opens.

vi Click on the Select button. The Select Service form opens.

vii Click on the Search button. A list of services is displayed.

viii Select a service in the list and click on the OK button. The Select Service form closes, and the service information is displayed on the Service (Create) form.

ix Configure the Auto-Assign ID parameter.

x Configure the Follow Service Topology Changes parameter, if required.

Note — Enabling this parameter will cause relevant Ethernet OAM objects in the MEG and MEG sub-groups to automatically change in response to topology changes in the service or composite service you selected in step viii. Such changes include the addition or deletion of sites, SDP bindings, and access interfaces. Applicable CFM tests (as specified in a test suite) will then also be automatically generated and/or deleted, as required. The specific Ethernet OAM objects that will respond to a service topology change are dependent on the selections you make in step xii below.

xi Configure the parameters in the Auto-Creation of MEG(s) panel, as required:

- Auto MEG Site Creation
- VLAN ID
- Multi-Service MEG

xii Configure the parameters in the Auto-Creation of MEP(s) panel, as required:

- MEP(s) Creation on Access Interfaces
- Direction
- Primary VLAN Enable
- MEP(s) Creation on SDP Bindings
- Direction
- Virtual MEP(s) Creation on VPLS Sites
- Direction

Note — You cannot configure the MEP(s) Creation on Access Interfaces, MEP(s) Creation on SDP Bindings, or Virtual MEP(s) Creation on VPLS Sites parameters when the Initial CCM Interval parameter is set to 10 ms or 100 ms.

xiii Configure the parameters in the Auto-Creation of MIP(s) panel, as required:

- MIP(s) Creation on Access Interfaces
- Primary VLAN Enable
- MIP(s) Creation on SDP Bindings

xiv Click on the OK button. A dialog box appears.

xv Click on the OK button. The Service (Create) form closes, and the Global Maintenance Entity Group (Create) form reappears, with the service listed on the form.

b Associate a single NE on a service with a Global MEG.

i Select an MD from the list and click on the Properties button. The Maintenance Domain Global Policy (Edit) form opens.

ii Click on the Global Maintenance Entity Group tab and click on the Search button. A list of Global MEGs appears.

iii Select a Global MEG from the list and click on the Properties button. The Global Maintenance Entity Group (Edit) form opens.

iv Click on the NE Maintenance Entity Group tab.

v Click on the Create button. The NE Maintenance Entity Group (Create) form opens with the General tab displayed.

vi Click on the Select button in the Site panel. The Select Site form opens.

vii Click on the Search button. A list of sites is displayed.

viii Select a site in the list and click on the OK button. The Select Site form closes, and the site information is displayed on the NE Maintenance Entity Group (Create) form.

ix Configure the parameters:

- CCM interval
- VLAN ID
- MHF-Creation
- CFM Hold Down Timer (Centiseconds)

You can only configure the CFM Hold Down Timer (Centiseconds) parameter when the CCM interval is set to10 ms or 100 ms.

You cannot choose the 10 ms and 100 ms options for the CCM interval parameter when the CCM Padding Packet Size(Bytes) parameter is enabled.

Note — Only the parameters that are supported on the selected site are displayed when you open the form.

x Click on the Service tab of the NE Maintenance Entity Group (Create) form and then click on the Create button. The MEG Service (Create) form opens.

xi Configure the parameters:

- Service ID
- MHF-Creation
- VLAN ID
- Id-Permission
- MIP LTR Priority

Note — Only the parameters that are supported on the selected site are displayed when you open the form.

xii Click on the OK button. The MEG Service (Create) form closes, and a dialog box appears.

xiii Click on the OK button. The NE Maintenance Entity Group (Create) form displays, with the service listed on the Service tab.

xiv Click on the OK button. The NE Maintenance Entity Group (Create) form closes.

Note — When an NE Maintenance Entity Group is created and applied, you can open the NE Maintenance Entity Group (Edit) form at any time and view on the General tab an information field that displays the number of MEPs currently associated with the NE Maintenance Entity Group.

8 Add an Ethernet path to the Global MEG, if required.

i Click on the Ethernet Path tab.

ii Click on the Create button. The Ethernet Path (Create) form opens.

Note — You must specify an Ethernet tunnel path or Ethernet ring path on this form.

iii To add an Ethernet tunnel path, click on the Select button in the Ethernet Tunnel Path panel. The Select Ethernet Tunnel Path form opens. Otherwise, go to step vi.

iv Select an Ethernet tunnel path in the list and click on the OK button. The Select Ethernet Tunnel Path form closes, and the Ethernet tunnel path is displayed on the Ethernet Path (Create) form.

v Go to step viii.

vi Click on the Select button in the Ethernet Ring Path panel. The Select Ethernet Ring Path form opens.

vii Select an Ethernet ring path in the list and click on the OK button. The Select Ethernet Ring Path form closes, and the Ethernet ring path is displayed on the Ethernet Path (Create) form.

viii Configure the parameters:

- Auto-Assign ID
- Object ID
- Run Continuity Check Protocol
- Set Control MEP property on created MEPs

ix Click on the OK button. A dialog box appears.

x Click on the OK button. The Ethernet path is displayed on the Global Maintenance Entity Group (Create) form.

9 Perform the following steps to add an NE MEG to the MD, if required.

i Click on the NE Maintenance Entity Group tab.

ii Click on the Create button. The Maintenance Entity Group (Create) form opens with the General tab displayed.

iii Click on the Select button next to the System ID (Loopback IP Address) parameter. The Select Site form opens.

iv Click on the Search button. A list of sites is displayed.

v Select an NE in the list and click on the OK button. The Select Site form closes, and the Maintenance Entity Group (Create) form displays the NE information.

vi Click the Select button in the Unicast Hub MEP panel to configure the MEP ID parameter, if applicable and if required.

Note — The Unicast Hub MEP panel will only be displayed when the site you selected in step v is a 7450 ESS, 7750 SR, or 7950 XRS NE.

Configuring this parameter allows you to add a unicast MEP to the remote MEPs list. This enables the deployment of a hub-and-spoke topology where multiple MEPs acting as spokes can communicate with one hub MEP. So in this scenario, the remote MEP has a MEP Mac Address which is the Operational MAC Address of the Unicast Hub MEP.

Refer to the MEP ID parameter description for additional information and constraints on configuring a unicast CCM hub.

vii Configure the parameters, if applicable:

- CCM interval
- VLAN ID
- MHF-Creation
- CFM Hold Down Timer (Centiseconds)

Note 1 — The VLAN ID parameter is configurable only when the selected NE is an OmniSwitch.

Note 2 — The CFM Hold Down Timer (Centiseconds) parameter can only be configured when the CCM interval is set to 10 ms or 100 ms.

Note 3 — The 10 ms and 100 ms options of the CCM interval parameter cannot be configured when the CCM Padding Packet Size(Bytes) parameter is enabled.

viii To associate a template with the MEG, if required, click on the Templates tab. Otherwise, go to step xi.

ix Click on the Select button. The Select Associated Template - Maintenance Entity Group form opens.

x Select a template in the list and click on the OK button. The Select Associated Template - Maintenance Entity Group form closes, and the Maintenance Entity Group (Create) form displays the template information.

xi Click on the Service tab, if required. A list of services is displayed.

xii Click on the Create button. The MEG Service (Create) form opens.

xiii Configure the parameters:

- Service ID
- MHF-Creation
- VLAN ID
- Id-Permission

xiv Click on the OK button. The MEG Service (Create) form closes.

xv Click on the Apply button. A dialog box appears.

xvi Click on the OK button. The form name changes to Maintenance Entity Group (Edit), and the service is listed on the form, which displays additional tabs.

10 Perform the following steps to add a managed MEP to the MEG, if required.

i Click on the Managed MEP tab.

ii Click on the Create button. The MEP (Create) form opens.

iii Click on the Select button in the Maintenance Entity Group panel. The Select Maintenance Entity Group form opens.

iv Select a MEG in the list and click on the OK button. The Select Maintenance Entity Group form closes, and the MEG information is displayed on the MEP (Create) form.

v Configure the parameters:

- Direction
- Administrative State
- Description
- Mac Address
- Type
- Interface Type

Note 1 — The Interface Type parameter is configurable when the Type parameter is set to Regular.

Note 2 — The Interface Type Port is only available if the MD level is 0.

Note 3 — For facility MEPs, the Direction parameter must be set to Down.

vi Expand the CCM panel and configure the parameters as required:

- CCM Messages Enabled
- Fault Propagation
- CCM Padding Packet Size (bytes)
- Low-priority Defect
- Priority Level for CCM Messages

vii Click on the Select button in the MEG Sub-Grouping panel to associate the managed MEP to a MEG sub-group. The Select MEG Sub-Group form opens.

viii Click on the Search button. A list of MEG subgroups is displayed.

ix Choose a MEG subgroup and click on the OK button. The Select MEG Sub-Group form closes, and the MEG subgroup information is displayed on the MEP (Create) form.

Note — If a MEG subgroup is not selected, the managed MEP is automatically associated with the default MEG subgroup.

x Expand the Test Generation Options panel and configure the parameters as required:

- Role
- Use as Test Source
- Use as Test Target

Note 1 — The Role, Use as Test Source, and Use as Test Target parameters are configurable only when you set the Direction parameter to Up.

