Getting the App

The Seguro app is available free of charge in the Google Play Store and the Apple App Store. Scan the barcode with your phone to start:

<http://onelink.to/7amept>

This device complies with Part 15 of the FCC Rules (FCC ID: 2A3LI-PM06). The full FCC compliance statement can be found under “Regulatory” in the Seguro app.

Setting Up an Account

1. Tap the “Cloud Account” button on the home screen, which will display a browser window with the Seguro authentication site.
2. Tap the “Sign up” link (under the Continue button).
3. On the signup page, you can choose between using your Google or Apple ID to log in, or creating a sensified.io account with a new email and password. If you choose to use a third-party identity provider (Apple or Google), only your basic profile information (name, email, language preference and picture) are used.

Note: A cloud account is not needed to use the Seguro 150 temperature data logger.

Connecting to the Device

For Android Devices:

Once the Seguro app is installed, simply touch the Seguro device to the back of the phone (usually near the top of the phone) and the app will open automatically, then the device screen will open.

For Apple (iOS) Devices:

Open the Seguro app, and tap the Connect to Device button on the home screen. A “Ready to Scan” window will appear at the bottom of the screen. Hold the Seguro device next to the back of the phone until the phone beeps and/or vibrates.

The exact location of the NFC reader in the phone may vary somewhat, but it is usually near the top of the phone. Once the app recognizes the device, the Device screen will open.

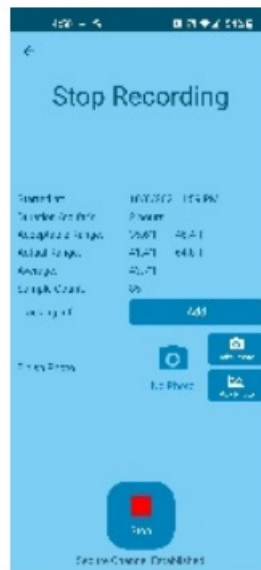

Starting a Recording

Once you have connected to a Seguro device, you can start a recording by tapping the Start Recording button. The Start Recording screen is displayed, and you can adjust the high and low thresholds, start delay, and

sampling interval before starting the recording. Cloud account users can also add a photo of the item being monitored, and Premium users can add shipment tracking information. When all of the options have been selected, tap the Start button to start the recording.

Ending a Recording

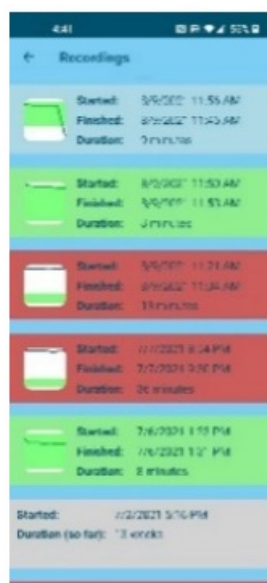

Stopping a recording that is already in progress is straightforward. After connecting to the device, the current recording will be displayed on the device screen.

Tap the Stop Recording button, and the Stop Recording screen will appear. Users who have a cloud account will have the option to add a photo to the recording, and premium cloud account holders will have the option to add tracking information, if it isn't already attached.

Tap the Stop button to stop the recording, and the device screen will reappear, with a summary of the recording. If you are not the person who started the recording, that person will get a notification on their mobile device that the recording is complete.

Reviewing Your Recordings

To review your past recordings, tap the RecentRecordings button on the home screen. A list of recordings will appear, most recent first.

Completed recordings are colored green, red, or blue (for in-range, too high, or too low, respectively). Incomplete recordings are gray.

Tapping on an individual recording displays the recording detail screen, which includes a chart of trip as well as various statistics and datapoints. If start or stop location is provided, you can see a detailed map of the location by tapping on the address. Also, if your account allows, you can display any photos included, as well as the

detailed tracking information.

Extras

Location

The mechanism for setting the location is also slightly different between Android and Apple. For Apple devices, the Seguro app will request location permission the first time a recording is started or stopped on a device. For Android devices, the app requires location permission just to connect to a Seguro device, but will also ask to attach location information to the recording the first time a recording is started or stopped.

Photos

You can add photos for both the start and end of a recording. The Seguro app requires Camera permission to add photos to a recording.

Shipping Information

For Premium account users, tracking information for popular carriers can be added when a recording is started or stopped. The app can scan the barcode on a waybill, or the user can type in the tracking number manually. The app requires Camera permission to scan barcodes.
