# PERUN V2 Hybrid Pro Electronic Trigger Unit Installation Guide

Perun V2 Hybrid replaces mechanical contacts in your airsoft replica or gel blaster and provides lots of useful features. Optical and magnetic sensors allow to eliminate many moving parts that are prone to damage, thus increasing the reliability. The elasticity of this unit gives you certainty, that replica made from parts made by different manufacturers will not have any incompatibility issues. Adaptive trigger control allows switching from a very short trigger travel to a long one even in the field, with almost any trigger, including stock ones.

Reading this manual will help you fully exploit this unit's potential and in case of encountering any problems, you can look for solutions to them here.

#### Manufacturer:

Perun Barwicka 8 St. 60-192 Poznań, Poland

e-mail: info@perunairsoft.pl

# **Technical data**

#### **Recommended power sources**

Perun V2 Hybrid works with any power source that provides a voltage between 7 and 17 volts and can deliver enough current to ensure smooth cycling of the replica. Li-Po and Li-Ion batteries with a nominal voltage of 7.4, 11.1 or 14.8 volts are recommended. It is also advised to use batteries with possibly high "C" parameter and capacity. This is safer for the battery, as it should not be working on the edge of its capability. In this video, we are showing why:

https://www.youtube.com/watch?v=s8RKcly810A

## Capacity and the "C" parameter also influence the rate of fire of the replica:

https://www.youtube.com/watch?v=5hO25aPvHcU

# Compatibility with high-ROF and high-power builds

Perun V2 Hybrid can work with any replicas, including highly tuned.

#### Compatible gearboxes, gears, and triggers

Perun V2 Hybrid works both in airsoft electric replicas and gel blasters. It is designed to fit version 2 gearboxes in Tokyo Marui standard. Examples of incompatible replicas are ECS series by Classic Army, EFCS by Ares, or ERG

#### by KWA.

Perun V2 Hybrid was successfully tested in and should fit without the need for any modification in gearboxes made by the following manufacturers: A&K, Bolt, Classic Army (except for ECS series), G&G (with exceptions), G&P, ICS, JG, King Arms, KWA (gen 2.0), Retro Arms, Specna Arms, Ultimate, and VFC. Some grinding of the contacts area is needed in Cyma, G&G G2 and Krytac gearboxes (see page 13). These are gearboxes that we tested for compatibility during the design process. Please be advised, that despite our best efforts to provide reliable information, we cannot guarantee full compatibility for all the gearbox shells mentioned above. Replica manufacturers sometimes slightly change dimensions of their parts from batch to batch, bringing need for some adjustment or in extreme cases, making them incompatible with Perun V2 Hybrid.

In the G&G replicas with "45°" selector, it might be very hard to make all fire modes function properly because of a very short selector plate travel.

Gearbox color or its "shininess" has no effect on the operation of Perun V2 Hybrid.

Perun V2 Hybrid works with any gearset, including DSG, TSG, short stroked, helical, non-helical, and with any ratio. The only exception are 32:1 gears, that work with "half-teeth" pistons. 19-teeth sector gears (used in SR25 replicas) might need special handling when it comes to use of spring drop feature.

Stock and aftermarket triggers in Tokyo Marui standard can be used with Perun V2 Hybrid. Trigger color does not affect the operation. Some ICS triggers might require dremelling before magnet holder can be placed on them. G&G ETU triggers are incompatible and should be replaced.

#### **Electronic fuse**

Perun V2 Hybrid has an integrated electronic fuse, which will automatically cut the power off in case of a short circuit or when a gearbox jam is detected. The fuse does not wear out when it is activated.

#### **Battery connector type**

Perun V2 Hybrid comes with an already soldered T-Plug connector (T-Deans).

#### Soldering pads for gel blasters and tracer hop-up chambers

There are two soldering pads on Perun's electronic board, designed especially for soldering the mag terminals' wires or tracer hop-up chamber wires to them.