Note 2 — You can propagate test generation role settings to all MEPs on a SAP or service site using the Propagate to MEPs button on the ETH-CFM tab of the Access Interface (Edit) and Site (Edit) forms.

xi If the Type parameter you configured in step v is set to Virtual, go to step xviii.

xii If the Interface Type you configured in step v is set to LAG or Port, configure the Facility Fault Notify parameter.

xiii If the Interface Type you configured in step v is set to LAG, configure the Facility VLAN ID.

Note — If you are configuring a tunnel facility MEP, Facility VLAN ID must match the outer encapsulation value of the SAP to which you are connecting the tunnel facility MEP.

xiv Click on the Select button in the bottommost panel to choose an object of the type specified by the Interface Type parameter you configured in step v. The Select *object_type* form opens.

xv Click on the Search button. A list of objects is displayed.

xvi Select an object in the list and click on the OK button. The Select *object_type* form closes, and the object information is displayed on the MEP (Create) form.

xvii Go to step xxi.

xviii Click on the Select button in the Service Site panel to choose a site for the virtual MEP. The Select Service Site Pointer form opens.

xix Click on the Search button. A list of sites is displayed.

xx Select a site in the list and click on the OK button. The Select Service Site Pointer form closes, and the site information is displayed on the MEP (Create) form.

xxi If the MD for the MEP has a Name Type of none and its Maintenance Association has a Name Format of icc-based, the Y.1731 Tests and AIS tabs are configurable. Otherwise, go to step xxvi.

xxii Click on the Y.1731 TEST tab.

xxiii Configure the parameters:

- Eth Test Enabled
- Eth Test Pattern
- Eth Test Threshold (number of bit errors)
- One-way-delay Test Threshold (seconds)

The Eth Test Pattern parameter is configurable when the Eth Test Enabled parameter is enabled.

xxiv Click on the AIS tab.

xxv Configure the parameters:

- AIS Enabled
- AIS Meg Level
- AIS Priority
- AIS Interval (seconds)

The AIS Meg Level parameter is configurable when the AIS Enabled parameter is enabled.

xxvi Click on the ETH-CSF tab.

xxvii Configure the parameters:

- Enable Client Signal Fault
- CSF Rx Multiplier

The CSF Rx Multiplier parameter is configurable when the Enable Client Signal Fault parameter is enabled.

Note 1 — ETH-CSF acts as one of the triggers for fault propagation on the receiving MEP, when the Fault Propagation parameter is enabled in step vi.

Note 2 — When the CSF Rx Multiplier is 0 (meaning that CSF will never timeout) and you need to manually clear the CSF state, you must first disable and then re-enable the Enable Client Signal Fault parameter. Otherwise, CSF must receive a C-DCI flag in a PDU to clear the state automatically, whenever the multiplier is 0.

Note 3 — If the CSF Rx Frame State read-only indicator displays anything other Client Defect Clear Indication, then a fault exists.

xxviiiClick on the OK button. A dialog box appears.

xxix Click on the OK button. The MEP is listed on the Global MEG (Create) form.

11 Perform the following steps to add a remote MEP to the MEG, if required.

Note 1 — You can add only one entry to the remote MEP list for a 7705 SAR.

Note 2 — When you execute a CCM test or synchronize the managed and unmanaged remote MEP lists, the 5620 SAM automatically distributes the local MEP and the remote MEP to the remote MEP list, except for 7705 SAR NEs, which are excluded from automatic MEP -distribution.

Note 3 — When you execute a CCM test or synchronize the managed and unmanaged remote MEP lists within a MEG sub-group, the 5620 SAM automatically distributes the local MEP and the remote MEP within that MEG sub-group.

Note 4 — If the remote MEP you are adding is to act as a Unicast Hub MEP, the remote MEP's MEP Mac Address will become the Operational MAC Address of the Unicast Hub MEP. If you subsequently delete the remote MEP, the Operational MAC Address of the configured Unicast Hub MEP will also be cleared.

Note 5 — If a local MEP and the corresponding remote MEP are on the same OmniSwitch, deleting the remote MEP results also deletes the corresponding local MEP.

i Click on the Remote MEP tab. The Remote MEP (Create) form opens.

ii Configure the MEP ID and MEP Mac Address parameters.

Refer to the MEP ID parameter description for additional information and constraints when configuring a remote MEP to act as a unicast CCM hub.

iii Click on the OK button. A dialog box appears.

iv Click on the OK button. The remote MEP is listed on the Maintenance Entity Group (Edit) form.

12 Click on the OK button. The Maintenance Entity Group (Edit) form closes, and the MEG is listed on the Global Maintenance Entity Group (Edit) form.

13 Perform the following steps to add an unmanaged remote MEP to the Global MEG, if required.

i Click on the Unmanaged Remote MEP tab.

ii Click on the Create button. The Unmanaged Remote MEP (Create) form opens.

iii Configure the parameters:

- MEP ID
- MEP Mac Address

iv Click on the Select button in the MEG Sub-Group panel to associate the unmanaged remote MEP to a MEG sub-group. The Select MEG Sub-Group form opens.

v Click on the Search button. A list of MEG subgroups is displayed.

vi Select a MEG sub-group in the list and click on the OK button. The Select MEG Sub-Group form closes, and the MEG sub-group information is displayed on the Unmanaged Remote MEP (Create) form.

Note 1 — If a MEG sub-group is not selected, the unmanaged remote MEP is automatically associated with the default MEG subgroup.

Note 2 — The outline color of a MEP icon indicates the MEG subgroup to which the MEP belongs.

vii If required, expand the Test Generation Options panel. Configure the parameters:

- Role
- Use as Test Source
- Use as Test Target

Note 1 — The Role, Use as Test Source, and Use as Test Target parameters are configurable only when you set the Direction parameter to Up.

Note 2 — You can only configure Test Generation Options when the unmanaged MEP has a MAC address.

Note 3 — You can propagate test generation role settings to all MEPs on a SAP or service site using the Propagate to MEPs button on the ETH-CFM tab of the Access Interface and Site (Edit) forms.

viii Click on the OK button. A dialog box appears.

ix Click on the OK button. The unmanaged remote MEP is listed on the Global Maintenance Entity Group (Edit) form.

14 Click on the Synchronize Remote MEPs button to distribute the MEPs to the NEs, if required.

Note — If the managed MEP or unmanaged remote MEP belongs to a MEG sub-group, the remote MEP synchronization will only occur within the MEG sub-group.

15 Click on the Resync Remote MEP DB button to re-synchronize the Remote MEPs database, if required.

Optionally, you can also view the DB state of any Remote MEP under a Managed MEP by performing the following sub-steps. Otherwise, go to step 16.

i Click on the Managed MEP tab in the Global MEG form and click the Search button.

ii Select the required Managed MEP and click the Properties button. The MEP (Edit) form opens.

iii Click the Remote MEP DB State tab and click the Search button. A list of Remote MEPs communicating with the Managed MEP appears.

iv Select the required Remote MEP from the list and click Properties. The Remote MEP DB State (View) form opens, with the General tab displayed.

The presented information includes:

- MEP ID
- Remote State
- Grace Period RX
- MAC Address
- Rdi
- Port Status
- Interface Status
- Last CCM

v Click Cancel to close the Remote MEP DB State (View) form.

16 Click the Audit Unicast CCM item in the More Actions button fly-out menu to have the 5620 SAM automatically populate all the Hub pointers, if required.

Note 1 — For discovered networks with CCM and a remote MEP list configured, Alcatel-Lucent highly recommends the use of this button to set up a correct HUB-spoke topology in 5620 SAM before executing a CCM test.

Note 2 — The Audit Unicast CCM action will use the remote lists from all NEs to automatically set the Hub MEP pointers to the appropriate MEPs. If an appropriate MEP is not found, an unmanaged MEP with MEP ID and MEP MAC Address matching the unicast remote MEP entry will be created. The Hub MEP pointer is then set to this unmanaged MEP.

If duplicate managed and unmanaged MEPs are detected, the unmanaged MEP will be deleted and the managed MEP will be used as the unicast Hub MEP. This action will also ensure that the Hub MEP is in the same sub-group as the spoke pointing to it.

17 Click on the OK button. A dialog box appears.

18 Click on the Yes button. The Global MEG (Create) form closes, and the Maintenance Domain (Edit) form reappears.

19 Close the Maintenance Domain (Edit) form.

20 Close the Manage Maintenance Domain Policies form.

Procedure 78-2 To configure automatic MEP ID assignment on an NE

Perform this procedure to configure an initial MEP ID value on an NE for automatic MEP creation.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Right-click on the device where you want to configure automatic MEP ID assignment and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

3 Click on the Globals tab.

4 Click on the OAM sub-tab.

5 Configure the MEP ID parameter.

6 Click on the OK button. A dialog box appears.

7 Click on the Yes button. The NE properties form closes.

Procedure 78-3 To automatically create identical MEPs on a redundant pair of service SAPs

Perform this procedure to create identical MEPs on service SAPs that are part of an MC-LAG. The procedure assumes that the service has been configured with MC-LAGs and redundant SAPs. The pair of redundant SAPs must have identical inner and outer encapsulations configured and they must be in the same service.

Refer to Procedure 14-10 for information on creating LAGs and to Chapter 39 on creating MC-LAGs.

