**nimly Connect Gateway Network Gateway**

## Product Information

The Nimly Connect Gateway is a device that communicates wirelessly with the Connect Module installed in the lock, using Zigbee-communication. It is designed to work with compatible smart locks by Nimly. The gateway is connected to your home network and can be controlled using the Nimly Connect application on your smartphone. The gateway can be placed as close to the lock as possible to ensure reliable communication. If the distance between the gateway and lock is too far, you can add another compatible Zigbee-product from the device list, between the gateway and lock to improve the range.

## Product Usage Instructions

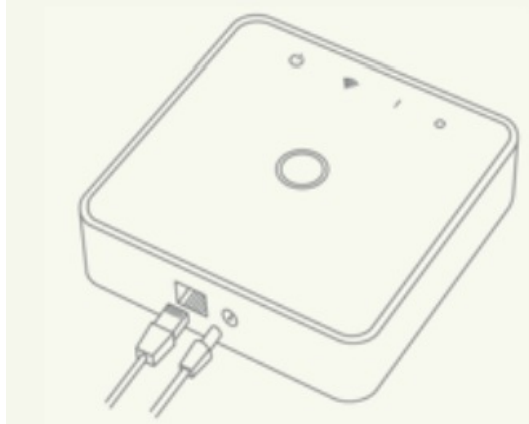

1. Connect the Nimly Connect Gateway to your home network by using the supplied network cable and power supply. Place the gateway as close to the lock as possible.
2. Download the Nimly Connect application to your smartphone from Google Play or Apple App-store.
3. Create your user account and log into the application. Create a home in the application, which will guide you further in the process. When your home is created, the gateway will be connected to your user account.
4. Add your compatible Nimly product to your home. Navigate to the device tab to add a new device. Select your smart door lock from the device list and follow the pairing process as instructed in the application. If the distance between your gateway and lock is too far, connect it to your wireless network found in the app settings.
5. OPTIONAL: If the distance between your gateway and lock is still too far, improve the range by adding another compatible Zigbee-product from the device list, between the gateway and lock. It must be a 230V product to contribute to Zigbee-signal strength.

Note: Master- and user codes registered manually on the lock (slot 001-049) are automatically deleted when pairing your lock with the gateway. This enables you to have an overview of all registered codes in the application. We still recommend that you perform a reset procedure of your lock if the device has been in use.

## Connect Gateway

**Necessary components: Connect Gateway, Connect Module and compatible smart lock by nimly**

1. Install the gateway to your home network by using the supplied network cable and power supply. The gateway communicates wirelessly with the Connect Module installed in the lock, using Zigbee-communication. Place the gateway as close to the lock as possible.

2. Download the Nimly Connect application to your smartphone. The application is available on both Google Play and Apple App-store. Read more about the application and download the app to your device.

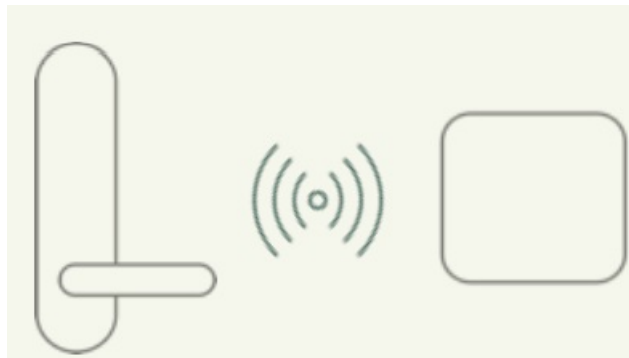

3. Create your user account and log into the application. You will be prompted to create a home in the application, which will guide you further in the process. When your home is created, the gateway will be connected to your user account.

4. Add your compatible nimly product to your home. When the gateway is connected, updated, and assigned to your home, you can add compatible products. Navigate to the device tab to add a new device. Select your smart door lock from the device list and follow the pairing process as instructed in the application. If the distance to your gateway is too far, connect it to your wireless network found in the app settings.

5. **OPTIONAL:** Is the distance between your gateway and lock still too far? Improve the range by adding another compatible Zigbee-product from the device list, between the gateway and lock. For example, a smart contact or another useful product. It must be a 230V product to contribute to Zigbee-signal strength.