#### Stand-by current consumption

Whenever the battery is connected and selector is set to "SAFE", the mosfet consumes 1.5mA of current. While unnoticeable during normal play, it may deplete your battery completely and damage it, if you store the replica with battery connect for a week or more. Therefore, always remember to disconnect the battery after use.

#### **Brushless motors**

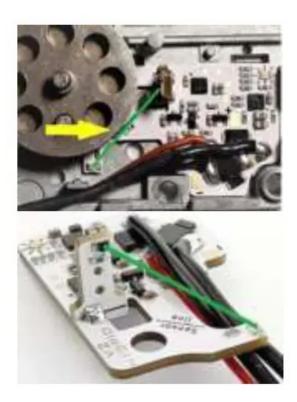

Perun V2 Hybrid works with BLDC motors like Option No. 1 or Warhead. RoF reduction feature must not be activated when these motors are used.

#### How does it work?

Perun V2 Hybrid uses optical and magnetic sensors for the detection of sector gear, trigger, and selector plate position. It has no moving parts at all. That provides not only great reliability but also flexibility, thanks to which Perun V2 Hybrid will work without problems in almost any combination of gearbox shells, triggers, selector plates and sector gears.

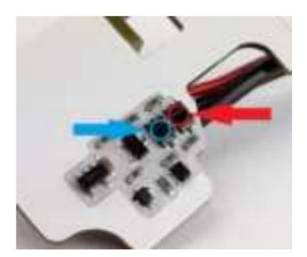

#### Sector gear detection

Sector gear phototransistor (sensor) and IR LED diode work in pair as a barrier switch. When sensor and diode are obstructed, it means that the gear teeth are between them. Perun V2 Hybrid is using information whether gear teeth are present or not, to determine which gearbox cycle phase is currently taking place. Algorithm used for counting teeth allows almost any gearset to be used. No adjustment needs to be made to enable compatibility with DSG, TSG, short-stroked or SR25 gears.

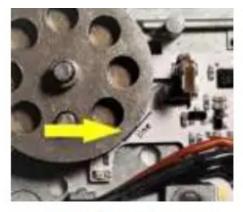

#### Selector sensor

There are two selector sensors on Perun V2 Hybrid, marked blue (for semiautomatic mode) and red (for auto) on the photo to the right. These sensors work by emitting infrared (IR) radiation and detecting, how much of it is coming back to them due to reflection from nearby objects. White objects reflect most of the IR, while black almost none. Also, objects must be very close (less than 1mm) to the sensors to be detected, so lack of anything above them also results in no reading

When the white area on the selector sticker is above the "SEMI" sensor, it is reflecting IR back to it, letting the unit know that the corresponding selector position has been set – provided that the sticker is well placed. The same principle works for "AUTO". "SAFE" is detected, when the white area on the sticker is not present above any of the sensors.

Sensor line and sector gear alignment

Magnet holder

#### **Trigger**

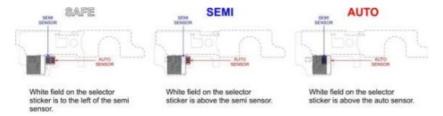

Hall-effect sensors are monitoring the magnetic field generated by the magnet in the magnet holder installed on the trigger. These readings are then conveyed to the microcontroller of the unit, which depending on the sensitivity setting and trigger position, may trigger a shot. The magnetic sensors are also able to detect, whether an external magnetic object is present near to the replica and in such case, will activate external magnetic field alarm to prevent an unintended shot.

#### Installation

Supplementary video manual is available here: <a href="https://www.youtube.com/watch?v=NCD2DWjRhj8">https://www.youtube.com/watch?v=NCD2DWjRhj8</a>

- 1. Disassemble the replica and the gearbox. Remove everything from the gearbox.
- 2. Place Perun in the gearbox so, that the sector gear's edge would align with the Sensor line that is printed on the PCB, as shown on the photo to the right. Max. 0.5mm deviation to the left or right from this line is acceptable, but it is better to avoid it. When ready, screw Perun in place. Make sure it is held firmly by the screw and does not wobble. Do not worry about the PCB, in the screw area there are no electronic paths, and you do not need to use any gaskets. Do not use excessive force, though.
- 3. Install the plastic magnet holder on the trigger, as shown on the photo to the right. When screwing the two halves of the holder together, use only little force, not to damage the threading. Depending on the trigger model you are using, there may and can remain a gap between the two halves. If the magnet holder still wobbles, use the third screw to remove any remaining slack (also be careful and do not use excessive force on the screw).

