NXP AN14179 Based Micro Controllers

Specifications

- **Core Platform:** Arm Cortex-M33 up to 150 MHz with TrustZone, MPU, FPU, SIMD, DSP SmartDMA
- **System Control:** Power control, Clock generation unit, PMC, Secure DMA0, Secure DMA1, Secure AHB bus
- **Analog:** 4x 16 b ADC, Temp sensor, 2x ACMP, Glitch detect, VREF
- **Interfaces:** 8x LP flexcomm supporting UART, SPI, I2C, 4ch SAI, 2x CAN-FD, USB HS, 2x I3C
- **Memory:** Flash up to 512 kB, RAM up to 320 kB, ECC RAM 32 kB
- **HMI:** FlexIO, DMIC
- **Security:** PKC, ECC-256, SHA-512, RNG AES-256, Multi-Rate Timer, Windowed WDT, Debug auth., PRINCE, RTC with anti-tamper pins
- **General Purpose Timers:** 5x 32 b Timers
- **Other Features:** Micro-Tick Timer, DICE + UUID, PFR, SRAM PUF, 2x FlexPWM with 2 QDC module, OS Event Timer, 2x Code WDG, OTP, Tamper detect

Product Usage Instructions

- **Step 1: Understanding the Migration Guide**
Read through the migration guide provided from MCXNx4x to MCXN23x to understand the differences and changes in the platforms.
- **Step 2: Assessing Application Compatibility**
Check if your current applications on MCXNx4x are compatible with the MCXN23x platform. Identify any specific features or peripherals that may need modification.
- **Step 3: Porting Applications**
Follow the guidelines in the migration guide to port your applications from MCXNx4x to MCXN23x. Make necessary code changes based on the platform variations.
- **Step 4: Testing and Validation**
After porting the applications, thoroughly test them on the MCXN23x platform to ensure proper functionality and performance.

Frequently Asked Questions (FAQ)

• **Q: What are the key differences between MCXNx4x and MCXN23x?**

A: MCXN23x is a cropped version of MCXNx4x with some co-processors and peripherals removed. The MCX series MCU is divided into subseries N, A, L, and W.

• **Q: How can I migrate my applications from MCXNx4x to MCXN23x?**

A: Refer to the migration guide provided by NXP that outlines the steps to migrate applications between the two platforms. Ensure compatibility and make necessary adjustments in the code.

AN14179

Migration Guide from MCXNx4x to MCXN23x

Rev. 1 — 6 May 2024

Application note

Document information

Information	Content
Keywords	AN14179, MCXNx4x, MCXN23x, migration guide
Abstract	This application note describes the differences between MCXNx4x and MCXN23x and guides customers on how to quickly migrate applications from the MCXNx4x platform to the MCXN23x platform.

Introduction

The MCXNx4x is a new-generation MCU launched by NXP after Kinetis and LPC. It integrates excellent IP from both Kinetis and LPC platforms, such as CMC, FlexCAN, FlexIO, and SPC from the Kinetis platform and PowerQuad, SmartDMA, PINT, RTC, and MRT from the LPC platform. The MCX series MCU is divided into four subseries: N, A, L, and W.

- **MCX N (Neural):**
 - 150 MHz, 512KB-2MB
 - On-chip accelerators, enhanced peripherals, and advanced security
- **MCX A (All-purpose):**
 - Up to 96 MHz, 32KB-1MB
 - Intelligent peripherals and various device options for a wide range of applications
- **MCX W (Wireless):**
 - Up to 96 MHz
 - Low-power Bluetooth LE, Thread, and Zigbee radio optimized for IIoT and Matter applications and advanced security
- **MCX L (Low-power):**
 - Below 50 MHz, up to 1 MB
 - Optimized for always on battery operated applications with the lowest active power and leakage

The MCXNx4x series microcontrollers combine the Arm Cortex-M33 TrustZone core with a CoolFlux BSP32, a PowerQuad DSP Co-processor, and multiple high-speed connectivity options running at 150 MHz. To support a wide variety of applications, the MCX N series includes advanced serial peripherals, timers, high-precision analog, and state-of-the-art security features like secure user code, data, and communications. All MCXNx4x products

include dual-bank flash, which supports read-while-write operation from internal flash. The MCXNx4x series also supports large external serial memory configurations.