1 Select Manage→Service→Services. The Manage Services form opens.

2 Click on the Search button. A list of services is displayed.

3 Select the required service from the list and click on the Topology View button. The Service Topology map opens.

4 Select the OAM check box at the bottom left of the map window. MEG and MEP objects are added to the map.

5 Perform one of the following:

a If you are creating a Global MEG:

i Right-click on the topology map background and select Create CFM Global MEG from the contextual menu. The Global Maintenance Entity Group (Create) form is displayed. Refer to Procedure 78-1 for information on configuring a Global MEG.

ii Once the Global MEG is created, a purple triangular MEP icon appears above each of the SAPs. Right-click on one of the MEP icons associated with the redundant pair of SAPs. The MEP (Edit) form for that SAP is displayed.

iii Click on the Properties button in the Redundancy panel.

This action automatically populates the Properties page of the redundant partner, thereby creating identical MEPs on both members of the redundant pair. Leave the MEP (Edit) form open.

iv Right-click on the other MEP icon associated with the redundant pair of SAPs. The MEP (Edit) form for that SAP is displayed.

v Confirm that the ID and Operational Mac Address parameters in the Redundant MEP panel for both MEPs are identical.

Note — If the redundant SAPs are in a VPRN or IES service, only the ID parameter will be synchronized between the two SAPs. Mac Addresses are not supported for these services.

b If you are working with an existing Global MEG where a MEP is missing from one of the SAPs in a redundant pair:

i Right-click on the MEP icon that is present for a SAP in the redundant pair. The MEP (Edit) form for that SAP is displayed.

ii Enable the Create Redundant MEP check box in the Redundancy panel.

iii Click the Apply button. A new MEP icon appears above the other SAP of the redundant pair.

This action automatically populates the Properties page of the redundant partner which was missing its MEP, thereby creating identical MEPs on both members of the redundant pair. Leave the MEP (Edit) form open.

iv Right-click on the new MEP icon. The MEP (Edit) form for that SAP is displayed.

v Confirm that the ID and Operational Mac Address parameters in the Redundant MEP panel for both MEPs are identical.

Note — If the redundant SAPs are in a VPRN or IES service, only the ID parameter will be synchronized between the two SAPs. Mac Addresses are not supported for these services.

6 Click on the OK button in both MEP (Edit) forms to close them.

Procedure 78-4 To change the MEG sub-group association for managed MEPs or unmanaged remote MEPs

Perform this procedure to change the MEG sub-group association for managed MEPs or unmanaged remote MEPs.

Note — The outline color of a MEP icon indicates the MEG sub-group to which the MEP belongs.

1 Select Manage→Service→Services. The Manage Services form opens.

2 Click on the Search button. A list of services is displayed.

3 Select a service in the list and click on the Topology View button. The Service Topology map opens.

4 Select the OAM check box at the bottom left of the map window. MEG and MEP objects are added to the map.

5 Right-click the interface object that includes the MEP that you wish to move to another MEG sub-group and choose Ethernet CFM→Edit MEP from the contextual menu.The Select MEP (Edit) form opens.

6 In the MEG Sub-Group panel, click on the Clear button to remove the current MEG sub-group association.

7 Click on the Select button. The Select MEG Sub-Group form opens.

8 Click on the Search button. A list of MEG sub-groups is displayed.

9 Click on an MEG sub-group and click on the OK button. The Select MEG Sub-Group form closes and the MEG sub-group information is displayed in the MEG Sub-Group panel.

10 Click on the OK button. The MEP (Edit) form closes, the MEP object color changes, and the MEP is moved to the newly selected MEG Sub-Group.

Procedure 78-5 To configure a default MD on an OmniSwitch

Perform the following procedure to configure a default NE-level MD on an OmniSwitch.

1 Choose Equipment from the navigation tree view selector. The navigation tree displays the Equipment view.

2 Expand the OmniSwitch NEs icon.

3 Right-click on the device where you want to configure a default MD and select Properties from the contextual menu. The Network Element (Edit) form opens with the General tab displayed.

4 Click on the Globals tab.

5 Click on the CFM tab.

6 Configure the parameters:

- Level
- MHF-Creation
- Id-Permission

7 Close the Network Element (Edit) form.

79 — Tunnel administrative groups

79.1 Tunnel administrative groups overview *79-2*

79.2 Workflow to configure tunnel administrative groups *79-3*

79.3 Tunnel administrative group procedures *79-3*

79.1 Tunnel administrative groups overview

The 5620 SAM supports SDP admin groups—or steering parameters—on all NEs and on all service tunnel types, prior to release 11.0. However, steering parameters are a logical concept within the 5620 SAM, and are not deployed to NEs. In release 11.0 of the 7750 SR, the support of SDP admin groups is introduced on the NE. SDP admin groups enable services to use a PW template to automatically include or exclude specific provisioned SDPs.

Note — For more information about SDP admin groups on the 7750 SR, see the specific device documentation.

In the 5620 SAM, Release 11.0, steering parameters are renamed to tunnel administrative groups. Tunnel administrative groups include not only the concept of steering parameters, but also 7750 SR SDP admin groups.

Tunnel administrative groups use the 5620 SAM policy distribution model. You can create a global tunnel administrative group and distribute it locally to NEs. Consider the following when you create a tunnel administrative group:

- you can create a maximum of 32 tunnel administrative groups
- the group value is uniquely associated with the group name
- an SDP can be added to more than one tunnel administrative group
- tunnel administrative groups are supported on:
  - GRE service tunnels
  - MPLS:BGP service tunnels
  - MPLS:LDP service tunnels
  - RSVP-LSP service tunnels
  - mixed LSP mode service tunnels

SDPs that share a specific characteristic or attribute can be made members of the same tunnel administrative group. When you create a service PW template, you can include and exclude one or more tunnel administrative groups. When a service is bound to the template, the SDP selection rules enforce the specified tunnel administrative group inclusion and exclusion constraints. Tunnel administrative groups allow you to control the SDP, or set of SDPs, that are selected while spokes are established among service sites using PW templates in BGP-AD, BGP-VPLS, or MS-PW applications. Tunnel administrative groups can be assigned to services that use the PW template policy, such as BGP-AD VPLS services, BGP-VPLS services, and Epipe spoke SDP FEC services. See chapter 73 for more information about PW template policies.

In addition, you can apply tunnel administrative groups to tunnel selection profiles. Tunnel selection profiles assign transport tunnels for a service when the service has been configured for automatic SDP binding creation. When a tunnel selection profile is used within a service to create SDP bindings, any tunnels that include the tunnel administrative group in that profile become eligible for consideration in the tunnel selection process. See chapter 27 for more information about tunnel selection profiles.

79.2 Workflow to configure tunnel administrative groups

The following workflow describes the high-level tasks required to create and configure tunnel administrative groups.

1 Create a tunnel administrative group. See Procedure 79-1.

2 Release and distribute the tunnel administrative group to the NEs. See Procedure 79-1.

3 Assign the tunnel administrative group to one or more of the following:

- A service tunnel. See Procedure 27-1 in chapter 27.
- A tunnel selection profile. See Procedure 27-3 in chapter 27.
- A service PW template. Ensure that the Use Provisioned SDP parameter on the service PW template is enabled. See Procedure 73-1 in chapter 73.
- A BGP or BGP AD VPLS. See Procedure 68-57 in chapter 68.

79.3 Tunnel administrative group procedures

Use the following procedures to configure 5620 SAM tunnel administrative groups.

Procedure 79-1 To create a tunnel administrative group

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens.

2 Click on the Create→Tunnel Admin Group button. The Tunnel Admin Group, Global Policy (Create) form opens with the General tab displayed.

3 Configure the parameters:

- Name
- Value

4 Click on the Apply button. The Tunnel Admin Group, Global Policy (Edit) form refreshes with additional tabs.

5 Click on the Distribute button to manually distribute the tunnel administrative group locally to devices. If the Distribute button is not visible, click on the More Actions button and choose Distribute.

Note — When the policy is in draft mode, the Distribute button, or the Distribute option under the More Actions button, is disabled and the policy cannot be distributed to the NEs. You must first release the policy for distribution, which also distributes the policy to existing local definitions.

6 Close the Tunnel Admin Group, Global Policy (Edit) form.

7 Close the Manage Service Tunnels form.

Procedure 79-2 To list and view tunnel administrative groups

1 Choose Manage→Service Tunnels from the 5620 SAM main menu. The Manage Service Tunnels form opens.

2 Choose Tunnel Admin Group (Service Tunnel Management) from the object drop-down list.

3 Click on the Search button. A list of tunnel administrative groups appears.

4 Choose a tunnel administrative group and click on the Properties button. The Tunnel Admin Group - Global Policy (Edit) form opens with the General tab displayed.

5 Click on the following tabs for additional information:

- Local Definitions
- Service Tunnels—lists the service tunnels to which this tunnel administrative group is assigned, based on ID only
- Tunnel Selection Profiles— lists the tunnel selection profiles that include or exclude this tunnel administrative group, based on ID only
- Service PW Templates— lists the service PW templates that include or exclude this tunnel administrative group, based on ID only
- Faults—lists the alarms raised for the policy

6 Close the Tunnel Admin Group, Global Policy (Edit) form.

7 Close the Manage Service Tunnels form.

80 — RCA audit

80.1 RCA audit overview *80-2*

80.2 Workflow to configure RCA audit *80-8*

80.3 RCA audit procedures *80-9*

80.1 RCA audit overview

The 5620 SAM RCA audit tool allows you to perform on-demand or scheduled verifications of the configuration of services and physical links to identify possible configuration problems. Except for physical links, the 5620 SAM provides a solution, which, at your request, can automatically be implemented to make all the required configuration changes.