- 4. Make sure that the trigger is not touching the electronic board and the sector gear can spin freely, not touching the screw. The sector gear can touch the magnet holder initially but should no longer do so after you insert the middle pin that goes through the gearbox right behind the trigger.
- 5. Put the selector sticker on the selector plate (remove the metal part from the plate if present), in place shown on the sticker set that came with Perun. If you are installing it in a replica manufactured by ICS or an MP5 by JG, use stickers "for ICS". The sketch below shows, how does the selector sensor work and how should the selector sticker be placed in relation to the selector sensors:

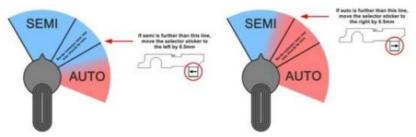

- 6. Assemble the gearbox only with the sector gear, Perun, and the trigger inside. It is advised to shim the trigger (standard gear shims can be used for this purpose), so that it can only move back and forth, not sideways. The trigger holder should rest on the contact stopper (a little protrusion or a screw on the gearbox), as shown on the photo:
- 7. Put the gearbox in the lower receiver and insert the rear and middle pins. While inserting the middle pin, you might need to pull and hold the trigger, to let the middle pin go through.

8. Connect the battery to the mosfet (with the motor still disconnected) and use the Sensor check feature (more details on page 13) to check, whether all the sensors work properly. Make sure that the selector positions are detected as shown below:

Also check the trigger and the sector gear. In case Perun does not detect trigger, sector gear, or selector positions properly at any of these trials, please refer to solutions described on the scheme above or below:

- 9. If the sector gear is not being detected, check whether the wires are not obstructing the IR diode in the bottom-left part of the mosfet. If the problem persists, you might need to try releasing the screw that holds the electronic board, moving the board to the sides (if possible) and then screwing it back and checking again.
- 10. If the trigger does not seem to be working, make sure that the magnet together with its plastic holder is on the trigger and it is placed correctly. The correct polarization of the magnet (which end of the magnet is pointing at the board) is important.
- 11. The selector must be on "SAFE" when the battery is being plugged in.

- 1. If everything works correctly, remove the gearbox from the lower receiver.
- 1. Open the gearbox again and put the rest of the components inside. If you are installing Perun in a gel blaster or using a tracer hop-up unit, use the soldering pads on Perun's electronic board marked with "+" and "-" to solder the mag terminals' wires or tracer wires. Be careful not to accidentally solder the pads together with the adjacent components! Note, that you can leave the mechanical safety mechanism, if you like, it is not necessary, though. It is a matter of your preference.
- Assemble the gearbox. Put the whole replica together. Watch out for the wires, make sure that the insulation does not get damaged during the assembly!
   Tracer or mag terminals sol during pads
- 3. It is recommended to check for any short circuits between the plugs, gearbox and body using a multimeter.

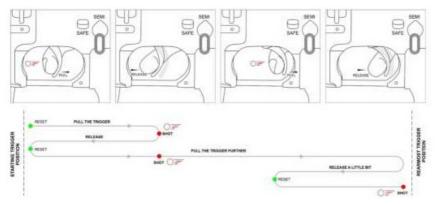

#### **During the start-up**

Every time, when connecting the battery to the replica, make sure that the selector is set to "SAFE". This is a safety concern, but it also helps Perun find out, where the "SAFE" position is. If you will connect the battery with the selector on "SEMI" or "AUTO", the replica may not shoot unless you switch to "SAFE" first or even if it does, the unit may sometimes function abnormally until the "SAFE" position is reached at least once.