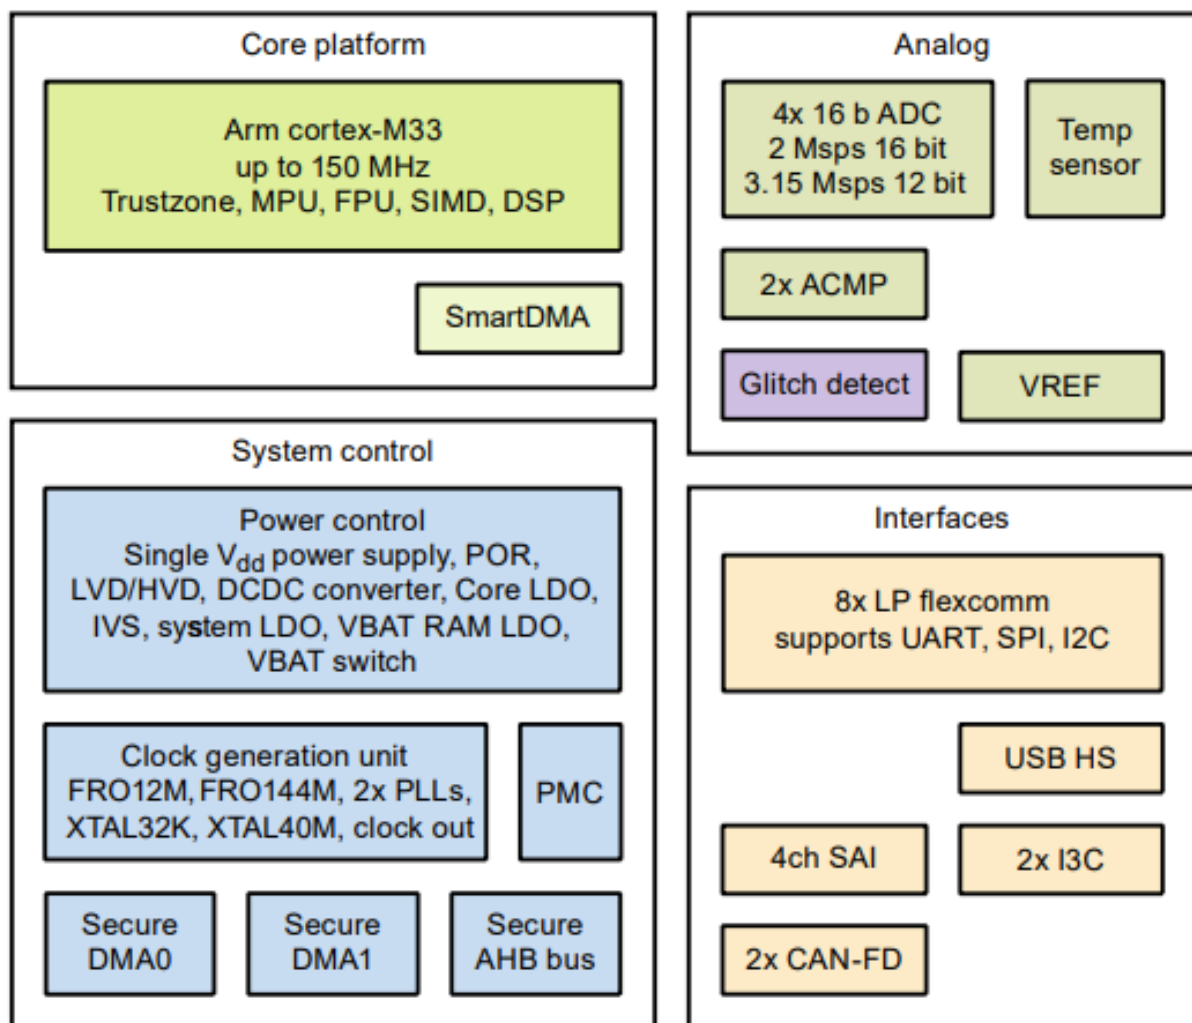

The MCXNx4x MCU families are as follows:

- N54x: Mainstream MCU with a second M33 core, advanced timers, analog and high-speed connectivity, including high-speed USB, 10/100 Ethernet, and FlexIO, which can be programmed as an LCD controller.
- N94x: Integration of CPU and DSP serial connectivity, advanced timers, high precision analog, and high-speed connectivity, including high-speed USB, CAN 2.0, 10/100 Ethernet, and FlexIO, which can be programmed as an LCD controller.
- MCXN23x is the second product in the MCX N series. It can be regarded as a cropped version of MCXNx4x. Almost all IPs are reused from MCXNx4x, and some co-processors and peripherals are removed. These removed modules are as follows:
 - Co-processor: Secondary Cortex-M33 Core, PowerQuad, NPU, CoolFlux BSP32, and so on.
 - Peripherals: FlexSPI, uSDHC, EMVSIM, Ethernet, 12-bit DAC, 14-bit DAC, and so on.

This document describes how to migrate applications from the MCXNx4x platform to the MCXN23x platform.

The system block diagram of MCXN23x is shown in Figure 1.

Migration Guide from MCXNx4x to MCXN23x

1. This feature is only supported on the MCXN947 VFBGA184 package.
2. The 100HLQFP supports two Anti-tamper pins.

The following section compares the MCXNx4x and MCXN23x in terms of memory, clock, pinout, and peripherals.