Note — The adjustments are made only to the 5620 SAM database and are not deployed to the network.

You can perform RCA audits of the following objects:

- VLL services
- VPLS services
- VPRN services
- physical links
- OSPF interfaces, areas, and area sites (5620 SAM/5650 CPAM integration only)
- IS-IS interfaces and sites (5620 SAM/5650 CPAM integration only)
- 9471 WMM instances and golden configurations

Note 1 — You need the 5650 CPAM license to perform the OSPF and IS-IS RCA audits. See the *5650 CPAM User Guide* for more information.

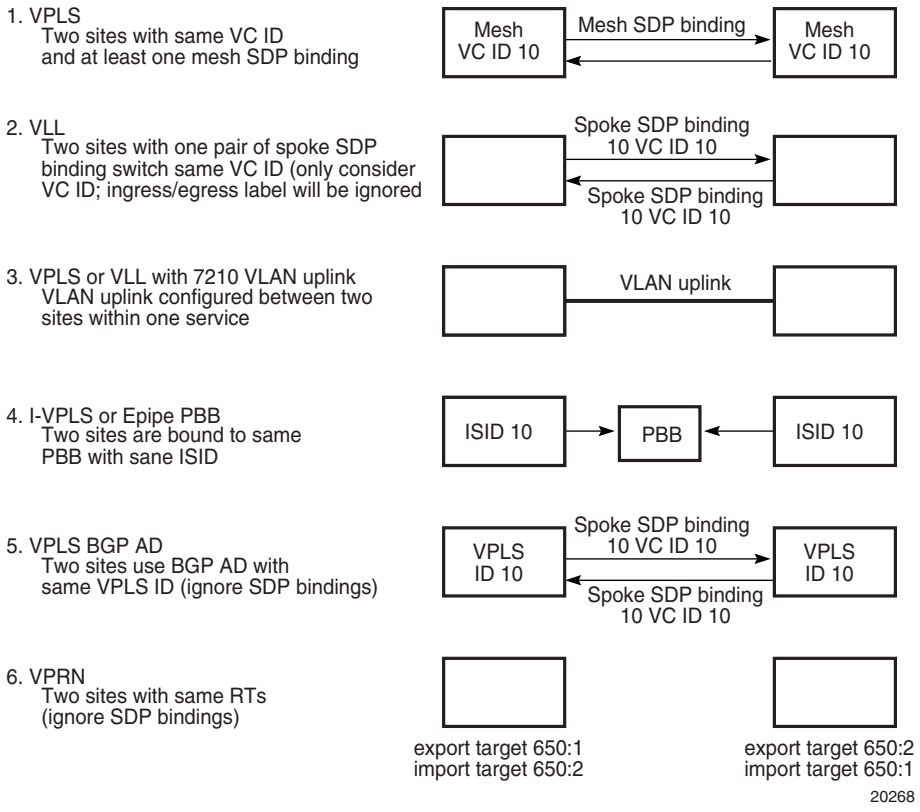
Note 2 — See "9471 WMM golden configuration management" in the *5620 SAM LTE EPC User Guide* for information about performing golden configuration RCA audits on 9471 WMM instances.

5620 SAM service audit

A 5620 SAM service is defined as a collection of service sites with the same customer ID, service type, and service ID. The 5620 SAM discovers services that are configured on a 7210 SAS, 7450 ESS, 7710 SR, 7750 SR, or 7950 XRS, using the service ID on the NE. Configuration errors may occur in networks where the services were created and deployed on the NEs using CLI before the NEs were managed by the 5620 SAM.

For example, when two VPLSs with the same service ID and the same mesh VC ID on an NE are discovered by the 5620 SAM, they are discovered as a single service in the 5620 SAM.

Another example of a configuration error is when a switching Epipe has multiple Epipe sites and multiple VC IDs for different segments. If different service IDs are used when the sites are created, the 5620 SAM assumes that the sites are connected and creates multiple VLL services within a composite service.



RCA audit policies allow you to modify the component membership of your 5620 SAM services to detect possible configuration problems. In addition, you can use the RCA audit to correct most configuration problems that are discovered in the audit.

Note — A 5620 SAM user who is assigned the Administrator or RCA scope of command role can create, modify, and execute all RCA audit policies. A 5620 SAM user who is assigned the Administrator or Service scope of command role can execute service audit adjustments.

Service membership rules

The 5620 SAM uses the rules in Figure 80-1 to identify whether two service sites are connected together. When two sites are identified as connected, they should belong to same service.

Figure 80-1 Rules to check whether two sites are connected

If service sites have different customer IDs, the 5620 SAM discovers the sites as belonging to different services. After the audit, the 5620 SAM generates a problem for each service. You can specify to which service the 5620 SAM should move the site and whether the empty service should be removed after the sites are moved.

For VPLS or VLL services, if the same service ID is used for two groups of sites that are not connected, the 5620 SAM detects a duplicate service ID. Two problems are generated for one of the group of sites, and the solution is to separate the services. If there are other groups of isolated sites, additional problems are generated for each group.

Consider the following when you perform an audit of a VPLS.

- Although different service IDs may be used, I-sites that are bound to same backbone VPLS and have the same ISID are considered to be in the same VPN.
- For VPLS sites that use BGP auto-discovery, the VPLS ID is used to determine service membership.
- H-VPLS is discovered as composite service in the 5620 SAM if different service IDs are used.

Consider the following when you perform an audit of a VLL service.

- Service sites with different customer IDs are discovered as two services, and can reconfigured as one service.
- More than two groups of sites that are connected can be detected and can be separated into different services.
- Redundant VLLs are not be affected by the audit and are considered correctly configured.
- If two Epipe sites are connected to the same PBB with same B-VPLS service ID, and the source and destination MAC addresses match, the 5620 SAM determines that the two sites are connected. If they are in different 5620 SAM services, a problem is generated during the audit.

Consider the following when you perform an audit of a VPRN service.

- VPRN service membership is based on the RTs defined in the VRFs.
- Sites that are in different services but have common import and export route targets. Import target of Site 1 is equal to the Export target of Site 2.

Physical link audits

Physical links represent the actual physical configuration of network connections between ports. You can view and manage physical links from the equipment window, physical topology map, and the Manage Equipment list form of the 5620 SAM, on each router using the CLI. Because several key parameters on each end of the physical link depend on each other, configuration errors are possible. The 5620 SAM RCA audit tool allows you to identify configuration errors in physical links. The 5620 SAM does not provide a solution for configuration problems that the RCA audit identifies for physical links. By default, the RCA audit detects the following configuration errors in physical links:

- **physical port parameters**
  - mismatched MTU values
  - mismatched speeds
- **Ethernet port parameters**
  - Auto-negotiate parameter misconfiguration
  - Duplex parameter misconfiguration

You can configure the RCA audit policy for the physical link to include additional physical link properties in the audit.

Viewing and analyzing RCA audit results

The RCA Audit Problem(s) indicator on the General tab of a network object properties form identifies whether configuration problems were detected in previous audits. The Last Audit Time indicator displays a timestamp of the last audit that was performed. The RCA Audit button is located at the bottom of the service properties form, or under the More Actions button.

After you associate an audit policy with the object, you can perform an RCA audit and view the results. If no problems are detected, the RCA Result tab does not appear.

The properties form of a problem displays the following information:

- problem severity
- probable cause
- description
- solution

The Caused By Objects tab lists the network objects that caused the problem. For service audits, the sites that should be moved out of a service, and the service they should move to, if there is only one destination service, are listed. If only one group of sites is listed, a new service is created and the sites are moved to the created service.

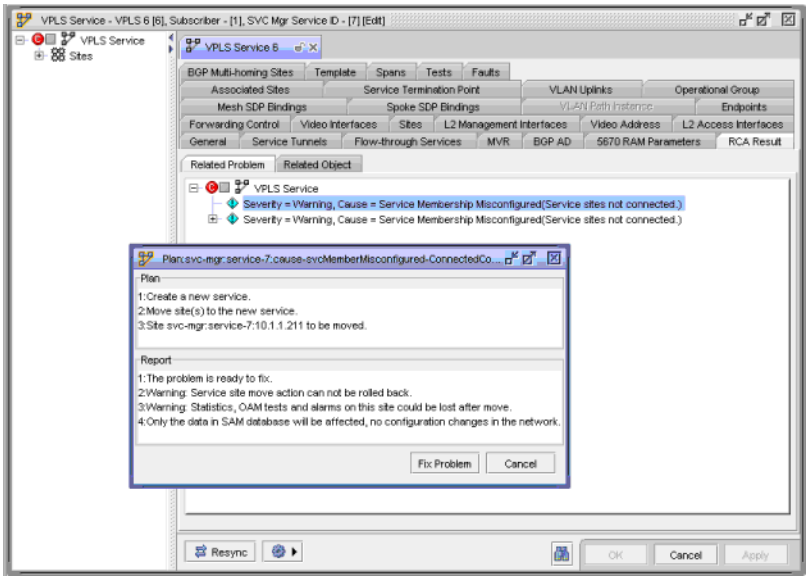
Table 80-1 describes the probable causes of problems.