#### Adaptive trigger control

Each time the battery is connected, Perun senses the trigger resting position and uses it as a reference (therefore, make sure to never pull the trigger during startup). Depending on the current trigger sensitivity setting, Perun will automatically fire after the trigger has traveled a long enough distance. This allows very short trigger pulls with no trigger modification needed whatsoever and the trigger sensitivity changes possible even in the field.

When using a trigger with regulation, only the overtravel limiter should be used. Pre-travel regulation can make the trigger pull necessary to fire a shot longer, than it would have been when left in the standard forward position. When in normal semiautomatic mode, the Perun Hybrid uses a progressive trigger activation method. This means that the trigger threshold and reset points are mobile and move together with the trigger, as shown on the sketch below:

#### This results in two things:

- 1. If high trigger sensitivity is set, in most cases (depending on the trigger model) you should be able to pull the trigger all the way back and shoot by only slightly releasing it from the rearmost position and pulling it again. It also allows to easily "spam" in the semiautomatic mode because you only need to quickly pull the trigger, not necessarily having to make sure it is fully released. This might be a point of interest, particularly for speed soft players.
- 2. For players looking for more realism, what might be important is that the trigger must always be reset (released) a certain distance before another shot can be taken, which is noticeable at lower sensitivities. This emulates how triggers in real firearms work and provides a greater degree of control.

The progressive method does not work when burst, auto, DMR mode, binary trigger or 2-stage trigger are enabled.

# Features and programming

Supplementary video manual is available here: <a href="https://www.youtube.com/watch?v=204eWEYyw7c">https://www.youtube.com/watch?v=204eWEYyw7c</a>

#### To enter the programming mode:

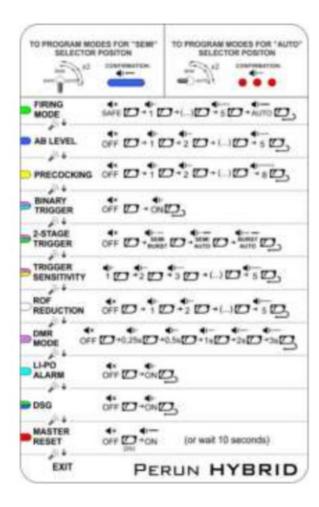

For "SEMI" – keep the selector on "SEMI" for a couple of seconds, then go to "AUTO" and back, twice. ("SEMI"  $\rightarrow$  "AUTO"  $\rightarrow$  "SEMI"  $\rightarrow$  "AUTO"  $\rightarrow$  "SEMI")

Successful entry into the programming mode for "SEMI" will be confirmed by one sound signal and a blue LED light.

For "AUTO" – keep the selector on "AUTO" for a couple of seconds, then go to "SEMI" and back, twice.("AUTO"  $\rightarrow$  "SEMI"  $\rightarrow$  "AUTO")

Successful entry into the programming mode for "AUTO" will be confirmed by three sound signals and red LED light.

Switching the selector between "AUTO" and "SEMI" and back allows to move between the modes. Pulling the trigger allows to enable, disable, or set levels for the modes.

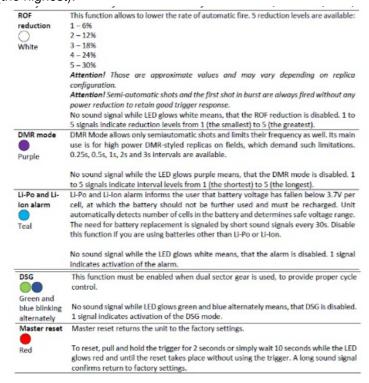

## Full feature description

All the settings are set independently for "SEMI" and "AUTO" selector positions, except for Li-Po alarm and Master reset, which work for both selector positions.