Memory

This section provides details about flash memory and SRAM memory.

Flash memory

The MCXNx4x has a flash size of up to 2 MB, while the MCXN23x has a flash size of up to 1 MB, both support dual bank flash and dual image boot. The configuration of flash size for each part is listed in Table 2 and Table 3.

Table 2. MCXNx4x part list

Part Number	Embedded memory		Features			Package	
	Flash (MB)	SRAM (kB)	Tamper pins (max)	GPIOs (max)	SRAM PUF	Pin count	Type
(P)MCXN547VNLT	2	512	2	74	Y	100	HLQFP

Part Number	Embedded memory		Features			Package	
	Flash (MB)	SRAM (kB)	Tamper pins (max)	GPIOs (max)	SRAM PUF	Pin count	Type

(P)MCXN947VNLT	2	512	2	78	Y	100	HLQFP
(P)MCXN946VNLT	1	352	2	78	Y	100	HLQFP
(P)MCXN946VDFT	1	352	8	124	Y	184	VFBGA

Table 3. MCXN23x part list

Part Number	Embedded Memory		Features			Package	
	Flash (MB)	SRAM (kB)	Tamper pins (max)	GPIOs (max)	SRAM PUF	Pin count	Type
(P)MCXN236VNLT	1	352	6	74	Y	100	HLQFP
(P)MCXN236VDFT	1	352	6	108	Y	184	VFBGA
(P)MCXN235VNLT	0.512	192	6	74	Y	100	HLQFP
(P)MCXN235VDFT	0.512	192	6	108	Y	184	VFBGA

SRAM memory

The RAM size of the MCXNx4x is up to 512 kB, and the RAM size of the MCXN23x is up to 352 kB. The size of flash and RAM for each part of the MCXNx4x and MCXN23x is listed in Table 4.

Table 4. Flash and RAM size of different parts

Parts		MCXN _x 47	MCXN _x 46	MCXN236	MCXN235
Flash		2M	1M	1M	512 kB
SRAM (kB)	Total size	512	352	352	192
	SRAMX	96 (0x04000000-0x04017FFF)	96 (0x04000000-0x04017FFF)	96 (0x04000000-0x04017FFF)	32 (0x04000000- 0x04007FFF)
	SRAMA	32 (0x20000000-0x20007FFF)	32 (0x20000000-0x20007FFF)	32 (0x20000000-0x20007FFF)	32 (0x20000000- 0x20007FFF)

	SRAMH	32 (0x20060000-0x20067FFF)	–	–	–

Clock system

The MCXN23x and MCXN_x4x use almost the same clock system, with a few differences.

FRG

A Fractional Rate Generator (FRG) is added to the MCXN23x to generate a more accurate clock for the CLKOUT divider. The FRG output is used as the input of the CLKOUT divider, see Figure 2. It can be used to obtain more precise baud rates when the function clock is not a multiple of standard baud rates. This can be primarily used to create a base baud rate clock for USART functions, and can be used for other purposes, such as metering applications.