Table 80-1 Probable causes

Probable cause	Description
Admin Down	The object is administratively down.
Aggregated	Aggregated cause
B-VPLS Backbone Attributes misconfigured	One or more B-VPLS backbone parameters are not configured correctly.
Control B-VPLS SPB ECT-FID mapping configurations are not consistent across all sites in this B-VPLS	The ECT algorithm to FID range mapping in a control SPB B-VPLS is not consistent on all of the sites in the same service. Each B-site must have the same number of ECT-to-FID mappings. In addition, the following ECT-to-FID range mapping parameters must be the same on all of the sites in the SPB-enabled B-VPLS: • FID Range Start • FID Range End • FID Range Algorithm See Procedure 68-61 for more information.
Misconfiguration	There is a misconfiguration error.
Missed service members for Multi-Segment PW	Missed service members for Multi-Segment PW

(1 of 3)

Probable cause	Description
No members configured for this Multi-homing site	The BGP VPLS multi-homing site does not have other sites as members that share the same multi-homing ID in order to comprise a group.
No valid Route Targets configured for VPLS BGP Multi-homing	No valid Route Targets currently exist for a VPLS site that has BGP multi-homing sites configured under it.
One or more SPB SAP(s) or SPB Spoke SDP Binding(s) exist on User B-VPLS that do not exist on Control B-VPLS. These extra links are not fate shared with the Control B-VPLS	One or more SPB SAPs or spoke SDP bindings on the user B-VPLS are not on the control B-VPLS. You must remove the SAPs or spoke SDP bindings, or create them on the control SPB B-VPLS site.
Route Targets are misconfigured for VPLS BGP Multi-homing	One of the following misconfigurations exists: • No matching RT for peered multi-homing sites • There are multiple RTs configured for a VPLS site that has BGP multi-homing sites configured under it. Multiple RTs will make the BGP multi-homing sites appear under multiple topologies or multiple services. • Multi-homing sites have the same multi-homing ID but different RTs (different RTs mean the sites are in different topologies or services)
Service Membership Misconfigured	The service membership is not configured correctly.
One or more SPB SAP(s) or SPB Spoke SDP Binding(s) configured on Control B-VPLS are missing from the User B-VPLS	One or more SPB SAPs or spoke SDP bindings are configured on the control B-VPLS that do not exist on this user B-VPLS. You must remove the SAPs or spoke SDP bindings, or create them on the user SPB B-VPLS site.
SPB is not enabled on one or more B-Sites in this B-VPLS	The SPB Mode parameter is not set to Control or User on one or more of the sites in the SPB-enabled B-VPLS service. See Procedures 68-61 and 68-62 for more information.
SPB Sites within this B-VPLS service do not have their SPB Modes (Control/User) consistently configured	One or more B-sites in the SPB-enabled B-VPLS service do not have the same value configured for their SPB Mode parameter as the other sites within the service. See Procedures 68-61 and 68-62 for more information.
The B-VPLS SPB FIDs are not identical across all sites in this B-VPLS service	The Forwarding Identifier (FID) parameter is not the same for all the sites in the SPB B-VPLS service. See Procedures 68-61 and 68-62 for more information.
The Control B-VPLS SPB unicast forwarding tree topology configurations are not consistent across all sites in this B-VPLS	The Unicast Forwarding Tree Topology parameter is not configured consistently on all of the sites in the same control SPB B-VPLS service. See Procedure 68-61 for more information.
Underlying Resource Operational Down	The underlying resource of the object is operationally down.
Underlying Resource Admin Down	The underlying resource of the object is administratively down.
Underlying Resource Missing	An underlying resource is missing.
Underlying Resource Problem	Problem with an underlying resource
Unknown	The probable cause could not be determined.



(2 of 3)

Probable cause	Description
Within this Control B-VPLS, not all SAPs or Spoke-SDPs are SPB enabled	SPB is not enabled on one or more SAPs or spoke SDP bindings in the control B-VPLS service. You must add the SPB interface to the SAP or spoke SDP binding. See Procedure 68-61 for more information.

(3 of 3)

You can use the RCA audit tool to correct a detected configuration problem from the RCA Result tab on the network object properties form. The 5620 SAM lists the operations to fix the problem, as shown in Figure 80-2.

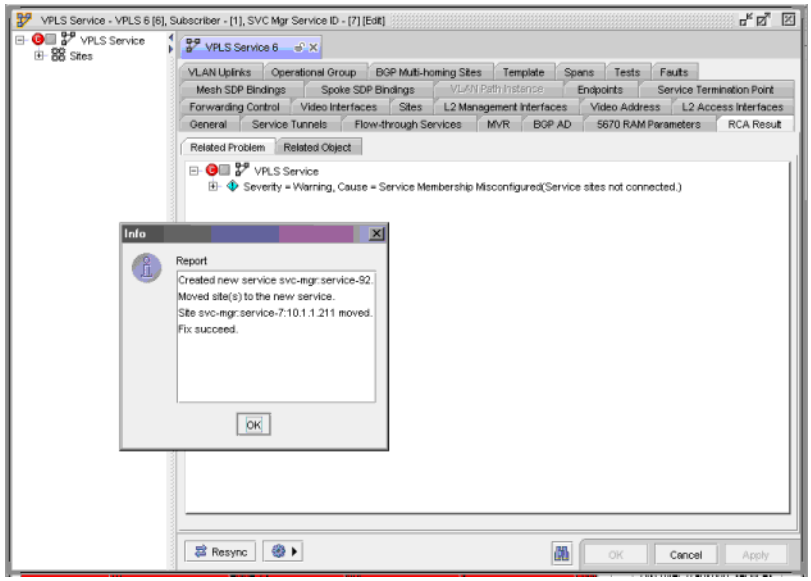


Figure 80-2 Correction plan for a problem

When you accept the proposed solution, a summary of the correction operation that the 5620 SAM implemented appears, as shown in Figure 80-3. To view the result in the server or client log, you must enable the logging option in the nms-server.xml or nms-client.xml file.

Caution — Contact your Alcatel-Lucent technical support representative before you attempt to modify the nms-server.xml file. Modifying the nms-server.xml file can have serious consequences that can include service disruption.

Figure 80-3 Correction report

80.2 Workflow to configure RCA audit

1. Create or configure an RCA audit policy. For service audits, configure one or more audit policies for each service type to detect different configuration problems. See Procedure 80-1 for more information.
2. Run the RCA audit policy for a specific service or object.
   - **a** Perform an RCA audit of a VLL service. See Procedure 80-2 for more information.
   - **b** Perform an RCA audit of a VPLS. See Procedure 80-3 for more information.
   - **c** Perform an RCA audit of a VPRN service. See Procedure 80-4 for more information.
   - **d** Perform an RCA audit of multiple services. See Procedure 80-5 for more information.
   - **e** Perform an RCA audit of a physical link. See Procedure 80-6 for more information.
3. Alternatively, create a service audit to run at a scheduled time. See Procedure 80-7 for more information.
4. Identify the problems and view the suggested solutions. Solutions are not provided for physical links.
5. Implement the changes, as required.

80.3 RCA audit procedures

Use the following procedures to perform RCA audit tasks.

Procedure 80-1 To configure an RCA audit policy

1 Choose Policies→RCA Audits from the 5620 SAM main menu. The RCA Audits form opens.

2 Select Audit Policy (RCA) from the drop down list.

3 Perform one of the following.

a To create an RCA audit policy, click on the Create button. The Audit Policy (Create) form opens with the General tab displayed.

b To configure an existing RCA audit policy, click on the Search button and choose an entry from the list. Click on the Properties button. The Audit Policy (Edit) form opens with the General tab displayed. Go to step 5.

4 If you are creating an RCA audit policy, configure the following parameters. Otherwise, go to step 5.

- Auto-Assign ID
- ID

5 Configure the Description parameter.

6 If you are creating an RCA audit policy, click on the Select RCA Policy To Run The Audit button. Otherwise, go to step 11. The RCA Policy form opens.

7 Choose one of the following options:

- RCA Audit OSPF
- RCA Audit Physical Link
- RCA Audit ISIS
- RCA Audit VPRN
- RCA Audit VPLS
- Compare MME Instance
- RCA Audit VLL

Note 1 — You require a 5650 CPAM license to create an RCA Audit ISIS or RCA Audit OSPF policy.

Note 2 — See "9471 WMM golden configuration management" in the *5620 SAM LTE EPC User Guide* for information about performing golden configuration RCA audits on 9471 WMM instances.

8 Double-click on an entry to modify the policy description, if required.

9 Click on the OK button. The RCA Policy form closes.

10 Click on the Apply button.

11 Click on the Entry tab. Depending on the option specified in step 7, a list of RCA audit policy entries is displayed.

The RCA audit policy entry for a VLL RCA audit is: RCA Audit for VLL Service Membership.

The RCA audit policy entry for a VPRN RCA audit is: RCA Audit for VPRN Service Membership.