Function and LED color	Description
Firing mode	Choose firing modes for each selector position: safe, semi, 1-5 shot burst and auto.
Green	No sound signal, steady green light - safe
	1 short single signal and blink – semi
	2-5 short signals and blinks – 2-5 round burst
	1 long signal and blink – auto
AB	Active brake (AB) stops the motor after the shot, preventing the spring from remaining
	in a compressed state and eliminates double shots on semi in replicas with high rate of
Blue	fire ("overspin"). 5 levels of braking strength are available - from 1 (weakest braking
	to 5 (the strongest). Braking can be also completely disabled. It is advised not to us
	braking or use it on the lowest level, if stronger braking is not necessary, as it negative
	impacts the service life of motor brushes and causes increased heating.
	Tip: Switch to semi, fire a single shot, and hold the trigger after the shot. This will caus
	a second single shot with strongest AB setting to be fired after 3 seconds, making sur
	the spring remains uncompressed. It is advised to do that when you finish shooting.
	Attention! While precocking is on, the AB setting becomes irrelevant. However, an
	programmed AB setting will be stored in memory and will become effective as soon a
	precocking is disabled.
	No sound signal while LED glows blue means, that the active brake is disabled. 1 to
	signals indicate braking levels from 1 (the weakest) to 5 (the strongest).
Precocking	When shooting on semi, precocking keeps the piston in the rear position, ready for the
	shot. This decreases the time between pulling the trigger and the actual shot, increasing
	realism, and giving advantage in CQB fights.
	Correct precocking level must be set individually to each replica and according to user
	preferences. Precocking power is automatically adjusted to battery voltage and semi or
	automatic shots.
	Tip: To release the spring after using precocking, switch to semi, fire a single shot, and
	hold the trigger after the shot. This will cause a second single shot with the strongest
	active brake setting to be fired after 3 seconds, making sure the spring remains
	uncompressed. It is advised to do that when you finish shooting.
	No sound signal while LED glows yellow means, that the precocking is disabled. 1 to 8
	signals indicate precocking levels from 1 (the weakest) to 8 (the strongest).
Binary	The Binary trigger allows the semi shots to be triggered not only during the pull, but
rigger	also the release of the trigger.
	Tip: Hold the trigger for 2 seconds to cancel the second shot.
Purple and	
eal blinking	Attention! Does not work with the two-stage trigger. When the two-stage trigger is
iternately	enabled, the binary trigger is automatically disabled.
	No sound signal while LED blinks purple and teal alternately means, that the binary
	trigger is disabled. 1 signal indicates activation of the binary trigger.
Two-stage	The two-stage trigger allows firing in one mode after pulling the trigger slightly, and
trigger	another when the trigger is pulled further. Following modes are possible:
	semi → burst
Violet and	semi → auto
green	burst → auto
blinking.	
alternately	Burst count is set to 3 by default, but if burst of 2, 4 or 5 will be set in the "Firing mode".
	such burst count will become active in the Two-stage trigger accordingly.

1 to 5 signals while the LED blinks violet and yellow alternately indicate sensitivity levels from 1 (the lowest) to 5 (the highest).

New units and units where master reset was activated will have modes set in a following way:

Problem and LED color	Description
Disconnected motor/Diagnostic mode	This not only provides information about the disconnection of the motor, but it is also a diagnostic mode for the trigger, selector, and
0	sector gear switches. With the motor disconnected, engaging the
Yellow, blinking	switches will cause the LED to glow purple (trigger), green (selector or blue (sector gear) for a moment. This can be used for troubleshooting problems with the switchboard in the gearbox.
	Reconnecting the motor will restore normal function.
	Attention: Motor check only takes place at start-up. A disconnection after the start-up will not be signaled!
Fuse activation Red, continuous, or blinking	Activation of the fuse with a distinction between a short circul (continuous red) and gearbox jam (blinking red). In some situations this distinction may not be correct, for instance, a gearbox jam may be incorrectly read as a short circuit and vice versa.
	Electronic fuse might as well be activated by parts combination, which draws too much current (e.g., high speed motor and gears).
	The unit will start functioning normally after the battery is reconnected unless there still is a short circuit that will be detected a the next start-up.
Gearbox cycle detection failure Vellow and blue blinking	The unit did not receive information about cycle end from the secte gear switch and stopped firing only after safety time limit wa exceeded. Check whether the gears or the sensors are not damage and whether the sensors are properly engaged by the gears.
alternately	
Unit temperature is too high  Yellow and white blinking alternately	Too high temperature of the unit (electronic board) was detected. will not function again until it cools down, after which it will operat normally.
Battery with too low voltage is connected Yellow and teal blinking alternately	Battery with voltage below 7V is connected. Change the battery tone with voltage between 7V and 17V.
Battery with too high voltage is connected Red and teal blinking alternately	Battery with voltage over 17V is connected. The battery must b immediately disconnected, as it can cause permanent damage Change the battery to one with voltage between 7V and 17V.
An external magnetic field was detected Red and violet blinking alternately	External magnetic field (originating not from the trigger magnet) we detected by the trigger sensors. The unit will be blocked until th source of the magnetic field is not removed.
Problem and LED color	Description
Main transistor or driver damage control of the control of the c	The main transistor or driver is damaged. The unit needs to be sent back for repair,

- Precooking disabled
- Binary trigger disabled
- Two-stage trigger disabled
- Trigger sensitivity level 3
- DMR Mode disabled
- ROF reduction disabled
- Li-Po and Li-lon alarm enabled
- DSG disabled

# **Diagnostic system**

Perun V2 Hybrid has a diagnostic system that will help you find the source, should you encounter a problem. After the battery is connected, the unit undergoes a start-up check, to make sure replica is ready to work. Successful completion of this check is indicated by a short green blink of the LED.

	Cause	Solution

Disconnected motor / Sensor check  Yellow, blinking	None of the sensors detects any change at this moment.	
Selector switched to "AUTO" Red	This should happen after the selector is switched to "AUTO".	
Selector switched to "SEMI"  Blue	This should happen after the selector is switched to "SEMI".	
Selector switched to "SAFE"  White	This should happen after the selector is switched to "SAFE".	
Trigger Purple	Trigger pull detected.	
Sector gear Green	Sector gear movement detected.	

## Sensor check

You can easily check the sensor readings by disconnecting the motor. When Perun V2 Hybrid is connected to the

battery, but disconnected from the motor, it informs about this by yellow, flashing light. If during that flashing a properly working and connected switch will be closed, the unit will signal that by changing the LED color for a moment.

**Attention!** To enter this mode, the motor must be disconnected first, only then connect the battery! Attention! After you enter the sensor check mode, it will be active for 5 minutes, after which the unit will shut down. To restart it, simply reconnect the battery.

Checking the trigger and selector sensor can be done by simply pulling the trigger or switching the selector between "SAFE", "SEMI" and "AUTO" positions. This can be done without disassembling the whole replica.

To check the sector gear sensor, it is best to open the gearbox and remove everything out of it, except for Perun and the sector gear (make sure to keep the shimming the same as in assembled replica, it can influence whether the sensor would work or not). Then spin the sector gear by hand and see, whether the color of the light changes to green.

#### Modifications needed in Krytac and other gearboxes

Some gearboxes need minor modification to allow installation of Perun V2 Hybrid. Here we describe some cases that are known to us. Never grind the electronic board instead! It can lead to permanent damage of the unit, even if no components and paths are visible in the area you want to modify.

#### **Krytac**

Remove the small knob on the right gearbox half, near the contacts. It is possible to assemble the gearbox with that part as it does not touch the PCB, but it can obstruct the vision of the sector gear sensor:

Make room for the sector gear LED "leg" by making a small dent in the wire channel wall, so that it can fit into the gearbox:

#### G&G G2

A modification like that of the channel wall in Krytac might be needed.

## Cyma

Contacts screw hole is located on a protrusion like that, on which the cut-off lever is located. It must be leveled.