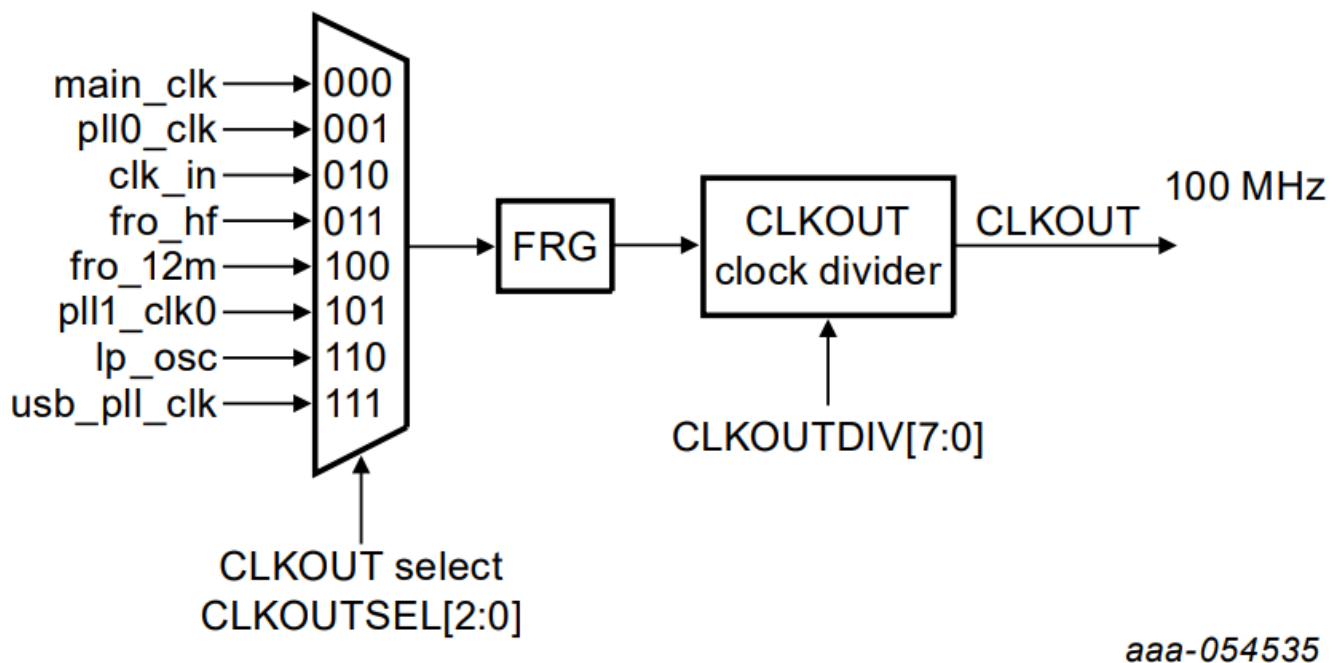

Figure 2. MCXN23x CLKOUT diagram
 For the CLKOUT diagram of the MCXN4x, see Figure 3.

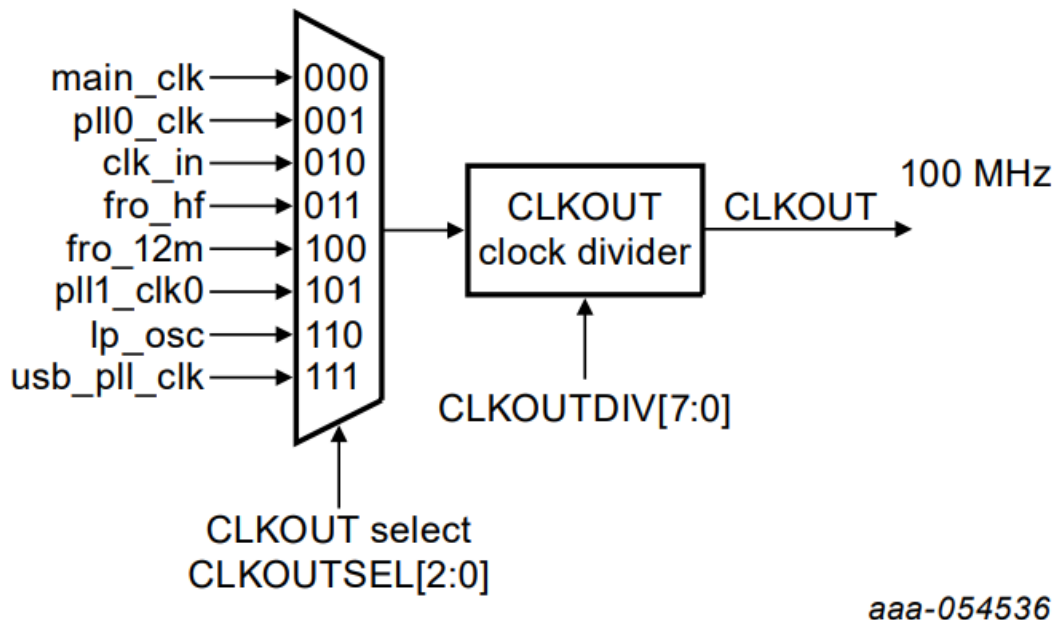

Figure 3. MCXN4x CLKOUT diagram
 The CLKOUT_FRGCTRL register has been added to the SYSCON module of MCXN23x and used to configure numerator and denominator values.

UTICK

The clock sources of UTICK (Micro-Tick) on the MCXN23x have been expanded from 1 to 3, and xtal32k[2] and clk_in have been added as clock sources of UTICK. The clock source of UTICK on the MCXN23x is shown in Figure 4.

Figure 4. MCXN23x UTICK clock source

In the metering application, UTICK is used to measure power line frequency. To support metering applications, `clk_in` and `xtal32k[2]` are added to the MCXN23x for high-accuracy clock source.

I3C

The clock diagram of I3C on the MCXN23x is shown in Figure 5.