The following are the RCA audit policy entries for a VPLS RCA audit:

- RCA Audit for B-VPLS PBB
- RCA Audit for VPLS Service Membership
- RCA Audit for BGP Multi-homing
- RCA Audit for B-VPLS SPB

The following are the RCA audit policy entries for a physical link RCA audit:

- RCA Audit For Physical Ports of Physical Links
- RCA Audit For Ethernet Port Specifics of Physical Links

12 Choose an entry from the list and click on the Properties button. The Audit Policy Entry - RCA Audit Policy - RCA Audit For *Network_Object* (Edit) form opens with the General tab displayed.

13 Configure the parameters:

- Enabled
- Remove Empty Service

14 If you are configuring an RCA audit policy for physical links, perform the following steps. Otherwise, go to step 15.

i Click on the Attributes tab. A list of default attributes for the physical link entry is displayed.

ii Perform one of the following:

- To configure default attributes, go to step iii.
- To add an attribute, go to step v.

iii Activate or deactivate the RCA audit for each attribute by enabling or disabling the check box in the Enabled column.

iv Choose one of the problem severity options for each attribute by clicking on the entry in the Severity column of the attribute. A contextual menu appears.

- Minor
- Conditional
- Info
- Critical
- Major
- Warning
- Indeterminate

v Click on the Add button to add an attribute. Otherwise, go to step 15. The Adding new Attribute(s) - RCA Audit For *entry_type* of Physical Links form opens with a list of attributes associated with the physical link entry.

vi Choose one or more attributes in the list and click on the OK button. The Adding new Attribute(s) - RCA Audit For *entry_type* of Physical Links form closes and the Audit Policy Entry - RCA Audit Policy - RCA Audit For *entry_type* of Physical Links (Edit) form refreshes with the attribute information.

15 Click on the OK button. The Audit Policy Entry - RCA Audit Policy - RCA Audit For *Network_Object* (Edit) form closes.

16 Click on the OK button. A dialog box appears.

17 Click on the Yes button. The Audit Policy (Edit) form closes.

18 Close the RCA Audits form.

Procedure 80-2 To perform an RCA audit of a VLL service

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and choose VLL from the object drop-down list.

3 Click on the Search button. A list of VLL services appears.

4 Choose an entry from the list and click on the Properties button. The *VLL_type* (Edit) form opens with the General tab displayed.

5 Check the following indicators:

- RCA Audit Problem(s)
- Last Audit Time

6 Click on the RCA Audit button. If the RCA Audit button is not visible, click on the More Actions button and choose RCA Audit. The Select RCA Policy list form appears with a list of configured policies.

7 Choose an entry and click on the OK button. The Select RCA Policy list form closes and a dialog box appears.

8 Click on the OK button.

9 Click on the RCA Result tab. The RCA audit information is displayed on the Related Problem tab.

Note — The RCA Result tab appears only if the RCA audit detects one or more problems.

10 If required, expand the VLL Service object in the problems tree to view the problems, the associated severity, and the cause.

11 Double-click on a problem icon to view information about the problem. The Problem (Edit) form opens with the General tab displayed. The following information is displayed:

- Last Time Changed
- Probable Cause
- Severity
- Description
- Solution

12 Configure the Disable Fix Window parameter.

13 Click on the Related Problem tab to view related problems.

14 Click on the Caused By Objects tab to view a list of objects that are causing the problem.

15 Choose an entry from the list and click on the Properties button. The properties form for the object opens.

16 Click on the tabs to view information about the configuration.

17 Configure the parameters, as required.

18 Click on the OK button to save the configuration and close the properties form. A dialog box appears.

19 Click on the Yes button.

20 Close the Problem (Edit) form.

21 To fix a problem:

i Click on the Related Problem tab.

ii Right-click on a problem icon and choose Fix Problem from the contextual menu. The Plan form appears.

Note — The Fix Problem menu option is disabled if you set the Disable Fix Window parameter to Enabled in step 12.

iii Check the recommended plan to fix the problem in the Plan panel.

iv Check the report about fixing the problem in the Report panel.

v Click on the Fix Problem button. The Plan form closes and a dialog box appears with a summary of the fix. Click on the OK button.

22 Close the *VLL_type* (Edit) form.

23 Close the Manage Services form.

Procedure 80-3 To perform an RCA audit of a VPLS

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Click on the Search button. A list of VPLS services appears.

Note 1 — In addition to the standard audit checks, for BGP VPLS multi-homing sites the audit also verifies:

- if no valid Route Targets are configured under a VPLS site that has BGP multi-homing sites configured under it.
- if there are no matching RTs for peered multi-homing sites
- if there are multiple RTs configured under a VPLS site that has BGP multi-homing sites configured under it. Multiple RTs will make the BGP multi-homing sites appear under multiple topologies (or multiple services, since the RT defines the service)
- if multi-homing sites have the same multi-homing ID but different RTs (different RTs mean the sites are in different topologies or services)
- if a multi-homing site does not have other sites as members (sharing the same multi-homing ID to comprise a group)

Note 2 — In addition to the standard audit checks, for SPB- enabled B-VPLS sites, the audit also verifies that:

- all user B-VPLS SAPs or spoke SDP bindings are fate-shared with a control B-VPLS
- control and user B-VPLS instances in the same service on different sites have the same FID
- FID-to-ECT mapping is consistent on all of the sites for the active SPB B-VPLS services
- control B-VPLS SPB level Unicast Forwarding Tree Topology parameter is consistent on all of the sites in the same service

3 Choose an entry from the list and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

4 Check the following indicators:

- RCA Audit Problem(s)
- Last Audit Time

5 Click on the RCA Audit button. If the RCA Audit button is not visible, click on the More Actions button and choose RCA Audit. The Select RCA Policy to run the audit list form appears with a list of configured policies.

6 Choose an entry and click on the OK button. The Select RCA Policy list form closes and the requested audit is performed. A dialog box appears.

7 Click on the OK button.

8 Click on the RCA Result tab. The RCA audit information is displayed on the Related Problem tab.

Note — The RCA Result tab appears only if the RCA audit detects one or more problems.

9 If required, expand the VPLS Service object in the problems tree to view the problems, the associated severity, and the cause.

10 Double-click on a problem icon to view information about the problem. The Problem (Edit) form opens with the General tab displayed. The following information is displayed:

- Last Time Changed
- Probable Cause
- Severity
- Description
- Solution

11 Configure the Disable Fix Window parameter.

12 Click on the Related Problem tab to view related problems.

13 Click on the Caused By Objects tab to view a list of objects that are causing the problem.

14 Choose an entry from the list and click on the Properties button. The properties form for the object opens.

15 Click on the tabs to view information about the configuration.

16 Configure the parameters, as required.

17 Click on the OK button to save the configuration and close the properties form. A dialog box appears.

18 Click on the Yes button.

19 Close the Problem (Edit) form.

20 To fix a problem:

i Click on the Related Problem tab.

ii Right-click on a problem icon and choose Fix Problem from the contextual menu. The Plan form appears.

Note — The Fix Problem menu option is disabled if you set the Disable Fix Window parameter to Enabled in step 11.

iii Check the recommended plan to fix the problem in the Plan panel.

iv Check the report about fixing the problem in the Report panel.

v Click on the Fix Problem button. The Plan form closes and a dialog box appears with a summary of the fix. Click on the OK button.

21 Close the VPLS Service (Edit) form.

22 Close the Manage Services form.

Procedure 80-4 To perform an RCA audit of a VPRN service

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and choose VPRN from the object drop-down list.

3 Click on the Search button. A list of VPRN services appears.

4 Choose an entry from the list and click on the Properties button. The VPRN Service (Edit) form opens with the General tab displayed.

5 Check the following indicators:

- RCA Audit Problem(s)
- Last Audit Time

6 Click on the RCA Audit button. If the RCA Audit button is not visible, click on the More Actions button and choose RCA Audit. The Select RCA Policy list form appears with a list of configured policies.

7 Choose an entry and click on the OK button. The Select RCA Policy list form closes and a dialog box appears.

8 Click on the OK button.

9 Click on the RCA Result tab. The RCA audit information is displayed on the Related Problem tab.

Note — The RCA Result tab appears only if the RCA audit detects one or more problems.

10 If required, expand the VPRN Service object in the problems tree to view the problems, the associated severity, and the cause.

11 Double-click on a problem icon to view information about the problem. The Problem (Edit) form opens with the General tab displayed. The following information is displayed:

- Last Time Changed
- Probable Cause
- Severity
- Description
- Solution

12 Configure the Disable Fix Window parameter.

13 Click on the Related Problem tab to view related problems.

14 Click on the Caused By Objects tab to view a list of objects that are causing the problem.

15 Choose an entry from the list and click on the Properties button. The properties form for the object opens.

16 Click on the tabs to view information about the configuration.

17 Configure the parameters, as required.

18 Click on the OK button to save the configuration and close the properties form. A dialog box appears.

19 Click on the Yes button.

20 Close the Problem (Edit) form.

21 To fix a problem:

i Click on the Related Problem tab.

ii Right-click on a problem icon and choose Fix Problem from the contextual menu. The Plan form appears.

Note — The Fix Problem menu option is disabled if you set the Disable Fix Window parameter to Enabled in step 12.

iii Check the recommended plan to fix the problem in the Plan panel.

iv Check the report about fixing the problem in the Report panel.

v Click on the Fix Problem button. The Plan form closes and a dialog box appears with a summary of the fix. Click on the OK button.