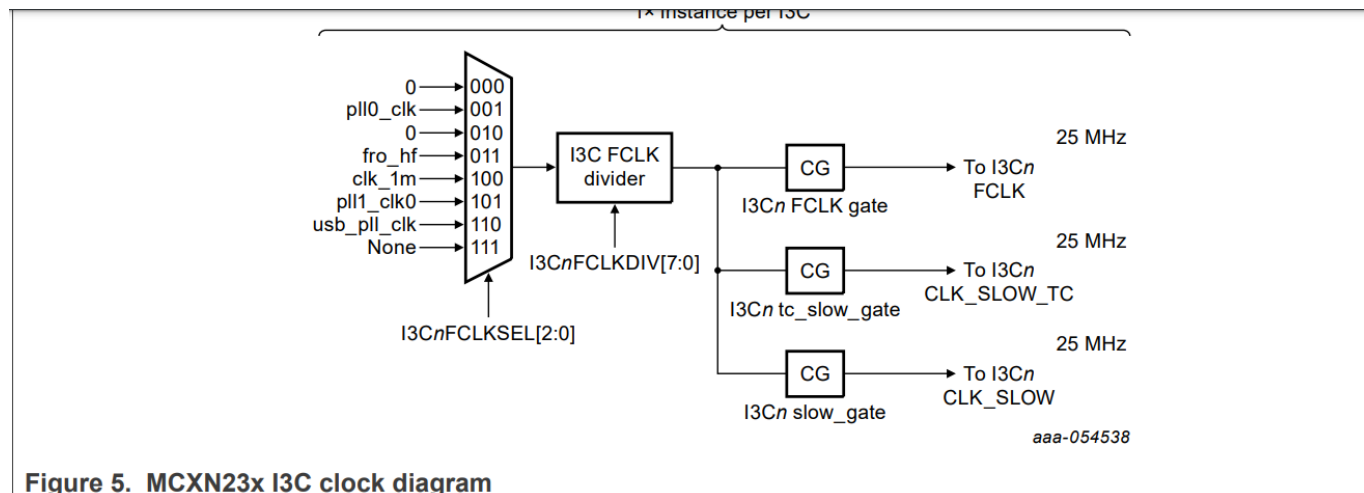

Figure 5. MCXN23x I3C clock diagram

Add `clk_1m` as the clock source to the I3C_FCLK divider, and keep `CLK_SLOW` and `CLK_SLOW_TC` synchronized with FCLK.

The I3C clock diagram of MCXNx4x is shown in Figure 6.

Migration Guide from MCXNx4x to MCXN23x

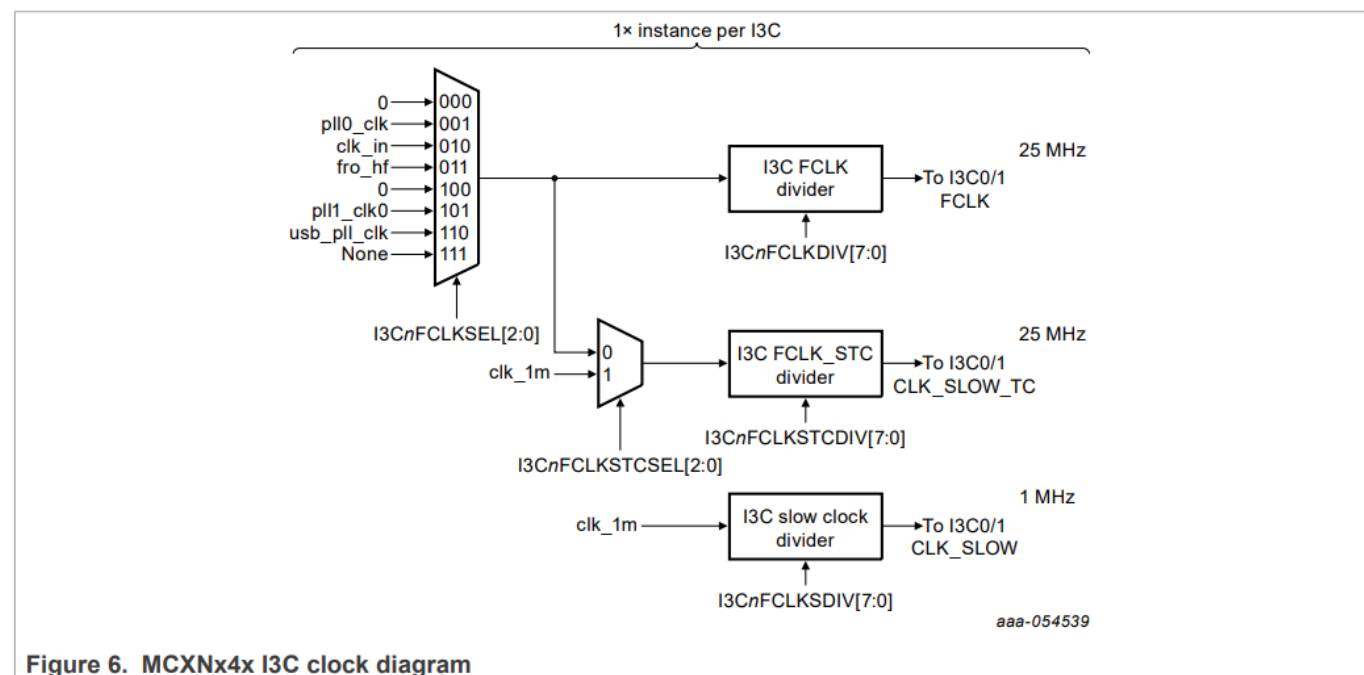

Figure 6. MCXNx4x I3C clock diagram

Pinout

This section compares the pinout differences between MCXNx4x and MCXN23x, including 184VFBGA and 100HLQFP packages.

184VFBGA

For the 184VFBGA package, the MCXN23x is pin-to-pin compatible with the MCXNx4x. However, there are some differences between the two. In MCXN23x, 28 pins are removed, including 18 GPIO pins, eight analog pins, and two USB pins. The pinout of the MCXN23x 184VFBGA package is illustrated in Figure 7.

Figure 10. MCXN94x and MCXN54x 100HLQFP pinout

MCXN94x has six pins P4_19, P4_20, P4_21, P4_23, USB0_DM, and USB0_DP. However, MCXN23x does not have these six pins but instead has four different pins USB1_DP, USB1_DM, USB1_VBUS, and VSS_USB. For more detailed information about the pinouts, refer to the pinout table in the attachments of MCX Nx4x Reference Manual (document MCXNX4XRM) and MCXN23x Reference Manual (document MCXN23XRM).

Peripherals

In Table 1, we have compared the differences between MCXN23x and MCXNx4x. The MCXN23x does not have various modules such as FlexSPI, PowerQuad, NPU, CoolFlux BSP32, uSDHC, EMVSIM, TSI, USB FS, Ethernet, 12-bit DAC, 14-bit DAC, Opamp, SINC Filter, and SCTimer. The following section describes the differences between the common peripherals between the MCXN23x and MCXNx4x.

GPIO

As described in Section 4.1, the MCXNx4x supports up to 124 GPIOs, and the MCXN23x supports up to 106 GPIOs. However, in the case of MCXN23x, 18 GPIO pins are not supported. Apart from being used as GPIOs, these 16 pins also support the functions listed in Table 5.

Table 5. Removed GPIOs on the MCXN23x 184VFBGA package

Table 5 lists the specific pins, including LP_FLEXCOMM0/1/4/5/7, TRIG, CTimer, FlexPWM, FlexIO, SmartDMA,

and SAI1 are involved. However, the other pins on the MCX23x can also implement the same functions as these pins. Before migrating from the MCXNx4x to MCXN23x, it is important to check if your design on the MCXNx4x uses these pins. If it does, you must reassign the pins to meet your requirements.

- **USB**

All the MCXN54x parts and the MCXN94x 184VFBGA packages support FS USB (USB0) and HS USB (USB1). Whereas the MCXN94x 100HLQFP package only supports HS USB. All the MCXN23x parts only support HS USB.

- **DMIC**

All parts of the MCXN23x and MCXN54x have a DMIC module and support up to four digital microphone channels. However, for the MCXN94x series, the MCXN946 does not support the DMIC module, and the MCXN947 only supports the DMIC module on the 184VFBGA package.

- **LP_FLEXCOMM**

The MCXNx4x series supports 10 LP_FLEXCOMM modules. Each LP_FLEXCOMM can be configured as UART, I2C, and SPI. Among them, the IO of LP_FLEXCOMM6/7/8/9 is high-speed IO, and the highest clock that can be configured is 150 MHz. The MCXN23x only supports eight LP_FLEXCOMM modules and does not support LP_FLEXCOMM8 and LP_FLEXCOMM9, only LP_FLEXCOMM6 and LP_FLEXCOMM7 can use high-speed IOs.

- **Comparator**

The MCXN94x series supports three Comparator (CMP) modules, while the MCXN54x and MCXN23x series only support two CMP modules.

- **ADC**

The MCXNx4x and MCXN23x series have two 16-bit ADC modules but differ in the number of ADC channels they support. The MCXNx4x can support up to 75 ADC channels, while the MCXN23x can support up to 63 ADC channels. For the 184VFBGA package, the MCXN23x cannot support the 12 ADC channels listed in Table 6 because the 16 pins mentioned in Table 6 are removed.

Table 6. Removed ADC channels on MCXN23x

184BGA ALL Pin Name	Analog
P1_20	ADC1_A20/CMP1_IN3
P1_21	ADC1_A21/CMP2_IN3

184BGA ALL Pin Name	Analog
P0_12	ADC0_B12
P0_13	ADC0_B13
P0_30	ADC0_B22
P0_31	ADC0_B23

Note: The term ADC channels refer to the external ADC input channels.

FlexPWM and Quadrature Decoder (QDC)

The MCXN94x and MCXN23x are compatible with dual-motor applications as they support two FlexPWM modules and two QDC modules. But, the MCXN54x supports only one FlexPWM module and one QDC module, making it suitable for single-motor solutions only.