22 Close the VPRN Service (Edit) form.

23 Close the Manage Services form.

Procedure 80-5 To perform an RCA audit of multiple services

1 Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

2 Configure the filter criteria and choose one of the following from the Service (Management) object drop-down list.

- VPLS (VPLS)
- VPRN Service (VPRN)
- VLL (VLL)

3 Click on the Search button. A list of services appears.

4 Select the services that you want to audit.

5 Click on the RCA Audit button. The Select RCA Policy list form opens.

6 Choose an entry and click on the OK button. The Select RCA Policy list form closes and a dialog box appears with the following information:

- number of services audited
- number of successful audits
- number of problems generated

7 Click on the OK button.

8 Scroll to the RCA Audit Problem column and set the filter to = true.

9 Click on the Search button. A list of services with problems appears.

10 Select a service and click on the OK button. The *Service* (Edit) form appears with the General tab displayed.

11 Click on the RCA Result tab. The RCA audit information is displayed on the Related Problem tab.

Note — The RCA Result tab appears only if the RCA audit detects one or more problems.

12 If required, expand the *Service* object in the problems tree to view the problems, the associated severity, and the cause.

13 Double-click on a problem icon to view information about the problem. The Problem (Edit) form opens with the General tab displayed. The following information is displayed:

- Last Time Changed
- Probable Cause
- Severity
- Description
- Solution

14 Configure the Disable Fix Window parameter.

15 Click on the Related Problem tab to view related problems.

16 Click on the Caused By Objects tab to view a list of objects that are causing the problem.

17 Choose an entry from the list and click on the Properties button. The properties form for the object opens.

18 Click on the tabs to view information about the configuration.

19 Configure the parameters, as required.

20 Click on the OK button to save the configuration and close the properties form. A dialog box appears.

21 Click on the Yes button.

22 Close the Problem (Edit) form.

23 To fix a problem:

i Click on the Related Problem tab.

ii Right-click on a problem icon and choose Fix Problem from the contextual menu. The Plan form appears.

Note — The Fix Problem menu option is disabled if you set the Disable Fix Window parameter to Enabled in step 14.

iii Check the recommended plan to fix the problem in the Plan panel.

iv Check the report about fixing the problem in the Report panel.

v Click on the Fix Problem button. The Plan form closes and a dialog box appears with a summary of the fix. Click on the OK button.

24 Close the *Service* (Edit) form.

25 Close the Manage Services form.

Procedure 80-6 To perform an RCA audit of a physical link

1 Choose Manage→Equipment→Equipment from the 5620 SAM main menu. The Manage Equipment form opens.

2 Click on the Select Object Type button and choose one of the following from the object tree.

- Physical Link (Network)
- Discovered Physical Link (Network)

3 Click on the Search button. A list of physical links appears.

4 Choose an entry from the list and click on the Properties button. The Physical Link (Edit) form opens with the General tab displayed.

5 Check the following indicators:

- RCA Audit Problem(s)
- Last Audit Time

6 Click on the RCA Audit button. If the RCA Audit button is not visible, click on the More Actions button and choose RCA Audit. The Select RCA Policy list form appears with a list of configured policies.

7 Choose an entry and click on the OK button. The Select RCA Policy list form closes and a dialog box appears.

8 Click on the OK button.

9 Click on the RCA Result tab. The RCA audit information is displayed on the Related Problem tab.

Note — The RCA Result tab appears only if the RCA audit detects one or more problems.

10 If required, expand the Physical Link object in the problems tree to view the problems, the associated severity, and the cause.

11 Double-click on a problem icon to view information about the problem. The Problem (Edit) form opens with the General tab displayed. The following information is displayed:

- Last Time Changed
- Probable Cause
- Severity
- Description
- Solution

12 Click on the Related Problem tab to view related problems.

Note — The 5620 SAM does not provide a solution for physical link configuration errors.

13 Click on the Caused By Objects tab to view a list of objects that are causing the problem.

14 Choose an entry from the list and click on the Properties button. The properties form for the object opens.

15 Click on the tabs to view information about the configuration.

16 Configure the parameters, as required.

17 Click on the OK button to save the configuration and close the properties form. A dialog box appears.

18 Click on the Yes button.

19 Close the Problem (Edit) form.

20 Close the Physical Link (Edit) form.

21 Close the Manage Equipment form.

Procedure 80-7 To create a service audit scheduled task

1 Choose Policies→RCA Audits from the 5620 SAM main menu. The RCA Audits form opens.

2 Specify a filter for the search, if required, and click on the Search button. A list of RCA audit policies appears.

3 Choose a service audit policy from the list and click on the Properties button. The Audit Policy (Edit) form opens with the General tab displayed.

4 Click on the Schedule button and choose Create RCA Audit Schedule Task. The Service Audit Scheduled Task (Create) form opens.

5 Configure the parameters:

- Scheduled Task Name
- Scheduled Task Description
- Administrative State

6 Click on the Select button in the Schedule panel. The Select Schedule - Service Audit Scheduled Task form opens.

7 Perform one of the following.

a Create a schedule to associate with the scheduled task.

b Associate an existing schedule to the scheduled task. Go to step 9.

8 Create a schedule.

i Configure the parameters:

- Name
- Description
- Current Client Start Time
- Current Client End Time
- Delay Time (seconds)
- Enable
- Ongoing
- Frequency

The Current Client End Time parameter is configurable when the Ongoing parameter is disabled and the Frequency parameter value is set to something other than Once.

When a SAM Schedule is not Ongoing and is assigned to a task, the 5620 SAM raises an alarm when the Current Client End Time expires.

ii Perform the step that corresponds to the Frequency parameter value specified in step i.

- When the parameter is set to Once, go to step iii.
- When the parameter is set to Per Second, configure the following parameters:
  - Run Every Second
  - Run Every Seconds
- When the parameter is set to Per Minute, configure the following parameters:
  - Run Every Minute
  - Run Every Minutes
- When the parameter is set to Per Hour, configure the following parameters:
  - Run Every Hour
  - Run Every Hours
- When the parameter is set to Per Day, configure the following parameters:
  - Run Every Day
  - Run Every Days
  - Run Every
- When the parameter is set to Per Week, configure the following parameters:

Note — The Run Every parameter is not configurable when the Ongoing parameter is enabled.

  - Run Every Week
  - Run Every Weeks
  - Run Every
- When the parameter is set to Per Month, configure the following parameters:

Note — The Run Every parameter is not configurable when the Ongoing parameter is enabled.

  - Run Every Month
  - Run Every Months
  - Run Every

iii Click on the OK button to save the changes. The SAM Schedule (Create) form closes and the Select Schedule - Service Audit Scheduled Task form reappears.

9 Choose an entry from the list and click on the OK button. The Select Schedule - Service Audit Scheduled Task form closes and the Service Audit Scheduled Task (Create) form reappears.

10 Ensure that the Administrative State parameter is set to Enabled.

11 Click on the OK button. The Service Audit Scheduled Task (Create) form closes. The RCA Audit Policy form reappears with additional tabs.

12 To apply a filter to the schedule, perform the following.

i Click on the Schedule Filter tab.

ii Click on the Select button in the Audit Filter panel. The Select Audit Filter - Audit Policy form opens.

iii Click on the Search button. A list of filters appears.

Note — If no filters appear, click on the Audit Filter button to create a new filter. See chapter 3 for more information about how to create a filter.

iv Choose an entry and click on the OK button. The Select Audit Filter - Audit Policy form closes and the Audit Policy (Edit) form reappears with additional tabs.

13 Click on the Scheduled Objects to be Audited tab to view the services that are included in the audit.

14 Click on the Scheduled Result tab to view the results of the scheduled audit.

15 Click on the Problems tab to view the problems associated with the audit.

16 Close the Audit Policy (Edit) form.

17 Close the RCA Audits form.

81 — Service throughput configuration

81.1 Service throughput configuration overview *81-2*

81.2 Workflow to prepare for and restore from a service throughput configuration *81-2*

81.3 Service throughput configuration procedures *81-3*

81.1 Service throughput configuration overview

The 5620 SAM allows you to create a copy of the SAP configuration of an end-user service that emulates the bandwidth, throughput, and QoS requirements of the service. You can perform any required OAM diagnostics on the service while sending the traffic through the NEs, to compare the customer SLA with current measurements and report the results.

Throughput configurations are supported on the 7210 SAS, 7705 SAR and 7750 SR, and on VLL Epipe, VPLS, and composite services that contain an Epipe and VPLS, or both. You can create a SAP based on the configuration of an existing SAP to prepare the service throughput configuration, where the port under the new SAP connects to the test entry or a loopback port as the destination.

Consider the following when you prepare a throughput test environment:

- The SAP to be replaced must reside under a Epipe site, including PBB Epipes, or a VPLS site including I-VPLS and B-VPLS.
- The following SAPs are not supported for the throughput test:
  - CCAGs
  - LAGs
  - SAPs that reside on an Ethernet tunnel element
  - SAPs that reside on an Ethernet ring element
  - SAPs used by a mirror service
- E-OAM objects, such as MEPs, are not copied to the test SAP.

You can view existing service throughput configurations on the Throughput Configuration tab of a service. Services and sites with a service throughput configuration have the Modified for Throughput Test parameter enabled on the General tab of the service or site.

81.2 Workflow to prepare for and restore from a service throughput configuration

The following workflow describes the high-level tasks required to prepare a throughput configuration. The workflow assumes that a 5620 SAM end user is challenging the offered SLA.

1. Open the service on which you need to create the test environment.
2. Set the Current OLC State parameter to Maintenance.
3. Prepare the configuration. See Procedure 81-1.
4. Perform OAM diagnostics, as required. See chapter 77 for more information about the 5620 SAM service test manager.
5. Restore the service to the original configuration. See Procedure 81-2.
6. Set the Current OLC State parameter to In Service.

81.3 Service throughput configuration procedures

Use the following procedures to prepare for and restore from a 5620 SAM service throughput configuration SAP configuration.

Procedure 81-1 To prepare a service throughput configuration

Perform the following procedure to create a throughput configuration to prepare a throughput configuration on an Epipe or VPLS.

Note 1 — The SAP that is replaced for the throughput configuration must exist under an Epipe or VPLS site. A throughput configuration cannot be performed on a SAP that:

- resides on CCAG or LAG
- resides on Ethernet tunnel element
- resides on Ethernet ring element
- is used by a mirror service

Note 2 — Alcatel-Lucent recommends that you set the Current OLC State parameter of the service to Maintenance before you prepare a throughput configuration. See Procedures 67-1 and 68-1.

1 Perform one of the following:

   a To prepare a service throughput configuration on an Epipe or VPLS, choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

   b To prepare a service throughput configuration on a composite service, choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Composite Services form opens.

2 Specify a filter for the search, if required, and click on the Search button. A list of services appears.

3 Perform one of the following:

   a Choose a VPLS and click on the Properties button. The VPLS Service (Edit) form opens with the General tab displayed.

   b Choose a VLL Epipe and click on the Properties button. The Epipe Service (Edit) form opens with the General tab displayed.

   c Choose a composite service and click on the Properties button. The Composite Service (Edit) form opens with the General tab displayed.

4 In the Throughput Configuration tab, click on the Create button. The Throughput Configuration form opens.

Note — Alternatively, you can choose a service throughput-capable service from the Manage Services or Manage Composite Services form, click on the Throughput Configuration button, and choose Create from the contextual menu.

5 Choose the entry SAP to be replaced for testing.

i Click on the Select button beside the SAP parameter in the Traffic Test Entry panel. The Select SAP - Throughput Configuration form opens with a list of L2 access interfaces configured in the service.

ii Choose a SAP and click on the OK button. The Select SAP - Throughput Configuration form closes and the Throughput Configuration form refreshes with the SAP information.

6 Specify a physical port or channel that is connected to the test entry and has the same encapsulation type as the SAP that you selected in step 5, on which to create the SAP. By default, the displayed port is the underlying port of the selected SAP. If you choose a different port, the 5620 SAM creates a SAP on the selected port by copying the configuration from the original SAP during the test preparation. E-OAM objects are not copied to the SAP.

i Click on the Select button beside the Port parameter in the Traffic Test Entry panel. The Select Port - Throughput Configuration form opens with a list of access or hybrid ports on the service site on which the SAP that you selected in step 5 resides, and that have the same encapsulation type as the selected SAP.

ii Choose a port and click on the OK button. The Select Port - Throughput Configuration form closes and the Throughput Configuration form refreshes with the port information.

7 Perform the following to choose the traffic destination site.

i Click on the Select button beside the Site ID parameter in the Traffic Test Destination panel. The Select Site ID - Service Throughput Configuration form opens with a list of sites configured in the service that support throughput configuration.

ii Choose a site and click on the OK button. The Select Site ID - Service Throughput Configuration form closes and the Throughput Configuration form refreshes with the site information.

8 Perform one of the following to configure the behavior for the traffic destination:

a To replace an existing SAP with a new SAP on a different port, set the Option parameter to Swap SAP and go to step 9.

b To loopback a port used by an existing SAP, set the Option parameter to Loopback Port Used By SAP and go to step 10.

c To replace an existing SAP with a new SAP on a different port and loopback the new port, set the Option parameter to Swap SAP and Loopback New Port and go to step 11.

d To loopback an existing SAP, set the Option parameter to Loopback SAP and go to step 12.

e To loopback an existing SDP binding, set the Option parameter to Loopback SDP Binding and go to step 13.

Note — The available options change depending on the node where the traffic destination site is configured.

9 Choose the destination SAP and port by performing the following:

i Click on the Select button beside the SAP parameter in the Traffic Test Destination panel. The Select SAP - Service Throughput Configuration form appears with a list of L2 access interfaces configured on the service.

ii Choose a SAP and click on the OK button.

iii Click on the Select button beside the Port parameter in the Traffic Test Destination panel. The Select Port - Service Throughput Configuration form appears with a list of ports on the same site as the selected SAP.

iv Choose the port that you need to swap to and click on the OK button. The port must have the same encapsulation type as the selected SAP.

v Go to step 15.

10 Choose the destination SAP and configure loopback parameters on the port by performing the following:

i Click on the Select button beside the SAP parameter in the Traffic Test Destination panel. The Select SAP - Service Throughput Configuration form appears with a list of L2 access interfaces configured on the service.

ii Choose a SAP and click on the OK button.

iii Configure the parameters. The available parameters change depending on the node where the destination SAP is configured, and include the following:

- Loopback SAP
- Loopback Type
- Loopback Time
- Swap MAC Address
- Source MAC Address
- Destination MAC Address

iv Go to step 15.

11 Choose the destination SAP and loopback port, and configure parameters on the port by performing the following:

i Click on the Select button beside the SAP parameter in the Traffic Test Destination panel. The Select SAP - Service Throughput Configuration form appears with a list of L2 access interfaces configured on the service.

ii Choose a SAP and click on the OK button.

iii Click on the Select button beside the Port parameter in the Traffic Test Destination panel. The Select Port - Service Throughput Configuration form appears with a list of ports on the same site as the selected SAP.

iv Choose the port that you need to swap to and click on the OK button. The port must have the same encapsulation type as the selected SAP.

v Configure the parameters. The available parameters change depending on the node where the destination SAP is configured, and include the following:

- Loopback SAP
- Loopback Type
- Loopback Time
- Swap MAC Address
- Source MAC Address
- Destination MAC Address

vi Go to step 15.

12 Choose the destination SAP and configure loopback parameters by performing the following:

i Click on the Select button beside the SAP parameter in the Loopback SAP panel. The Select SAP - Service Throughput Configuration form appears with a list of L2 access interfaces configured on the destination site.

ii Choose a SAP and click on the OK button.

iii Configure the loopback parameters:

- Loopback Mode
- MAC Swap
- MAC Swap Address
- MAC Swap Address All

iv Go to step 15.

13 Choose an SDP binding and configure loopback parameters by performing the following:

i Click on the Select button beside the Destination Site parameter in the Loopback SDP Binding panel. The Select SDP Binding - Service Throughput Configuration form appears with a list of supported SDP bindings configured on the destination site.

ii Choose an SDP binding and click on the OK button.

iii Configure the loopback parameters:

- Loopback Mode
- MAC Swap
- MAC Swap Address
- MAC Swap Address All

iv Go to step 15.

14 Click on the OK button. The Service Throughput Configuration form closes.

15 Click on the Apply button on the VPLS Service (Edit) form to perform the following, if applicable:

- create a SAP on the selected port if the selected port differs from the port on the SAP
- configure the SAP with the same configuration as the original SAP, including all child objects that are copied over to the SAP
- delete the original SAP
- propagate port loopback parameter changes to the test port
- change the test SAP to a loopback SAP with the configured loopback parameters
- change the test SDP binding to a loopback SDP binding with the configured loopback parameters
- update the throughput information on the site
- update the throughput information on the service

Note — A site can only be used in one throughput configuration at a time. If a throughput configuration exists that uses a site as either a source or a destination, that site cannot be used in another throughput configuration.

16 Perform OAM diagnostics as required.

17 Close the VPLS Service (Edit) form or the Epipe Service (Edit) form.

18 Close the Manage Services form.

Procedure 81-2 To restore a service after a throughput configuration

The 5620 SAM performs the following when you restore the service:

- deletes the newly created SAPs
- re-creates the original SAPs
- on the loopback port: resets the loopback type to none if it was changed by the throughput configuration, and changes the loopback parameters to their default values

- updates the site throughput status information
- updates the service throughput status information

1 Perform one of the following:

   a Choose Manage→Service→Services from the 5620 SAM main menu. The Manage Services form opens.

   b Choose Manage→Service→Composite Services from the 5620 SAM main menu. The Manage Services form opens.

2 Specify a filter for the search, if required, and click on the Search button. A list of services appears.

3 Choose the service for which you need to restore the configuration and click on the Properties button. The *Service_type* Service (Edit) form opens with the General tab displayed.

4 Click on the Throughput Configuration tab. A list of throughput configurations on the service appears.

5 Select the throughput configuration you need to remove, and click on the Delete button.

Note — Alternatively, you can select a service or composite service that is modified for throughput configuration from the Manage Services form or Manage Composite Services, click on the Throughput Configuration button, and choose Delete (all) from the contextual menu. This removes all the service throughput configurations on the service.

6 Close the *Service_type* Service (Edit) form.

7 Close the Manage Services form.