DMA

The MCXNx4X has two eDMA modules, eDMA0 and eDMA1. Each module supports 16 DMA channels. The MCXN23x also has 2 eDMA modules, but eDMA1 only supports eight channels.

Anti-tamper pin

The tamper pins for MCXNx4x are listed in Table 7 and Table 8. The MCXNx4x has eight tamper pins, and the MCXN23x has six tamper pins. Pin P5_8 and P5_9 are removed on MCXN23x.

Note: The 100HLQFP packaged parts of MCXN4x and MCXN23x only support two tamper pins.

Table 7. Tamper pins on MCXNx4x

Miscellaneous

This section provides details about the boot source and debugging.

1. Boot source

The MCXN23x does not have the FlexSPI module and does not support external flash boot, but the MCXNx4x supports external flash boot, which can be configured with the BOOT_CFG field in the Customer Manufacturing/Factory Configuration Area (CMPA) to implement this function.

2. Debug

The MCXNx4x debug module supports ITM, DWT, ETM, ETB W/2KB RAM, and TPIU function, but the ETM

and ETB W/2KB functions are removed on the MCXN23x.

3. Power management

Power management The power management of MCXN23x and MCXN4x is identical, so they can use the same power supply circuit.

Software

This chapter describes some software considerations when porting the code from the MCXN4x platform to the MCXN23x platform. In this section, take the hello_world project from the FRDM-MCXN236 SDK as an example, and the IDE is IAR 9.40.1.

1. Chip-specified header files

Each SDK project has a device directory containing chip-specific header files. These header files must be replaced when porting code between platforms, see Figure 11.

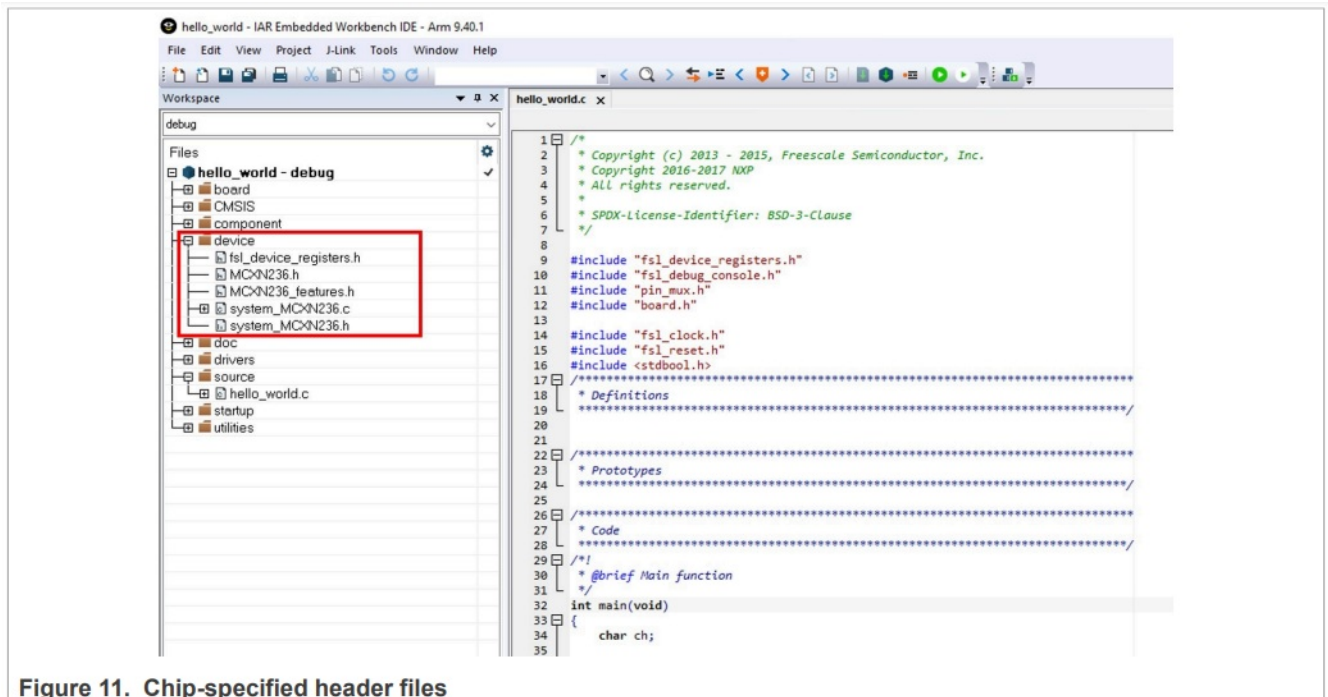

Figure 11. Chip-specified header files

2. SDK driver

Ensure that the SDK driver directory does not include unsupported modules such as FlexSPI and uSDHC for MCXN23x.

3. Start_up file

Replace the start_up file of MCXN4x with MCXN23x start_up file, as some modules are removed, and the interrupt vector table is different.

4. Linker file

The MCXN23x and MCXN4x can have different Flash and RAM sizes, so the customer must replace the linker file to ensure the Flash and RAM range used in the linker file is suitable.

5. IDE-related configuration update

When porting code from the MCXN4x to MCXN23x, update IDE-related configurations such as path and macro definition, see Figure 12.

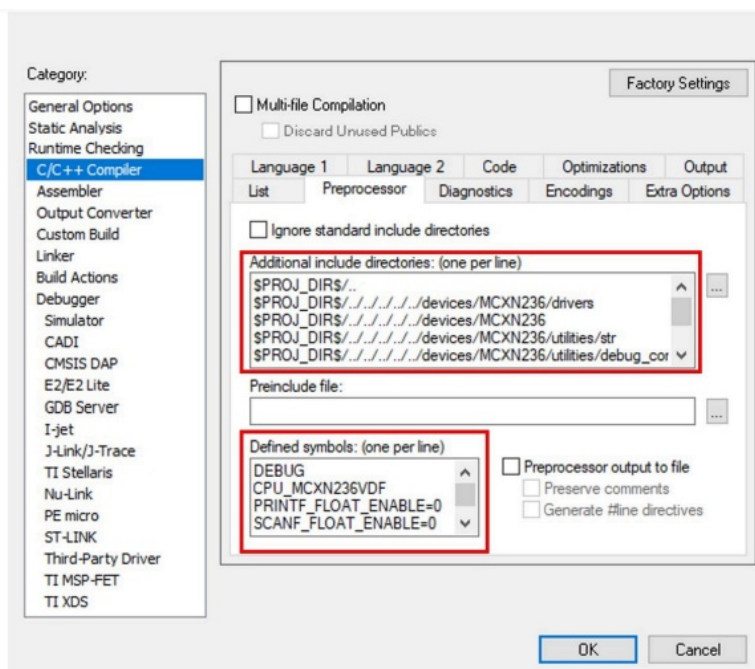

Figure 12. Path and macro definition

.Note: If the customer does not use the removed pins and peripherals on the MCXN23x, then the customer can directly solder the MCXN23x chip to the MCXN4x board and can directly use the MCXN4x software, but the linker file must be updated to match the flash and RAM size of MCXN23x. Currently, this method has only been verified on IAR IDE.

Conclusion

This document compares system resources and software differences between the MCXN4x and MCXN23x, making project migration quick and easy.

Related documentation/resources

Table 9 lists additional documents and resources that can be referred to for more information. Some of the documents listed below may be available only under a non-disclosure agreement (NDA). Acronyms and abbreviations

Table 10 defines the acronyms and abbreviations used in this document.

Table 10. Acronyms and abbreviations

Acronym	Definition
---------	------------

ADC	Analog-to-Digital Converter
CAN	Controller Area Network
CMP	Comparator
CMPA	Customer Manufacturing/Factory Configuration Area
CPU	Central Processing Unit
CRC	Cyclic Redundancy Check
DAC	Digital-to-Analog Converter
DMA	Direct Memory Access
DSP	Digital Signal Processor
DWT	Drop-Weight Tear
ECC	Error Correcting Code
eDMA	Enhanced Direct Memory Access
ETM	Embedded Trace Macrocell
ETB	Embedded Trace Buffer
FlexCAN	Flexible Controller Area Network Interface
FlexIO	Flexible Input/Output
GPIO	General-Purpose Input/Output
HS USB	High-Speed USB
I2C	Inter-Integrated Circuit
ITM	Instrumentation Trace Macrocell
IP	Internet Protocol
LDO	Liquid Crystal Display
LPC	Low Pin Count
MAC	Media Access Control
MCU	Microcontroller Unit
MII	Media-Independent Interface
NDA	Non-Disclosure Agreement
OS	Operating System
QDC	Quadrature Decoder
RTC	Real-Time Clock
TPIU	Trace Port Interface Unit
TSI	Touch System Interface
SAI	Serial Audio Interface

SDK	Software Development Kit
SPI	Serial Peripheral Interface
SRAM	Static Random-Access Memory

Acronym	Definition
RAM	Random-Access Memory
RMII	Reduced Media Independent Interface
TPIU	Trace Port Interface Unit
UART	Universal Asynchronous Receiver Transmitter
USB	Universal Serial Bus
VREF	Voltage Reference

Legal information

Definitions

Draft — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including – without limitation -lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default

in the customer's applications or products, or the application or use by customer's third party customer(s).

Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications

and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <https://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Suitability for use in non-automotive qualified products — Unless

this document expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

Translations — A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at PSIRT@nxp.com) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

NXP B.V. — NXP B.V. is not an operating company and it does not distribute or sell products.
